SIR,—Will you allow me to correct a misleading impression which I gather has been produced in the minds of some by the trend of the discussion on "The Administrative Control of Tuberculosis" at the recent meeting of the British Medical Association, reported in THE LANCET of August 5th?

When the invitation of the committee of the section reached me that I should open the discussion *re* the Tuberculosis Dispensary, I hesitated lest it might seem that in advocating the dispensary I was placing its claims in opposition to that of the sanatorium, the hospital for advanced cases, and other elements in the campaign against tuberculosis. Because of this, it seemed desirable once more to throw into prominence—as I have always endeavoured to do—that, while the tuberculosis dispensary is of much direct value, its significance is greatly increased by close relationship to the other factors in a coördinated scheme. The tuberculosis dispensary constitutes, on the one hand, an information bureau, a receiving house for tuberculous patients, a "sorting house" of the different types of case, the centre of direction and treatment for the great mass of patients who do not require institutional treatment, a "clearing house" for patients of different kinds who need hospital treatment; and, finally, a storehouse of records regarding tuberculosis, as it occurs within the community. On the other hand, the dispensary should be in closest relationship with—if, indeed, it be not the developmental centre of—the other agencies which are evolved naturally by the local needs—namely, the sanatorium (the hospital for early cases), the hospital for advanced cases, and the farm colony. In proportion as these institutions are linked together and form with the dispensary a coördinated scheme, in such proportion will the complex problem of tuberculosis be effectively solved.

The relationship between municipal and voluntary effort will readily adjust itself on the part of those who are really interested in the solution of the question as to the need for, and the limitations of, the different factors. It has been sometimes ignorantly suggested that the Edinburgh scheme is chimerical—not practical. The facts are quite otherwise. It is just because of its intensely practical character that this coördinated scheme has come into being. It has been the slow and natural evolution from the needs of the case, as these have presented themselves in the day by day antituberculosis activity, which commenced in Edinburgh with the foundation of the Victoria Dispensary in 1887. Following the elaboration of domiciliary visitation there came to be felt the need for a sanatorium, which was established a few years later, then the need for the segregation hospital for advanced cases, then notification, and, finally, the farm colony for the care of a certain number of recovered patients to whom return to ordinary conditions of life meant physical relapse and economic wastage. With the growth of public opinion, and the direction of municipal activity in relation to tuberculosis, certain aspects of the problem were especially taken up from that side. The municipality sought expert opinion as to what departments of the work came properly within their sphere. The result was that they took in hand the hospital for advanced cases, and introduced compulsory notification. There can be little doubt that this is the side from which local authorities, as such, should approach the question. Within the last 18 months a closer relationship has been established between the municipal and voluntary divisions of the work, and the final result is a scheme of closely coördinated activity, in which each element plays its distinct rôle, and the several elements are harmoniously linked together for the common good.

If the complex problem of tuberculosis, with its extraordinarily protean manifestations, be properly understood, there can never be a question as to the competing value of notification, the dispensary, the hospital for advanced cases, the sanatorium or the farm colony, each of which, however effective in itself, is less effective than it might be if the other factors be awanting.

I am, Sir, yours faithfully,

Edinburgh, August 5th, 1911. R. W. PHILIP.

[1] THE LANCET, March 4th, 1911, p. 564.

ARTIFICIAL PNEUMOTHORAX IN TREATMENT OF TUBERCULOSIS.

To the Editor of THE LANCET.

SIR,—I regret that Dr. H. Rhodes in his letter published in THE LANCET of August 5th asserts that I describe "rather contemptuously" Brauer's and Spengler's method of inducing an artificial pneumothorax. I am indebted both to Professor Brauer and to Dr. Lucius Spengler for advice freely and courteously given when I have met with difficulties in the course of the treatment in England; and for me to be "contemptuous" towards these pioneers would be almost as incongruous as it was for the juvenile curate to commence his sermon with "St. Paul says, and I partly agree with him."

Dr. Rhodes draws on his creative inner consciousness when he credits me with stigmatising Brauer's and Spengler's method as "either obsolete or at any rate almost useless." I have neither held nor expressed such a view. On the contrary, I stated that Brauer's method was not only still practised, but that its adherents claim for it certain advantages over Forlanini's method.

The arguments for and against the two methods of inducing an artificial pneumothorax are too numerous and lengthy to be fully dealt with in these columns, but there is one point I should like to emphasise at once. The open method, known as Murphy's, Brauer's, or the schnitt method, presents as many septic pitfalls as a laparotomy, and among the first 140–150 reported cases in which Brauer's method was adopted there were four deaths from septic infection of the pleural cavity (v. Muralt, Brauns). The physician is therefore not likely to carry out this operation in person. Forlanini's "puncture" method as practised by Saugman requires no lancets, ligatures, or artery forceps. The physician, therefore, who has mastered its technique may carry it out from start to finish without the aid of a surgeon. Consequently it is to the advantage of the patient that this method be taught which involves no changing of horses in midstream, and which accordingly appeals more to the physician on whom, in 99 cases out of 100, the choice of treatment depends.

The brilliant results which have been achieved by both methods certainly outweigh the occasional disasters which have occurred. Saugman has now given over 2200 injections to 104 patients, and he reports only one death due to the treatment itself. Death was due not to gas embolism but to pleural reflex—an accident that may also befall the

followers of Brauer's method. Deaths from gas embolism certainly have occurred in the course of the treatment by the puncture method, but I am convinced that most, if not all, were due to faulty execution of the proper technique.

I am, Sir, yours faithfully,

Gorleston-on-Sea, August 7th, 1911. CLAUDE LILLINGSTON.

THE TREATMENT OF ECLAMPSIA.

To the Editor of THE LANCET.

SIR,—Referring to some remarks attributed to me on pp. 378–379 of your last issue, I shall be glad if you will correct the report of what I said. I have not wholly abandoned obstetric interference by the milder methods in certain cases of eclampsia. As to Schultze's method, I said it was dangerous in *inexpert hands*, and not suitable to be taught to the ordinary midwife.

I am, Sir, yours faithfully,

Leeds, August 5th, 1911. JOHN B. HELLIER, M.D.

SPONTANEOUS COMBUSTION OF METHYLATED SPIRIT.

To the Editor of THE LANCET.

SIR,—The following incident that happened recently may be worthy of notice if, as I consider, a hitherto unsuspected danger is revealed.

During the extreme heat and sunshine of the second week of July a party of girls went along the cliffs for a picnic and took with them the usual outfit for making tea—viz., provisions, cups and saucers, spirit lamp, spirit container, &c. The lamp was one of those which have no wick, but just a central absorbent surface somewhat like a pen-wiper. The container (of the capacity of one pint) was half full of methylated spirit, and had a screw metal stopper and slight lip at one angle. When tea was thought of one of the older girls proceeded to pour the spirit from the container on to the lamp, and almost immediately her younger sister, who was sitting a few feet to leeward of her, was seen to be enveloped in flame. As the dress material worn by the girl was naturally of a light texture on such a day, a most serious accident was probably averted by the promptitude with which the elder sister made her lie flat on the grass and stifled the flames with her own skirt. As it was, the younger girl's left arm was deeply burned from above the elbow to the wrist. The promptitude and value of the elder sister's action were clearly manifest when I examined the skirt worn by the younger sister and found it badly singed from the waist to the lower hem.

The lamp and container were conveyed to the place where the picnic was held in a basket along with the cups and saucers. The other contents of the basket were not, therefore, very hot. No naked light of any kind was in the vicinity at the time.

I am, Sir, yours faithfully,

JOHN J. ROBERTSON, M.B. Glasg.

Portpatrick, Wigtownshire, August 1st, 1911.

PS. What should be the flash-point of methylated spirit?

*** The boiling-point of methyl alcohol, or wood spirit, is 66° C.; that of ethyl alcohol is 78° C.; so that the boiling-point of methylated spirit would lie somewhere between these figures. Light petroleum may have been present in the methylated spirit, but even then there can be no "flashing" or ignition without an initiating spark. Thousands of gallons of rapidly volatile petrol are carried through the London streets without being ignited by the excessive heat of the present summer. We think there must be an essential piece of evidence missing in the above incident, and that further inquiry would probably elicit the presence of a starting spark somewhere, which was overlooked. The incident shows, at all events, that care needs to be exercised when any inflammable substance is being handled in case a fire-brand is near and unsuspected.—ED. L.

MANCHESTER.

(FROM OUR OWN CORRESPONDENT.)

Degree Day at the University.

AT the recent medical degree day at the University of Manchester, the Vice-Chancellor, Sir Alfred Hopkinson, in his address to the graduates made several pronouncements of great interest on matters of medical education. Amongst the questions dealt with was the character of the instruction and of the course of study which should be required in scientific subjects as the preliminary training for medical students. The Victoria University had always insisted that in the first of the five years required for a degree in medicine a sound training in general science should be taken within the University itself or in some similar institution. By recent changes in the curriculum of the University the study of anatomy might be begun in the latter part of the first year. How far could these preliminary scientific studies be so arranged as to afford a sound general scientific training and at the same time be suited to those who wished to study medicine in such a way as definitely to affect their future work? The Vice-Chancellor quoted the important remarks made by Sir Thomas Barlow, the President of the Royal College of Physicians of London, before the London University Commission. "Many objections," Sir Thomas said, "have been urged in times past by those who have led the crusade for a more accessible medical degree in London against the preliminary scientific subjects of the London University curriculum. I submit that under the recent modifications these objections are now invalid, and that it would be very short-sighted, in view of the modern progress of medicine, which has been largely based on biological, chemical, and physical development, to suggest any curtailment of the scientific equipment of our medical graduates. The principle to which I have already referred, of endeavouring to direct studies in these subjects along lines which will bear directly on the subsequent clinical part of the curriculum is, I submit, absolutely vital." The whole of the passage applied, *mutatis mutandis*, to the position in Manchester. Already the chemistry course had been modified to bear more directly on future medical study. A course on bio-chemistry was now established, and it had been arranged that some work in organic chemistry should be taken in the first two terms in the academic year. In fact, in the first year, while the standard of scientific attainment was being maintained, the study was being more and more definitely adapted to the special needs of the medical student for his future work. The matter was summed up in the Vice-Chancellor's words, "The subjects of the first professional examination should be taught to medical students in such a manner that they form a real introduction to the subjects of the curriculum in anatomy, physiology, and pathology." Any changes which would curtail the general education and literary culture of the medical man were to be deprecated. It was better that the school stage should be devoted entirely to general education without regard to the prospective profession. True, if boys remained at school till 19, or later, it would be difficult in the later years not to specialise definitely for their particular business or profession; but although in the past school-life had been too short, there was a tendency to-day to go too far in the opposite direction. It was not desirable, in the interests of the pupil or of either the school or the university, that boys should remain at school till the age of 19. Sir Alfred Hopkinson also drew attention to the "splendid opportunities that can now be offered in Manchester for clinical study." They did not for one moment allow, he said, that clinical study could be better carried on in London than elsewhere. By the hearty coöperation of the Infirmary and the other hospitals with the University facilities were offered which had the great advantage of being concentrated as well as extensive. Finally, an appeal was made for a fund to enable original research in medical subjects to be prosecuted.

Is Scarlet Fever an Accident within the Meaning of the Workmen's Compensation Act?

A very important decision was given by Judge Mellor at the Manchester county court on July 28th on the question whether scarlet fever is an accident within the meaning of

the Workmen's Compensation Act, and whether consequently a mortuary porter, who alleged that he had contracted scarlet fever while at work in the Monsall Fever Hospital, was entitled to compensation from the Manchester corporation who employed him. The judge said that the case was the first which had arisen as to the liability of hospital authorities to pay compensation to the members of the staff who contract infectious disease through their work. The evidence showed that the claimant's work included the cleaning out of the mortuary, and that all he had to use was a broom and a bucket of water. He was given no antiseptic whatever. The medical man called for the claimant had said that if the body of a person who had died from scarlet fever was taken into the mortuary—and several bodies had been so taken—it could be said to be a perfect hotbed of germs of disease. The judge on the evidence found that the disease was contracted in the mortuary, and he held that it amounted to an accident within the meaning of the Workmen's Compensation Act. He therefore awarded the claimant 15*s.* a week during incapacity, with costs on the higher scale. A stay of execution was granted, pending appeal.

National Association of Teachers of the Deaf.

The National Association of Teachers of the Deaf held its seventh biennial conference in Manchester on July 24th and 25th. The association has about 350 members. For nearly a century Manchester has taken a prominent part in the education of the deaf, not only in the city itself but beyond. The Royal Schools for the Deaf at Old Trafford, founded in 1823, had a great influence on other communities. When the late Lord Egerton was president of the institution he, along with the committee of the Manchester schools for the Deaf, did much to promote and secure the passing of the Act of 1893, which made the education of the deaf compulsory and a public charge. The Manchester Schools are now the second largest in the kingdom. Practically the whole of the education of the deaf in this country up to about 40 years ago was conducted on the silent method by finger-signs. Since then the lip-reading method has made great progress in the schools. Each individual child is now carefully studied with a view to providing the instruction most likely to be suitable to the case, to obtain the best development of the mental life of the child. The humanising effect of the oral method of instruction is not the least valuable of its merits. A resolution was carried that an increased proportion of the cost of the education of the deaf should be borne by the State, and suggesting that the grants paid should at least be in the same proportion to the total cost as in the case of ordinary elementary education. The cost of education for the deaf in residential schools has risen from £26 in 1893 to about £40. The grant is only 5 guineas, which is out of all proportion to the cost. A further resolution was adopted endorsing the views of the chief medical officer of the Board of Education, that it is wise that deaf children should be admitted to school at the age of 5 years, and that the compulsory school age of deat children at admission should be brought into line with that of normal children and of blind children. Lord Sheffield, president of the association, in a paper on the State of Deaf-mute Education in Britain, stated that the proportion of certificated to non-certificated teachers had gone up considerably, and that the great majority of the boarding institutions were still under private management, though relying almost entirely upon the contributions of local authorities. The day schools were under local authorities. Lord Sheffield urged the importance of a national organisation of the work of teaching the deaf. He said a proper training college for teachers of the deaf was needed, which might be grafted on to some existing institution more or less under national direction, and which need not be entirely managed by the Board of Education. There were at least 6000 children in various schools for the deaf, and for those he would postulate 700 teachers. It was resolved to make representations to the Chief Secretary for Ireland urging the necessity for the passing of an Act for the compulsory education of the deaf in Ireland. As regards the distribution of deafness, statistics showed that in the British Isles it was decreasing. It would appear that where the mobility of the population was greatest, there deafness was least common. It might be that consanguinity had much to do with certain forms of deafness. In certain parts of Switzerland where people did not move about very freely, and where there was much intermarriage of relatives, deafness occurred to the extent of 1 in 408; whereas in Belgium, where nations met and intercourse was lively, the ratio was 1 in 2247. Dr. J. Kerr Love discussed the medical inspection of school children, with special reference to deaf children. At present, he said, though some children were examined, medical treatment formed no part of the work of the school doctor. This was not enough. To educate the child in a palatial modern school and to send him back for 18 out of the 24 hours to a slum tenement was poor education. Treatment was essential, and if it was to be thorough it must be undertaken in or near the school, in school clinics, with a competent staff of nurses and doctors. An examination of 20,000 cases of ear disease in Glasgow—nearly all the children of the very poor—led Dr. Love to the conclusion that the combination of overcrowding and poverty was responsible for most of the ear disease sent to hospitals. These results, often spoken of as physical degeneration, were not handed down from one generation to another. When disease was really hereditary it affected rich and poor alike. The death-rate amongst very young deaf children he thought was less than amongst very young hearing children. They, however, had worse eyesight, and there was a larger number of mentally deficient children amongst them—about 15 per cent. Deafness, when congenital, was often hereditary, and even persistently hereditary, though congenitally deaf children were not usually mentally defective. In his opinion one thing should be insisted on—viz., that on no account should the deaf, as distinct from the mentally defective deaf, be segregated like the insane.

August 8th.

BRISTOL AND THE WESTERN COUNTIES.

(FROM OUR OWN CORRESPONDENTS.)

The Lord Mayor of Bristol's Hospital Sunday Fund.

THE total amount received this year for the Bristol Hospital Sunday Fund is £1887 13*s.* 3*d.* Last year the amount realised by ordinary collections was £1887 17*s.* 5*d.*, which with sums received at the services in memory of the late King made up a total of £2007 11*s.* Allocations made this year are as follows: £739 10*s.* to the Royal Infirmary, £620 10*s.* to the General Hospital, £232 13*s.* to the Children's Hospital, £110 10*s.* to the Eye Hospital, and £105 1*s.* to other institutions.

Bristol Royal Infirmary.

The report presented by the committee of the infirmary to the governors at their recent half-yearly meeting included several items of interest. The work of the institution seems to be growing, for the excess of this half-year's work over that of the corresponding half of last year is remarkable. There were 2178 in-patients and 23,917 out-patients in the first half of this year, an increase of 350 and 3011 respectively on the work of the first six months of last year. The total income shows a decrease of £21 only, the subscriptions having actually increased by £207 11*s.* The ordinary expenditure shows an increase of £62, but this is partly redeemed by a decrease of £29 in extraordinary expenditure. The balance due to the treasurer on the half year is £783, bringing the total deficit to £4769. In addition to this, the institution stands committed to an expenditure of £70,000 on the new wing, which is to be named the King Edward Memorial Infirmary. Of this sum only £35,000 are in hand. The new building is proceeding, and it is expected that it will be completed within 12 months. The committee, therefore, expects to issue an appeal shortly for £40,000 or £50,000 as soon as the civic fund for a memorial to King Edward VII. is completed.

The British Dental Association.

The annual meeting of the Western Branch of the British Dental Association was recently held at Barnstaple. Mr. J. J. H. Sanders presided, and there was a good attendance of members. The report showed that the branch numbered 117 members, and the financial statement was satisfactory. Mr. Sanders, in the course of an interesting address, stated that an amended and strengthened Dental Act formed the question of the hour for dentists, and added that the tendency of recent legislation had added enormously to the importance of the problem. A paper was read on Tantalum

and its Uses in Dentistry by Mr. H. R. Shapland, and specimens were exhibited by Mr. Sanders, Mr. G. R. Brittan, and others. The annual dinner was held at the Imperial Hotel, Barnstaple. The next annual meeting will be held at Bath, with Mr. Stuart Carter as president-elect.

Henry Soltau, L.R.C.P. & S.Edin., L.F.P.S.Glasg., F.R.G.S.

Mr. Henry Soltau died at Malvern on July 25th. The deceased was the second son of the late Mr. H. Soltau, barrister, of Barnstaple. Mr. Soltau went to China as a medical missionary and performed much useful work there. He was the first Englishman who made the journey across China from west to east. Mr. Soltau acted as an interpreter to the British Forces during the Burmese war of 1885. He returned to England about 12 years ago, was made a Fellow of the Royal Geographical Society, and lectured before the society on his travels in China. At one time he was superintendent and general secretary of the Medical Missionary Association. He had lately been residing at Hornsey-lane-gardens, Highgate, London.

Vaccination in Somerset.

Dr. W. G. Savage, the county medical officer of health of Somerset, states that in 1905 the unvaccinated children in the county were 12 per cent.; in 1909 the percentage had increased to 43 8. The Bridgwater district has 83·3 per cent. unvaccinated children, and Weston-super-Mare 70·1 per cent.

The Inspection of Midwives in Cornwall.

At the last meeting of the midwives committee of the Cornwall county council it was decided, upon the suggestion of Dr. R. Burnet, the medical officer of health, to recommend the county council to pay £100 to the Cornwall Nursing Association for the services of two nurses who should be sub-inspectresses under the Midwives Act.

The Mortuary Question at Falmouth.

At an inquest held recently at Falmouth attention was again called to the state of the mortuary. The coroner, Mr. E. L. Carlyon, is reported to have said that it was a crying shame that the council had done nothing to make the place fit for a post-mortem examination to be made in it. After some discussion the jury requested the coroner to make a further recommendation on the subject to the Falmouth town council.

August 8th.

SCOTLAND.

(FROM OUR OWN CORRESPONDENTS.)

Edinburgh University: Medical Graduation.

THE summer medical graduation ceremony of Edinburgh University took place in the McEwan Hall on July 29th. Sir William Turner presided, and among those present were the Right Hon. George Wyndham, LL.D., M.P., Lord Rector of the University, and Mrs. Wyndham, the Countess of Grosvenor, and also the Thakore Sahib of Gondal, who is an M.D. of Edinburgh University. The degree of Doctor of Medicine was conferred on 68 candidates, of whom seven were women. Four candidates were awarded a gold medal for their thesis—namely, William Boyd (Scotland), M.B., Ch.B., 1908 for a thesis on the Cerebro-spinal Fluid in Certain Forms of Nervous and Mental Disease; Alexander Ninian Bruce (Scotland), D.Sc., M.B, Ch.B. (with second-class honours), 1909, for his thesis on the Suprarenal Glands and the Thyroid Gland; Kenneth Mackenzie (New Zealand), M.B., Ch.B. (with first-class honours), 1908, for a thesis on the Physiology of the Mammary Gland; and Samuel Alexander Kinnier Wilson (London), M.A., B.Sc., M.B., Ch.B., 1902, for a thesis on Progressive Lenticular Degeneration. Two candidates obtained the degree of Master of Surgery, one of whom. Alexander Pirie Watson (Scotland), M.A., M.B, Ch B, 1908 (with second-class honours), was awarded a gold medal for his thesis on the Treatment of Fractures by Massage and Passive Movements. The degree of M.B., Ch.B., was conferred on 92 candidates, of whom 5 were women. A number of degrees in Arts and Science were also conferred, and seven candidates obtained the diploma in Tropical Medicine and Hygiene. The Cameron prize in practical therapeutics was awarded to Dr. Simon Flexner of the Rockefeller Institute, New York, for his researches in connexion with cerebro-spinal meningitis and with dysentery and summer diarrhœa. This is the first occasion on which the recipient of the prize has been an American. Professor H. Harvey Littlejohn, in announcing the award, said they expected that in the course of next session Dr. Flexner would give an address in Edinburgh University descriptive of his researches. Professor J. Walker delivered the address to the graduates. He referred to the difference between the University training and that of the Colleges, which, he said, lay in the greater prominence given by the University to the scientific branches of the course. The University, with its well-equipped laboratories, should be in a position to teach those branches well, but there was a lack of correlation between the scientific courses and the general medical curriculum. It was disastrous to the student if he looked on his course as a series of disconnected subjects. He considered there should be a medical school in the University apart from the science school. In his own subject of chemistry, with the best intentions to adapt the course of chemistry to the wants of medical students, he and his assistants were hampered by their lack of knowledge of physiology, pathology, and clinical methods. He should like to see in the University a department of medical chemistry in the charge of teachers who had had a complete medical training. In it should be taught not only the elementary chemistry of the first year, but the chemistry of physiology, pharmacology, and toxicology, immuno-chemistry, and clinical chemistry. After the graduation ceremony a house luncheon was given in the University Union. Among the guests was the Right Hon. George Wyndham, who replied to the toast of "The Guests."

New Medical Chairs at Glasgow University.

Intimation has been received by the Glasgow University Court that the ordinance relating to the new medical chairs at the Royal Infirmary has received the approval of His Majesty in Council. The various elective bodies will now appoint curators to the patronage of the respective chairs, which, it is hoped, will be duly filled in time for the commencement of the winter session.

Aberdeen Provincial Committee: New Medical Officer.

At a meeting of the Aberdeen Provincial Committee, held on August 1st, Dr. George A. Williamson was appointed to the post of medical officer and lecturer on school and personal hygiene at a salary of £400. Dr. Williamson is a native of Inverness, is 40 years of age, and possesses the following degrees: M.A. and M.D., Aberdeen University; D.T.M., University of Liverpool; and D.P.H. (with honours), Aberdeen University. After graduating Dr. Williamson acted as house surgeon, first at Gray's Hospital, Elgin, and then at the Northern Infirmary, Inverness. He then entered the Colonial Service, and in 1895 was appointed medical officer of health of Larnaca town and district in Cyprus, a post which he still holds.

Appointment of School Medical Officers.

At a meeting of the Aberdeen County Committee on Secondary Education, held on August 4th, the report of the medical inspection subcommittee was moved. The report recommends that arrangements should be made with the county council whereby the county medical officer of health should act as chief school medical officer for the general supervision of the scheme of medical inspection, at an annual salary of £50, with two whole-time assistants for the work of actual inspection, the assistants being appointed assistant medical officers of health for the county. An amendment that a whole-time chief medical officer be appointed with one assistant as before was moved, and carried by 20 votes to 10 for the motion. The salaries were fixed at £300, rising by increments of £25 to £400, and £200, rising by increments of £25 to £300 per annum.

August 8th.

IRELAND.

(FROM OUR OWN CORRESPONDENTS.)

The Royal Institute of Public Health.

THE annual meeting will open at Dublin on Tuesday, August 15th, with a reception by the Countess of Aberdeen and the executive committee in the Examination Hall of St. Stephen's College. At 11 o'clock His Excellency the

Lord Lieutenant of Ireland will deliver his presidential address. The sectional meetings will be: Comparative Pathology and Veterinary Hygiene; Vital Statistics and Preventive Medicine; Chemistry and Bacteriology; Municipal and Parliamentary; Housing of the Working Classes; Town Planning; Chi'd Study and Eugenics; and a Conference of Medical Officers of Health and Port Sanitary Authorities. The list of entertainments includes numerous garden parties, the annual dinner, and a conversazione at the Royal College of Physicians. There will be special services on the Sunday at the Pro-Cathedral and at St. Patrick's Cathedral.

Membership of the Royal College of Physicians.

New by-laws governing the admission of Members of the College, to come into force in January, 1912, have been drawn up by the Royal College of Physicians of Ireland. Candidates must, in addition to passing an examination in medicine and pathology, select from the following groups a special subject, in which they will be expected to reach a high standard of proficiency. The groups are: medicine, gynæcology and obstetrics, pathology and bacteriology, and any further group of subjects deemed by the College to be equal in value to one of the preceding groups. It will be seen that midwifery and gynæcology are now recognised as subjects qualifying for membership.

The Distribution of Lord Iveagh's Gift to the King for Dublin Hospitals.

His Majesty has approved the following grants, recommended by the Advisory Committee:—Mater Misericordiæ Hospital, £4000; Fever Hospital and House of Recovery, Cork-street, £3500; National Hospital for Consumption for Ireland, £3000; Adelaide Hospital, £2750; Sir Patrick Dun's Hospital, £2500; Meath Hospital and Co. Dublin Infirmary, £2250; Richmond, Whitworth, and Hardwicke Hospitals, £2250; Rotunda Hospital, £2250; Royal City of Dublin Hospital, £2000; Dr. Steevens' Hospital, £2000; St. Vincent's Hospital, £2000; Royal Victoria Eye and Ear Hospital, £2000; Royal Hospital for Incurables, £2000; Our Lady's Hospice for the Dying, £1750; Children's Hospital, Temple-street, £1700; Coombe Lying-in Hospital, £1700; Convalescent Home, Stillorgan, £1500; Linden Convalescent Home, £1500; the Orthopædic Hospital of Ireland, £1500; National Maternity Hospital, £1500; Charitable Infirmary, Jervis-street, £1350; Mercer's Hospital, £1350; National Children's Hospital, Harcourt-street, £1000; St. Michael's Hospital, Kingstown, £750; Monkstown Hospital, £500; Incorporated Dental Hospital of Ireland, £500; Rest for the Dying, Camden-row, £500; Drumcondra Medical and Surgical Hospital, £200; and Allan A. Ryan's Home Hospital, £200. The distribution has given rise to comment, as in some cases it seems difficult to recognise its relationship either to the work done by the different institutions or their individual needs.

The Rotunda Hospital.

The board of governors of the Rotunda Hospital has unanimously adopted a resolution thanking Dr. James Roy Freeland and expressing appreciation of his conspicuous ability and courtesy during his three years of office as assistant to the Master.

Health of Belfast.

The report of the medical officer of health to the Belfast city council on August 1st showed that the death-rate during the month ending July 15th was 14·0, as compared with 13·3 in the preceding month and 19·1 in the corresponding month of 1910. The residents of Fort William Park, one of the best suburbs of Belfast, complained to the health committee of the foul smells from the bad drainage of that district, when it was found that the corporation had no plans of the sewers in that quarter. The surveyor's department is at present lowering the sewer in one part of the district and exploring the other part. The drains are to be made right as soon as possible. It was in this district that recently there was an extensive outbreak of diphtheria.

Methylated Spirit Drinking.

At the Donegal petty sessions, held on August 2nd, a man was fined for being drunk on methylated spirit. The district inspector of police pointed out that the drinking of methylated spirit was greatly on the increase in the district. The Belfast and Ulster Vintners' Association has decided to take steps to have the law relating to the sale of methylated spirit altered. Since the increase of the spirit duties under the Budget the sale of methylated spirit has greatly increased, especially in the country towns of Ulster, and has led to a peculiarly objectionable form of drunkenness. The drinking of methylated spirit should be made a punishable offence. In the county of Londonderry, especially round Draperstown, some years ago ether drinking was very prevalent, and on market days in Cookstown and other places—for instance, on the Derry Central Railway, by which farmers journeyed—the smell of the ether could be easily detected. Legal enactments have put an end to this dangerous custom of drinking ether.

Down Lunatic Asylum.

In the report for 1910 of this asylum regret is expressed, and with great truth—indeed, the Inspectors of Lunatics in their fifty-ninth report lament it—that the county councils have failed to avail themselves of the provisions of Section 5 of the Act 1 Edward VII. cap. 17, authorising the provision of a common laboratory as well as of a pathologist who should give instruction in the pursuit of scientific investigation to the medical staff. This clause, unfortunately, is not obligatory. The committee of management of the Down Asylum pledged itself on March 15th, 1902, to contribute in accordance with the spirit of this measure, but, unfortunately, only a few other like bodies followed suit. Unless some such action is taken to keep pace with the advances of modern scientific medicine no real progress can be made in mental diseases, and the medical superintendent of an asylum will be reduced to the rank of a mere clerk recording a mass of useless details in books never seen except by the inspectors and by his board of management, and he will have to continue at word-spinning in his annual reports instead of supplying some really accurately observed scientific facts.

August 8th.

PARIS.

(FROM OUR OWN CORRESPONDENT.)

The Tropical Heat in Paris and the Lack of Water.

THE end of July and the beginning of August at Paris have been characterised by an altogether exceptional heat, as seems also to have been the case in the other European capitals. As a natural consequence there has been an increase in the cases of heat-stroke, of congestive complaints, and of suicides and crimes occasioned by cerebral excitation. Drinking-water has also been deficient—as, indeed, happens nearly every year in Paris during the hot spells—and the deficiency would have been even more serious had there not been a considerable exodus of inhabitants to the country. Both the public and the press complain that, in spite of the huge sums expended by the municipal council for an abundant supply of drinking-water to Paris, such a supply as would do away with apprehension as to its being forthcoming at the time when it would be of greatest service is not yet assured. The normal supply of Paris is undoubtedly insufficient, as is evident so soon as the temperature rises and the sources of supply become less abundant, which is usually the case in summer. On the other hand, the desire to make use of only the present sources of supply for the capital makes it necessary to reject confluents that could be most easily utilised, but which are inadmissible because the water is contaminated by drains and the industrial effluents of the very populous localities surrounding Paris. The water of the Seine used for industrial purposes and for general watering is brought by lifting apparatus which cannot give it sufficient head for employment in those parts of Paris situated at some elevation, such as Montmartre, the Trocadero, the Maison Blanche, and the Buttes Chaumont. Consequently, to obtain a sufficient pressure the water has to be drawn by means of aqueducts from mountain sources having a great pressure. This takes away a part of the potable water that ought to be reserved for drinking for the factories, the watering and fire hose, and the water power for lifts. Another important

cause of loss of water also is reckless waste. Finding that the tap-water in the apartment houses is not sufficiently fresh (inasmuch as the pipes, which are all situated on the outside of the houses under the police regulations, are exposed to the sun), it is a common practice, in order to obtain a glass of cold water, first to let quite a copious stream flow to waste. Many even leave the tap on all the day so as to be sure of cold water at any time. The waste from this practice is so considerable that it has been even suggested that it might be to the city's advantage to supply ice gratuitously to all the inhabitants during the hot spells. Through the nomination of M. de Selves to the Ministry of Foreign Affairs, the office of Prefect of the Seine has a new incumbent, and, as might be expected, a greater activity is just now manifest in the municipal services. The new Prefect has taken steps to lessen the deficiency of drinking-water by half. After consultation with the committee of hygiene, and particularly with Dr. Roux, director of the Pasteur Institute, he has decided to divert into the reservoirs of Paris 30,000 cubic metres daily of water from the Marne, after filtering it through three successive layers of porous stone. Moreover, at the outlet of these filters there is to be added to the water a slight quantity of sodium hypochlorite to destroy the microbes that may have escaped through the filter. Inasmuch as the water of the Marne is calcareous, the sodium hypochlorite, being promptly neutralised by the calcium salts, leaves no unpleasant taste. It is really a remarkable thing that 15 days have sufficed for making this installation and for providing against a dearth in the normal supply of drinking-water. It is true that the works for supplying water from the Marne for industrial and watering purposes and the needs of the bathing places of Paris existed, as well as the pipes that allowed the conducting of this water into the mains of the drinking-water reservoirs. Although this communication could not have been effected in so few days, the Parisians, in their delight at at last having water, forget to ask themselves if this mysterious communication has not been made use of very often, in times of drought, without its being so flamboyantly heralded as it is to-day. The interesting fact is the rapidity with which it has been possible to organise so perfect a system of purification, for which Dr. Roux and the Consultative Commission deserve great credit. It should be added that the water was not supplied to the public until after numerous bacteriological and chemical tests, and many tastings by the members of the Commission, had established the innocuousness and the potable quality of the water. It was quite time, because, to meet the drought, recourse had again been had to the deplorable measure of stopping the flow during the night to allow the reservoirs to refill. Consequently the inhabitants of Paris were entirely without water between midnight and 6 A.M., which caused considerable discomfort; for though it was possible and customary to put aside a supply of drinking-water, it was not equally so to provide for baths, the toilet, the lifts—which consequently did not work during the night—and, what was still more serious, for the fire mains. On many occasions fires broke out during the night, with disastrous results, owing to the lack of water in the mains. It is true that a watch service was organised, and that the firemen, on being summoned by telephone, immediately themselves undertook the task of reopening the water mains. But even so, a quarter of an hour or 20 minutes elapsed before the water in the mains attained an adequate pressure. During this time the fire gained a good footing, for the firemen's hose was intended to work under heavy pressure, and without it gave only a very feeble stream. One shudders now at the thought of what would have happened had a fire occurred, for instance, in a place of entertainment some minutes after midnight. The losses thus caused have already cost a sum not far short of what it would have cost to bring an additional supply of drinking-water to Paris—an expense before which the administration for several years has recoiled. The new Prefect has promised that before next summer the works now under construction for the purification of the water of the Seine by ozone and the ultra-violet rays shall be finished, and that Paris shall not again run the risk of its water-supply giving out, even in case of a drought of the sources and of reckless waste in the use. The purification of river water is, in short, the means to be adopted for supplying the city of Paris with a fresh supply of drinking-water, for the various processes are now sufficiently perfected to deserve confidence. This solution is less costly than the bringing of water at great expense from fresh sources far afield, Paris having already exhausted all the available water-supplies within a radius of 200 miles. These water sources, moreover, require incessant surveillance by chemical stations and laboratories along their course, and the imprudence of the dwellers alongside might contaminate them with typhoid germs and so risk infecting the entire capital, as has all but happened many times with regard, for instance, to the sources of the Avre. The plan of bringing water to Paris from Lake Geneva, which has been put forward, has been abandoned on account of the enormous expense and the risk that in war-time an enemy might destroy these works and threaten Paris.

August 7th.

VIENNA.

(FROM OUR OWN CORRESPONDENT.)

Proposed Restrictions on the Journalistic Puffing of Medicines.

AT a recent meeting of the Union of Austrian Medical Councils a suggestion was made which is of considerable interest to medical journalists. The substance of it was to the effect that something of the nature of a permanent committee should be created whose duty it would be to examine and control the articles in which some medical periodicals extol the value of certain medicines and other substances used therapeutically. In the result a resolution in this sense was adopted by the meeting, in spite of the fact that it is impossible to test the efficacy of such remedies or to verify the statements of the author of such an article otherwise than by repeating his experiments. At any rate, the incident reveals the existence of some dissatisfaction with the frequency of these puffing announcements in our medical journals. It is, no doubt, true that a medical man will be able to judge for himself how much reliance can be placed on paragraphs of that kind, but the chief objection to them is the custom of the manufacturers of proprietary medicines to distribute broadcast condensed abstracts of such articles wherein the medicine is praised, and practitioners cannot find out from a few lines whether the statements that are made are the result of honest observations or merely the production of a vivid and artificially stimulated imagination.

The Karolinen Kinderspital in Vienna.

During the year 1910 at the above-mentioned hospital, one of our special institutions devoted to the treatment of children, 18,292 children came under observation, of whom 965 were received as in-patients. Of this number 352 were under 2 years of age. The mortality of the in-patients was 15 per cent.; 13·3 per cent. were discharged as improved and 57 per cent. as recovered. A large proportion of the inmates were received because of infectious diseases. Only severe cases were admitted. The mortality of some prevalent diseases was as follows: measles, 2 per cent.; scarlet fever, 4 per cent.; and diphtheria, 8·7 per cent. This institution is one of the few hospitals in Austria supported by voluntary contributions and not under direct official control, but managed by a privately appointed council. Plans have been prepared for the erection of a new hospital, as the present premises are antiquated and insufficient both for the increasing number of patients and also for the fulfilment of modern requirements. The scientific report of the hospital contains six elaborate papers by the director, Dr. Knöpplmacher, as well as instructive contributions by Dr. Lehndorff, Dr. Zak Spieler, Dr. Leines, and several others.

A Case of Acute Bedsore after a Large Dose of Veronal and Pyramidon.

A rare case of gangrene of the skin and subcutaneous tissues, described under the name of acute bedsore, was shown recently by Dr. Liechtenstern at a meeting of the Gesellschaft für Innere Medicin in Vienna. The patient, a woman aged 28 years, had taken, with a suicidal intention, 8 grammes (a quarter of an ounce) of veronal and 6 grammes of pyramidon. She was found in an insensible condition, and when she was taken to a hospital a bluish-black spot of the size of a shilling was then noted in the region of the coccyx. After 48 hours, the unconsciousness still being present, there

was evidence of suppuration and the affected area had increased to the size of a five-shilling piece. In spite of careful treatment the gangrene spread until it reached the sacrum. The patient was treated with peroxide of hydrogen and iodine and was placed on a water-bed. This finally brought the destruction of tissue to a stop, and she was discharged from the hospital after 40 days with a defect of tissue measuring three inches in depth and about an inch in breadth. It could not be ascertained with certainty whether or not there had been a lesion of the medullary conus, for there were no bladder troubles and no loss of control of the rectum, but only changes in the sensibility of the gluteus muscles. No similar case due to poisoning by veronal has yet been seen or reported upon. Acute bedsore was sometimes met with in cases of disease of the spinal cord; it appeared and developed within a few hours, and in the case above mentioned it seemed that the mixture of veronal and pyramidon (amido-antipyrin) had exercised a toxic influence upon the lower segment of the spinal column.

Reappearance of Cholera in Austria.

In addition to the few cases of cholera mentioned in my letter in THE LANCET of June 24th there has been a definite outbreak of this disease in Trieste, where at present there are 20 cases under observation. The very strict quarantine and the careful search that has been made have resulted in the discovery that among the persons who have been in contact with undoubted cases of cholera there are several who, although to all appearance in good health, nevertheless harbour the bacillus of that disease. The intensely hot weather which at present prevails in the southern districts of Austria has also had a share in promoting the spread of infection by indiscriminate eating of fruit and assuaging of thirst, especially amongst the lower class of the population. The coast district of Austria has now been declared to be infected with cholera, and due notice of the fact has been given by the sanitary authorities to all states and governments as required by the Cholera Convention. In all cases the direct or indirect tracing of the source of infection pointed to Italy as the place of origin, except where direct contact with infected persons occurred in our country.

The Medical Sanatorium in Marienbad.

In Marienbad a few days ago the convalescent home for medical men was opened, and will no doubt prove a boon to many practitioners when suffering from the effects of illness. Residence in the institution will be free for subscribers, while non-subscribers will have to pay a small sum for their accommodation; the waters and the use of the baths of Marienbad will be free to all medical men.

August 7th.

CANADA.

(FROM OUR OWN CORRESPONDENT.)

Care of Milk in Montreal.

Dr. McCarney, chief food inspector in Montreal, has recently made a special investigation of milk delivery in Montreal. He has submitted to the Board of Control a strong recommendation in favour of refrigerator railway cars for the conveyance of milk in hot weather. He has further recommended that cooling houses should be provided at the points of arrival to prevent the milk from souring prematurely.

Annual Report upon the Feeble-minded in Ontario.

Dr. Helen MacMurchy, in her fifth annual report upon the feeble-minded in Ontario, thus sums up the situation as regards the school population. The school population of Ontario is about 600,000, and of this number it is estimated that 1000 or so feeble-minded are in the schools or of school age. In the opinion of Dr. MacMurchy these should be registered under the direction of the Education Department, in order that they may be known and located. As for the remainder, the adults or those over school age should be reported to the Provincial Secretary's Department. Those coming under the notice of the officers of the law should be similarly tabulated. Finally, there should be a gradual development of the policy of the care of the feeble-minded, in accordance with enlightened public opinion in the province.

Accident to Dr. Andrew Macphail.

Some few weeks ago an unpleasant accident happened to Dr. Andrew Macphail, editor of the *Journal* of the Canadian Medical Association. A bottle of aerated water exploded and particles of glass lacerated his face and injured both eyes. I am assured, however, that neither eye is permanently injured.

Dr. George E. Armstrong and the Royal Victoria Hospital, Montreal.

Dr. George E. Armstrong, of the Montreal General Hospital, has been appointed surgeon to the Royal Victoria Hospital, Montreal, in the place of the late Dr. James Bell. Dr. Armstrong is President of the Canadian Medical Association.

Milk Stations and Infant Mortality in Montreal.

Dr. Lachapelle and Dr. Blackader have reported recently to the Board of Control of Montreal that during the late extremely hot weather, as a result of the work done by the milk stations in connexion with La Crèche de l'Enfant Jésus, Ste. Justin Hospital, and the dispensaries of St. Edward and Hochelaga, infant mortality in Montreal has been very considerably reduced. Several more milk stations are to be established.

July 22nd.

UNITED STATES OF AMERICA.

(FROM OUR OWN CORRESPONDENTS.)

The Cholera in New York.

EIGHT deaths from cholera have been reported to the Department of Health of New York City from the outbreak of the disease in Naples up to July 18th, six of these deaths having followed the arrival of the steamship *Moltke*. Two passengers of the steamship *Abruzzi*, which reached this port some two weeks ago, were the first victims, one dying in Auburn, N.Y., some 100 miles from New York, and the other in Brooklyn. Of the remaining six, five were passengers of the *Moltke*, and the sixth a night watchman at the detention hospital. Dr. Herman M. Biggs, chief bacteriologist of the Health Department, with Dr. Alvah H. Doty, health officer of the port, visited both Hoffman and Swinburne Islands, and reported that the colonies of detained passengers and cholera suspects on Hoffman Island, and the patients on Swinburne Island, were doing well. On July 20th Mayor Gaynor visited Hoffman Island in company with Dr. Doty, Dr. Biggs, and Assistant Surgeon-General L. E. Cofer, who represented Surgeon-General Wyman of the Public Health and Marine Hospital Service. Passed Assistant Surgeon R. H. von Esdorf, who has been in charge of the United States Marine Hospital at Mobile, Ala., and is an expert bacteriologist, has been sent to New York by the United States Government to inquire into conditions at Quarantine, and a rigid investigation is being made. It is believed, however, that there is no further danger of the infection spreading, and the public has been reassured by the official publication of facts concerning cholera, to the effect that it is introduced into the system only through infected food and drink, and is not contagious in the popular sense. It is understood that the steamship companies are taking great precautions to avoid shipping patients, and especially 'cholera carriers,' thus coöperating with both the United States and the Italian Governments to put an effectual stop to the incipient epidemic. This cholera excitement has put a complete check to the political efforts to discharge Dr. Doty in order that the political party recently victorious at the polls in New York State might put in one of its henchmen, and so secure the high emoluments of this responsible office. It is not unlikely that the result of the whole cholera scare will be to put the Quarantine Department of the State under the control of the Federal Government, where it properly belongs, all the water highways of the country being under central control.

Study of Infantile Anterior Poliomyelitis.

The Rockefeller Institute for Medical Research announces that it will devote its resources during the present season to the study of infantile paralysis and to the treatment of acute cases in its hospital. The ravages of the disease have been enormous during the past hot spell throughout the country.

Dr. Flexner has no doubt that the disease is communicated by means of the common house-fly. Physicians everywhere are requested to communicate to the institute reports of prevalence of the disease, and when possible to send by post sections of the spinal cord and naso-pharyngeal mucosa, preserved in glycerine, addressed to Dr. Simon Flexner, Sixty-sixth Street and Avenue A, New York.

A Clinic for Mental Diseases.

A clinic for mental diseases, to be open on Wednesday and Saturday mornings, and conducted under the auspices of the State Charities' Aid Association, has been inaugurated at the Long Island College Hospital, Brooklyn, New York City. It is the second of its kind in the State and the first in the city, and if successful will be followed by the establishment of similar clinics.

Infant Mortality in New York.

In the first six months of 1911 there were 7337 deaths from all causes of infants under one year of age in New York City, ten less than for the same period in 1910. The nurses of the Health Department have now under constant supervision over 11,000 infants. The seaside hospital at Coney Island, with a capacity of 184 beds, has been reopened for the summer in its new fireproof building, and will continue its very successful work in caring for invalid babies, with two internes, eight nurses, and a large visiting staff.

Travelling Luxury for the Insane.

The Long Island Railroad has put into commission a car built especially for insane patients who are to be conveyed to any of the numerous asylums on the island; the expense is borne partially by the State. It is larger than an ordinary car, being on the lines of a Pullman, is completely furnished with surgical instruments, strait-jackets and other apparatus for restraining violent patients, and the windows are protected with heavy brass grille work.

A New Treatment for Rheumatism.

Great interest has been manifested by the medical profession in the publication of a paper by Dr. Algernon Brashear Jackson of Philadelphia on the treatment of rheumatism. This treatment consists simply in the hypodermic injection of Epsom salts or magnesium sulphate in three-grain doses. The results are not only the free purgation that might be expected, but a rapid drop in the temperature and speedy relief from pain. In all the cases reported by Dr. Jackson he had previously exhibited sodium salicylate, either without result or with but slightly palliative effects. Previous literature on this treatment is practically *nil*, there being but one reference in a minor work on therapeutics, although there was at one time some slight vogue for the hypodermic use of Epsom salts for the relief of otherwise intractable constipation.

Charges against Dr. H. W. Wiley.

For a long period attempts, instigated by food and drug adulterators and manufacturers of misbranded products in America, have been made to discredit Dr. H. W. Wiley, chief of the Bureau of Chemistry of the United States Department of Agriculture, whose zeal in administering the Pure Food Act has made him extremely unpopular among these classes. These attempts have not been successful, nor have they had the effect of diminishing Dr. Wiley's zeal. By a curious coincidence, however, a committee of the Department of Agriculture has brought a series of charges against Dr. Wiley, and the Attorney-General, after examining these charges, has recommended that Dr. Wiley be allowed to resign, and has expressed the opinion that his action merits "condign punishment." The basis of the charge is that Dr. Wiley arranged to pay Dr. H. H. Rusby, a pharmacognosist of high standing, employed in connexion with the administration of the Pure Food Act, a higher salary than that allowed by law. The charge appears to be purely technical in character, and it is difficult to understand for what reason it is being pressed so relentlessly. It is known that President Taft fully approves of Dr. Wiley's strenuous administrative policy, and is, in fact, anxious that the law as to food and drug adulteration should be strengthened.[1] It will be interesting to learn the President's opinion of the technical grounds on which Dr. Wiley has been asked to resign from a position in which he has done such valuable public service.

July 24th.

[1] THE LANCET, July 8th, 1911, p. 106.

NOTES FROM SOUTH AFRICA.

(FROM OUR OWN CORRESPONDENT.)

The Medical Profession and the Union Government.

MEDICAL men throughout South Africa of all shades of political thought are profoundly dissatisfied with the methods of the first Union Ministry. Grave discontent was caused within a few days of Union by the breaking up of the old Colonial Health Departments. Although a year has since elapsed no effective substitute has been provided; nor is such apparently contemplated in the near future. A succession of unsatisfactory measures intimately affecting the medical profession were introduced into the House of Assembly, which, on being strenuously opposed by the profession, were subsequently whittled down or abandoned by the Ministry. The treatment of the Medical Council of the Orange Free State by two Members of the Cabinet still rankles. The manner of filling by General Smuts since the taking effect of Union of practically every medical vacancy of importance has given grave cause for criticism. Finally, there is the announcement of the retrenchment of Dr. A. J. Gregory and Dr. G. Pratt Yule, the medical officers of health for the Cape and Orange Free State respectively, to take effect as from August 31st next. The news of the proposed retrenchment of these officers, and particularly of the former, has been received with dismay by the profession and by local authorities. Dr. Gregory is universally considered the most suitable officer in South Africa to-day to be appointed to the post of chief medical officer of health for the Union on account of his qualifications, his long official experience and ripe knowledge of South African conditions, and of his well-known administrative powers. In view of the character of some recent appointments, it would seem as if Dr. Gregory's very fitness for the post and the fact that such is recognised by the profession are sufficient to cause him to be retired from the service under present conditions. The only reason that can be advanced in the case of Dr. Pratt Yule would appear to be because as a Government nominee on the Medical Council of the Orange Free State he had the courage to resign with his colleagues from that Council during the recent controversy with General Hertzog and General Smuts. In both cases the feeling of the profession is that no effort must be spared to deter General Smuts from carrying out his proposals. They cannot be explained on the ground of a reduced staff being necessary under the Union, for if an adequate health administration for South Africa is to be maintained, more whole time medical officers of health than are at present in the service of the Government will be required. The retrenchment of these officers is not likely to be carried out without causing much indignation from all who desire to see a healthy South Africa, and already a number of strongly-worded protests have been made to the Government on the subject by local authorities and medical societies. In the meantime it is understood that Dr. Pratt Yule has been offered and has accepted an important public health appointment in Canada.

Medical School of South Africa.

Amongst the recent arrivals in South Africa was Dr. R. B. Thomson, the newly appointed professor of anatomy at the South African College, Cape Town, and the first holder of the chair of anatomy established in South Africa. Dr. Thomson was the Crichton research scholar in anatomy in 1906–07 and again in 1907–08, and has held several teaching appointments at the Edinburgh University since he graduated in 1905, including the appointment of lecturer in anatomy with charge of the Bristo-street department of the University. He will be engaged for the next few months in superintending the organisation and equipment of the new anatomy department. The professor of physiology has not yet been appointed, but applications are now being invited for the post. The salary attaching to each of these appointments is £500 per annum, rising to £800, with a retiring pension of £300 per annum.

The Prevalence of Small-pox.

A few weeks ago over 200 cases of small-pox were discovered in the district of Herschel in the Cape Province. The cases appear to have been of a fairly mild type, and consequently the outbreak was not reported to the

authorities by the natives amongst whom it broke out. Unfortunately, it has now spread over a wide area, and judging from press reports promises to give the authorities considerable trouble in stamping it out. The disease has not only spread to other districts in the Cape Province but also to the Orange Free State and the Transvaal. The reason appears to have been the usual one—namely, a restricted expenditure on vaccination. The laws relating to vaccination in the Union—at any rate, in certain provinces of the Union—are far from satisfactory, and recently they have not been enforced. The vaccine stations in South Africa have been working under great pressure to supply sufficient lymph to meet the great demand that has arisen owing to the prevalence of the disease, and a large expenditure is being incurred all over South Africa on public vaccination. Amongst natives the disease used to be called "amaas," and was regarded by many practitioners until the beginning of the present century as a different disease from small-pox. Dr. G. Turner, when medical officer of health for Cape Colony, clearly proved that the disease is nothing but small-pox, modified possibly by racial or climatic factors. There are still a few practitioners who hold a contrary view, but the profession now recognise generally that "amaas" and small-pox are one and the same disease. It must be admitted that the disease is generally so modified in natives that its recognition by the new-comer from Europe is often a matter of difficulty. Yet those with any considerable experience of the disease as met with in South Africa have often seen slight attacks of amaas responsible for severe outbreaks of typical confluent small-pox, and cases of typical small-pox causing outbreaks of so-called "amaas." Moreover, vaccination protects against "amaas," the same as it does against small-pox, and patients recovering from "amaas" will not take when vaccinated. The real reason why doubt has ever arisen is apparently because even amongst unvaccinated natives the disease, as a rule, runs a very mild course, the usual mortality not being more than about 4 per cent., though striking examples of really severe cases are at times seen. Owing to the modification of the disease as it usually appears amongst natives in South Africa, it has been occasionally mistaken for other diseases, and one epidemic is recorded where the disease was actually reported by the district surgeon as syphilis, the true nature of the outbreak not being discovered until neighbouring districts had become infected. All health officers in South Africa to-day, as well as the profession generally, have accepted the disease as small-pox, but still occasionally even now doubts are cast by individual members of the profession on the diagnosis of particular outbreaks. To ensure the proper notification of the disease, however, by those medical men who still maintain that it is a disease other than small-pox, the Health Acts of most of the provinces require, *inter alia*, that small-pox, "amaas," and other diseases resembling small-pox shall be notified to the local authority by the medical practitioner in attendance.

Leprosy in Basutoland.

The time will soon arrive when there will be a uniform policy throughout South Africa in the dealing with leprosy. Mr. E. C. Long, the principal medical officer of that Protectorate, recently, at the invitation of the Resident Commissioner, addressed the native council on the prevalence of leprosy in Basutoland, which in recent years appears to have been making considerable headway. He proposed to the council that all lepers should be concentrated at a place chosen for the purpose, that suitable buildings should be erected, and all necessary arrangements made for providing medical and nursing attendance, more or less on the lines of the leper settlement in the Transkei. He expressed the hope that the council would advise Chief Letsie to grant a suitable tract of country which should be near the seat of a magistracy and not far from the railway. Mr. Long's address was listened to earnestly by the native chiefs in council assembled, and Chief Motsocui, in voicing their views, stated that Mr. Long was advocating a movement with which the council agreed, and that in due course they would advise the paramount chief accordingly.

The Proposed Johannesburg Research Laboratory.

It appears that it is the Witwatersrand Native Labour Association that intends to build the research laboratories at Johannesburg at a cost of £40,000, and to maintain the same at an annual cost of £10,000, and not the mining companies, as was at first believed. There is a rumour that the Government desires to transfer all its laboratory work to the new laboratory when established and to assume control of it. This would mean the closing down of all the laboratories in the provinces and would be disastrous to public health work generally, and very inconvenient to those who are engaged in private practice and who rely on bacteriological assistance furnished by the provincial laboratories. If the Witwatersrand Native Labour Association is willing to undertake the maintenance of the new laboratory it is sincerely to be hoped that the Government will not be able to obtain any measure of control over it, and that it will remain purely a research laboratory without undertaking any routine public health work whatsoever. It is desirable to prevent at all costs the research work in the new laboratory being swamped with routine work, as has been the case in the existing Government laboratories, and above all to ensure that the Government should have no say in the making of the new appointments to the laboratory staff in order that such appointments may be made on the merits of candidates and not possibly owing to political bias. Primarily it is understood that the institution is to be for the investigation of those diseases which affect particularly the health of mine workers, but also that it will be open for any research work into human diseases occurring in South Africa. If the laboratory can be established and maintained on sound lines a great future should be open for it, as remarkably little research work into human diseases peculiar to the country has hitherto been undertaken, and a vast field lies open. For instance, during the last three years there have been numerous outbreaks of an unknown infectious disease occurring amongst natives throughout South Africa, more particularly in densely populated native areas, that has hitherto defied investigation. It has been variously diagnosed as epidemic cerebro-spinal meningitis, scarlet fever, measles, influenza, enteric fever, paratyphoid, and typhus. Outbreaks of the disease have been recognised for at least the last 12 years. It appears to attack natives only, and it has occurred practically all over South Africa. It is understood that it has recently been specially studied by Dr. A. J. Gregory, the medical officer of health for the Cape, but no official report of his investigation has as yet been made public. The disease has given the authorities a great deal of trouble, and during the recent session of Parliament questions were asked in the House of Assembly regarding it. It will be unfortunate if the present investigation cannot be carried to completion, and if the retirement of Dr. Gregory should unfortunately be effected, it is to be sincerely hoped that he may be enabled to carry out his research in some other sphere of activity, as, for instance, in connexion with the proposed new Research Laboratories.

July 1st.

AUSTRALIA.

(FROM OUR OWN CORRESPONDENT.)

The Control of Charities.

THE Acting Premier of Victoria is dissatisfied with the present system of hospital management and proposes to introduce a Bill dealing with the matter. Replying to a deputation recently he said there was at present no control worth calling control. "As all roads from charitable institutions led to the Treasury it was possible to form an idea whether the management was satisfactory or not. He wanted to preserve what was good in the present system and sweep away what was bad. What he was hopeful of doing was of creating a board of three members. They would have to be well selected or the system would fail, but with good men they ought after a year's examination of existing institutes to know which were useful and what changes were advisable."

Alfred Hospital.

This institution has been especially indicated by the Acting Premier as needing reform. Matters came to an acute crisis when the committee proposed to appoint a clinical pathologist and take a certain portion of his salary from the general hospital revenue. The Acting Premier replied that the pathologist should be paid for out of students' fees, and that if the general revenue were drawn upon for such a purpose he would cancel the Government grant in aid. The managers replied that a clinical pathologist was

as necessary to the equipment of a modern hospital as a dispensing chemist, and that in any case the students' fees were insufficient for the needs. The Premier has since agreed to modify his position, but at the same time criticised the managers sharply on some other matters.

Friendly Societies Hospital.

The Victorian friendly societies recently held a conference with the local branch of the British Medical Association as to the terms on which the latter would coöperate in the establishment of a friendly societies hospital. Dr. A. E. White, the secretary of the British Medical Association, recently conveyed the following resolutions adopted at a special meeting of the branch:—

It appeared to be the feeling of the meeting that, whilst the object of the hospital was a laudable one, it was imperative that the hospital should be open to all medical officers of the different lodges, as you will see by the following resolutions which were passed: That the hospital should be classed as an intermediate hospital, and the Association had already resolved that intermediate hospitals shall be for patients who are ineligible for public hospitals but who are unable to pay the customary fees as well as the charges usually made at private hospitals. That there shall be no medical staff, but that any medical man may send in patients and attend them. That the medical profession shall be adequately represented on the management. That no patient shall be admitted without first producing a certificate of suitability from a medical practitioner who should whenever possible be the patient's regular medical attendant. If the signatory be not the patient's usual medical attendant an explanation to that effect should be appended. There shall be no out-patients. The same maintenance charge shall be made to all patients in any one hospital. Professional fees to be arranged between the doctor and patient. Touting for patients by advertisement or otherwise shall not be permitted.

These resolutions had been approved by the Eighth Australasian Medical Congress, but in addition the following resolution (also approved by the Congress) was made a *sine qua non* as regards the present hospital proposal:—

That no medical man should pass for admission into any friendly society lodge, club, or association for professional attendance at contract rates of remuneration any person whose income from all sources, together with that of his wife (if any), exceeds £4 per week—i.e., £208 per annum. Further, no contract rates (should be available) for anyone whose income (with that of wife) exceeds £6 per week, or £312 per annum.

The friendly societies have never agreed to this stipulation and declined to consider it in connexion with their proposal for the establishment of a hospital. The negotiations have therefore fallen through for the present.

Medical Unionism.

A deputation, consisting of the Australian Medical Association and various friendly societies, waited on the Acting Chief Secretary of New South Wales in regard to an alleged boycott of the friendly societies and other medical men by the New South Wales branch of the British Medical Association. The Chief Secretary said the British Medical Association members had the same right to say they would not work with non-unionists as any other calling. However, it might be as well to inquire into the matter, and he agreed to grant a Royal Commission. The deputation asked that all members of the medical profession registered in New South Wales should be compelled to consult with one another in the interests of public health at the risk of having their names erased, and that "cliquism" in hospital appointments be abolished.

Morning "Nips."

An agitation is at present being made in Victoria for legislation compelling the early closing of hotels. Mr. Ernest Jones, Inspector-General of Insane, has given his opinion that if the hours of business are to be curtailed hotels should be closed in the morning rather than at night. He states that the ill-effects of alcohol are almost all traceable to the "early morning nip," and that if facilities in this direction were abolished there would be public benefit. The opinion is said to be strengthened by experience gained in the Government inebriate retreat at Lara, which is under the direction of the Lunacy Department.

July 7th.

SOUTH DEVON AND EAST CORNWALL HOSPITAL, PLYMOUTH.—Hospital Saturday was recently observed in Plymouth, when collections were made for the South Devon and East Cornwall Hospital. For some years the expenditure of this institution has exceeded the income, and at the commencement of this year there was a deficit of £6709 against the hospital. In 1910 the sum of £611 was collected on Hospital Saturday, and it is hoped that this year a larger amount will be obtained.

NOTES FROM CHINA.

(FROM OUR OWN CORRESPONDENT.)

Tarabagan Disease.

NEWS has arrived in Peking of a recrudescence of marmot disease in Transbaikalia, Eastern Siberia. The details are indefinite as yet, but the latest information is that the epidemic is spreading southward towards the Chinese frontier. Dead marmots are now found as far south as Sharasun, which is only 35 miles north of the Russo-Chinese frontier. Some Chinese doctors are said to be at the frontier on the look-out and are instituting precautions, but where such a wide, sparsely populated area has to be dealt with it will be almost impossible to prevent the epidemic showing itself in Manchuria if it is at all active, as tarabagans inhabit the country all round Manchouli and the largest part of the trapping industry is conducted inside the Chinese frontier. Professor Zabolotny is on the spot investigating. It will be recalled that at the recent International Plague Conference no evidence was forthcoming which gave complete bacteriological proof that tarabagan disease was true plague. In the *Manchurian Daily News* (a Japanese paper) of July 10th there was a paragraph to the effect that Professor Zabolotny had dissected a dead tarabagan and had "found in the same animal both bubonic and pneumonic plague bacilli." In a letter to Dr. Kitasato he informs him of this, and is quoted in the Japanese papers as having said: "The presence in one living system of the germs of the two types of plague is indeed a disconcerting discovery, and has created a fresh subject of professional study." Probably there is some blunder here, as all the work hitherto done has shown that the B. pestis of pneumonic and that of bubonic plague are identical, the only differential cause being the channels of infection. It is perhaps well that this tarabagan epidemic has broken out so soon again while Professor Zabolotny and his experienced staff of assistants are still in the Far East, as the much-needed material for the elucidation of this important problem will now be forthcoming.

Chinese Medical Training: a New Scheme.

An interesting scheme is now on foot among American medical men and leaders of the American community in Shanghai. The idea is to establish a school to be known as the Harvard Medical School, and the enthusiasm already manifested should guarantee the success of the movement. A part of the arrangements has been concluded, and the first step is likely to be taken in September. The work is to be undertaken principally by Harvard University men under the superintendence of Dr. Edwards, a well-known medical educationist in the United States. Dr. Edwards, with three other members of the University, are shortly due in Shanghai to study the conditions of the task before them. They will coöperate with Dr. F. L. Hawks Pott, principal of St. John's University Medical School and his staff. The scope of this school will then be extended and a much greater number of students will be invited to join the classes. Original research work will be the principal feature of the curriculum. Some idea of the magnitude of the scheme may be gathered from the fact that contributions to the extent of $80,000 spread over a period of five years are already pledged. St. John's University has had a medical department since 1896. It is incorporated under American law. Students are required to have six years of English before they are allowed to enter on the medical course. The degree of M.D. is conferred upon graduates who have completed the five years' course and have maintained throughout the entire course a general average of 75 per cent. The South Manchurian Railway Company, which is a Japanese Government official line, superintending and running various industrial concerns and encouraging the economic development of South Manchuria, has arranged to establish a medical school at Mukden, comprising two departments—namely, pharmacology and medical science—and it is to be opened in September. The object of the school, it is said, is to lead the Chinese to the path of modern civilisation by instructing them in modern medical science and practice. The students of the school are to be recruited from Chinese young men. The company has a large well-equipped hospital at Mukden, which will be used for a time until the school has its own buildings constructed.

Peking, July 13th.

Obituary.

JOHN DUNNELL RAWLINGS, M.B. LOND., M.R.C.S. ENG., L.R.C.P. LOND.

THE death occurred on July 17th of Dr. John Dunnell Rawlings of Dorking at the untimely age of 43. Dr. Rawlings took the conjoint diploma of the Royal Colleges of Physicians of London and Surgeons of England in 1893, and in the following year the M.B. of London University. He became in succession resident medical officer to the Royal Free Hospital, house physician to St. Bartholomew's Hospital, and house physician to the Lying-in Hospital, York-road. He then entered into practice with the late Mr. Chaldecott, and on the retirement of the latter he succeeded to the entire practice, which he worked single-handed until a few months ago, when increasing work compelled him to take a partner. He was surgeon to the Dorking Hospital, and was this year President of the Reigate Division of the British Medical Association.

We add the following appreciation by a personal friend:—"Dr. Rawlings was so exactly suited to the profession he chose that it is difficult to imagine him in any other career. He had just the necessary qualities to make an admirable practitioner. He was an excellent clinical observer, and took a keen interest in all the developments of medicine. His contributions to medical literature, though few, were characterised by shrewd insight, terse, vigorous expression, and possessed the salt of humour. His personal character made of the sound medical adviser also the close friend, for he had in a high degree the genius for friendship, so that he at once commanded the confidence and respect of his patients, while the esteem in which his colleagues held him is shown by his elevation this year to the chairmanship of the Reigate Division of the South-Eastern Branch of the British Medical Association. In the midst of a busy and useful career he suddenly learned that he had but a short time to live. He faced death with unflinching courage, still considerate and anxious to help others when he knew himself to be beyond human aid. Swiftly and surely the end came, and he was laid to rest amid every token of respect and affection."

Sir Dyce Duckworth, whose house physician Dr. Rawlings was, also writes: "I am much grieved to hear of the death of my former pupil and house physician. His short and grave illness was quite tragical. I had a great regard for him. He was a very able man and availed himself of every opportunity to add to his knowledge. He formed his opinions deliberately and had a robust element of singlemindedness and straightness in his character. All his work was done carefully and he gave of his best. Nothing daunted him in doing what was right and urging what he believed to be true. I remember that some years ago he was much provoked by the anti-vaccination party in his district, and withstood with much vigour the ignorance and prejudice which they sought to propagate. He had secured a good position in Dorking and its neighbourhood, and was on the road to success which his attainments and high character richly deserved. As a good friend, and an honourable member of the profession, he will be much missed by all who knew him. R.I.P."

WESTERN HOSPITAL FOR INCIPIENT CONSUMPTION, TORQUAY.—Dr. W. Odell, who has recently resigned the post of honorary physician to the Western Hospital, Torquay, after 16 years' service, has been appointed honorary consulting physician. Dr. J. E. Paul has been elected to fill the vacancy caused by the retirement of Dr. Odell. This institution, which was founded in 1850, contains 40 beds, and performs much useful work.

COLONIAL MEDICAL SERVICES.—*West African Medical Staff:* Mr. D. T. H. Croly, medical officer, Gold Coast, has retired; Mr. P. J. Garland, C.M.G., deputy principal medical officer, Gold Coast, has retired on pension; and Dr. W. F. Roach has retired with a gratuity. The following gentlemen have been selected for appointment to the staff: Dr. A. J. M. Crichton (Northern Nigeria) and Dr. A. J. R. O'Brien (Gold Coast).—*Other Colonies and Protectorates:* Mr. R. Bury has been selected for employment as a medical officer in Nyasaland.

Medical News.

ROYAL COLLEGES OF PHYSICIANS OF LONDON AND SURGEONS OF ENGLAND.—**At a meeting of the Comitia of the Royal College of Physicians of London and of the Council of the Royal College of Surgeons of England, on July 27th, Diplomas of L.R.C.P. and M.R.C.S. were respectively conferred upon 97 candidates (including two ladies—Miss Collie and Miss Ricketts) who have passed the Final Examination in Medicine, Surgery, and Midwifery of the Conjoint Examining Board, and have complied with the by-laws. The following are the names of the successful candidates:—**

Mohammed Afifi, Cairo and London Hospital; Edward William Atkinson, B.A. Cantab., Cambridge University and London Hospital; John Horatio Baldwin, M.A. Cantab., Cambridge University and St. Bartholomew's Hospital; William Rawson Barlow, Middlesex Hospital; Frank Basford, St. Mary's Hospital; Maurice Beddow Bayly, Charing Cross Hospital; Edward Billing, B.A. Cantab., Cambridge University and Guy's Hospital; Henry George Barham Blackman, Guy's Hospital; Herbert Stuart Blackmore, L.D.S. Eng., University College Hospital; Leon Francis Brandenbourg, M.B., C.M. Madras, Madras University and King's College Hospital; Thomas Creswell Brentnall, Manchester University; Ernest Frederick Westmore Buckell, University College Hospital; Monamy Aston Cornwall Buckell, University College Hospital; Joseph Henry Campain, Liverpool University and Guy's Hospital; Ronald George Canti, B.A. Cantab., Cambridge University and St. Bartholomew's Hospital; Frederick George Chandler, B.A. Cantab., Cambridge University and St. Bartholomew's Hospital; Arthur Ryland Chavasse, M.A., B.M., B.Ch. Oxon., Oxford University and St. Thomas's Hospital; Gilbert Charles Chubb, University College Hospital; Maysie Alice Marianne Collie, Otago University and Royal Free Hospital; *James Garfield Crawford, New Zealand University; John Hamilton Cumming, Cambridge University and St. Bartholomew's Hospital; Henry Harvard Davis, Guy's Hospital; Jyotish Chandra De, M.B. Calcutta, Calcutta University and Middlesex Hospital; Alexander Arnitt Dear, Liverpool University; Georg Dorner, M.D. Königsberg, Königsberg and Freiburg Universities; William Henry Dupré, St. Bartholomew's Hospital; Garas Girgis El-Daba, Cairo and University College Hospital; Daniel Charles Evans, University College, Cardiff, and London Hospital; Robert Noel Farrer, Leeds University; Alfred George Timbrell Fisher, Bristol University and St. Bartholomew's Hospital; Geoffrey Troughton Foster-Smith, Guy's Hospital; Percy Lempriere Gibson, B.A. Oxon., Oxford University and King's College Hospital; Vincent Glendining, Guy's Hospital; Harold Kinder Griffith, B.A. Cantab., Cambridge University and St. Bartholomew's Hospital; Harry Leroy Satterlee Griffiths, University College, Cardiff, and Guy's Hospital; John Griffiths, University College, Cardiff, and London Hospital; Henry James Hacker, St. Bartholomew's Hospital; Edwin Cecil Hardwicke, B.A. Cantab., Cambridge University and St. Mary's Hospital; Alfred Ridley Hargreaves, B.A. Cantab., Cambridge University and St. Thomas's Hospital; Leonard Austin Harwood, L.D.S. Eng., Westminster Hospital; John Rollo Hayman, Middlesex Hospital; John Eric Hepper, St. Bartholomew's Hospital; Harold Howard Hiley, Bristol University and King's College Hospital; Sydney Francis Huth and Charles Eric Sweeting Jackson, St. Mary's Hospital; Tiruvallur Katakam Jayaramulu, Madras and Edinburgh Universities and Middlesex Hospital; John Cecil Jefferson, Manchester University; Stanley Gower Johnson, Middlesex Hospital; Rupert Llewellyn Jones, London Hospital; Hugh Percival Joseph, L.M. & S. Ceylon, Ceylon Medical College and Middlesex Hospital; Anthony Kennedy, B.A. Cantab., Cambridge University and Middlesex Hospital; Alfred Bertie Kramer, Edinburgh University, University College and London Hospitals; Edward Claude Linton, London Hospital; Frederic George Lloyd, Guy's Hospital; Richard Hugh McGillycuddy, University College Hospital; Reginald Kinlock MacGregor, St. Bartholomew's Hospital; Quintus Madge, B.A. Cantab., Cambridge and Liverpool Universities; Geoffrey Marshall, Guy's Hospital; Valentyne Cleeve Martyn, St. Mary's Hospital; Mendel Mayers, London Hospital; James Menzies, St. Mary's Hospital; Clement Treves Neve, St. Bartholomew's Hospital; John Herbert Owens, London Hospital; Chandrashekhar Damodar Pande, Bombay University and Middlesex Hospital; Cecil Joseph Herbert Pearson, London Hospital; George Reynolds Peterson, M.D., C.M. McGill, McGill University and St. Bartholomew's Hospital; Vivian St. Leger Pinnock, Bristol University and University College Hospital; Arthur Thomas Pitts, Middlesex Hospital; James Potter, London Hospital; *Walter Woodall Pratt, Bristol University; Cecil Walpole Preston-Hillary, Guy's and Middlesex Hospitals; Robert Anstruther Ramsay, B.A. Cantab., Cambridge University and St. Bartholomew's Hospital; Rachel Ricketts, Calcutta University and Royal Free Hospital; Christopher Hugh Leete Rixon, St. Thomas's Hospital; Hermann Melchior Robertson, M.D., C.M. McGill, McGill University and London Hospital; Frederic Gardiner Rose, B.A. Cantab., Cambridge University and St. Thomas's Hospital; Stewart Henry Rouquette, B.A. Cantab., Cambridge University and St. Thomas's Hospital; Lionel Walter Kennedy Scargill, Cambridge University and St. George's Hospital; Edward Gustave Schlesinger, B.Sc. Lond., Guy's Hospital; Emanuel Prinski Scott, London Hospital; Arthur Ashton Smalley, M.B., Ch.B. Manch., Manchester University; Reginald Gershom Sparkes, St. Mary's Hospital; John Richard Cook Stephens, London Hospital; William Steuart, St. Bartholomew's Hospital; Alan Murray Stuart, St. Mary's Hospital; Cecil Hearle Symons, Charing Cross Hospital; Frederick John Thorne, B.A. Cantab., Cambridge University and Middlesex Hospital; John St. Andrew Titmas, L.D.S. Eng., Middlesex Hospital; Francis Richard Todd,

St. Bartholomew's Hospital; John Reginald Arthur Digby Todhunter, B.A. Cantab., Cambridge University and St. Thomas's Hospital; Bernard Thomas Verver, Guy's Hospital; Maximilian Christian Wall, Guy's Hospital; Rowland Ward, Leeds University; John Robert Douglas Webb, Liverpool University; Arthur White, St. Thomas's Hospital; Owen Elias Williams, Guy's Hospital; and Matthew May Woods, Cambridge University and St. George's Hospital.

* Diploma of M.R.C.S. granted on July 13th, last.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—Diplomas in Public Health were conferred (in conjunction with the Royal College of Physicians of London) upon the undermentioned 20 gentlemen:—

David Main Baillie, M.B., Ch.B. Aberd., Aberdeen University and University College; Samuel Lindsay Brohier, L.R.C.P., M.R.C.S., Ceylon and Middlesex Hospital; John Philip Henry Davies, B.C. Cantab., L.R.C.P., M.R.C.S., Cambridge University and St. Bartholomew's Hospital; Reginald Inglis Douglas, M.B., B.S. Durh., L.R.C.P., M.R.C.S., St. Bartholomew's Hospital; William Henry Wilson Elliot (Lieutenant-Colonel I.M.S., D.S.O.), M.B. Lond., M.R.C.S., L.S.A., Guy's Hospital; William Charles Dillon Hills, L.R.C.P., M.R.C.S., University College; James Bonnell Howell, L.R.C.P., M.R.C.S., University College; John Johnstone Jervis, M.B., Ch.B. Edin., Edinburgh University and University College; Robert Henry Hatten Jolly, M.B., B.S. Lond., L.R.C.P., M.R.C.S., Charing Cross Hospital and University College; Thomas McCririck, M.B., Ch.B. Glasg., Glasgow University and King's College; John McKenzie (Captain R.A.M.C.), M.B., B.Ch. Aberd., Aberdeen University; Bernard Moiser, M.B. Lond., L.R.C.P., M.R.C.S., University College; Henry Pratt Newsholme, M.B., B.Ch. Oxon., M.R.C.P., Oxford University and St. Thomas's Hospital and University College; Jitendra Nath Rai, L.R.C.P. & S. Edin., L.F.P.S. Glasg., Edinburgh and University College; Bikrama Jit Sahni, L.R.C.P. & S. Edin., L.F.P.S. Glasg., Edinburgh and University College; Percy Herbert Stirk, L.R.C.P., M.R.C.S., University College; William Reginald Margetts Turtle, M.B., B.S. Lond., L.R.C.P., M.R.C.S., University College; Ernest Alfred Freear Wilkes, L.R.C.P., M.R.C.S., University College; Frederic C. Wood, L.M.S.S.A., London Hospital and University College; and William Allan Young, M.B., Ch.B. Edin., Edinburgh and Cambridge Universities and University College.

The Licence in Dental Surgery was conferred upon Oliver Beale Townshend of Guy's Hospital Dental School, who has now complied with all the necessary by-laws of the College.

VICTORIA UNIVERSITY OF MANCHESTER.—On July 28th the following degrees in Medicine, Surgery, and Dental Surgery were conferred:—

M.D.—Roland Hereward Titcombe (awarded gold medal); Herbert Evelyn Allanson, James Randal Hutchinson, Peter Moran, Herbert Tomlin, Henry Whitehead, and John Stirling Young (thesis commended); William Edward Bamber, George Herbert Brown, Harry Howard Bywater, James Frederick Corson, George Hamer Leigh, James Wood, Martin Stanley Wood, and Ambrose Edgar Woodall.

M.S.—John Morley.

B.M., B.S.—Arthur Hillyard Holmes, William Henry Kauntze, Jane Craig Miller, Sidney Bertram Radley, and John Sebastian Bach Stopford (second class honours); Charles Edward Butterworth, Norman Duggan, Alan Willis Gaye, Harold Heathcote, Mabel Eliza May, Manfred Moritz, Lovel Moss, George Ernest Sawdon, James Bethune Scott, William Stirling, and George Kenworthy Thompson.

B.D.S.—Arthur Cyril William Hutchinson.

ASSOCIATION INTERNATIONALE D'UROLOGIE.—The Second Triennial Congress of this association was held in London from July 24th to 28th. On the evening of the 24th a reception was held by Mr. E. Hurry Fenwick, President of the Congress, and Mrs. Fenwick at Princes' Gallery, Piccadilly, which was largely attended by members and their friends. At the first meeting on the 25th opening addresses were given by Professor Israël of Berlin, vice-president of the association, Professor Pousson of Bordeaux, also vice-president of the association, and Mr. Hurry Fenwick. The first scientific meeting followed immediately after the opening meeting, the question on the order of the day being Phosphaturia and Oxaluria. The discussion was opened by Dr. Hogge of Liège, Professor Richter of Berlin, and Professor Teissier of Lyons. On the 26th the question on the order of the day was Remote Results of Prostatectomy. The speakers opening this discussion were Dr. Hugh Young of Baltimore, U.S.A., Professor Robert Proust, Paris, Dr. Regino Gonzales, Mexico, and Professor O Zuckerkandl of Vienna. So much interest was taken in this subject that a second meeting was called later in the day to continue and finish the discussion. In the evening a banquet was given at the Savoy Hotel by the members of the British section to the foreign members and their friends, at which more than 200 were present. On the 27th the general assembly of the association was held in the morning, at which it was decided that the next Congress should be held in Berlin, under the presidency of Professor Israël, who appointed Professor Posner of Berlin as general secretary of that Congress. The question on the order of the day was then discussed—viz., Extensive Resections of the Bladder. The discussion was opened by Mr. Hurry Fenwick, Dr. D. Giordano of Venice, and Professor Thorkild Rovsing of Copenhagen. On the 28th the members of the Congress were received at the following hospitals: St. Bartholomew's, the London, Guy's, St. Thomas's, and St. Peter's. Throughout the duration of the Congress visits were paid to various hospitals and places of interest. From the scientific point of view the Congress proved extremely successful, as the discussions were well attended and the papers of a high standard.

THE GRAND PRIORY OF THE ORDER OF THE HOSPITAL OF ST. JOHN OF JERUSALEM IN ENGLAND.—The King has sanctioned the following appointments—To be Knights of Grace: The Hon. Surgeon-General Charles Pardey Lukis, C.S.I., Surgeon Lieutenant-Colonel Sir Warren Roland Crooke-Lawless, C.I.E., and Mr. David Charles Lloyd Owen, F.R.C.S.I. (from Esquire). To be Esquires: Mr. John Horatio Yolland, M.R.C.S., L.S.A. (from Honorary Associate), Major Gilbert Stewart Crawford, R.A.M.C. (from Honorary Associate), and Dr. Thomas Gibson.

NORTH DEVON INFIRMARY, BARNSTAPLE.—At the annual meeting of the supporters of the North Devon Infirmary, which was held on July 25th, the honorary medical staff advised that one of their members should be appointed honorary pathologist to the institution. Dr. Frank Leslie Thomas was elected to the post. "The Ladies' Association" has collected £10 for a microscope, and the necessary apparatus for bacteriological work has been purchased by the committee of the infirmary.

Parliamentary Intelligence.

NOTES ON CURRENT TOPICS.

The National Insurance Bill.

As was stated last week, the House of Commons on Wednesday, August 2nd, proceeded with the discussion on Clause 14 of the National Insurance Bill. This clause deals with the administration of medical benefit, and on it arose several of the points which have agitated the medical profession since the Bill was introduced. The text of the actual amendments made in the clause was published last week. The effect of those changes is that the proposed income limit of £2 a week has been rejected in favour of local arrangements with the Local Health Committees, combined with an accumulation of the medical benefits of persons having incomes above the local limit. These accumulations are in the first place the source from which payment for medical attendance is secured. Then another amendment gave free choice of doctors drawn from a local panel. A third amendment safeguarded the position of existing medical institutes of Friendly Societies, but a proposal to impose a minimum per capita payment of 8*s.* 6*d.* was negatived. Another change in the clause gave free choice of chemists and druggists on the same principle as the free choice of medical men.

The whole sitting was occupied by a discussion on these changes, and it is only possible to note the leading speeches and features of the debate. Sir PHILIP MAGNUS began the discussion by moving an amendment to exclude from medical benefits persons whose incomes from all sources exceeded £104 a year. The arguments with which he supported his contention were familiar, as they touched upon the various points which had been discussed in medical circles for the last two or three months.

Mr. LLOYD GEORGE made a speech rejecting the idea of finding a solution for the various problems on the lines suggested by Sir PHILIP MAGNUS. The Chancellor of the Exchequer regarded the income limit of £2 a week as rigid and artificial and inapplicable to both town and country. The amendment would deprive people who were earning over £2 a week of the services of the medical man on contract terms. He pointed out that in a district where it was the position that the medical practice was a contract practice, and where the men earned, especially in good times, over £2 a week, they would be deprived of these benefits. He quoted from a report of the British Medical Association in which a medical man from the Durham district said: "I am almost convinced that private practice would be a failure among miners. There would be no getting one's bills paid, and as there is a considerable floating population among them—say, 10 to 15 per cent.—the loss on bad debts from this cause alone would be considerable." That doctor protested against an amendment of this kind. The right honourable gentleman went on to point out that the £2 limit would not be of the slightest use to medical men in country districts, where the man who earned £2 a week was a very exceptional person. In these districts men earning 25*s.* or

30s. a week were paying their medical men on the fee system. The amendment gave no protection at all to the medical men in these districts. A pound a week in one district might be as much as 30s. a week in another district. The £2 a week was a perfectly artificial limit and did not represent anything like the merits of the case. Was it not very much better to leave the adjustment of the income limit to the Local Health Committees, and to say that in these districts where men had been in the habit of paying fees to doctors they could do so in the future where the income was, say, 25s. a week? There was a sort of rough-and-ready line which might be created by the medical profession and the County Health Committee and the representative of the Friendly Societies. What would happen under that arrangement would be that with regard to a class of the population there would be the guarantee of the Health Committees that the medical men would be paid. He contended that medical men would be better off for the simple reason that now they were losing heavily upon the lower-wage people of the country. A medical man in the country hardly ever refused to attend a man. He did not know of a case of refusal, though there might be cases where a man had run up bills until at last the patience of the doctor had been exhausted. A doctor had sometimes 40 per cent. of bad debts, but under the new proposals the country practitioner would get 6s. or 4s. or 5s. in respect of that class of the population. If the amendment of the Member for Hoxton (Dr. ADDISON) were carried there would not be a limit imposed. But a rough-and-ready line which would be agreed upon between the practitioners and the Public Health Committee would be enforced. In this case the medical man would say, "We decline to attend people of that kind except upon the old system"—the 5s. or 6s. would be accumulated to the credit of the person. Thus, if a man who was ill paid his doctor's fees he could draw upon the reserve which was placed to his credit in the Friendly Society. The man might roll up his benefit for years, and then he could draw on the reserve to pay the medical man. There was a personal advantage in this. Many medical men would not take contract work on any terms, and if a man who was insured wanted to be attended by such a medical man an arrangement could be come to. The man would say: "I do not want you to work on contract terms; I only want you to be on the panel so as to enable me to draw on the medical reserves on the books of the Commissioners for the purpose of paying your bill." That arrangement could be adopted with advantage. He suggested to those who had the interests of the doctors and of the national health at heart that it was better to have an elastic system of that kind than to have a sort of attempt to fix a rigid income limit. It would certainly be better in the rural districts where this £2 limit would not be worth the paper on which it was printed. On the other hand, a free, open, and elastic system would work admirably. There were thousands of medical practitioners who drew the bulk of their patients from men who earned 25s., 30s., or 35s. a week. An elastic system would enable the doctor to carry on his present practice; it would enable him to get his bills paid because there would be something to assist the workman to pay; and it would also enable the workman to secure the services of his present medical adviser, even although the medical adviser refused to act on contract terms. He therefore thought it would be better if the Committee would proceed to the amendment of the honourable Member for Hoxton, because that met the realities of the case, and did not attempt to fix an artificial limit which suited neither the doctor nor the patient, and which certainly was not in the interests of national health.

Several speakers strongly supported the contentions put forward by Sir PHILIP MAGNUS. Sir ROBERT FINLAY, who sits for Edinburgh University, stated that on the point of an income limit the medical profession was absolutely united. He emphasised the strong feeling in the medical profession against the contract system. There was a very strong feeling that it was bad in its effect alike on the doctor and on the patient, and a great many medical men would not take contract prices. It was perfectly plain that the Bill was introduced without sufficient inquiries from those qualified to give information as to the conditions which actually attended medical practice. He therefore hoped that the Chancellor of the Exchequer would reconsider his position and accept the amendment, to be supplemented by discretionary power in the districts to which the right honourable gentleman had said the amendment was inapplicable. Sir HENRY CRAIK also made a protest against the attitude of the Chancellor of the Exchequer, and considered that the Bill without the amendment would have a very injurious effect upon medical practice. Mr. BOYTON, who spoke as the Parliamentary representative of something like 1000 medical men, said that the profession was entirely in favour of the amendment. However, when the amendment was put a division was not pressed and it was allowed to be negatived.

Mr. LLOYD GEORGE then moved his amendment to provide for a free choice of doctor. As was stated last week, it sets forth a scheme for the formation of a panel of medical practitioners who are willing to give treatment to insured persons, and a right is given to the insured person to choose any practitioner on the list. This proposal of the Chancellor of the Exchequer received some criticism on points of detail, but it was unanimously accepted and embodied in the clause.

Dr. ADDISON's amendment was then discussed. It was to the effect that the medical benefits of insured persons enjoying an income above a certain limit to be fixed locally by the Health Committees should be accumulated for them, and when they required medical attendance their accumulations should go towards the payment of the medical man's fees. The amendment further permitted similar arrangements to be made by insured persons who came within the income limit, but desired to make their own arrangement for medical attendance and treatment. Dr. ADDISON said that in putting forward this amendment he had no intention of putting forward some special plea for the medical profession. Some Members seemed to suggest that the medical Members in the House were exalting the medical profession—"dictating" to the House. Against that he would enter a very respectful and modest protest. However, he would sincerely hope that the House would credit them with the sincere intention to have the medical service placed on a sound footing. He had no desire that the medical profession should be placed in an unduly privileged position. Doctors up and down the country quite unnecessarily said that they would be ruined by the Bill. These representations had often arisen owing to their not quite understanding it. They had overlooked the fact that they would be paid for people who were well and that they would have no bad debts. They had overlooked the fact that many families would not really be dependents of insured persons, and that they would be entitled to charge for these as hitherto. A great deal of the alarm, he believed, was unwarranted, but still a certain amount of the alarm was quite real. It might be unfounded, but it was genuine. The principle laid down by his amendment was local option, and it was very much preferable to the definite statutory limit. A number of medical men practising under quite different conditions in different districts might have a number of private patients who became insured persons. He thought that the people should be consulted and an opportunity given to those who had been private patients, so that under a satisfactory arrangement they might have their wish to continue on the same lines. The principle was that those who had hitherto been private patients under a satisfactory arrangement should still be accepted if they wished to continue on the same lines. There was another important consideration which had not yet been pointed out. If a number of persons in any place continued to pay fees under arrangement, the demand for higher capitation payment for those of lower means would of course be correspondingly diminished. If this payment could be reasonably called upon by fees which were not on a universal scale, there was not the same necessity for asking for a high capitation rate for the lower classes. An arrangement of that kind would be a great advantage. His amendment allowed for conditions of diverse arrangements. Did the Committee think that the present arrangement would introduce elasticity into the whole system? The thing was experimental, and he thought it would be quite a mistake if the Committee straight away laid down hard-and-fast lines. The amendment would leave it open to evolve a satisfactory system both of work and pay. It was applicable to the whole country, and he believed that it would conduce to the smooth working of the whole if the Committee were to accept it now. He would ask those honourable Members who, he believed, were somewhat inclined to oppose some of the principles laid down, to refrain from doing so as far as they conscientiously could, because after all he felt that in the course of a few years there would be evolved an equitable system of contract throughout the country generally. The experience of contract practice had been used with some misunderstanding. He did not think that the whole medical profession was against a contract. It depended upon the terms of the contract. The amendment would apply equally to the rural districts of Yorkshire and elsewhere and the crowded parts of London. It would provide a basis for gradually working out an equitable system.

The general discussion on the principle involved in the amendment had taken place on the proposal of Sir PHILIP MAGNUS, when the Chancellor of the Exchequer had indicated his preference for Dr. ADDISON's method of dealing with the situation. A few speakers made very brief comments on the amendment. A division took place on it, but it was carried by 279 votes to 41. Amongst those who voted for the amendment were Mr. LLOYD GEORGE, Dr. ADDISON, Sir HENRY CRAIK, Dr. ESMONDE, Sir ROBERT FINLAY, Dr. HILLIER, and Sir PHILIP MAGNUS. The Government Whips acted as tellers for the amendment.

About an hour's debate took place on Mr. CECIL HARMSWORTH'S amendment to safeguard the interests of the medical institutes which have been established by Friendly Societies in great towns. The terms of the amendment were indicated last week. This amendment was accepted without a division. There was no opposition to Mr. GLYN-JONES'S proposal to give a free choice of pharmacists to insured persons. He proposed that there should be a panel of pharmacists in a district composed in the same method as the panel of medical men, and a patient having obtained a prescription from a medical man might take it to any pharmacist on the panel to have it dispensed. This proposal was accepted. There was a good deal of discussion in regard to the sharing of excess expenditure on account of medical benefit by the Treasury and local authorities, but the point at issue was financial rather than medical.

Before the clause as amended was submitted to the Committee for

approval, Dr. ESMONDE brought forward a proposal to insert a new subsection to the effect "that no Health Committee shall contract with any medical practitioner for a less fee than eight shillings and sixpence per insured person per year." The honourable Member contended that insured persons should be secured against any attempt to employ medical men at a remuneration which did not afford them an opportunity of giving their very best attention to the patient. A capitation grant of 6*s.* was quite inadequate. Dr. ESMONDE proposed 8*s.* 6*d.* because the sum was already paid by a Government department. He did not see how honourable Members could logically expect medical men to give their best attention for less. Mr. LLOYD GEORGE'S attitude to this amendment was hostile. He said that Dr. ESMONDE was making a demand which the medical profession had not made before. There were at present many rural districts where the amount of the capitation payment was 2*s.* 6*d.* He thought that was unreasonable, but the honourable Member asked that it should be instantly raised to 8*s.* 6*d.* A committee of the British Medical Association had made an investigation and out of all the suggestions received only about thirty ventured as high as the honourable Member. The vast majority asked for a sum of 6*s.* or under. The case of the Post Office precedent was cited by the honourable Member, but it was very different from the one presented by the Bill. These provisions had to be made for one or two men in a rural district, and naturally the minimum was higher than if it had applied to a few hundred patients in the district. The Chancellor of the Exchequer expressed a hope that there would be no attempt to fix an amount of remuneration which might very well in some districts be higher and in some districts lower. In his attempt to fix a minimum of 8*s.* 6*d.* the honourable gentleman never seemed to give a thought to the benefit of the workmen themselves. If 8*s.* 6*d.* was given as a minimum to the medical man he must get it at the expense of the benefits of the workmen themselves. After some discussion Dr. ESMONDE'S amendment was negatived without a division, and Clause 14 as amended was agreed to.

Clause 15, which relates to the administration of sanatorium benefit, was also passed, but some amendments consequential on other changes in the Bill were made in it.

On Friday, August 4th, Clause 16 (administration of maternity benefit) was considered, and two questions of particular medical interest were raised. As the result of a discussion, it was decided to insert in the clause a provision to the effect that the mother should decide whether she should be attended by a registered medical practitioner or by a duly certified midwife, and should have free choice in the selection of such practitioner or midwife. Sir ALFRED MOND, when the amended clause was under review, asked whether when the midwife required the aid of a medical practitioner there was any fund out of which to pay the latter. The point was one of substance, especially in view of the duties imposed on the midwife by the Midwives Act in these cases. Mr. J. W. HILLS also enforced this point. Mr. MCKENNA, on behalf of the Government, acknowledged that the question was material and promised to give it consideration before the report stage. Clause 16 was then passed. Clause 17 gives power to approved societies to subscribe to hospitals, and some drafting and consequential amendments were embodied in it before it was passed.

When it finished the consideration of Clause 17 the House of Commons concluded that part of the National Insurance Bill which deals with the administration of benefits. It does not seem probable that further progress will be made with the Bill until the autumn session, which will begin in October. Thirteen sittings in Committee have now been devoted to the measure, and if the rate of progress has been slower than the Government desired, it is also the case that some of the difficulties have been surmounted with greater ease than was anticipated. Clause 14, which raised in its acutest shape the controversy with the medical profession, was passed in a single sitting, many of the amendments of which notice had been given not being moved. This, however, would have been impossible had there been a rigid adherence to the original terms of the clause. The vesting of the administration of medical benefit in the Health Committees to the exclusion of the approved societies, the granting of free choice of medical men to insured persons, and the acceptance of Dr. ADDISON'S amendment smoothed the way for the passing of the clause. Ample time for review of its provisions will be given before the report stage is reached. Owing to the two months' holiday which the House of Commons is going to take, it will be November or December before the House will be able to review its present decisions with regard to the medical profession in the light of the matured criticisms on the clauses in their new form.

Asylum Officers (Employment, Superannuation, and Pensions) Bill.

The Asylum Officers (Employment, Superannuation, and Pensions) Bill has been re-shaped by a Select Committee of the House of Commons. The original Bill proposed a 60-hours week exclusive of meal times for officers and servants in asylums. The amended Bill would impose on the visiting committees of asylums the duties of framing a scheme prescribing the hours of duty for nurses and attendants, and other conditions of service. The 60-hours week was discarded in favour of 140 hours per fortnight for day staffs and 120 hours per fortnight for night staffs. In the amended Bill the committee decided that 25 years' service, irrespective of age, was to entitle female officers and servants to a superannuation allowance. A clause permitting gratuities to them when they retired after ten years' service was embodied in the Bill. The clause forbidding the visiting committee to delegate its powers of dismissal in certain cases was redrafted. The Committee has issued a special report dealing with the changes which have been introduced into the Bill.

HOUSE OF COMMONS.

THURSDAY, AUGUST 3RD.

Calf Lymph.

Mr. C. DUNCAN asked the President of the Local Government Board whether the calves that were used for providing lymph for vaccination purposes were afterwards sold as veal; if so whether he could see his way to put an end to such a practice; and, if not, what became of these animals after they were no longer used for lymph.—Mr. BURNS said in reply: After slaughter each calf is carefully examined by a veterinary surgeon and the veal from those animals which are found to be free from disease is sold. There is no reason to doubt that such veal is perfectly wholesome.

Mr. C. DUNCAN: What proportion of the calves is not sold for human food?—Mr. BURNS: I could not say.

Mr. C. DUNCAN also asked the right honourable gentleman whether, since the Royal Commission on Tuberculosis had reported that bovine tuberculosis was communicable to human beings as well as animals, he would say whether any, and, if any, what, precautions were taken to prevent the danger that cancer and consumption might spread by vaccination with calf lymph, seeing that the calves used were inoculated from other calves, and any one in the series might therefore transmit the germs of tuberculosis.—Mr. BURNS replied: Each calf after vaccination and abstraction of the lymph from the vesicles is sent to be slaughtered and is then carefully examined by a veterinary surgeon. The lymph is not issued for use unless the veterinary surgeon certifies that the calf was free from disease. In addition to this primary precaution, there is the further fact that the lymph is glycerinated, and it has been proved by the experimental addition of tubercle bacilli to vaccine lymph that the glycerine destroys such tubercle bacilli. Before issue all lymph is bacteriologically examined and tested. There is no evidence whatever pointing to the possibility that cancer—a disease chiefly of late adult life—can be spread by vaccination.

Deaf-mutes.

Dr. CHAPPLE asked the Secretary of State for the Home Department what were the numbers of deaf-mutes in the United Kingdom at present supported by State or charitable funds; whether these numbers had been increasing; what percentage exhibited hereditary transmission of their defect; and whether, in view of the frequent celebrations of the marriage of deaf-mutes, he would cause these statistics to be sent to all authorities and guardians connected with deaf and dumb institutions.—Mr. CHURCHILL answered: Figures relating to deaf children of school age will be found in Part I. of the volume of statistics of public education. I have no information as to the number supported from charitable funds. It should be borne in mind that if there be any increase in the figures it is likely to be due to greater care in dealing with all proper cases and not necessarily to an increase in the number of deaf and dumb children. The Census returns from 1851 to 1901 show a continuous decrease in the number of deaf and dumb proportionately to the population, and I think it would be well to wait for the new Census figures before considering whether any action is required.

Local Government Board Administration.

On the vote for salaries and expenses of the Local Government Board in Committee of Supply,

Mr. PETO called attention to the grievances of vaccination officers whose remuneration had been diminished owing to the increased number of exemptions from vaccination that had taken place under the legislation of recent years.

Mr. BUTCHER, in supporting the appeal for the remedy of the grievances of these officers, mentioned that in 1907 there were 651,000 successful vaccinations in England and Wales. In 1909 they had gone down to 547,000, so that it was obvious that these men were suffering a serious reduction of income.

Mr. CHAPLIN regarded the administration of the Vaccination Act under the present system as a discouragement of vaccination. It was a very serious thing when year after year the claims for exemption were increasing to such an extent that if they continued in the present ratio for another 10 or 15 years the exemptions would be the rule, and the vaccinated children would be only the exceptions.

Mr. BURNS replied that last year there were 1420 vaccination officers, but only 400 of them gave their whole time to the work. Between 1907 and 1911, mainly at the instigation of the Local Government Board, gratuities had been sanctioned to 321 vaccination officers, increased fees had been given to 279, and in 13 other cases compensation of some form or another had been given. The Local Government Board, instead of looking at the vaccination officer's grievances with a cold eye and a lack of generosity, had helped, either through gratuities, increased fees, or in some other form of compensation, in 623 cases out of the 1020 cases which were paid by fees. Vaccination officers were not the servants of the Local Government Board. However, if further persuasion of the guardians was not productive of fair treatment in a certain small number of cases the Local Government Board would consider what steps would be necessary to secure reasonable treatment for the vaccination officers. As to the suggestion to remunerate them all by salary, he could not ask the guardians to give a fixed salary for a very small amount of work in certain instances. The Local Government Board would look into the matter in a fair and broad spirit with a view to remedying the gross grievance from which a few suffered and with a view to adopt a standard of remuneration which was fair and reasonable and to which these public officers were entitled. Speaking later on the administration of the Housing and Town Planning Act, the right honourable gentleman mentioned that in 1910-11 1046 local authorities issued closing orders with regard to 2678 houses, as against 587 orders two years previously. That, he thought, was satisfactory. The right honourable gentleman also expressed satisfaction with the progress which town planning had made in the last two years.

MONDAY, AUGUST 7TH.

Sleeping Sickness in Nyasaland.

Mr. LLOYD asked the Secretary of State for the Colonies whether cases of sleeping sickness had recently been reported in Angoniland, on the south-western arm of Lake Nyasa, in proximity to the Government game reserve; whether 22 cases had occurred in the last six months in the Protectorate; and, if so, what special measures had been and were being taken to safeguard Nyasaland.—Mr. L. HARCOURT replied: Three cases of sleeping sickness have recently been reported on the south-western arms of Lake Nyasa, in proximity to the Government game reserve. Fresh cases are being continually discovered, and I am unable to give the exact number for the last six months, but 54 cases in all have been reported to me. An account of the measures which are being taken will be found in the Sleeping Sickness Diary of the Protectorate, Part XIV. The honourable Member is probably aware that I have sent to Nyasaland a well-equipped scientific expedition, under the leadership of the distinguished expert Sir David Bruce and the general direction of the Royal Society, to investigate the relation between the African fauna and the trypanosome diseases of men and animals. Some of the members of the Commission have already sailed, and the rest will follow in about three months when the laboratory and dwelling houses will be approaching completion.

The Prevention of Anthrax.

Mr. C. BATHURST asked the Parliamentary Secretary to the Board of Agriculture whether, in view of the recent increase of anthrax throughout Great Britain, and the universally accepted theory that the main source of infection was the association of animal foodstuffs with hides, skins, wool, horsehair, mohair, rags, and other like materials prior to importation, the Board had considered the efficacy and desirability of insisting upon such articles being effectively sterilised at the port of their shipment by some process which would cause no injury to the material or fabric; whether the Board's scientific advisers had in this connexion considered the efficacy of the process advocated by Mr. Alfred Seymour-Jones, of Wrexham, of treating such materials with formic acid and mercuric chloride, and the recent report on the subject submitted by Dr. Constant W. Ponder to the Leather-sellers Company of London; and, if so, with what result.—Sir E. STRACHEY answered: The reply to the first and second parts of the question is in the affirmative. The Board do not consider that the investigations made with regard to the process are sufficiently complete to justify the Board in advocating its adoption, but the matter will be kept in view.

BOOKS, ETC., RECEIVED.

BAILLIÈRE, TINDALL, AND COX, London.

Operative Midwifery. A Guide to the Difficulties and Complications of Midwifery Practice. By J. M. Munro Kerr, M.D., C.M. Glasg., Fellow of the Royal Faculty of Physicians and Surgeons, Glasgow. Second edition. Price 21*s.* net.

Appointments.

Successful applicants for Vacancies, Secretaries of Public Institutions, and others possessing information suitable for this column, are invited to forward to THE LANCET *Office, directed to the Sub-Editor, not later than 9 o'clock on the Thursday morning of each week, such information for gratuitous publication.*

BUNBURY, EDWIN GARRETT, L.R.C.P. Lond., M.R.C.S., has been appointed District Medical Officer by the Helston (Cornwall) Board of Guardians.

EATON, OLIVER, L.R.C.P. Lond., M.R.C.S., D.P.H. Camb., has been appointed Honorary Consulting Surgeon to the Exmouth Cottage Hospital.

HODGSON, JOSEPH WILLOUGHBY, M.D., C.M. Aberd., M.R.C.S., has been appointed Honorary Radiographer to the Exmouth Cottage Hospital.

MACDONALD, R. N., L.R.C.P. & S. Edin., L.F.P.S. Glasg., has been appointed Certifying Surgeon under the Factory and Workshop Act for the Tobermory District of the county of Argyll.

MACNALTY, A. S., M.D., B.Ch. Oxon., M.R.C.S., L.R.C.P. Lond., has been appointed Medical Registrar to the London Hospital.

MARTYN, REGINALD, L.R.C.P. Lond., M.R.C.S., has been appointed Honorary Consulting Surgeon to the Exmouth Cottage Hospital.

MOORE, REGINALD MARK, L.R.C.P. Lond., M.R.C.S., has been appointed Medical Officer of Health of Malmesbury (Wilts) and District Medical Officer by the Malmesbury Board of Guardians.

NEWSHOLME, H. P., M.B. Oxon., D.P.H., M.R.C.P. Lond., has been appointed Resident Medical Officer at the Brighton Borough Fever Hospital.

TATTERSALL, N., M.B., B.S. Manch., M.B., Ch.B. Lond., has been appointed House Physician at the Brompton Hospital for Consumption.

THORNTON, GEORGE LESTOCK, M.R.C.P. Lond., M.R.C.S., has been appointed Honorary Consulting Surgeon to the Exmouth Cottage Hospital.

VIBERT, B. P., M.B. Lond., L.R.C.P. Lond., M.R.C.S., has been appointed Certifying Surgeon under the Factory and Workshop Act for the Bradford, West, District of the county of Yorks, West Riding.

Vacancies.

For further information regarding each vacancy reference should be made to the advertisement (see Index).

ASHTON-UNDER-LYNE, DISTRICT INFIRMARY AND CHILDREN'S HOSPITAL.—Senior House Surgeon. Salary £120 and fees, with board, residence, and laundry.

BANGOR, CARNARVONSHIRE AND ANGLESEY INFIRMARY.—House Surgeon. Salary £100 per annum, with board, washing, and lodging.

BETHLEM HOSPITAL.—Locum Tenens as House Physician. Salary at rate of 4 guineas a week, with apartments, board, and washing.

BETHNAL GREEN INFIRMARY AND WORKHOUSE, Cambridge Heath, E.—Assistant Medical Officer. Salary at rate of £100 per annum, with board, lodging, and washing.

BRIGHTON, HOVE, AND PRESTON DISPENSARY.—Resident Medical Officer, unmarried. Salary £130 per annum, with board and residence.

ISTOL GENERAL HOSPITAL.—House Physician for six months. Salary £60, with board, residence, &c.

BUXTON, DERBYSHIRE, DEVONSHIRE HOSPITAL.—Assistant House Surgeon for six months. Salary £70 per annum, with apartments, board, and laundry.

CANTERBURY, KENT AND CANTERBURY HOSPITAL.—House Surgeon and House Physician, both unmarried. Salary in each case £90 per annum, with board, lodging, and washing.

CARLISLE NON-PROVIDENT DISPENSARY.—Resident Medical Officer. Salary £150 per annum, with apartments.

CENTRAL LONDON OPHTHALMIC HOSPITAL, Gray's Inn-road, W.C.—House Surgeon. Salary at rate of £50 per annum, with board and residence.

CHELTENHAM EYE, EAR, AND THROAT FREE HOSPITAL.—Assistant Surgeon. Salary £200 per annum.

CITY OF LONDON LYING-IN HOSPITAL, City-road, E.C.—Resident Medical Officer for six or four months. Salary at rate of £50 per annum, with board, lodging, and washing.

COLCHESTER, ESSEX COUNTY HOSPITAL.—House Surgeon and House Physician. Salary in each case £80 per annum, with board, residence, and washing.

CROSSLEY SANATORIUM, Delamere Forest, Cheshire.—Assistant Medical Officer. Salary £100 per annum, with board, apartments, and laundry.

CROYDON GENERAL HOSPITAL.—Senior and Junior House Surgeons. Salaries £105 and £60 respectively, with board, laundry, and residence.

DEVONPORT, ROYAL ALBERT HOSPITAL.—Assistant House Surgeon for six months, unmarried. Salary at rate of £50 per annum, with board, apartments, and laundry.

DUDLEY, GUEST HOSPITAL.—Assistant House Surgeon for six months. Salary £75 per annum, with residence, board, and washing.

GLASGOW WESTERN INFIRMARY NEW CLINICAL LABORATORY.—Lecturer on Clinical Methods. Salary £400 per annum.

GLOUCESTER, GLOUCESTERSHIRE ROYAL INFIRMARY AND EYE INSTITUTION.—Assistant House Surgeon for six months. Salary at rate of £80 per annum, with board, residence, and washing.

GUILDFORD, ROYAL SURREY COUNTY HOSPITAL.—House Surgeon. Salary £100 per annum, with board, residence, and laundry. Also Assistant House Surgeon. Salary £75 per annum, with board, residence, and laundry.

HALIFAX, ROYAL HALIFAX INFIRMARY.—Senior House Surgeon, unmarried. Salary £120 per annum, with residence, board, and washing.

HARTLEPOOLS HOSPITAL.—House Surgeon. Salary £100 per annum, with board, washing, and lodging.

HEMEL HEMPSTEAD, HERTS, WEST HERTS HOSPITAL.—Resident Medical Officer. Salary £100 per annum, with rooms, board, and washing.

HOSPITAL FOR WOMEN, Soho-square, W.—Resident Medical Officer for six months. Salary at rate of £60 per annum.

LONDON COUNTY COUNCIL.—Medical Officer of Health of the County of London. Salary £1250 a year and travelling expenses.

LONDON HOSPITAL DENTAL SCHOOL.—Two Demonstrators, House Surgeon, and Instructor in Dental Mechanics.

MANCHESTER NORTHERN HOSPITAL FOR WOMEN AND CHILDREN, Park-place, Cheetham Hill-road.—House Surgeon. Salary £80 per annum, with apartments and board.

MANCHESTER, ST. MARY'S HOSPITALS FOR WOMEN AND CHILDREN.—Two House Surgeons. Salary at rate of £50 per annum, with board and residence.

MIDDLESEX HOSPITAL, W.—Surgeon. Also Assistant Surgeon.

NEWCASTLE-UPON-TYNE CITY ASYLUM, Gosforth.—Junior Assistant Medical Officer, unmarried. Salary £140 per annum, with apartments, board, and laundry.

NEWCASTLE-UPON-TYNE DISPENSARY.—Visiting Medical Assistant. Salary £160 per annum.

NORTHAMPTON GENERAL HOSPITAL.—House Surgeon, unmarried. Salary £90 a year, with apartments, board, washing, and attendance.

NOTTINGHAM GENERAL DISPENSARY.—Assistant Resident Surgeon, unmarried. Salary £160 per annum, with apartments, attendance, &c.

NOTTINGHAM GENERAL HOSPITAL.—Assistant House Surgeon. Salary at rate of £100 per annum, with board, lodging, and washing.

ORKNEY, PARISH OF ROUSAY AND EGILSHAY.—Resident Medical Officer. Salary £71 per annum.

OXFORD, RADCLIFFE INFIRMARY AND COUNTY HOSPITAL.—Casualty House Surgeon, unmarried, for six months. Salary at rate of £80 per annum, with board, &c.

PLYMOUTH, SOUTH DEVON AND EAST CORNWALL HOSPITAL.—House Physician for six months. Salary £75 per annum, with board, residence, and washing.

PORTSMOUTH BOROUGH ASYLUM.—Assistant Medical Officer, unmarried. Salary £150 per annum, with board, lodging, and washing.

QUEEN CHARLOTTE'S LYING IN HOSPITAL, Marylebone-road, N.W.—Assistant Resident Medical Officer for four months. Salary at rate of £50 per annum, with board, residence, and washing.

QUEEN'S HOSPITAL FOR CHILDREN, Hackney-road, Bethnal Green, N.E.—House Surgeon for six months. Salary at rate of £80 per annum, with board, residence, and washing.

ROBBEN ISLAND, LEPER WARDS, Cape of Good Hope.—Junior Medical Officer. Salary £250 per annum, with free quarters and two rations.

ROCHESTER, SAINT BARTHOLOMEW'S HOSPITAL.—House Physician. Salary £110, with board and residence.

RYDE, ROYAL ISLE OF WIGHT COUNTY HOSPITAL.—Resident House Surgeon, unmarried. Salary £125 per annum.

Births, Marriages, and Deaths.

BIRTHS.

RIX.—On August 3rd, at Dennington Park-road, West Hampstead, the wife of F. W. Rix, M.B., of a son.

ROOKE.—On August 2nd, at Fairfield, North Finchley, N., the wife of W. Stanley Rooke, M.R.C.S., L.R.C.P., of a daughter.

MARRIAGES.

HORNER—FEARON.—On August 4th, at St. Luke's, Redcliffe-square, S.W., Norman Gerald Horner, B.A., M.B., B.C. Cantab., only son of the late Arthur Claypon Horner, M.R.C.S., of Tonbridge, to Grace Malleson, younger daughter of Walter Malleson Fearon, of Newquay, Cornwall.

DEATHS.

GEE.—On August 3rd, suddenly, at Keswick, Samuel Jones Gee, M.D. Lond., F.R.C.P., in his 72nd year.

N.B.—A fee of 5s. is charged for the insertion of Notices of Births, Marriages, and Deaths.

Notes, Short Comments, and Answers to Correspondents.

THE FRENCH LAW ON THE MANUFACTURE OF SERUMS, TOXINS, ETC.

A DECISION has been given by the Paris Supreme Court which may have an important bearing on the modern developments of medical practice. A law that bears the date of April 25th, 1895, deals with attenuated virus, therapeutic serums, modified toxins that may be used for the prevention or cure of disease, and all organic substances that can be injected and cannot be chemically defined but are used in the treatment of disease. Such products must not be sold unless both from the point of view of their origin and manufacture they have been authorised by the Government, and this authorisation is only to be given after approval received from the Consultative Committee of Public Hygiene and the Academy of Medicine. The penalty for infringing this law is a minimum fine of £2 and from 3 to 12 months' imprisonment.

The question now arises whether this law can be applied against a medical practitioner who invents a serum and gives doses of this serum to his patients. The difficulty is due to the employment of the word *débitées* in the text of the law. We derive our English word debit from this term, and it is generally taken to mean selling; thus a *débit de tabac* is the shop where tobacco is sold, but the term may also apply to the giving of things out without payment. A spring may "*debit*" or give out so many gallons of water per hour. Last year Dr. Lorot was summoned before the Second Correctional Chamber and accused of giving his patients subcutaneous injections of an anti-tuberculous serum he had himself manufactured. The Tribunal concluded that there was no *débit* and acquitted Dr. Lorot. The Public Prosecutor, however, appealed against this decision but the first verdict was confirmed. The case was now carried *en cassation*—that is, before the Supreme Court—and here the two previous verdicts were revoked and Dr. Lorot condemned. In vain it was pleaded that the serum was not sold, that it was not placed at the disposal of the general public. The view was taken that whatever the meaning of the word *débit* might be, the obvious intention of the law was to prevent the injection of serums, toxins, and such substances into the bodies of patients unless their manufacture had been properly controlled by other competent authorities than the manufacturer, even if the latter should prove to be a qualified practitioner.

HOSPITAL OUT-PATIENTS AND THE INSURANCE BILL.

To the Editor of THE LANCET.

SIR,—One point seems to have been overlooked in regard to the expected decrease of out-patients and the consequent lessened cost to the hospitals. It is that the falling off in numbers will be amongst hose costing least, the patients who receive advice and medicine only. Those coming up frequently for the most expensive treatment by electricity and massage, X rays, Finsen light, &c., cannot possibly be taken over at contract price by the general practitioner, who has neither the time nor, as a rule, the installations and apparatus for such work. Minor operations, dental and surgical cases, of which there are a vast number needing the services of an anæsthetist and the expense of an anæsthetic, and the innumerable cases of ulcerated legs and septic fingers—all these will come to the out-patient department as they always have done. We shall lose the chronic and the trivial medical cases, that is all, and the expensive ones will remain. I enclose my card.

I am, Sir, yours faithfully,

August 9th, 1911. MATRON.

Ethelinda.—The book alluded to seems to be complete rubbish. By real inhalation the effects are fully obtained, and concerning these our previous reply holds good.

COMMUNICATIONS not noticed in our present issue will receive attention in our next.

A DIARY OF CONGRESSES.

WE shall publish this diary from time to time that our readers may have under their hands the dates of the approaching scientific Congresses. It is unnecessary to issue the lists of all these functions week by week, and we propose to make only such gatherings as will occur in the immediate future the subject of regular announcement. The following Congresses, Conferences, and Exhibitions are announced for August and September, 1911:—

April–October.—Rome Exhibition (United Italy's Jubilee).
,, 29th–Oct. 26th (Turin).—International Exhibition.
May 3rd–Oct. 31st (Glasgow).—Scottish Exhibition.
,, 6th–Oct. 31st (Dresden).—International Hygiene Exhibition (British Section opens June 14th).
May 12th–Oct. 31st (London, Crystal Palace).—Festival of Empire Imperial Exhibition. (Profits to King Edward VII. Hospital Fund.)
May 18th–October 31st (London, Shepherd's Bush).—Coronation Exhibition.
,, 19th–Oct. 31st (London).—Earl's Court Exhibition.
June 1st–August 31st (Squirrels Heath, Romford).—Town Planning and Modern House and Cottage Exhibition.
August 12th–18th (Brussels).—First International Congress on Child Study.
,, 12th–30th.—E.M.I. (Enseignement Médico-mutuel International) Tour in Scandinavia.
,, 15th–21st (Dublin).—Royal Institute of Public Health.
,, 21st–23rd (Larvik).—Fourteenth Norwegian Physicians' Congress.
,, 28th–Sept. 11th (South-East of France).—Eleventh "Voyage d'Etudes Médicales."
,, 30th–Sept. 2nd (Berlin).—Third International Laryngo-Rhinological Congress.
,, 30th–Sept. 6th (Portsmouth).—British Association.
,, 31st and Sept. 1st (Vancouver).—Thirteenth Annual Meeting of the British Columbia Medical Association.
Sept. 4th–9th (Yarmouth).—Sanitary Inspectors' Association. Annual Conference.
,, 5th–7th (Philadelphia).—American Electro-therapeutic Association.
,, 9th–11th (Ostend).—Fifteenth Flemish Nature and Medical Congress.
,, 11th–13th (Vienna).—German Urological Society.
,, 11th–13th (Berlin).—Third International Conference on Infantile Mortality (*Goultes de Lait*).
,, 11th–16th (The Hague).—Thirteenth International Congress on Alcoholism.
,, 12th–15th.—Celebration of the 500th Anniversary of the Foundation of the University of St. Andrews.
,, 18th–23rd (Sydney).—Australasian Medical Congress.
,, 18th–23rd (Paris).—International Conferences of Genetics.
,, 23rd–Oct. 21st (London, Olympia).—Electrical Exhibition.
,, 24th–30th (Karlsruhe).—Eighty-third Meeting of German Physicists and Physicians.
,, 26th–28th (Louisville, Ky.).—American Association of Obstetricians and Gynecologists.
,, 26th–30th (Brussels).—Third Congress of the International Society of Surgery and Exhibition of Fractures.
,, 28th–30th (Dresden).—International Congress for the Protection of Mothers and Sexual Reform.
,, 29th (Edinburgh).—Association of Veterinary Officers of Health. Annual Meeting.
September (Genoa).—International Exhibition Marine Hygiene.
,, (Turin).—Congress of the Association of Italian Railway Physicians.
,, (London).—Bakers' and Confectioners' Exhibition
,, (Manchester).—Second Conference of the British Hospitals Association.
September–November (Antwerp).—International Exhibition of Alimentation, Brewing, Wines, and Liqueurs.

Medical Diary for the ensuing Week.

LECTURES, ADDRESSES, DEMONSTRATIONS, &c.

POST-GRADUATE COLLEGE, West London Hospital, Hammersmith-road, W.

MONDAY.—10 A.M., Surgical Registrar: Demonstration of Cases in Wards. Dr. Simson: Diseases of Women. 12 noon, Dr. Bernstein: Pathological Demonstration. 2 P.M., Medical and Surgical Clinics. X Rays. Operations. 2.30 P.M., Mr. Dunn: Diseases of the Eye.

TUESDAY.—10 A.M., Dr. Robinson: Gynæcological Operations. 2 P.M., Medical and Surgical Clinics. X Rays. Operations. Dr. Davis: Diseases of the Throat, Nose, and Ear. 2.30 P.M., Dr. Abraham: Diseases of the Skin. 5 P.M., Lecture:—Mr. Pardoe: Stricture of the Urethra.

WEDNESDAY.—10 A.M., Dr. Saunders: Diseases of Children. Dr. Davis: Operations of the Throat, Nose, and Ear. 12.15 P.M., Lecture:—Dr. Bernstein: Clinical Pathology. 2 P.M., Medical and Surgical Clinics. X Rays. Operations. Mr. B. Harman: Diseases of the Eye. 2.30 P.M., Dr. Simson: Diseases of Women. 5 P.M., Lecture:—Mr. Addison: Clinical.

THURSDAY.—10 A.M., Surgical Registrar: Demonstration of Cases in Wards. 2 P.M., Medical and Surgical Clinics. X Rays. Operations. 2.30 P.M., Mr. Dunn: Diseases of the Eye.

FRIDAY.—10 A.M., Dr. Robinson: Gynæcological Operations. Dr. Simson: Gynæcological Demonstration. 2 P.M., Medical and Surgical Clinics. X Rays. Operations. Dr. Davis: Diseases of the Throat, Nose, and Ear. 2.30 P.M., Dr. Abraham: Diseases of the Skin. 5 P.M., Lecture:—Dr. Davis: Diseases of the Throat, Nose, and Ear.

SATURDAY.—10 A.M., Dr. Saunders: Diseases of Children. Medical Registrar: Demonstration of Cases in Wards. Dr. Davis: Operations of the Throat, Nose, and Ear. Mr. B. Harman: Diseases of the Eye. 2 P.M., Medical and Surgical Clinics. X Rays. Operations.

LONDON HOSPITAL MEDICAL COLLEGE (UNIVERSITY OF LONDON), Clinical Theatre, London Hospital, Mile End-road, E.

MONDAY.—2 P.M., Demonstration in Clinical Medicine:—Dr. Wall: Pulmonary Diseases.

TUESDAY.—2 P.M., Demonstration in Clinical Medicine:—Dr. Grünbaum: Diseases giving rise to Morbid Renal Excretion.

WEDNESDAY.—2 P.M., Demonstration in Clinical Medicine:—Dr. Hutchison: Abdominal Disease.

THURSDAY.—2 P.M., Demonstration in Clinical Medicine:—Dr. Head: Diseases of the Nervous System.

FRIDAY.—2 P.M., Demonstration in Clinical Medicine:—Dr. L. Smith: Diseases of the Heart.

OPERATIONS.

METROPOLITAN HOSPITALS.

MONDAY (7th).—London (2 P.M.), St. Bartholomew's (1.30 P.M.), St. Thomas's (3.30 P.M.), St. George's (2 P.M.), St. Mary's (2.30 P.M.), Middlesex (1.30 P.M.), Westminster (2 P.M.), Chelsea (2 P.M.), Samaritan (Gynæcological, by Physicians, 2 P.M.), Soho-square (2 P.M.), Gt. Northern Central (2.30 P.M.), West London (2.30 P.M.), London Throat (9.30 A.M.), Royal Free (2 P.M.), Guy's (1.30 P.M.), Children, Gt. Ormond-street (9 A.M.), St. Mark's (2.30 P.M.), Central London Throat and Ear (Minor 9 A.M., Major 2 P.M.).

TUESDAY (8th).—London (2 P.M.), St. Bartholomew's (1.30 P.M.), St. Thomas's (3.30 P.M.), Guy's (1.30 P.M.), Middlesex (1.30 P.M.), Westminster (2 P.M.), West London, (2.30 P.M.), University College (2 P.M.), St. George's (1 P.M.), St. Mary's (1 P.M.), St. Mark's (2.30 P.M.), Cancer (2 P.M.), Metropolitan (2.30 P.M.), London Throat (9.30 A.M.), Samaritan (9.30 A.M. and 2.30 P.M.), Throat, Golden-square (9.30 A.M.), Soho-square (2 P.M.), Chelsea (2 P.M.), Children, Gt. Ormond-street (9 A.M. and 2 P.M., Ophthalmic, 2 P.M.), Tottenham (2.30 P.M.) Central London Throat and Ear (Minor, 9 A.M., Major, 2 P.M.), Royal National Orthopædic (9.30 A.M. and 4 P.M.).

WEDNESDAY (9th).—St. Bartholomew's (1.30 P.M.), University College (2 P.M.), Royal Free (2 P.M.), Middlesex (1.30 P.M.), Charing Cross (3 P.M.), St. Thomas's P.M.), London (2 P.M.), King's College (2 P.M.), St. George's (Ophthalmic, 1 P.M.), St. Mary's (2 P.M.), St. Peter's (2 P.M.), Samaritan (9.30 A.M. and 2.30 P.M.), Gt. Northern Central (2.30 P.M.), Westminster (2 P.M.), Metropolitan (2.30 P.M.), London Throat (9.30 A.M.), Cancer (2 P.M.), Throat, Golden-square (9.30 A.M.), Guy's (1.30 P.M.), Royal Ear (2 P.M.), Children, Gt. Ormond-street (9 A.M. and 9.30 A.M., Dental, 2 P.M.), Tottenham (Ophthalmic, 2.30 P.M.), West London (2.30 P.M.), Central London Throat and Ear (Minor, 9 A.M., Major, 2 P.M.).

THURSDAY (10th).—St. Bartholomew's (1.30 P.M.), St. Thomas's (3.30 P.M.), University College (2 P.M.), Charing Cross (3 P.M.), St. George's (1 P.M.), London (2 P.M.), King's College (2 P.M.), Middlesex (1.30 P.M.), St. Mary's (2.30 P.M.), Soho-square (2 P.M.), North-West London (2 P.M.), Gt. Northern Central (Gynæcological, 2.30 P.M.), Metropolitan (2.30 P.M.), London Throat (9.30 A.M.), Samaritan (9.30 A.M and 2.30 P.M.), Throat, Golden-square (9.30 A.M.), Guy's (1.30 P.M.), Royal National Orthopædic (9 A.M. and 3.30 P.M.), Royal Ear (2 P.M.), Children Gt. Ormond-street (9 A.M. and 2 P.M.), Tottenham (Gynæcological, 2.30 P.M.), West London (2.30 P.M), Central London Throat and Ear (Minor, 9 A.M., Major, 2 P.M.).

FRIDAY (11th).—London (2 P.M.), St. Bartholomew's (1.30 P.M.), St. Thomas's (3.30 P.M.), Guy's (1.30 P.M.), Middlesex (1.30 P.M.), Charing Cross (3 P.M.), St. George's (1 P.M.), King's College (2 P.M.), St. Mary's (2 P.M.), Ophthalmic (10 A.M.), Cancer (2 P.M.), Chelsea (2 P.M.), Gt. Northern Central (2.30 P.M.), West London (2.30 P.M.), London Throat (9.30 A.M.), Samaritan (9.30 A.M. and 2.30 P.M.), Throat, Golden-square (9.30 A.M.), Royal National Orthopædic (3.30 P.M.), Soho-square (2 P.M.), Children, Gt. Ormond-street (9 A.M., Aural, 2 P.M.), Tottenham (2.30 P.M.), St. Peter's (2 P.M.)., Central London Throat and Ear (Minor, 9 A.M., Major, 2 P.M.).

SATURDAY (12th).—Royal Free (9 A.M.), London (2 P.M.), Middlesex (1.30 P.M.), St. Thomas's (2 P.M.), University College (9.15 A.M.), Charing Cross (2 P.M.), St. George's (1 P.M.), St. Mary's (10 A.M.), Throat, Golden-square (9.30 A.M.), Guy's (1.30 P.M.), Children, Gt. Ormond-street (9 A.M. and 9.30 A.M.), West London (2.30 P.M.).

At the Royal Eye Hospital (2 P.M.), the Royal London Ophthalmic (10 A.M.), the Royal Westminster Ophthalmic (1.30 P.M.), and the Central London Ophthalmic (2 P.M.), Hospital operations are performed daily.

EDITORIAL NOTICES

IT is most important that communications relating to the Editorial business of THE LANCET should be addressed *exclusively* "TO THE EDITOR," and not in any case to any gentleman who may be supposed to be connected with the Editorial staff. It is urgently necessary that attention should be given to this notice.

It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this office.

Lectures, original articles, and reports should be written on one side of the paper only, AND WHEN ACCOMPANIED BY BLOCKS IT IS REQUESTED THAT THE NAME OF THE AUTHOR, AND IF POSSIBLE OF THE ARTICLE, SHOULD BE WRITTEN ON THE BLOCKS TO FACILITATE IDENTIFICATION.

Letters, whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers—not necessarily for publication.

We cannot prescribe or recommend practitioners.

Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor."

Letters relating to the publication, sale and advertising departments of THE LANCET *should be addressed "To the Manager."*

We cannot undertake to return MSS. not used.

MANAGER'S NOTICES.

THE INDEX TO THE LANCET.

THE Index and Title-page to Vol. I. of 1911, which was completed with the issue of June 24th, were given in THE LANCET of July 1st.

VOLUMES AND CASES.

VOLUMES for the first half of the year 1911 are now ready. Bound in cloth, gilt lettered, price 16*s.*, carriage extra.

Cases for binding the half-year's numbers are also ready. Cloth, gilt lettered, price 2*s.*, by post 2*s.* 3*d.*

To be obtained on application to the Manager, accompanied by remittance.

TO SUBSCRIBERS.

WILL Subscribers please note that only those subscriptions which are sent direct to the Proprietors of THE LANCET at their Offices, 423, Strand, London, W.C., are dealt with by them? Subscriptions paid to London or to local newsagents (with none of whom have the Proprietors any connexion whatever) do not reach THE LANCET Offices, and consequently inquiries concerning missing copies, &c., should be sent to the Agent to whom the subscription is paid, and *not* to THE LANCET Offices.

Subscribers, by sending their subscriptions direct to THE LANCET Offices, will insure regularity in the despatch of their Journals and an earlier delivery than the majority of Agents are able to effect.

THE COLONIAL AND FOREIGN EDITION (printed on thin paper) is published in time to catch the weekly Friday mails to all parts of the world.

The rates of subscriptions, post free from THE LANCET Offices, have been reduced, and are now as follows:—

FOR THE UNITED KINGDOM.		TO THE COLONIES AND ABROAD.	
One Year	£1 1 0	One Year	£1 5 0
Six Months	0 12 6	Six Months	0 14 0
Three Months	0 6 6	Three Months	0 7 0

(The rate for the United Kingdom will apply also to Medical Subordinates in India whose rates of pay, including allowances, is less than Rs. 50 per month.)

Subscriptions (which may commence at any time) are payable in advance. Cheques and Post Office Orders (crossed "London County and Westminster Bank, Covent Garden Branch") should be made payable to the Manager, Mr. CHARLES GOOD, THE LANCET Offices, 423, Strand, London, W.C.

TO COLONIAL AND FOREIGN SUBSCRIBERS.

SUBSCRIBERS ABROAD ARE PARTICULARLY REQUESTED TO NOTE THE RATES OF SUBSCRIPTIONS GIVEN ABOVE.

The Manager will be pleased to forward copies direct from the Offices to places abroad at the above rates, whatever be the weight of any of the copies so supplied.

SOLE AGENTS FOR AMERICA—Messrs. WILLIAM WOOD AND CO., 51, Fifth Avenue, New York, U.S.A

METEOROLOGICAL READINGS.

An original and novel feature of "THE LANCET General Advertiser" is a Special Index to Advertisements on pages 2 and 4, which not only affords a ready means of finding any notice but is in itself an *additional* advertisement.

Advertisements (to insure insertion the same week) should be delivered at the Office not later than Wednesday, accompanied by a remittance.

Answers are now received at this Office, by special arrangement, to advertisements appearing in THE LANCET.

The Manager cannot hold himself responsible for the return of testimonials, &c., sent to the Office in reply to advertisements; copies only should be forwarded.

Cheques and Post Office Orders (crossed "London County and Westminster Bank, Covent Garden Branch") should be made payable to the Manager, Mr. CHARLES GOOD, THE LANCET Office, 423, Strand, London, to whom all letters relating to Advertisements or Subscriptions should be addressed.

THE LANCET can be obtained at all Messrs. W. H. Smith and Son's and other Railway Bookstalls throughout the United Kingdom. Advertisements are also received by them and all other Advertising Agents.

Sole Agents for Advertising in Germany, Austria, Hungary Switzerland and the French and Italian Riviera—RUDOLF MOSSE, Berlin. S W., and all Branches.

Agent for the Advertisement Department in France—J. ASTIER, 35, Rue Franklin, Asnières, Paris.

ABSTRACT OF

A Lecture

ON

HOUSING AND TOWN PLANNING.[1]

Delivered at the Medical School of St. George's Hospital

BY F. E. FREMANTLE, M.B. OXON., F.R.C.P. LOND., F.R.C.S. ENG., D.P.H.,
COUNTY MEDICAL OFFICER FOR HERTFORDSHIRE.

GENTLEMEN,—Housing and town planning are taken in this lecture as an embodiment of the outward conditions affecting man's health. They include the whole sanitary circumstances of the home life, as apart from the physiological circumstances—food and drink, exercise and rest—and as apart from the circumstances of the non-domestic working life in workshop and school. They afford, therefore, a good illustration of sanitation in the narrower sense, especially as affecting the women and younger children.

Of the facts of overcrowding there is exact information through the censuses taken in 1891 and 1901. Over two and a half million persons, or 8·2 per cent. of the population of England and Wales, were in 1901 living more than two to a room, 9 per cent. in urban and 6 per cent. in rural districts. This figure varies in different districts from almost zero to nearly 35 per cent., some purely industrial towns, like Leicester and Northampton, having barely 1 per cent. overcrowded, London 16 per cent., and six towns, all old seaports, over 20 per cent., Gateshead heading the list with 34·5 per cent. In the counties the coal-mining districts of Northumberland and Durham are the worst, Tynemouth district having 38 per cent. overcrowded. But the diminution in these figures since 1891 is substantial, London having improved from 20 to 16 per cent., and the whole country from 11·2 to 8·2 per cent., owing to travelling facilities, to building enterprise, to administrative action against overcrowding, and, not least, to the declining birth-rate.

EFFECTS OF BAD HOUSING.

Housing may be defective either in amount or in quality; but in either respect the co-existence of defective housing and ill-health is obvious. Let us, then, compare the death-rates, first with the density of population on area (Tables I., II., and III.), then with figures showing crowding in rooms (Table IV.), and thirdly, with prevalence of one particular defect—namely, back-to-back houses.

TABLE I.—*Density of Population and Mortality in Countries.*

Countries.	Inhabitants per square kilometre.	Crude death-rates, 1886.
Norway	6	16·1
France	72	22·5
Germany	86	26·2
Italy	105	28·3
England and Wales ...	182	19·5

With the exception of England density varies with death-rate.

Table II., again, shows, with only two unimportant exceptions, how density varies with the death-rate. The contrast is still more clearly marked and more pertinent as between different districts of the same town.

The comparison becomes more precise when we consider the death-rates in respect of overcrowding in rooms. This is defined as the occupation of a tenement by a number exceeding two to a room. Let us compare three London districts, representing respectively wealth, slums, and suburbs, with two big industrial cities, and with my own healthy county of Herts.

[1] We published a fortnight ago one of Mr. Fremantle's Edward Jenner Lectures at St. George's Hospital. This lecture is an abstract of one of the same course.

TABLE II.—*Density of Population and Mortality in Districts, England and Wales, 1891–1900.*

(From the Supplement to the Sixty-fifth Report of the Registrar-General, 1891–1900, p. lxix.)

Districts having corrected death-rates per 1000 of—	Density (persons to a square mile).	Districts having corrected death-rates per 1000 of—	Density (persons to a square mile).
11–12	136	19–20	1,705
12–13	161	20–21	2,339
13–14	181	21–22	4,424
14–15	261	22–23	4,884
15–16	407	23–24	4,194
16–17	457	24–25	2,925
17–18	737	25–30	7,480
18–19	1303	30–35	55,563

Mean density of above districts, 525 persons to a square mile.

TABLE III.—*Crowding and Mortality 1891–1900.*

—	Corrected death-rate.	Infant mortality.	Percentage of tenements with less than five rooms.	Percentage of these with over two persons to a room.
England and Wales	18·2	153	47	12
London	20·1	160	66	19
Lewisham	14·8	134	30	6
Westminster ...	17·0	144	70	20
Whitechapel ...	33·1	172	85	48
Manchester	28·3	211	70	10
Liverpool	35·4	223	68	2
Herts	14·1	110	36	5

To show the unhealthiness of defective housing a striking contrast in death-rates has been made out with regard to houses built back to back, in which, therefore, light and air are only admitted on one side of every house and there can be no through-ventilation, as compared with through-ventilated houses.

TABLE IV.—*Defective Housing and Mortality,*

Comparable observations by—I., Dr. Tatham; II., Mr. Herbert Jones.		Population.	Mortality per 1000 population. All causes.	Lung diseases, excluding phthisis.	Phthisis.	Principal zymotic diseases.	Diarrhœa only.
I., Salford	No back-to-back houses	8,713	27·5	6·6	2·8	4·5	1·4
	56 per cent. back-to-back houses	11,406	30·5	7·9	3·6	6·2	2·1
II., Saltaire, Through houses ...		4,218	15·6	3·6	2·7	1·1	0·2
Shipley	Back-to-back in 75 ft. streets ...	2,200	18·1	4·9	2·8	1·3	0·2
	Back-to-back in 40 ft. streets ...	710	28·1	7·4	4·6	2·9	0·8

Back-to-back houses, then, show a higher death-rate than through-houses, but this difference is materially reduced in broad streets.

As a last example of these statistics we may note those cited to show the healthiness of the Letchworth Garden City, which in 1909 showed a death-rate of 5·2 per 1000, as compared with 14·0 for London and higher figures for well-known sea resorts; an infant mortality of 32 as compared with 96 for Brighton and 108 for London.

I trust, however, that my first two lectures to you, gentlemen, on vital statistics may have kindled your fiery criticism on these figures. They are commonly quoted, even by medical officers of health and widely by housing reformers, as showing the dire effect of evil housing on health. When

the King visits Hampstead Garden Suburb he is supplied with facts of this sort and is duly reported to have been deeply impressed.

But it is obvious that those live cheapest who live most crowded; they will surely include the least careful and least healthy, the dirtiest, most ignorant, and most criminal of their class, amongst whom the death-rate is bound to rule high. New dwellings, on the other hand, and garden cities would naturally house a more select population. The figures quoted above show a broad connexion between density of population and cheap housing on the one side and mortality on the other. Overcrowding, whether on area or in rooms, back-to-back houses, age, decay, and insanitary conditions, are all factors in cheapness of which poverty is quick to avail itself.

One of the best articles hitherto written on the subject of housing, that by Dr. Shadwell in the new "Encyclopædia Britannica," emphasises the fact that—

> The poorest people live under the worst housing conditions because they are the cheapest; the economic factor governs the situation. Poverty again is associated with bad habits, with dirt, waste, idleness, and vice, both as cause and as effect. These factors cannot be separated in real life; they act and react upon each other in such a way that it is impossible to disentangle their respective shares in producing physical and moral evils. To lay all responsibility upon the structural environment is an error constantly exposed by experience.

REQUIREMENTS FOR ADEQUATE HOUSING.

A good house should be light and airy, warm, dry, and sound; for general purposes it should contain three bedrooms; and the arrangements for artificial lighting, heating, washing, and cooking, for the disposal of sewage, slops, and refuse, and for the water-supply should be both sufficient and convenient. Let us consider these factors in turn, recognising as the British standard for all new houses the model by-laws respectively for urban and rural districts.

1. *Surroundings—Site, aspect, soil, yard.*—The site should be above the general level of the district for the sake of dryness; it may with comfort be protected from the easterly winds, but it should be open to two, and preferably three, sides of the compass; it should be clear of rising ground or of trees around it; it should be as sunny as possible. The aspect for preference should be to the south-west, but streets are best built north and south so as to get sun on both sides during the day. The soil is best porous and should in any case not be of organic rubbish. The yard at the back of a small town house must be at least 150 square feet in area, and as it is liable to be a source of trouble it should be paved and drained.

As to the space required around a house, the ideal no doubt is total solitude; the minimum should be free space fore and aft, each equal to the height of the house. This gives a "building angle" of 45° from the building line on the opposite side of the street to the top of the house. In London, however, the by-laws allow buildings to be half as high again as the length of space in rear.

2. *Structure.*—Walls and roof must be sound and impervious to rain, either in themselves or—since both tile and brick will hold their own weight of water—by stucco or rough-cast outside, by plaster and ceiling in. A damp-course—e.g., of slate—must be inserted in the walls all round the house above ground level to prevent damp rising from the ground; and for the same reason the basement must be concreted, or, if there be no basement, as, for instances, in villages, there must be through ventilation under the floor. In this way the modern house is perfectly dry even when built on damp ground. A century ago snipe were shot in the marshy ground now occupied by Belgrave-square.

3. *Rooms.*—In height the object is to allow the expired air to rise, instead of persons being compelled to inhale each other's breath; rooms therefore should be 8 or 9 feet high. Over 13 feet of height is of little value. The smaller rooms should be large enough to take a full-sized bed with as much space beside; window area should be at least one-tenth of floor area and every room should have a window to open, a door to shut, and a fireplace.

4. *Sanitation.*—Every house should have a separate closet, with a window to open to the outside and a door to close, so constructed as to remain clean and dry. In towns it should be a water-closet in every case; in villages it should be a pail-closet with dry earth or ashes handy. Both in town and country water should be laid on in the house and a sink and a bath provided, properly drained either to a sewer or cess pool, which must not be within 30 ft. of the house. For removal of refuse the only proper arrangement is a metal ash-bin.

NEW METHODS OF CONSTRUCTION.

One of the greatest changes in the history of housing is due to the still recent discovery of cheaper methods of construction.

Steel-concrete.—This combined material is now commonly known as steel-concrete, ferro-concrete, or reinforced concrete, and is extensively used for buildings of every kind where its appearance is not a bar to its use. In the Hennebique system, on which the new Post Office in Newgate-street is built, the steel rods are round; in other systems they are flat; but the commonest system involves the use of "expanded" steel, in which a steel plate is cut along intermittent parallel lines into a series of strips connected at regular intervals; when this plate is forcibly stretched it becomes a network which, when embedded in concrete, strengthens it materially. Edison has recently urged the standardisation of workmen's houses made in this material, so that they might be turned out in slabs from common moulds, each wall being moulded as a single piece and the pieces fixed together on the site.

Hollow walls, again, are used on the principle that the air-space contained is a source of warmth and dryness and that the supporting strength can always be obtained by steel or by solid building at the angles. The walls may be of hollow brick, or, as in the Frazzi method, hollow slabs of terra-cotta four inches thick, in which the terra-cotta is a mere half-inch shell with half-inch partitions between the parallel hollow spaces.

These various methods of construction demand reconsideration of the function of house-walls. Walls are no longer required to support the floors and roof above. Support is given by a separate steel skeleton, which in buildings of this style is the first part to be erected and then is gradually clothed, often from above downwards, by means of a crane reaching above the roof line.

These curtain-walls then, as they are technically called, are only required to keep the contents warm and dry and to afford privacy. This might well be done by walls of mere glass, doubled for sake of warmth, draped for sake of privacy and internal appearance. Opaque walls cut out sunshine; and the sun is good both for health and spirits. On this principle larger windows are now provided and should be further encouraged.

Steel concrete has again affected the science of construction with regard to the public health by enabling buildings to be erected of immense height—40 storeys, for instance, in New York, where the streets are still comparatively narrow; where light and air, therefore, in the lower floors are seriously defective. The London "building angle" prevents the erection of such buildings here, for if 300 ft. high they would necessitate a street 300 ft. wide, and this would be neither economical nor convenient. Nevertheless, the general tendency of these new methods of construction is to promote higher buildings and broader roads; while in districts where brick and labour are dear and steel concrete is cheap such methods may cheapen the cost of the workman's cottage.

RURAL HOUSING.

It is in the village and small towns rather than in the great cities that the threads of this, as of most social and sanitary problems, may be unravelled and traced to their source. In the villages overcrowding, if not so acute, is almost as common, and defective housing of all sorts is far commoner, more variable, and more extreme than in the cities. Less is heard of it because the country is less under the eyes of the press, and the simple villager has not yet made his voice heard in the turmoil raised by the city slums. It is indeed of less importance, as the villager commonly spends his day in fresh air and healthy living. But its effects and its causes are the same everywhere.

Here a careful study shows that the oldest, dirtiest, and most dilapidated houses in poor districts and in villages will always be inhabited. It is only as these are closed that successive strata of society are compelled by the law of supply and demand in each stratum in turn to move higher in the housing scale. It is only in order to accelerate, not to supplant, this movement that the landowner or the local authority should be asked to provide new houses; and if tenants can be found for them, it matters little whether the actual working classes are directly or only indirectly

benefited, so long as the worst houses are closed. Best of all is the provision of new houses by the workmen themselves on co-partnership lines, as is now being extensively affected by the "Coöperative Tenants, Limited."

REMEDIAL POWERS.

It is often forgotten that the chief housing powers are those of the great Public Health Act of 1875 and the corresponding Act for London of 1891, by which the local sanitary authority is empowered, not only by by-laws to supervise new buildings erected, but to inspect and order the abatement of unhealthy conditions, including overcrowding, and if necessary to declare houses unfit for habitation and close them by order.

The Housing Act of 1890 gives powers of demolition and rebuilding. By Part I. it allows whole areas, which are reported insanitary, to be demolished under an improvement scheme. By Part II. single houses or small groups can be closed on the report of the medical officer of health either as insanitary or as obstructive, including back-to-back houses, and, failing repair by the owners, can be demolished. By Part III. local authorities may build houses to supply needs shown, acquiring land by compulsory purchase and raising loans for the purpose. The exercise of these powers is subject to the sanction of the Local Government Board, which sends down inspectors to hold local inquiries into each case. Compensation has to be made to private owners for property thus affected, demolished, or acquired.

Under this and subsequent amending Acts a great amount of work has been carried out in the cities. As regards Part I., in the 15 years 1891–1905, 28 provincial towns raised loans for improvement schemes amounting to £2,300,000; Leeds spent half a million in clearing 75 acres; and London up to 1908 had cleared 104 acres and displaced 48,500 persons at a gross cost of nearly three and a half millions, at a net cost of nearly two and a half millions. So much for improvement schemes. There will not be much need for them in future, the worst slums being now abolished.

But it is under Part II. of this 1890 Act, apart from action under the 1875 and under local Acts, that the most useful work will continue to be done. In the six years 1899–1904 400 local authorities outside London received representations against over 33,000 houses, caused over 17,000 to be made fit for habitation, closed 4220, and demolished 748.

Municipal building, however, under Part III. of the Act, especially in the great cities, has attracted more attention. It is well to note that whereas London and 130 boroughs and districts had to the end of 1906 built some 20,000 dwellings, the private enterprise of the Peabody, Rowton, Guinness, and other large trusts had in London alone housed 150,000 persons.

TOWN PLANNING.

Lastly, by the Housing, Town-Planning, &c., Act, 1909, the law has taken note of the principle, new to housing reformers but as old as time, that not only the individual structure, but the relationship of the houses to each other, is of importance, alike to amenity, convenience, and health. Rome and Athens, Paris and Washington, aye, and even in their utilitarian way the gridiron-patterned American cities of mushroom growth, are conspicuous instances of town-planning. Their plan, however, has been mainly designed with a view to amenity, or rather grandeur; barely, if at all, to convenience, except in the mind; certainly not to public health. The boulevards of continental cities hide the most squalid, dark, and unhealthy conditions behind their palatial frontages; health, convenience, and real amenity are sacrificed to architectural effect.

While the first part of the new Act makes inspection and consideration of housing conditions the definite and constant duty of every local authority and its medical officer of health, and strengthens their hands, the second part of the Act gives power to the local authority to supervise the laying-out of land under development. One or more authorities may either themselves prepare a town-planning scheme or may adopt a scheme prepared by one or more landowners. Both a *primâ facie* case and the completed scheme have to be sanctioned by the Local Government Board; every facility is given for objections, and provision is made both for worsement and betterment of the property.

What is the practical effect of town-planning? 1. Roads are laid out from the first with a view to their probable use—wide enough and not too wide—gravel paths being in some cases sufficient for the immediate approach to cottages, 8 ft. roads in others. 2. Grass borders, paths, or gardens are left alongside the road with a view to possible widenings. 3. Convenient cross connexions are ensured. 4. The number of houses to the acre is limited. 5. The space and light round each house are controlled. 6. The municipal and State services—water, sewage, scavenging, gas, electricity, tramways, posts, telephones, and telegraphs—can be provided for in advance. 7. Open spaces and parks can be provided where required, and not otherwise.

Town-planning is as essential to local government as by-laws for new buildings; and schemes, great or small, should be adopted for the outskirts of every town or village not actually at a standstill in development.

GARDEN CITIES.

The enthusiasm in this country for town-planning is due to a shilling book entitled "Garden Cities of To-morrow," written by Mr. Ebenezer Howard in 1898. Town-planning was an essential part, but part only of his scheme. He proposed to check the constant growth of towns and of slums by a counter-stroke. At present it is the residents alone that try to leave the towns, to establish their houses as far out into the country as possible, returning by rail every day to the town for their work.

This centralisation of industry, Howard contended, is no longer necessary. It is cheaper for the industry itself, directly and indirectly, to be in the country, where rates are low, land for expansion cheap, conditions of life healthy; where steam and electricity establish sufficient communication with the offices and exchanges in town; where industrial life becomes healthier and more simple, while agriculture gains a market for its produce. The future remedy for the urbanisation of our race rests, as Mr. Justice Neville has said, not in garden suburbs, but in garden cities and villages. Bournville, Port Sunlight, Letchworth—go and see them when you can, and you will see visions of the future Utopia, in which the most urgent social problems, housing foremost, have been solved, the public health set on a firm basis, and the foundations of a healthy nation assured.

SUMMARY.

1. The housing problem consists of defects both in quantity and quality of accommodation in relation to a changing standard of requirement.
2. English conditions are considerably better than those in Scotland and Ireland or in foreign countries.
3. There is marked improvement during the past 20 years.
4. The poor will always live in the cheapest houses, and the oldest and poorest are essentially the cheapest.
5. Wholesale removal of slums has been done much in the past and leaves little to be done in the future.
6. Closure and demolition of single houses are means much used and of prime importance.
7. New buildings for inhabitation by the labouring classes involve unnecessary waste of money, but may occasionally be necessary; they will then involve a charge on the rates.
8. Town-planning and the decentralisation of industry in garden cities and villages offer a hopeful solution of the problem of congestion.
9. Better administration, not legislation, is required.
10. The main faults in the people's houses depend on their habits, characters, and intelligence. Practical education is the most important factor in improvement.

ST. THOMAS'S HOSPITAL MEDICAL SCHOOL.—The Science Scholarships of £150 and £60 have been awarded respectively to William Thomas, B.Sc. Lond., of St. Bartholomew's Hospital, and to F. Molina, of St. Thomas's Hospital. The Scholarship in Arts has been awarded to Ailwyn H. Clarke, of Haileybury College.

THE HEREDITARY TENDENCY TOWARD TWIN-BEARING, AND THE INFLUENCES AIDING IN THE DETERMINATION OF SEX.

BY JAMES OLIVER, M.D. EDIN., F.R.S. EDIN.,
PHYSICIAN TO THE HOSPITAL FOR WOMEN, LONDON.

ROUGHLY speaking, 24 patients out of every 2500 that I see have once or oftener given birth to twins—a proportion, that is, of about 1 in 104; and regarding the existence of an hereditary tendency towards twin-bearing there can be no doubt. The following is a fairly representative 24 group. It speaks for itself, as in three only of these cases was there no history of twins either on the female or the male side, and in one or more of those it is quite possible that the default may have been due to ignorance.

1. Aged 44 years. Married twice. Has had five children; twins once (boy and girl). All the children are by the first husband. Conception has never taken place through the second husband. History: Mother of patient had twins; wife of mother's brother had twins twice; daughter of mother's sister had twins twice; two cousins of patient (father's side) had each had twins.
2. Aged 29 years. Married twice. Has had four children; twins once (two girls). All these children are by the first husband. She has not as yet been impregnated by the second husband, but she has only lived one year in wedlock with him. History: Two sisters of patient had twins; mother of patient had 13 children, all single births.
3. Aged 44 years. Has had six children; twins once (two girls); the other four children are boys. History: None of twins.
4. Aged 23 years. Twins once (two girls). History: Sister of patient's mother had twins.
5. Aged 28 years. Has had four children; twins once (two girls). History: Mother of patient had twin girls once, but patient is not one of these.
6. Aged 32 years. Has had four children; twins twice (two girls, and boy and girl). History: Wife of brother of father of patient had twins.
7. Aged 40 years. Has had 12 children; twins once (two girls). History: Sister of patient had twins twice; wife of brother of father of patient had triplets.
8. Aged 37 years. Has had five children; twins once (boy and girl). History: Sister of mother of patient had twins.
9. Aged 50 years. Has had eight children; twins once (two girls). History: Sister of patient had twins; mother of father of patient had twins (boy and girl), and the father of patient was one of these.
10. Aged 32 years. Has had three children; twins once (two boys). History: Mother of husband of patient had twins twice, but the husband is not one of these.
11. Aged 41 years. Has had eight children; twins once (boy and girl). History: Sister of patient had twins; wife of brother of husband had twins.
12. Aged 37 years. Has had eight children; twins once (boy and girl). History: Sister of mother of husband had twins.
13. Aged 24 years. Has had four children; twins twice (two girls and boy and girl). History: Mother of patient had twins; mother of mother of patient had twins; mother of father of patient had twins.
14. Aged 33 years. Has had three children; twins once (boy and girl). History: Mother of patient had twins twice; sister of mother of patient had twins twice; sister of mother of mother of patient had twins once.
15. Aged 26 years. Has had two children; twins (boy and girl). History: Sister of patient had twins.
16. Aged 46 years. Has had two children; twins (boy and girl). History: Husband of patient is a twin with a girl; sister of patient had twins.
17. Aged 55 years. Had had two children; twins (two girls). History: Mother of husband had twins, but husband is not one of these.
18. Aged 34 years. Has had six children; twins once (two girls). History: Mother of husband had twins, but husband is not one of these.
19. Aged 27 years. Has had three children; twins once (two boys). History: Sister of husband had twins.
20. Aged 44 years. Has had 17 children; twins three times (boy and girl twice and two girls). History: None of twins.
21. Aged 36 years. Has had five children; twins once (two boys). History: None of twins.
22. Aged 35 years. Has had three children; twins once (boy and girl). History: Mother of husband had twins, but husband is not one of these.
23. Aged 42 years. Has had four children; twins once (two girls). History: Mother of husband had twins, but husband is not one of these.
24. Aged 26 years. Had had two children, twins (boy and girl). History: Mother of patient had twins, but patient is not one of these; mother of mother of patient had twins, but mother of patient is not one of these.

In this group it will be observed there are 28 sets of twins, as one patient had borne twins three times and two others had each had twins twice. The twins in 13 instances are boy and girl, in 12 they are two girls, and only in 3 are they two boys. The aforesaid 28 confinements produced altogether 37 females and 19 males, a proportion, that is, of practically 2 females to 1 male; and this, I would remark, is fairly constantly the relationship of female to mal as a result of twin conceptions. This is a not phenomenon, since in all European countries, whe legitimate and illegitimate births be computed sepa together, the total annual number of male birth exceeds that of females, and this has been a constar tion year after year in northern and southern countr In our own case, in England and Wales the total female births during the year 1907 were respectively and 450,314, or proportionally 103 or 104 males to e females. The percentage of males in excess of fe now rather lower than it was years ago. If we t total illegitimate births in England and Wales dur year 1908 we note a similar condition of affairs, for th and female births under such circumstances were respe 19,025 and 18,506, or roughly 3 per cent. more male females. In countries, however, where polygamy pr this relationship of male to female births is reversed, f are assured that polygamy produces about two female b to every one male. This relationship, it will be obser corresponds closely with that noted as a result of t conceptions.

In the case of the human race and the higher anir kingdom we are nevertheless driven to the conclusion th there must be some force or forces at work which tend balance the relationship of male to female births. For mo than 2000 years philosophers and physicians alike hav diligently endeavoured to seek out and elucidate these forces but so far their efforts have been attended with practically no success, and I am confident that this has been a blessing and not a misfortune, for it is more than probable that if we should ever succeed in disclosing the secret of this stable equilibrium of the sexes the utilisation of the knowledge would be fraught with evil rather than good to humanity, and might even lead eventually to the extermination of the human race. In a few cases where, for example, a crown was at stake a fabulous price and great sacrifice might be paid and made to ensure that the result of a given conception should be a male progeny, but the indiscriminate use of any such power would undoubtedly be a curse rather than a blessing, and would not, as some are disposed to believe, conduce to domestic happiness.

We, as the philosophers and physicians of old were, are familiar with the fact that in the case of the majority of animals, eggs do not develop unless spermatozoa enter them, and our knowledge on this matter is more precise than theirs was, inasmuch as we know that one spermatozoon only suffices, and is, in fact, necessary for the fertilisation of an egg. At one time it was believed that the sex of the offspring depended upon the number of spermatozoa which penetrated the egg, being male if many entered and female if a less number were included in the egg. It is now, however, conceded that polyspermy leads invariably to the production of monsters, and that natural fertilisation is always effected by one spermatozoon only.

Quite recently Herbst, Driesch, Loeb, and others have shown that it is possible to fertilise the eggs of some of the lower animals by physico-chemical agencies alone, and these scientists have even produced living larvæ by the action of chemical substances alone—without the intervention of spermatozoa at all—on the unfertilised eggs of sea-urchins, star-fishes, and a number of annelids and molluscs. In consequence of the startling results obtained by chemical fertilisations, by artificial parthenogenesis, fresh interest has been aroused in the question of the determinants of sex and in the transmission of the hereditary tendency to beget twins.

In the case of man we recognise two different types of twins—twins which are so unlike each other that it is difficult indeed to believe that they could possibly have been begotten at the same time, and these twins may or may not be of the same sex; but there is the other type in which the twins resemble each other closely, and these invariably are of the same sex. We are induced to believe that the latter result from the splitting into two of one egg through the influence of one spermatozoon, but it is difficult to understand why twins thus produced are not identical both physically and mentally.

Twins are begotten by the same seminal emission but they may be produced in consequence of the splitting of one ovum after fertilisation into practically two ova, or they may result merely because two ova are extruded from one Graafian

cle, or again because of the simultaneous rupture of two Graafian vesicles and the consequent extrusion of two ova for fertilisation. Now the hereditary tendency to the production of twins is in my opinion transmitted about equally by males and females, and as the phenomena of fertility must be connected with a substance possessing a definite chemical and molecular constitution it is highly probable that the majority of twins are produced from one ovum and one spermatozoon. A woman who has a tendency to bear twins may give birth to twins of the same sex at one time and to twins of a different sex at another time, but never joined twins are never of the opposite sex. When twins are produced from one egg the first two cells into which the segments after fertilisation become separated from each other, and independently of each other they thereafter proceed to segment and develop.

In the case of the sea-urchin's egg this separation of the first two segments has been brought about by a change in the chemical constitution of the sea-water in which the eggs are hatched. Herbst, for instance, observed that if the fertilised eggs of the sea-urchin were put into sea-water which had been deprived of its calcium the cells into which the egg segmented had a tendency to segregate and fall apart. Driesch further remarked that sea-urchin eggs after fertilisation if specially treated with sea-water freed from lime had a tendency to produce twins, and Loeb noticed that the tendency to produce twins could be caused not only by an absence of lime but by an absence of either potassium or sodium from the sea-water. Generalising from certain experiments Loeb goes so far as to say, "If the liquids which surround the human egg a short time before and after the first cell division are slightly acid and at the same time lacking in one or more of the three important metals, calcium, sodium, and potassium, then the conditions for the separation of the first two cells and the formation of identical twins are provided."

If we accept this tenet then we are forced to conclude that there is in the human race practically no hereditary tendency to the production of twins. Judging, however, from my own clinical facts and experience I am convinced that the production of twins in the human female is not a chance affair, and has nothing to do with the deficiency of lime or potash or soda salts in the blood or generative tissues of the mother, for it is well known that deficiency of these salts so alters the sensitivity and irritability of the Fallopian tubes and uterus that well-marked symptoms make their appearance therefrom and abortion is apt to ensue. If, therefore, twin productions were in any way associated with deficiency in the amount of calcium, or potassium, or sodium in the maternal blood, twin productions would more commonly result in abortions than they do.

In dealing with the question of the causation of sex we must at the outset recognise the fact that not only in the case of individual women but in the case also of individual female animals we find a proneness to the production of one sex of progeny rather than the other; in one case the proneness may be especially female, whilst in another it is especially male. Of all the forces, however, which it is believed play an important rôle in the determination of sex the influence of food is that which has been and still apparently is most accredited, but in this case, as in that of the question of the production of twins, the evidence adduced has been derived chiefly, if not entirely, from experiments upon lower animals and especially upon insects. The bee is a favourite instance, as it is alleged that the fertile female or queen bee is a product dependent entirely upon the pabulum supplied. Again, in the case of tadpoles it has been remarked that by offering a highly nutritious food to these aquatic animals more females than males are produced.

Experimental evidence of this character has led some authorities to affirm that the primordial germinal cells are sexually indifferent that they are neither fixedly male nor female, but that evolution of sex depends upon extrinsic conditions, and that food-supply is the most important of these conditions. Nutrition, of course, involving as it does chemical changes, exercises a powerful influence upon all organic phenomena, but so, too, does temperature, and in the case of many insects it is impossible to say whether the evolutional changes taking place may not be dominated as much by the influence of temperature as the influence of pabulum. Under equal temperature conditions, experiment nevertheless appears to favour the view that well-fed females tend to produce a preponderance of female offspring and badly fed females a preponderance of male progeny.

On this nutritive dogma some authorities have even gone so far as to affirm that in the case of the human female if fertilisation occurs immediately after menstruation the product is likely to be a male, whereas if fertilisation occurs immediately before an expected menstrual period the product is likely to be a female, for, say they, menstruation is a katabolic or destructive process, and the ovum fertilised immediately after menstruation is in the early days less liberally fed than an oosperm which becomes harboured in the uterus before an expected menstrual period. No one, however, who has devoted any attention to the diagnosis of early pregnancy can for one moment believe that the relationship of the time of fertilisation to that of menstruation has anything to do with the determination of the sex of the progeny.

Under ordinary circumstances menstruation is always suspended in consequence of the occurrence of pregnancy, and we are accustomed to reckon the stage of any pregnancy as well as the duration of gestation from the date of the cessation of the last menstruation. To all intents and purposes it is possible to diagnosticate the existence of uterine pregnancy in every case 14 days after the date of the first suspended menstrual period, but the uterus containing an ovum impregnated only 18 or 19 days before a physical examination is made is not likely to be as big as a uterus containing an ovum impregnated 39 or more days prior to our examination, consequently as early as 14 days after the date of the first suspended menstruation the clinician from the size of the uterus should be able to say whether the product of conception is destined to be male or female. No one has yet been able thus to predict the sex *in utero*, nor is anyone ever likely to be able to do so, for it is very evident that the relationship of the time of fertilisation to that of menstruation has nothing to do with the causation of sex. Moreover, as we reckon the duration of gestation from the date of cessation of the last menstruation if the time of fertilisation had anything to do with the determination of sex, an ovum impregnated 14 or more days later than another ovum would be harboured 14 or more days longer, and the duration of gestation in the case of a female child would invariably be greater than in the case of a male, and of this we have no evidence.

If we investigate some of the other theories these too are found to be as erroneous as that which we have just discussed. Take, for example, the question of the part played by the right or the left ovary. At one time it was believed that the spermatozoa of the left testicle had an affinity only for ova from the left ovary and spermatozoa of the right testicle for ova from the corresponding ovary and that the sex of the progeny depended upon the ovary from which came the ovum which was fertilised. Everyone with extensive gynæcological experience, however, has remarked that women with one ovary are just as likely to give birth to male and female children as women who are in possession of both ovaries. To the part played by polyspermy we have already referred.

The question of the causation of sex is, in fact, to us as great a mystery as it has ever been.

Gordon-square, W.C.

THE DISCRIMINATION OF COLOUR.[1]

BY F. W. EDRIDGE-GREEN, M.D. DURH., F.R.C.S. ENG.,
BEIT MEDICAL RESEARCH FELLOW.
(*From the Institute of Physiology, University College.*)

IN a paper on the relation of light perception to colour perception,[2] and in previous writings,[3] I have stated that if a portion of the spectrum be isolated it will appear monochromatic, the length of the monochromatic region varying with the intensity and wave-length of the light and the colour perception of the observer. Most normal-sighted persons make about 18 such divisions in a bright spectrum.

In a paper in the Proceedings of the Royal Society,[4] Lord

[4] December, 1910.

Rayleigh, whilst agreeing that the facts were as I stated in the conditions described by me, expressed the opinion that he could distinguish between the wave-lengths included in a monochromatic division to the extent of discriminating between the colours of the two D lines. Lord Rayleigh kindly lent me the colour box with which he had made the experiments, and, on repeating them in the manner described by him, I arrived at similar results. I hope, however, to be able to show that the results obtained by Lord Rayleigh were due to the admixture of small quantities of white and coloured light and to certain physiological influences which had not been taken into consideration, and which prevented him from arriving at a correct interpretation of the colours.

If a prism, even of the finest polish, be examined with a strong light against a dark background, numerous small particles and irregularities of the surface, which irregularly disperse the light, will be seen. The reflections from the sides of the prisms, lenses, and sides of the box have also to be taken into consideration. The amount of this irregularly dispersed light is small, but is a very important factor taken in conjunction with other facts. It is necessary, therefore, in order to get rid of the greater part of this irregularly dispersed light to allow the light included in a monochromatic region to pass through a second aperture, such as that in my spectrometer. When this is done, I have found it impossible by any method which I have adopted to distinguish between the various waves included in the monochromatic region. I have magnified the image of this region with eye-pieces of different power, making a corresponding increase in the light to make up for the loss of luminosity caused by the magnification. I have also obstructed the central portion of the monochromatic region with a screen, and the remaining portions have still appeared monochromatic. The most conclusive experiment, however, is the examination of the monochromatic region with an achromatic double image prism, the intensity of the source of light being increased as before. By this method two rectangular monochromatic fields are seen, and can be arranged so that they are side by side and just touch. The portion belonging to the red side of the spectrum of one can be made to touch the portion belonging to the violet side of the spectrum of the other. This position is therefore most favourable for the detection of any difference, and yet I cannot detect any, neither can any other observer to whom I have shown the experiment. The experiment can be observed objectively in the following manner: an arc light being used for the illuminating source, a pure spectrum is obtained; a portion of this spectrum, forming a monochromatic region, is allowed to pass through an adjustable slit. Two images of this monochromatic region can be thrown with the aid of a double image prism upon a screen and made of any required size. The varying size of the monochromatic regions with different persons can by this means be demonstrated to a large number.

Another point which I found with Lord Rayleigh's apparatus is the difficulty of obtaining both fields of similar intensity. The slightest movement of the eye also causes an alteration in the number and kind of rays which enter the eye. When two fields are of unequal intensity the physiological effect of contrast is evoked, which causes an erroneous judgment of the colours under observation. In fact, weak orange light may, by contrast with bright red light, appear green. In making experiments on the discrimination of colour, the rays of light from the two regions to be compared should strike the eye at as nearly as possible the same angle; the fixation point of the eye should be in the centre between the two regions, so that one region may not be more influenced by the pigment of the yellow spot, or the blood in the retina, than the other, and that equal amounts of light from each region enter the eye.

The importance of the irregularly dispersed light in association with contrast in dealing with questions of colour has been overlooked by many physicists, as several instruments have been constructed for the investigation of colour and colour-vision which are defective on this ground. It was this irregularly dispersed light, as shown by Helmholtz,[5] which caused the apparent change in the colours of the spectrum observed by Brewster, and which led him to suppose erroneously that there were three kinds of solar light.

[5] Poggendorff's Annalen, 1852, No. 8.

In conclusion, when special means are taken to have as pure a spectrum as possible, I can find no method which will enable me to distinguish the colours in a monochromatic region. I therefore regard the appearance of the monochromatic region as a fundamental physiological fact, as I stated over 20 years ago.

Willesden Green, N.W.

THE PATHOLOGICAL RELATIONSHIP BETWEEN THE APPENDIX CÆCI AND THE UTERINE ADNEXA.

BY J. BIRT, L.R.C.P. EDIN., M.R.C.S. ENG.

(*With a Note on the Operation by* T. CRISP ENGLISH, M.B., B.S. Lond., F.R.C.S. Eng., *Senior Assistant Surgeon to St. George's Hospital, &c.*).

A VERY interesting and instructive address was published in THE LANCET of July 29th by Dr. H. Macnaughton Jones on the Pathological Relationship Between the Appendix Cæci and the Ovary and Tube, with notes on the various theories as to the course of the invasion of the infecting microbe, and in relation to this subject the following case may be of some interest.

The patient who was married, but with no children, had had four previous illnesses suggestive of appendicitis, necessitating each time rest in bed for a week or more (extending over a period of about 15 years, with intervals of about four years between each). Her catamenia had from the very first been attended with pain and some degree of menorrhagia. Chronic ovarian pain had existed on the left side since the age of 17 years. She was curetted seven years ago for menorrhagia, dysmenorrhœa, and intercurrent leucorrhœa, and her periods from that time had been quite regular up to the middle of May of this year, when there was metrorrhagia, the period lasting about 12 instead of, as was usual with her, five or six days. She had had some troublesome pain in the right thigh from the crest of the ilium to the knee for four months.

On June 9th, 1911, I was asked to see her, and found her in bed complaining of pain low down in the right side of the abdomen, which had troubled her very much for some days, and which was greatly aggravated by the act of defæcation. Her expression was slightly careworn, and the colour aspect of her face greyish. There was marked tenderness over an area, the centre of which was halfway between the umbilicus and the right superior iliac spine, and downwards towards the pubes. There was, however, no rigidity of the abdominal muscles, nor had there been any vomiting, and the abdominal movements in breathing were normal. The temperature was 102° F. and the pulse 96. On vaginal examination the uterus was freely moveable and the cervix normal, but a very tender, thick knotty cord was to be felt in Douglas's pouch. Absolute rest in bed was ordered and a fluid diet, together with a hot douche of 110° F. to be used twice daily.

On June 12th the patient woke up in the early morning with excruciating pains in the right lower abdomen. The tenderness over this area had greatly increased, but there was still no muscular rigidity. The temperature was 101·5° F. Frequent hot fomentations were applied and the douching was discontinued. On the next day (the 13th) menstruation started. The temperature and general conditions were not altered, but the pain was considerably better; in fact, it had commenced to be less on the first application of the fomentations.

The various signs and symptoms suggested to me that the appendix or ovary and tube, or all of them together, were affected, and it seemed to me that an exploratory cœliotomy should be done, but that it would be desirable, if possible, to wait till menstruation had ceased and also for the advent of a quiescent condition of these local troubles. I communicated with Mr. T. Crisp English, and it was decided to adopt the above course and the patient was very carefully watched. She practically slightly improved and remained much in this condition from June 14th to the 21st. The pain had gone, but the rather marked tenderness remained, and the temperature varied from day to day between 97·8 and 99·2, with a pulse between 84 and 96. On the 22nd, menstruation having stopped after a duration of nine days,

Mr. Crisp English met me in consultation and examined her thoroughly. He concluded that a cœliotomy should be done and that whatever was found likely to be the cause of the mischief should be removed. It was also decided to wait a few days more before operating, the chief reason being the hope of the inflammatory condition becoming still more quiescent. On June 28th Mr. Crisp English operated.

Note on the Operation.—"The patient was placed in the Trendelenburg position, and an incision 3 inches in length was made through the lower part of the right rectus muscle. The appendix was first examined, and was found to be thickened and adherent; two stercoliths were felt in its distal half. The wound was then enlarged, and a hand was passed into the pelvis. The right tube was distended and greatly thickened; with the ovary it formed a large inflammatory mass firmly adherent to the rectum and posterior wall of the pelvis. The left tube and ovary and the uterus were normal. The right tube and ovary were then removed. The uterine end of the tube was first divided between two ligatures, and during the process of removal an encysted abscess lying between the ovary and the rectum was opened. The walls of this abscess were carefully dissected away. The appendix was subsequently amputated, its proximal end being crushed with the crushing clamp, and the stump being invaginated with a Mayo's appendix tucker, and buried with a purse-string suture of fine silk. A split drainage-tube containing a strand of gauze was then inserted into Douglas's pouch, and the wound was closed with through-and-through sutures of silk-worm gut."

The condition of the patient on the afternoon of the operation was one of rather marked collapse, and there was a good deal of vomiting which lasted four days, but which may have been to an extent of nervous origin, as the patient had very strongly anticipated it. With this exception, however, she made a rapid and uncomplicated recovery, and after the fourth day slept and took her food well. The drainage-tube was removed on the twelfth day, and the only trouble which was at any time in evidence was some constipation, which was, nevertheless, overcome by a daily enema and some senna tea at bedtime.

Remarks.—The history of the case and the pathological condition of the organs affected seemed to point to the appendix being the original source of infection, especially in view of the obvious evidence of recent inflammation in the appendix, and the fact that the left ovary and tube were normal. The organisms may have travelled directly along the appendiculo-ovarian ligament (Clado), which is described in Dr. Macnaughton Jones's address, or by some other more or less direct route. Dr. Macnaughton Jones states at the end of his address how necessary he considers it in an operation of this nature that due regard be paid to its severity and necessary prolongation. In the above case, however, the patient did extremely well, and in 24 days after the operation was sitting up in her room in excellent health and spirits.

Belgrave-road, S.W.

MENINGITIS FOLLOWING MEASLES.

BY C. A. BASKER, M.B., B.S. LOND.,
HOUSE PHYSICIAN TO ADDENBROOKE'S HOSPITAL, CAMBRIDGE.

DURING the first half of this year, when an epidemic of an unusually severe form of measles was prevalent, six children suffering from meningitis were admitted into Addenbrooke's Hospital. In one of the patients the disease was primary pneumococcic. The other five had symptoms of post-basic meningitis. In three of these the cerebral symptoms followed measles, one a week, one six weeks, and one eight weeks after the rash had been seen. In all five the onset of the disease was sudden; most of the patients vomited and rapidly lost consciousness, and retraction of the head and Kernig's sign were well marked. The temperature was usually not above 101° F., and the pulse and respirations were irregular. In three cases improvement followed and seemed to be due to lumbar puncture. One patient recovered completely, and though meningitis was diagnosed it was not proved, as an examination of the cerebro-spinal fluid was sterile and showed no excess of cells. The other four patients died and their brains were examined, and all showed a meningitis alike in appearance. There was a greenish-yellow exudation of lymph into the pia arachnoid membrane at the base of the brain with more fluid than usual in the ventricles. In the cerebro-spinal fluid of one patient (who had not had measles recently) the meningococcus of Weichselbaum was found, and in another diplococci were seen in the exuded lymph at the base of the brain.

On account of the similarity of the clinical course of the disease and of the appearance of the brains after death it is not improbable that the meningococcus was responsible for the meningitis in all the cases. Whether the measles disposed to, or whether it was accidentally followed by, the meningitis is uncertain, but in either case the occurrence of nervous symptoms after measles is interesting on account of its rarity. The following is an account of the cases:—

CASE 1.—Boy, aged 6 years, under Dr. L. Humphry. Admitted on February 27th, 1911; discharged on April 15th.

History.—Eighteen days ago patient was taken ill and was sick. He had a slight rash that was diagnosed as measles. Twelve days ago he seemed sleepy and has been getting worse since. Once or twice he has been unconscious.

Feb. 28th: Lumbar puncture: two drops of fluid came away that were sterile and contained no cells.

Examination.—March 1st: Temperature 100° F., pulse 130, respirations 34. The patient looks healthy. He is irritable. He recognises no one, and when spoken to cries out. The pupils are dilated. Slight retraction of the head is present. Tache cérébrale is feebly marked. There are râles at both bases and also in the right axilla. Kernig's sign is present. The spleen is not palpable. No optic neuritis.

March 2nd: Patient much better. He speaks now and then but not distinctly. When he attempts to catch hold of anything with his right hand he puts it to the left of the object. 3rd: Kernig's sign is still present; patient can talk. The patient is still irritable. (The patient recovered completely. He came to the hospital three weeks after discharge and seemed quite normal as regards intelligence.)

March 7th: A swab from the throat showed the presence of pneumococcus, M catarrhalis, and M. tetragenus.

A brother of the above patient, aged 1 year and 2 months, was admitted on March 1st, 1911, suffering from pneumococcal lobular pneumonia. He had had measles 10–14 days before this.

CASE 2.—A boy, aged 4 years, under Dr. Humphry. Admitted on May 6th, 1911; died on May 28th.

History.—In October, 1910, the patient had scarlet fever. At the end of February, 1911, patient had measles. About three weeks ago he started to lose his appetite. For six days he has been unable to keep any food down. For four days the patient has had headaches and has slept very little and he has screamed. The bowels are constipated. There has been no aural discharge.

Examination.—Temperature 101·2° F., pulse 128, respirations 32. Patient is flushed and drowsy, and now and then he shrieks out. He has a slight cough. The pupils are equal and react to light, no ocular paralysis, no nystagmus. Photophobia is present. Epigastric and abdominal reflexes are present. No optic neuritis. Right knee-jerk is absent and left knee-jerk very slight. Plantar reflex is flexor. No retraction of the head. Kernig's sign present. No aural discharge and tympanic membranes normal. There are a few small glands to be felt in the neck. The liver and spleen are not palpable.

May 7th: The patient slept well last night, but cried out about every ten minutes. 11th: Patient still drowsy. 12th: Patient seems a little better, his right arm is flaccid but not paralysed, and the right corneal reflex is absent. In the evening he had a fit lasting a few minutes. In it he had rapid movements of flexion and extension of the right forearm. Now and then there were a few similar movements of the forearm. 13th: Lumbar puncture; three test-tubefuls of clear fluid under pressure came away. Child more comatose, squint present. Now and then the right pupil is larger than the left. Kernig's sign more marked. Tache cérébrale present. 16th: Lumbar puncture; many cells seen—polymorphonuclear 42 per cent., lymphocytes 58 per cent. No organisms seen, none grown in cultures. 17th: Patient had a fit. 20th: Slight optic neuritis, more marked in the right eye than the left. 27th: Patient worse, much retraction of head. Kernig's sign present in left leg, not in the right. Pupils rather dilated, eyeballs wander together in all directions. Face gets flushed very easily. Child is very wasted. 28th: Death. Temperature before death rose to 106·4°.

Necropsy.—Brain: Convolutions flattened. Pia arachnoid at base of brain thickened and greenish yellow; this condition extends into the Sylvian fissure and superior surface of cerebellum. Ventricles are distended with fluid. Brain substance normal. No sign of tuberculous disease in the body. No growth in cultures from material removed from base of brain.

CASE 3.—Girl, aged 10 years, under Professor J. B. Bradbury. Admitted on May 23rd, 1911; died on June 1st.

History.—Measles six weeks ago. The child recovered except for a headache. May 15th: Patient had pain in the left ear. Last night she had a fit and the fit has not left her and she has been unconscious since the fit started. In the fit the hands were drawn up and the legs extended. For the past few days the child has been sleepy. The bowels have been constipated but diarrhœa set in this morning.

Examination.—Temperature 101·2° F., pulse 136, respirations 24. Child lies unconscious in bed, curled up, and she is flushed. The respiration is irregular. Nasal feeds have to be used. Eyes: Pupils dilated, reacting but little to light, lateral nystagmus and drooping movements of eyelids present. No squint, no optic neuritis. Membrana tympani normal. Jerks of upper extremity, abdomen and knee absent. Plantar reflex is flexor. No retraction of neck. Kernig's sign present. Tache cérébrale is present. Respiratory and circulatory system normal. The liver and spleen are not palpable.

May 23rd: Lumbar puncture—three test-tubefuls of clear fluid removed, a few lymphocytes present, no organisms seen microscopically. No growth on culture. 24th: Nystagmus disappeared. 25th: Child is conscious, she cries out frequently. She says she has no headache. She can feed by the mouth. 26th: Child is conscious and very irritable. Pupils are dilated, and do not react to light, and now and then squint is present. Knee-jerks can just be obtained. Kernig's sign is well marked. 28th: Lumbar puncture — no fluid removed. 30th: Child unconscious again. Some paresis of right arm and leg. Head is

not retracted and Kernig's sign is not so marked. A little twitching in left arm and leg is present. Plantar reflex is extensor on the right side. For two to three days the patient has been drowsy. 31st: Athetosis of left hand started. The arm is abducted and the forearm flexed and the athetotic movements take place on the left side of the head. June 1st: Patient became very cyanosed at 1 P.M. and died at 3 P.M. Just before death lumbar puncture—two test-tubefuls of fluid removed. Very few lymphocytes—much albumin.

Necropsy.—Basal meningitis, exudation of yellowish lymph at base not spreading into Sylvian fissure but spreading a little over upper surface of cerebellum. Brain œdematous, ventricles contained much fluid. Direct examination of lymph showed a diplococcus, but there was no growth in broth. Collapse of lower portion of right lung. The right bronchus was filled with a thick white material. No sign of tuberculous disease anywhere in the body.

CASE 4.—Girl, aged 10 years, under Dr. Humphry. Admitted on June 3rd, 1911; died on the 11th.

History.—No history of consumption in the family. Patient had measles 11 months ago and left pleuritic effusion eight months ago. The present illness started with sickness ten days ago and the child became constipated. There has been some headache. She has been drowsy five to six days. Of late she has wasted. There has been no rash.

Examination.—Temperature 99° F., respirations 20, pulse 80. The child is unconscious and lies curled up on her side, but she can take her feeds. The pupils are equal and dilated and react to light. The right eye is turned outwards. Tache cérébrale is present. There is no facial paralysis and no retraction of the head. Kernig's sign is well marked. Knee-jerks are absent and plantar reflex is flexor. There is the scar of an old perforation in the left tympanic membrane. There is an impaired note over the back of the left side of the chest. The heart is normal. The abdomen is retracted; the liver and spleen are not palpable. Lumbar puncture—fluid under pressure, two test-tubefuls removed; fluid clear, contained a little albumin, slight reduction of Fehling on prolonged boiling. Meningococcus cultivated from the fluid. Centrifugalisation—very few lymphocytes; no tubercle bacilli.

June 4th: Patient unconscious, divergent squint present at times; now and then there are nystagmoid movements. Slight retraction of head; abdomen not retracted. The margins of the optic discs are blurred. 6th: Child a little conscious; she speaks sometimes. The right pupil is larger than the left. 8th: Child is not so well. The pupils are widely dilated and do not react to light. Kernig's sign just present. Patient has a flushed face. Lumbar puncture—half test-tubeful removed. Many lymphocytes and a few polymorphonuclear cells present in the fluid; diplococci seen in fluid. 9th: Lumbar puncture—two drops of fluid removed. 10th: Child deeply comatose. Pulse and respiration irregular. Retraction of head and Kernig's sign absent. 11th: Death.

Necropsy.—Brain: The pia arachnoid in the interpeduncular space is greenish yellow and gelatinous and thickened. This condition passes into the Sylvian fissures over the cerebellum and medulla. There is an increase of fluid in the ventricles. No sign of miliary tubercles. Lungs adherent to the chest wall. Two bronchial glands contained small caseo-calcareous areas. Adhesions between upper surface of liver and diaphragm; on the latter were numerous white nodules.

CASE 5.—Boy, aged 11 years, under Dr. Humphry. Admitted on Feb. 11th, 1911; death on the 12th.

History.—Thirteen days ago patient fainted in chapel. He came home and was sick. The sickness continued for three days and he had great headache for a day or two. Soon after this he became delirious and lately has been noisy. He has had no retraction of the head. A cough has been present for a few days. During the past fortnight the bowels have been opened twice with enemata. Three round worms have come away.

Examination.—The patient has a flushed face, he lies in bed unconscious with his head a little retracted and knees drawn up. He is intolerant of light and is generally irritable. There is a scattered macular rash behind the ears and over the chest and back and down the back of the thighs. The hands are a little cyanosed. The eyeballs wander independently of one another, the pupils are rather dilated. The tongue is protruded to the right; it is very furred. Knee-jerks are absent. Plantar reflex is extensor on the right side. Kernig's sign is present. There is no aural discharge and no joints are painful. Non-consonating râles are present all over the lungs. The liver and spleen are not palpable. A lumbar puncture was performed. There were no organisms in the fluid and no growth took place on cultures.

Feb. 12th: Patient died.

Necropsy.—An exudation of greenish-yellow lymph beneath the arachnoid in the interpeduncular space passing forward over the olfactory lobes, laterally into the Sylvian fissures, and posteriorly on the superior surface of the cerebellum. Increase of fluid over the vertex. The brain was examined microscopically by Dr. L. Cobbett, who said the disease was not due to tubercle. There was a large caseous gland at the bifurcation of the trachea and a few small nodules in the lungs which on examination were found to be tuberculous.

I wish to thank Professor Bradbury and Dr. Humphry, under whom the patients were in this hospital, for permitting me to publish these notes.

Cambridge.

A CONVENIENT METHOD TO TEST THE VISUAL FIELDS FOR COLOUR WITHOUT THE USE OF A PERIMETER

FOR APPLICATION IN CASES SUSPECTED OF INCREASED INTRACRANIAL TENSION.

BY TOM A. WILLIAMS, M B., C.M. EDIN.,
MEMBRE CORRESPONDANT DE LA SOCIÉTÉ DE NEUROLOGIE DE PARIS, ETC.

IT was formerly supposed that inversion of the visual fields for blue and red was pathognomonic of hysteria, especially when a contraction of the field for form was present in addition. Not everyone is yet acquainted with the work of Babinski,[1] which has clearly shown that the perimetric examinations of hysterical patients as ordinarily conducted are redolent of suggestions, and that these very often influence the patient, so that the findings are not reliable except as indices of suggestibility. Thus, there is no characteristic visual-field type in hysteria.

But there are certain affections in which the visual field is characteristically inverted or interlaced. This happens whenever the intracranial tension is increased to the point where there is an interference with the functions of the neurons which conduct visual impressions. This manifests itself most particularly, clinically speaking, towards the periphery of the retina, where the sensibility is feeblest; so that, as Bordley and Cushing[2] have shown, the red is perceived even sooner than the blue on approaching the centre of the visual field of cases where the intracranial tension is increased by œdema of the brain, whether this is produced by a tumour within the cranium, by hæmorrhage therein, or by some constitutional condition resulting from chronic nephritis, diabetes, or other modification of the blood.

To measure this inversion or interlacement of the colour fields accurately a perimeter is, of course, required, but I have found that the inversion may be ascertained roughly by the following method: The patient sits with his back to a good light looking fixedly at a point in the distance. He is directed to signal as soon as he perceives any movement. The visual field is then approached by the observer's hand, which holds alongside and parallel two objects coloured of an intense pure bright red and blue respectively. After the patient signals, he is asked to signal again as soon as he perceives any colour, while the centre of the field is very slowly approached. The observer then stops the movement and asks what colour is seen. To corroborate, the movement is then continued until the other colour is also seen. In normal persons blue is always seen before red. If this is not the case increased tension may be suspected. In two recent cases, one of tumour and one of albuminuric retinitis, this method has been as positive as that with the perimeter.

If the techique is carefully performed, the test is quite a reliable one and is a useful addition to clinical methods. Indeed, Cushing believes that when inversion of visual fields appears in the case of a tumour operation should not be further delayed.

Clinical Notes:

MEDICAL, SURGICAL, OBSTETRICAL, AND THERAPEUTICAL.

THE CURIOUS HISTORY OF A SWALLOWED PIN.

BY WILFRED BALGARNIE, M.B. LOND., F.R.C.S. ENG.,
SURGEON TO THE COTTAGE HOSPITAL, FLEET.

THE following case, where a pin was swallowed, probably some years previously, perforated the stomach, and became embedded in the peritoneum, seems of sufficient interest to be worth recording.

The patient, a woman, aged 35 years, consulted me in January of this year, complaining of symptoms of acute indigestion. She stated that she had had slight trouble since her "teens," but during the last five years her life had been more or less a misery to her. She had been treated in a hospital for gastric ulcer, and though she improved somewhat whilst lying in bed, her symptoms speedily recurred when she resumed work. The pain at times was so acute as to cause her, so she expressed it, to writhe on the floor, and she had frequent attacks of vomiting on taking food. When first seen she was struggling on with her work, though only able to swallow small quantities of milk, anything else causing much pain and vomiting. I offered to take her into the hospital, but she demurred at this, as her previous hospital experience, where the treatment consisted of rest and diet, did not encourage her to

[1] Ma Conception de l'Hystérié, Paris, 1906. See also various articles of the writer: New York Medical Journal, January, 1909; International Clinics, August, 1908; American Journal of Medical Sciences, August 1910, &c.

[2] Observations on Choked Disc, Journal of the American Medical Association, Jan. 30th, 1909.

submit to another similar course. She was very anxious to know if any operation could be performed, and she only consented to enter the hospital provided she was operated on.

On examination the patient was found to be fairly well nourished but somewhat emaciated about the face. There was nothing abnormal in the outline of the stomach, but towards the upper border, a little to the right of the middle line, there was marked hyperæsthesia, the patient shrinking at the slightest pressure, so much so as almost to suggest a neurotic condition. I asked my colleague, Mr. F. Bowreman Jessett, to see her with me, and he agreed as to the justifiability of an exploration, and subsequent gastro-enterostomy if necessary, and kindly offered his assistance at the operation, which was performed on Feb. 7th.

The abdomen was opened through the right rectus. The stomach was found to be healthy except for a small scar of about the size of a sixpence at the great curvature, 4½ inches from the pylorus. While examining the upper border I felt a hard substance in the gastro-hepatic omentum, then a sudden slight prick on my finger, and next moment a large black pin came into view, firmly embedded and completely hidden in a fold of the gastro-hepatic omentum. It lay vertical, with its point downwards towards the stomach. It was as brittle as spun glass and broke into four pieces during removal. It was rough and corroded, most of its substance having been presumably eaten away by the acid of the gastric juice. Nothing further was done, and the patient made an uninterrupted recovery, and in a few days was on ordinary diet (fish and chicken chiefly).

On making further inquiries, the patient stated that she was never conscious of having swallowed a pin, that she made a practise of never holding one in her mouth, and that this one must have been swallowed in her food. When the accident occurred it is impossible to say, but as she herself declared her symptoms had been much worse during the last five years, it is reasonable to assume that the unfortunate occurrence happened about that time.

The pin had evidently perforated at the greater curvature where the small scar was found, but why it took an upward course over the stomach instead of downwards is one of those mysteries which will always be associated with swallowed foreign bodies. The sensitive area previously mentioned during examination exactly corresponded with the site of the pin. It seems natural to suppose that when food entered and dilated the stomach and peristalsis commenced the organ would tend naturally to scratch itself against the point of the pin; pain and vomiting were most reasonable methods of protest by this long-suffering organ.

As this was not a set operation to "find the missing pin," I could not help congratulating myself that a chance prick on the finger led to the discovery of this cause of offence.

Winchfield.

THE OCCURRENCE OF ECLAMPSIA IN TWO SUCCESSIVE PREGNANCIES.

BY J. HOBART NIXON, M.D., B.S. LOND.

ECLAMPSIA is stated to occur about once in every 500 cases in general practice, though the statistics of lying-in hospitals show a frequency between 0·34 per cent. (Reinburg, Paris, 1905), and 1·17 per cent. (Newell, Boston, 1900). The occurrence of this condition twice in the same woman is illustrated by the following case.

The patient, aged 23 years, a primipara, commenced her labour at 6 P.M. After four hours of ordinary pains she became convulsed and had three fits before the arrival of the medical man. The uterine pains were found to be strong and rapid and the cervix well dilated. The patient was anæsthetised with chloroform and delivered with forceps. One fit occurred two hours after recovering from the anæsthetic. The urine at this time was practically solid with albumin after boiling. The amount of albumin gradually diminished daily and disappeared at the end of the third week of the puerperium, which lasted four weeks. There were occasional rises of temperature the result of infection, the maximum temperature being 103° F. The child was fed at the breast and is quite healthy at the present time.

After an interval of three years the patient became pregnant a second time. During the thirty-sixth week of gestation she wrote to say that she was told she became unconscious whilst partaking of tea with friends on the previous day, but could remember nothing about it, and she had completely lost any recollection of any events that occurred during that afternoon. On examining the patient she had slight œdema of the ankles, the skin was not dry, and the thyroid gland was slightly enlarged. There was no disturbance of vision, and the fundi were found to be normal. The patient did not complain of headache on this occasion. Her urine contained only a trace of albumin, and she passed two pints in the next 24 hours. The patient's condition was so good that I decided not to induce premature labour, but advised rest in bed with strict milk diet and a simple diuretic of potassii nitras, potassii acetas, and decoctum scoparii every four hours, with a purgative pill of calomel and cascara every night. Her urine at the end of a week showed no trace of albumin, and she was feeling so well that she got up.

Three weeks later her second labour commenced at 10 P.M. with feeble pains and headache, which later became intense. She became unconscious about 9 A.M. next morning for about half an hour. On arrival I found a right occipito-posterior presentation, with the head well engaged and the cervix dilated. The pulse was full and bounding, the temperature 102°, and the patient, who had recovered consciousness, complained of severe headache and numbness in the legs. She volunteered the statement that "she knew she was going to have another fit because of pain in the stomach." After administration of chloroform the forceps were applied and the presentation was converted into an occipito-anterior by turning. After removal and re-application of forceps the head was delivered and the child born. The patient was kept under chloroform until about two pints of blood had been lost after the expulsion of the placenta, and on recovering consciousness she expressed her joy "at getting rid of that awful headache." Her puerperium was normal and there was no trace of albuminuria in the daily specimens of her urine.

The following features about the case are interesting. 1. The small quantity or absence of albumin in the urine gives support to the view, advocated by Whitridge Williams and others, that the total output of nitrogen should be estimated by Keldjahl's method, and the ratio between the urea and ammonia equivalent decided when diagnosis is uncertain. 2. The non-recollection of a convulsion or the incidents which had taken place some hours before—a not infrequent observation but one of important medico-legal value. 3. The aura of epigastric pain which might suggest epilepsy, but is a common and valuable symptom in eclampsia. 4. The good results which follow the free extraction of blood by not hastening the third stage. 5. The increased susceptibility to rises of temperature during the puerperium, indicating a diminished resistance to infection in subjects of eclampsia.

Chipping Norton, Oxon.

A CASE OF FRACTURE OF THE FIFTH LUMBAR VERTEBRA.

BY OWEN A. R. BERKELEY-HILL, M.A., M.B., CH.B. OXON., CAPTAIN, INDIAN MEDICAL SERVICE.

THE patient, a man, aged 23 years, unmarried, was brought into the hospital of the Cavalry School at Saugor, Central Provinces, on the evening of Dec. 8th, 1910, having fallen while riding and been rolled upon by his horse. On admission he complained of complete loss of power of the left lower limb and pain in the abdomen. The patient was quite unable to move the left leg or to bend forward. The slightest movement of the lower part of the body caused extreme pain.

On examination the patient was found to be suffering from a good deal of shock. No fracture of the pelvis or femur could be made out. The abdomen was very tender. There was also much tenderness over the sacrum. Sensation of the skin over the affected regions was normal. The knee-jerks were normal. On the following day the abdomen was swollen and very tympanitic. There was great tenderness over the abdomen, especially over the symphysis pubis. There was an inability to pass urine and the bladder was distended. Sixteen ounces of urine were drawn off by a catheter. The bowels were constipated, so an enema (soap and water) was given. Hot fomentations were applied to the abdomen, and the leg and thigh were gently massaged.

On the 11th much swelling with ecchymosis appeared over the upper part of the inner side of the left thigh. The patient was still unable to move the thigh. The bladder and rectum had recovered their tone.

On the following day—i.e., four days after the accident—a swelling appeared at the base of the spine between the crest of the os innominatum and the border of the sacrum on the left side of the body. The swelling fluctuated freely. It was about as big as a walnut. There was slight ecchymosis but no tenderness and no signs of inflammation. The patient was able to move his left limb and to bend forward in bed, but this with difficulty. The same treatment was adopted—fomentations and massage. On Dec. 15th the patient had so far recovered that he could get out of bed and walk about with a stick. The swelling over the adductor muscles was smaller, but the ecchymosis was increased. The swelling on the back covered an area as large as the palm of a man's hand. It obviously contained fluid, but there were no signs of inflammation. The patient's temperature was normal. On the 19th the patient could walk without any pain, but bending forward caused slight pain.

On the next day I saw the case in consultation with Colonel W. D. Sutherland, I.M.S., and we decided to insert a needle into the swelling over the sacrum. An exploratory needle was inserted and 5 c.c. of blood-stained serous fluid were drawn off. The fluid contained no pus cells. The patient's back in the affected region was then covered with adhesive plaster in strips which were carried round the body to meet over the symphysis pubis so that he wore a complete belt of strapping. The patient could then walk and move his legs without any pain or discomfort. An X ray photograph, kindly taken by Lieutenant W. L. Watson, I.M.S., electrical specialist for the Mhow Division, showed a distinct crack between the transverse process and the body of the fifth lumbar vertebra on the left side.

On Jan. 6th, 1911, the patient's back and "riding muscle" of the left leg were again strapped and gentle riding on horseback was begun. On Jan. 9th he was discharged as fit for duty, and except for some weakness of the adductor muscles of the left thigh he is perfectly well. The swelling over the sacrum has completely gone.

Saugar, India.

Reviews and Notices of Books.

Case Histories in Pediatrics. By JOHN LOVELL MORSE, A.M., M.D., Assistant Professor of Pediatrics, Harvard Medical School. Boston: W. M. Leonard. 1911. Pp. 314. Price $3.00.

THIS book represents a new departure in the methods of teaching diagnosis and prognosis. Its virtues are as conspicuous as its faults are transparent. Within the compass of some 300 pages 100 cases are arranged according to the following classification: diseases (1) of the new-born; (2) of the gastro-enteric tract; (3) of nutrition; (4) of specific infectious character; (5) of nose, throat, ears, and larynx; (6) of bronchi, lungs, and pleuræ; (7) of heart and pericardium; (8) of liver; (9) of kidneys and bladder; (10) of blood; (11) of nervous system; and (12) unclassified. The clinical history of each case is given in considerable detail. The evidence on which a diagnosis can be based is then marshalled in logical order; and, finally, a few words on prognosis are pronounced with *ex-cathedrâ* authoritativeness. In the great majority of cases, however, there is no reliable evidence that the diagnosis made is correct, or that the prognosis was borne out by subsequent events. The great merits of the book are that it teaches the beginner—and, for the matter of that, it might teach many a grey-haired practitioner—how to sift his evidence, how to distinguish between facts and speculations, how to give weight to important signs and symptoms, how to discount minor discrepancies in observed facts, and, finally, how to give the favour of the doubt to that which is common and usual rather than to that which, by reason of its rarity, is exceptional and improbable. We imagine that there are very few practitioners who school themselves in methods of this kind, and certainly many a mistake would be avoided if in each case all the available evidence for and against any particular diagnosis had been put down on paper, mentally visualised, and slowly digested. Knowledge is not knowledge unless it is available, and we contend that the greater proportion of the average medical man's clinical and scientific equipment is not available, through the lack of some such method of mental pigeon-holing as that which the author demonstrates in every page of this volume. Without further attempting to disclose the many merits of these case-histories, we will at once set ourselves to indicate certain of the blemishes which deprive this work of claims to greatness.

In the first place the literary style is abominable; it is vernacular and colloquial to a degree which outrages the English sense of propriety of expression. In the second place the design of the book is such that it fails as a work for arm-chair perusal, owing to the monotonous character of the case-taking, and it fails as a book of reference owing to inherent faults of arrangement and for the want of appropriate headings and variations in the type. Without any introductory headings or change of type we pass from Case 1 to Case 2, and so on throughout the entire series until we reach the end of the book. There is nothing to distract the attention, nothing to rest the eye. All is monotony, all is sameness, *toujours perdrix et toujours perdrix*, until for very weariness of good things we almost pray for something that is common, or even bad.

We understand that this work has met with a favourable reception in America and that a new edition is shortly to appear. We can only hope that the author will study the interests of those who are likely to apply the new edition to the purposes of reference, and make the headings of each case explanatory of what is to follow. We cannot conceive, by the way, that the book could in any directions act as a substitute for a series of clinical lectures, a possibility which, to our surprise, the author appears to entertain.

An International System of Ophthalmic Practice. Edited by WALTER L. PYLE, A.M., M.D., Philadelphia. *Therapeutics.* By Dr. A. DARIER, Paris. Translated by SYDNEY STEPHENSON, M.B. Edin., F.R.C.S. Edin., London. London: Rebman Limited. 1911. Pp. 444. Price 17*s.* 6*d.* net.

THIS volume inaugurates an "International System of Ophthalmic Practice," under the editorship of Dr. Walter L. Pyle of Philadelphia. Subsequent volumes are to include "Medical Ophthalmology," by Dr. Arnold Knapp of New York; "Ophthalmic Diagnosis," by Dr. Charles H. Beard of Chicago; "Pathology and Bacteriology of the Eye," by Messrs. E. Treacher Collins and M. S. Mayou of London; "Affections of the Orbit and Accessory Cavities," by Dr. Christian R. Holmes of Cincinnati; "The Examination and Refraction of the Eye," by the Editor; and a "Treatise on Ophthalmic Surgery." The scheme is therefore a somewhat elaborate one, and judging by the first volume of the series it is destined to occupy a prominent place in ophthalmic literature. The names of those responsible for the several volumes are well known and are guarantees of excellence of achievement.

Turning to the work before us, it is so much superior to the "Lectures on Ocular Therapeutics," previously published by Dr. Darier and reviewed in THE LANCET, that we suspect that the translator or editor, or both, have submitted the original to stringent control. Our acquaintance with Dr. Darier's writings has led us to discount some of the enthusiasm which he is in the habit of displaying for the latest drugs and methods. Here we find a sound exposition of up-to-date ocular therapeutics, in which all the encouragement to be derived from recent discoveries is fully

dwelt upon, yet with such reserve as to remove the suspicion of unjustifiable optimism. Whilst we may not always agree with the routine methods which the author advocates, we should certainly derive much help from his wide experience of new drugs and methods, and from his advice as to their employment in difficult and recalcitrant cases. In the first part of the book will be found just the information we require upon such topics as subconjunctival injections, serum-therapy, photo-therapy, electro-therapy, hydro-therapy, massage, and the more recently introduced drugs—analgesics, vaso-dilators and vaso-constrictors, mydriatics and miotics, silver compounds, and so on. In the second part the treatment of the various diseases of the eye and its adnexa is discussed in order. Perhaps our readers may have some diffidence in using argyrol lavage and protargol massage with apparently so little discrimination, but on the other hand they may be induced to give dionine a more frequent trial and to employ guaiacol more often when there is a suspicion of tuberculous disease.

We can cordially recommend the book to the ophthalmic surgeon as a very useful collection of second strings for his bow. There are some inaccuracies in the spelling of proper names and some more serious mistakes of fact, but they are minor blemishes which can easily be corrected in a new edition.

Animal Micrology: Practical Exercises in Microscopical Methods. By MICHAEL F. GUYER, Ph.D., Professor of Zoology in the University of Cincinnati. Chicago: The University of Chicago Press. 1910. Pp. 240. Price 7*s.* net.

THIS book, with a title unfamiliar to English ears, is the outcome of a ten years' experience by the author as instructor of classes in microscopical technique. It is not intended for the advanced specialist student, but hopes to be of use as a class text-book and as a guide to the independent individual worker, whether teacher or novice. The instruction is arranged as a series of practical exercises, giving full directions as to what the learner is to do with his material and reasons for his methods. A book which is intended for the unaided worker and is arranged on the above plan is met by two difficulties. It is apt to be overwhelmed by detail if it is to be of real service to an uninstructed novice, and is difficult to adapt to the needs of a specific course the aim of which is in any degree different from the one proposed in the book. It is to the credit of the author that the difficulties are to a large extent surmounted, more especially in the last respect, as the subjects selected are of such general importance that they must necessarily be dealt with in any course of histology. The work has a third aim. It is intended to serve as a reference book for teachers in the preparation of material for courses in elementary zoology, histology, or embryology, and in this aspect will prove of considerable value. The range of subjects covered is somewhat extensive. It not only deals with the usual histological methods—which occupy some 97 pages—but also treats of hæmatology, the examination of bacteria, and some embryological methods. The reconstruction of objects from sections forms the subject of a short chapter.

Nearly half the book is occupied by a series of appendices. The first of these is concerned with the microscope and its optical principles; the second contains the formulæ and uses of a considerable number of standard reagents; while the third, which will prove of much use to the individual worker and to demonstrators, gives a table of the tissues and organs required in a course of histology, the source from which they are to be obtained, and the methods of preparation to be adopted. The final appendix gives similar information for a general course in zoology.

The author's aim has been to produce a practical book, and he has taken care to include in his directions those small matters—the tricks of technique—which are so important in procuring good results. There is no doubt that to work through the course prescribed in this book would give the student a sound knowledge of the methods of histology. There is, of course, no attempt to describe the tissues or objects prepared. The book is well printed on good paper and is of attractive appearance.

LIBRARY TABLE.

Collected Papers by the Staff of St. Mary's Hospital, Mayo Clinic, Rochester, Minnesota, 1905-1909. London and Philadelphia: W. B. Saunders Company. 1911. Pp. 668. Price 24*s.* net.—This volume contains 65 papers by those connected with the famous Mayo Clinic. All the articles have appeared already in print in periodical literature and some have been read as papers before medical societies. It is clear that with so large a number of papers they can hardly be all of the same value, and it is equally clear that we can refer to only a few of the articles. The editor tells us that the chief reason for bringing them together in the present form has been the convenience of reference by those who have written them, and it was at first intended merely to print them for private distribution, but that many members of the profession asked to have the book published. When we consider the wealth of material available at the Mayo Clinic, the skill of its surgeons, and the care taken in the pathological examination of the cases, we can feel no surprise at the great advances in surgery which have been made there. Perhaps the most striking paper, if we must specially distinguish one amongst so many of great excellence, is that on the Surgery of the Large Intestine with a review of 100 resections, by Dr. W. J. Mayo. We may also mention a paper by Dr. L. B. Wilson on the Value of Sondern's Differential Leukocyte Resistance Line in the Diagnosis and Prognosis of Acute Appendicitis, and an article on Acquired Diverticula of the Large Intestine, by Dr. W. J. Mayo, Dr. L. B. Wilson, and Dr. H. Z. Giffin.

Formulaire: Consultations Médicales et Chirurgicales. By Professors G. LEMOINE, E. GÉRARD, E. DOUMER, and J. VANVERTS, of the Faculty of Medicine of Lille. Fifth edition. Paris: Vigot Frères. 1911. Pp. 1012. Price fr. 7.—This work is well known in France and the present edition has been brought thoroughly up to date. In the first part of the book the various drugs and their preparation are considered in alphabetical order, and some of the newest medicaments have been included, such as guipsine, hectine, and rhamnol. The chapters on opotherapy and serotherapy have been completely rearranged. Under each drug are given its properties, the indications for its use, and its therapeutical action, its dosage and pharmacology, also the preparations which are derived from it. The whole information is given clearly and concisely. The second part of the book is occupied with the treatment of particular maladies. The diseases are arranged alphabetically in order to facilitate reference and a uniform plan of description is adopted throughout. A definition of the disease is first given, then its etiology, then a brief account of the principal clinical signs, and finally the treatment. The therapeutical indications are carefully considered and numerous prescriptions are suggested which would be of great assistance in actual practice. Medical and surgical affections are included. 127 pages are devoted to the treatment of diseases of the skin and of venereal disorders, and the information found under this

heading will prove particularly useful to practitioners. Electro-therapy is also touched upon, and the various conditions likely to benefit by this method of treatment are duly mentioned. The remarks on diet are also worthy of attention. The last portion of the work deals with the various forms of mineral waters, and a short account is given of the principal spas in France and other countries. The authors may be congratulated on having produced a useful handbook.

Guide Pratique de l'Infirmière-Hospitalière et de l'Infirmier-Brancardier: Bandages Usuels—Premiers Soins d'Urgence—Relèvement et Transport des Blessés. Par le Dr. EDMOND MORIN. 200 figures dans le texte. Paris: Vigot Frères. 1911. Pp. 200. Price fr.2.25.—This little work, published under the auspices of the Union des Femmes de France, a department of the French Red Cross Society, is a very practical work on first-aid. The three parts into which the work is divided are indicated in the title-page. It is needless in these days to take up the argument in favour of a wide diffusion of the elementary principles and methods of first-aid. The book is very complete and it is fully and well illustrated, and should prove a serviceable manual for French-speaking persons intending to take up first-aid training seriously.

Beiträge zur Diagnostik der Inneren und Chirurgischen Pankreaserkrankungen. (Contributions towards the Diagnosis of Medical and Surgical Diseases of the Pancreas.) Von Professor Dr. ALBERT ALBU. Halle-a-S.: Carl Marhold Verlagsbuchhandlung. 1911. Pp. 108. Price M.2.80.—This is one section of a large collection of treatises on matters connected with the diseases of digestion and metabolism which is being issued under the auspices of a number of distinguished German physicians. A short account is given of the etiology and symptomatology of the pancreas, but the greater part of the book is devoted to the diagnosis. The disturbances in the digestion of proteids, fats, and carbohydrates are considered in turn, and the methods of investigation employed are described and discussed. A few pages are devoted to an account of the evidence in favour of an internal secretion of the pancreas, especially in connexion with some forms of diabetes. The latter half of the book deals with the special diagnosis of the different affections of the pancreas. The treatment follows briefly, and the book concludes with a fairly extensive bibliography of the subject. The book represents the present state of our knowledge on this somewhat difficult subject, and it will be of value especially to those who are studying the question of diagnosis of disease of the pancreas.

Tuberculosis as Regards Heredity in Causation and Elimination from Infected Herds. London: JOHN MURRAY. 1911. Pp. Price 1*s.*—This pamphlet will be read with interest not only by those connected with the breeding of live stock in this country, but also by medical men who know how important to the community all questions are which relate to the transmission of tuberculous infection. The statistical evidence with regard to the influence of heredity is examined carefully in the pamphlet, and reasons are given for maintaining that the hereditary transmission of a special predisposition to the disease is in the present conditions of breeding a factor of no serious importance. It is admitted that in a small proportion of cases the calves dropped by tuberculous cows are tuberculous at the time of their birth, but it is held to be improbable that the disease is ever handed on from the male parent to the unborn fœtus. The second part of the pamphlet describes in detail the methods by which tuberculosis may be eliminated from a tuberculous herd. The difficulties encountered in different circumstances are fully considered, and the principal causes of failure in attempts to get rid of the disease are pointed out.

JOURNALS AND MAGAZINES.

The Journal of Physiology. Edited by J. N. LANGLEY, Sc.D., F.R.S. Vol. XLII. Nos. 5 and 6. London: C. F. Clay, Cambridge University Press. July 15th, 1911. Price 8*s.* 6*d.*—In the paper on the Reversal of Reflexes, by Professor C. S. Sherrington and Mr. S. C. M. Sowton, it is made abundantly clear that the sense of the reflex which is excitable from one and the same afferent nerve may be reversed on alteration of some one definite factor in the conditions of the reaction, a typical example being chloroform. The reflex effect of stimulating afferent nerves, causing a rise of blood pressure, may be changed by a sufficient dose of chloroform from a rise of pressure into a fall. The authors have particularly examined the influence of chloroform upon reflexly exciting contraction of the knee extensor muscle of the decerebrate cat. So that just as pressor effects on blood pressure can be changed into depressor effects, so can the chloroform reversal be traced in reflexes expressed in the skeletal muscle. Miss A. E. Porter, discussing the identity of pepsin and rennet, says that Pawlow, in 1901, suggested it, while Hammarsten regarded the two ferments as independent. She has found that several commercial rennets were actively milk-curdling but antipeptic. On this and other grounds she supports Hammarsten's view that the two ferments are distinct and independent. Dr. H. M. Vernon's paper on the indophenol reaction is rather technical and cannot readily be abstracted. This reaction has been used as a test for oxidases in tissues, and occurs when tissues finely chopped are allowed to act on a mixture α-naphthol, paraphenylene-diamine, and sodium carbonate. By this means it is found that the heart muscle is the richest of all in oxidase. Dr. F. W. Edridge-Green's communication on Subjective and Other Phenomena connected with the Retina is a continuation of a previous paper and will be interesting to physiologists. Dr. E. P. Cathcart, studying the reflux from intestine to stomach, points out that Beaumont, in his classical observation on Alexis St. Martin, refers to the presence of bile in the stomach in certain circumstances—e.g., mechanical stimulation. Dr. Cathcart used dogs with a pre-pyloric fistula, and determined the effect of the introduction of solutions of glucose, tap-water, and 0·2 hydrochloric acid or sodium oleate into the stomach, on the regurgitation of bile into the stomach. When the bile does regurgitate through the pylorus it only enters the antrum pylori. This seems to favour the view that the pre-pyloric sphincter cuts off the pyloric part completely from the fundic part. It would appear probable that the stimulus which causes the regurgitation is the hyperacidity of the gastric contents of the antrum pylori. Mr. I. Feldman and Mr. L. Hill conclude that the increased production of lactic acid by the muscles is due to oxygen want, and that oxygen inhalation has a favourable influence, at any rate in part, in lessening the rise of acid concentration. Mr. H. Scott-Wilson's paper on the Estimation of Acetone in Animal Liquids deserves the attention both of physiological chemists and of clinicians. The original memoir must be referred to for details, but the author claims that his method of estimating acetone in animal fluids can be carried out on as little as 20 c.c. of normal urine, and that the whole estimation occupies only 40 minutes with an error less than 0·006 mg. of acetone. The average daily excretion of free and combined acetone in human urine is 2–4 mg., and there is a striking parallelism normally between the acetone and nitrogen excreted daily and even from hour to hour. Mr. G. C. Mathison's paper is primarily of pharmacological interest, and gives a full account of the action of potassium salts. When injected intravenously they cause a primary fall of blood pressure,

followed by a secondary rise, the fall being due to the action of the potassium on the heart, which undergoes dilatation and expels less blood, and there may be stoppage in diastole or heart-block. Intra-arterial injection of KCl causes an immediate rise of the blood pressure in the decerebate animal, the spinal animal, and the animal with the spinal cord destroyed. The rise is partly due to excitation of the vaso-motor centres and partly to a direct effect upon the vessel wall. Potassium chloride causes marked and immediate contraction of smooth muscle fibre—e.g., œsophagus and uterus of the cat. It would appear that in the cat potassium acts as an excitant to somatic and visceral nerve centres and to plain muscle. The paper of Mr. J. Crighton Bramwell and Mr. Lucas Keith on the Relation of the Refractory Period to the Propagated Disturbance in Nerve will be especially interesting to physiologists, as also will that on blood-gas apparatus by Mr. J. Barcroft and Mr. H. L. Higgins. The following are some of the titles in the Proceedings of the Physiological Society for June 3rd, 1911:—J. Argyll Campbell: The Action of Chloroform upon the Blood Vessels. R. A. Krause and W. Cramer: Sex and Metabolism. W. Cramer: On the Inactivation of Adrenaline in Vitro and in Vivo. C. R. Marshall: On the Mode of Action of Tetra-methyl-ammonium Chloride. Harold Pringle and John Tait: Anticoagulants on Frog's Blood, Part II. G. H. Clark: The Influence of Increase of Temperature upon Cardiac Inhibition. Harold Pringle: On the Presence of Secretin during Fœtal Life (Preliminary Communication). Proceedings of the Physiological Society for July 1st, 1911:—W. Burridge: Lactic Acid and Cardiac Muscle. W. Burridge: Nicotine and Curarised Muscles. George J. Burch: The Time-relations of the Negative and Positive After-effects.

The Medical Chronicle.—The July issue of this magazine deals mainly with an Epidemic of Acute Tonsillitis which presented peculiar features. Papers are contributed by Dr. J. W. Grange, Mr. W. Bruce Bell, Mr. John Rust, Mr. C. H. Tattersall, and Dr. J. R. Carver. The disease was very acute in onset, and was accompanied in some cases by an erythematous rash. It also exhibited as sequels arthritis, adenitis, and nephritis. It thus showed curious resemblances to scarlet fever. The causal agent was a streptococcus of the *conglomeratus* type. Mr. J. Arnold Jones records a case of Permanent Deafness following Mumps, and Mr. Lindley Sewell writes on Certain Dangers Associated with the Removal of Tonsils and Adenoids.

The Birmingham Medical Review. — The July number contains an abstract of the Ingleby lectures on Advances in Knowledge of Cancer by Dr. E. F. Bashford, which have already appeared in our columns (June 10th, p. 1596). Dr. D. Buchanan discusses the Public Health Problem of Tuberculosis, the article not being concluded in the present issue; and Dr. James E. H. Sawyer records the occurrence of Locomotor Ataxy in Two Sisters.

West London Medical Journal.—The Cavendish lecture by Dr. A. Neisser on the Evolution of the Modern Treatment of Syphilis takes first place in the July issue of this journal. The author recommends the combined use of mercury and salvarsan, giving the latter intravenously and the former by intramuscular injection. He also at times uses arseno-phenyl-glycin in place of arseno-benzol. Dr. Edward Reginald Morton writes on the Present Position of the X Rays and Radium in the Treatment of Malignant Disease, holding that all cells are liable to injury by these agents, but cancer cells most readily through their lack of vital resistance. Dr. Henry E. Barnes records some Acute Abdominal Cases met with in General Practice. Dr. L. C. V. Hardwicke records Two Cases of Vicarious Menstruation, and Dr. Harold S. Sington one of Sulphonal Poisoning.

THE BRITISH MEDICAL ASSOCIATION.

SEVENTY-NINTH ANNUAL MEETING IN BIRMINGHAM.

THE SECTIONS.

MEDICINE.

FRIDAY, JULY 28TH.

President, Dr. A. H. CARTER (Birmingham).

Dr. WILLIAM EWART (London) gave a demonstration of a

Method for the Clinical Use of Carbonic Acid Gas.

The apparatus consisted of a special mouthpiece with two tubes, one for the inhalation of carbonic acid gas, the other to act as an air-way or for the inhalation of any other substance. The carbonic acid gas was collected in a container from an ordinary soda-water syphon. Dr. Ewart has found that these syphons supply on an average about 2400 cubic centimetres of the gas. The container was graduated and was connected by tubing with the mouthpiece and with a contrivance for discharging the gas. Dr. Ewart gave a review of the development of our knowledge in regard to the employment of carbonic acid gas for therapeutic purposes. He had drawn attention to this matter in a paper read before the annual meeting of the Association at Portsmouth ten years ago. He pointed out that until recently physiological study had been directed to the lethal and asphyxial properties of the gas, but now physiologists had confirmed the results of clinical work upon its usefulness in smaller quantities. Experiments had demonstrated that it was safe to inhale as much as 6 per cent., but Dr. Ewart did not go beyond 4 per cent. in employing it in his wards. He described its chief therapeutic actions as follows: it stimulates expiration, acts as a cardiac stimulant, exerts an indirect effect as a sedative, and possesses the property of toning up a weak pulse. It is also useful in spasmodic conditions. Dr. Ewart also attributed the beneficial effects of the Nauheim baths to the inhalation of the carbonic acid gas given off from the water.

The PRESIDENT, Dr. J. F. HALLS DALLY (London), and Dr. T. STACEY WILSON (Birmingham) briefly discussed the communication, and Dr. EWART replied.

Dr. STACEY WILSON read a paper on

Colon Dyspepsia.

He suggested that in many cases showing symptoms of gastric indigestion the primary disturbance was a functional disorder of the colon and not of the stomach. Systematic palpation of the colon demonstrated clearly the difference between the softness and insensitiveness of the normal bowel and the hardness and tenderness of one that was abnormal. He stated that when the colon was abnormally hard it was usual to find certain definite symptoms present. These symptoms he referred to a functional disturbance of the colon, consisting in an abnormal muscular activity, which he described as "expansile tone." The basis of this was an expansion of some of the circular fibres of the muscular wall, causing hardening of the bowel with enlargement of the lumen. It was probably due to some irritant or stimulant produced in the bowel as the result of the action of micro-organisms. This expansion of the muscles of the colon was of the nature of a reflex, because the amount of the effect produced by the irritant appeared to be determined by the excitability of the nervous system, expansile tone being more readily produced when the nervous system was over-excitable than when it was more stable. The main symptoms of the condition were due to the conflict between the two opposing types of muscular activity in the bowel—namely, between contraction and expansion, resulting in tenderness of the bowel wall and in pain or other afferent impulses, which might influence the nervous system in various ways. These impulses might be felt as pain in the bowel or as pain referred to the skin area, which is in relation with the segment of the cord receiving the afferent impulses from the bowel. They might pass direct to the brain or to the vaso-motor centres controlling the brain circulation, and be felt as mental depression or some other form of brain misery, or they might pass to the vaso-motor centres controlling the heart and circulation, and then the only symptoms of colon dyspepsia might be palpitation or other

functional cardiac disturbance. The facts that these symptoms occurred at times when the colon was active, after meals, and also when the nervous system was hypersensitive, and when the colon was subject to gouty irritation—e.g., in the early morning—might be of diagnostic value. Dr. Stacey Wilson discussed the relation of colon dyspepsia to mucous colitis, and stated that it may be a pre-mucous stage of mucous colitis or an allied affection accompanying it. He discussed the use of salol and benzonaphthol in treatment.

The PRESIDENT, in discussing the condition of colon-dyspepsia, expressed his opinion that Dr. Stacey Wilson did not quite carry conviction in regard to what he described as expansile tone.

Dr. H. MALET (Wolverhampton) also expressed scepticism in regard to the possibility of a muscle fibre being able to push its ends apart. He suggested that some cases of pain might be due to arrhythmia in the peristalsis of the bowel. He confirmed the effect of colon conditions upon the mental state.

Dr. EWART referred to the condition of appendix dyspepsia.

Dr. STACEY WILSON replied.

Dr. F. W. PRICE (London) read a paper on

Recent Advances in Cardiac Therapeutics.

He pointed out that the employment of graphic methods had given rise to an enormous advance in our knowledge of cardiac disorders and had rendered the whole field of cardiac therapeutics open to accurate and scientific study. His own observations were made upon digitalis and its allies in collaboration with Professor A. R. Cushny and Dr. James Mackenzie. The method adopted was that in all except urgent cases the patient was kept at rest for some days before the drug was given. The cases were observed in great detail, and the patient's subjective symptoms were carefully recorded. Weighing and measuring were done to estimate the degree of dropsy when that was present. The size of the heart was measured by percussion, the systolic blood pressure was taken by Martin's apparatus, and the graphic records were obtained by means of the ink polygraph. In some cases electro-cardiograms were also obtained. The doses of digitalis given were one drachm of the tincture daily or two drachms if the symptoms were urgent. Its administration was continued until some definite effect was obtained. Twenty-one cases of mitral disease, 11 cases of aortic and mitral, 1 case with an aortic systolic murmur, and 3 cases of cardio-sclerosis were investigated in addition to cases of paroxysmal tachycardia, tachycardia of obscure nature, heart-block, emphysema, and pulmonary tuberculosis with pyrexia. Of the 36 cases of cardiac disease 16 were cases with auricular fibrillation, and in all of these except two there was slowing of the heart and great improvement in the patient's condition after the use of digitalis. In only two of the cases of valvular disease without auricular fibrillation were there marked slowing and improvement; in most of the remaining cases there was no action at all. In the case of paroxysmal tachycardia digitalis produced auricular fibrillation and then slowing, and a similar result was obtained in the other case of tachycardia. In regard to the question of dosage, Dr. Price had found that a longer time was required to obtain effects with small doses; he therefore advised beginning with a full dose till the full effect was obtained, and then continuing with small doses. No appreciable effect was observed upon blood pressure except in one case. In no case where digitalis failed did other drugs like squills and strophanthus succeed. Squills showed little effect, and helleborin was disappointing. No diminution of the pulse-rate was observed after the use of aconite. Dr. Price concluded that the great variation in the action of digitalis and its allies observed with different patients was not due to differences in the drug, but to differences in the patients' lesions. Cases of auricular fibrillation responded well to the drug unless pyrexia was present, or unless there were marked fibrotic changes in the heart muscle. Cases without auricular fibrillation rarely showed marked improvement. The signs of auricular fibrillation were then briefly described as follows: (1) in the great majority of cases the pulse is continuously irregular and of disorderly character; (2) in mitral stenosis with auricular fibrillation the presystolic bruit invariably disappears, though a diastolic bruit may be present; (3) the normal auricular wave is absent in tracings taken with an ink polygraph; and (4) the electrocardiogram shows no sign of the normal auricular systole.

The paper was discussed by the PRESIDENT, Dr. STACEY WILSON, and Dr. R. D. RUDOLF (Toronto), and Dr. PRICE replied.

Dr. OSCAR JENNINGS (Le Vesinet, Paris) read a paper on

The Treatment of Morphinism.

He differentiated between cases in which morphine only was taken and those in which cravings for other drugs occurred, and he objected to the use of the term "morphinomania," believing that it encouraged the patient to regard himself as devoid of will. He affirmed that cases of morphinism treated by chemicals or by restriction cures tended to relapse, and he advocated a system which he described as guidance without compulsion. The main features of this method were to encourage the patient to regain confidence, hope, and self-reliance, to employ suitable therapeutic, hygienic, and dietetic measures, and to insist that the patient should devote himself entirely to the object in view. Cases were described in support of Dr. Jennings's views. He claimed that by this method the auto-suggestive anticipation of difficulties was obviated and that the patient was not required to do anything heroic. He objected to the view that strong narcotic drugs were necessary in weaning patients from addiction to morphine. He counselled strict temperance in eating and drinking, even to the degree of abstemiousness or temporary fasting. He thought Turkish baths were a useful adjunct and that cycling was also beneficial.

Dr. H. CRICHTON MILLER (London) could not bring himself to believe that Dr. Jennings's method was applicable to really bad cases. He thought that an essential to cure was that freedom from pain during treatment should be guaranteed. It was necessary to obliterate the memory of the craving. He therefore availed himself of coma produced by the bromide sleep.

Dr. W. H. BRYCE (Colinsburgh) accepted the division into two groups suggested by Dr. Jennings. He had found sparteine, originally recommended by Dr. Jennings, to be very useful.

Dr. JENNINGS in his reply stated that some of his cases were patients taking large quantities of morphine daily.

Dr. HALLS DALLY read a paper on

The Clinical Determination of Blood Pressure by means of Pachon's Sphygmo-oscillometer.

The construction and manner of using the instrument were described, and the theory of oscillations upon which it is based was briefly reviewed. Dr. Halls Dally stated that it was extensively used on the Continent, but so far had not received much notice in this country. It was capable of giving accurate records of both systolic and diastolic blood pressures. He thought that the diastolic pressure had not obtained the attention it deserved, as it was probably more constant for the individual than the systolic pressure. The Pachon sphygmo-oscillometer gave higher readings for the pressures than the Riva-Rocci apparatus. Dr. Halls Dalby stated that the Pachon instrument worked throughout at constant pressures and with a maximum sensibility. It also reduced the personal equation to a minimum.

Dr. W. J. TYSON (Folkestone) read a paper on

Mania following Pneumonia.

He excluded from consideration the ordinary febrile delirium which might occur in this disease and also those cases referred to by Addison where the symptoms of mania were the chief early clinical features, and the physical signs of pneumonia were discovered in the course of routine examination. He referred to cases following upon pneumonia. He believed that the scanty literature of this subject, which he briefly summarised, was due to the fact that the cases generally occurred in private practice and were not recorded. The chief features of this condition were that it generally occurred in patients under the age of 40 years and of neurotic temperament. The pneumonia was usually of sthenic type, and was associated with sleeplessness. The disease need not necessarily be very acute, and the degree of the mania bore no relation to the amount of lung tissue involved. The mania occurred after the crisis. Dr. Tyson believed that it was toxic in origin, and was to be looked upon as part of the pneumonia. The prognosis was good, and asylum treatment need not be considered. It was most important to treat the

sleeplessness. The best hypnotic was good food, especially at night, but morphia might be given.

Several members briefly discussed the paper.

Dr. J. STRICKLAND GOODALL and Mr. W. N. KINGSBURY (London) communicated a paper on

Acute Interstitial Emphysema.

The causes of subcutaneous emphysema were briefly considered, and the rarity of this condition apart from some form of strain or injury was mentioned. The case observed by them was a child, aged 1 year, showing signs of rickets, who presented definite signs of pneumonia lasting about 16 days. Shortly before death swelling due to subcutaneous emphysema appeared above the manubrium and spread to the left side of the neck and face. There was at no time violent cough and no laryngeal obstruction. On post-mortem examination both lower lobes and the dorsal part of both upper lobes were congested. There was also acute dilatation of the crepitant part of the right lung. There was air in the connective tissue and in the mediastinum. There was great enlargement of the liver, which Dr. Goodall and Mr. Kingsbury believed to have impeded the action of the diaphragm. They also thought that their case supported the view of Dr. A. Keith that the diaphragm expands the lower lobes and the dorsal parts of the upper lobes. They had examined the post-mortem reports of 147 fatal cases of pneumonia, in 125 of which the liver was weighed, and in all of them it was much enlarged.

SURGERY.

FRIDAY, JULY 28TH.

President, Sir THOMAS F. CHAVASSE (Birmingham).

Dr. G. WILLIAM HILL (London) gave a demonstration of

The Use of the Gastroscope.

The instrument that he had devised consisted of a direct vision gastroscope passed under visual observation, so that there is the minimum risk of doing any harm. Inflation of the tube with air removes the mucous membrane from the advancing end of the tube. In conjunction also with Dr. George Herschell, Dr. Hill has had made a periscope for indirect vision to fit inside the outer tube. The method has been found to be of value in distinguishing gastric erosions or gastrostaxis from ulcer, and also simple from malignant ulcers. The instrument was shown in use on a patient, and many of the members present were able to examine parts of the stomach even as far as the pylorus.

Mr. D. P. DALBRECK WILKIE (Edinburgh) read a paper on

Some Functions and Surgical Uses of the Omentum.

He maintained and proved by experiment that the omentum is not a specialised organ for the absorption of fluids, but it possesses a very remarkable capacity for taking up any foreign bodies or solid particles left in the peritoneal cavity. This was shown by the injection of a quantity of particles of carbon into the peritoneal cavity of an animal, and when the animal was killed after an interval it was found that all the particles were in the omentum, while the rest of the abdominal organs were free from any carbon. This "scavenging" function is well seen in the late stages of recovery from peritonitis. Removal of the omentum appreciably lowers an animal's resistance to peritoneal infection. In acute peritonitis the bacteria tend to adhere to the omentum, which forms a very favourable battleground for the phagocytes in the fight between the host and the germs. When there is an infected area in the peritoneum the omentum moves towards it, and these movements depend on two factors; one factor is the action of the respiratory and peristaltic movements, and the other is peritoneal irritation and roughening. There is no evidence to justify the opinion that the omentum has any power of intelligent movement. If the blood-supply of the spleen be interfered with the omentum will wrap itself round the spleen and the spleen will survive, while if the omentum be excised at the same time as the blood-vessels of the spleen are tied it usually causes the death of the animal. Experiments give some ground for believing that in cases of strangulation of the bowel, where the vitality of a portion of it is endangered and a resection of the doubtful part is deemed inadvisable on account of the general condition of the patient, the omentum may with benefit be wrapped round the loop of gut. The use of omental grafts to reinforce intestinal suture-lines is not advisable, for the graft adheres not only to the area to which it has been applied, but also to adjacent coils of intestine; the reinforcing of suture-lines by a corner of the omentum which is not severed from its blood-supply is a valuable procedure in some cases. The omentum may be used and may be relied on to plug the perforations of hollow viscera when the lesions cannot be closed by the ordinary methods. The mucous lining of the viscus grows over the omental plug with surprising rapidity. Where there is the possibility of an abdominal wound having been infected during an operation it is well before closing it to spread the omentum behind the deep surface of the wound. If the wound suppurates the omentum will adhere firmly to its peritoneal surface, and will not only prevent the development of a peritonitis but will also very considerably lessen the risk of a complete rupture of the wound. The paper was illustrated by a number of very striking lantern slides.

Dr. W. I. DE C. WHEELER (Dublin) read a paper on

Two Cases of Abdominal Aneurysm Treated by Operation.

Every form of abdominal aneurysm is rare, and as medical treatment can hold out little hope of a cure all cases which have been treated by operation should be recorded. He referred to some of the earlier cases, and pointed out that sepsis was responsible for the fatal issue of many of them. This would not occur now, but it was advisable for the surgeon to supervise personally all the sterilisations. The use of electricity cannot be recommended, for it is of very little direct value, and the risk of sepsis is decidedly great, for there is a length of wire which is more or less septic and not easily sterilised. The introduction of wire into an aneurysm favours the deposition of fibrin, and the apparatus devised by Colt is the most convenient form and the least likely to lead to sepsis. It has been shown by post-mortem examination that the cœliac axis can be obliterated without any interference with the function of the organs which it supplies. Mr. Wheeler has employed Colt's method in two cases. It consists of a wire "cage," which is inserted in the aneurysm by means of a special cannula. The first patient was a man, 38 years old, who had had syphilis some years previously. The presence of a pulsating swelling in the abdomen had been noticed for eight months. The patient was placed on his back with a sand-bag under the loins. An incision was made through the abdominal wall over the aneurysm, which was easily separated from surrounding structures. The special trocar was inserted into the sac for about two inches, and when the cannula was withdrawn the blood welled out. A cartridge with 150 inches of wire was placed within the sac and a few stitches were inserted so as to close the trocar opening in the sac wall. For the first five days after the operation the pulsations of the sac were more tumultuous than before, but after that the pulsation became less. One month later an injection of "606" was given. The pain and discomfort all disappeared, but the tumour could still be felt. In this case it is at least open to doubt what part was played by the wire in the cure. In the second case there was a history of syphilis, and before the operation an injection of "606" was given. When the abdomen was opened the pancreas was seen to be adherent to the sac. A wisp of 105 inches of wire was inserted through the cannula. For a few days the pulsation was more marked but it soon subsided, and no murmur could be heard. In both cases open ether anæsthesia was employed. Five cases have been operated on in Dublin by the Colt method, including the two cases described now, and of these three died a short time after the operation. The high mortality was due to the late stage when the condition was recognised. The method was worthy of being employed and it offered the best chance at present.

Mr. HERBERT J. PATERSON (London) contributed a paper on

Appendicitis Without Physical Signs.

Most surgeons agreed that chronic disease of the appendix might exist without any physical signs; indeed, the appendix might be the seat of gross lesions although the patient had never had a definite attack of appendicitis. In some chronic cases the disease might mimic gastric disease very closely. Mr. Paterson had had 44 such cases; in some of these operation was undertaken for a supposed gastric or duodenal

ulcer, but it is generally possible to recognise the true condition. The prominent symptom is pain following the taking of food; it is generally referred to the left of the middle line, and sometimes the pain radiates downwards to the right iliac fossa. In most of the cases the history is long, the average duration being about five years. Vomiting of blood is common, and it comes probably from the gastric mucous membrane. In about half of the cases free hydrochloric acid is absent. The extent of the lesion of the appendix varies greatly. Duodenal ulcer is frequently associated with appendicitis, and in two-thirds of the cases in which he had operated for duodenal ulcer he had found appendicitis also, and he suggested that the duodenal ulcer was the result of toxic absorption from the appendix or from the large intestine. In operation for supposed gastric or duodenal ulcer the absence of or failure to discover either of these lesions should suggest the examination of the appendix, and in cases of recurring abdominal pain of obscure origin it should be borne in mind that the appendix may be the cause, although there may have been no definite clinical attacks of appendicitis. Even in acute cases there may be no rigidity, tenderness, or distension. In all cases of appendicitis the immediate operation is indicated.

Mr. G. P. NEWBOLT (Liverpool) read a paper on

Tuberculous Mesenteric Glands.

He presented three questions on the subject. First, Is a diagnosis always possible? Secondly, May tuberculous glands cause serious trouble? Thirdly, What should be done with tuberculous glands which are discovered when the surgeon is operating for some other condition? The diagnosis is by no means always possible, for the swelling caused by the enlarged glands, even if it can be felt, can easily be mistaken for some other condition. There can be no doubt that serious trouble may follow from the presence of enlarged tuberculous glands in the mesentery. They may suppurate and burst, or they may do harm in other ways. He related a case in which a volvulus had occurred as the result of the presence of suppurating tuberculous glands. The patient died 36 hours after the commencement of symptoms as the result of the shock. During the operation for appendicitis it is not at all rare to find one or more calcareous lymphatic glands in the mesentery, and the question is what should be done with them. It may be a very simple thing to remove such glands or it may be difficult. Sometimes a fistula remains as the result of removing a gland, and sometimes during the removal it is found that it is adherent to the mesenteric vessels.

Mr. JAMES BERRY (London) read a paper on

A Further Series of Cases of Cleft Palate Treated by Operation.

In 1905 he gave at the Leicester meeting of the Association a detailed account of all the cleft palates on which he had operated up to that date, and now he presented to the meeting a series of tables of all the cases on which he had operated since that time. He had never refused to operate on a case except on the ground of ill-health. In rather more than half the cases the child was over the age of three years at the time of operation. The best period for the operation was between the ages of one and three years, and even a few slight cases in which the cleft has been confined to the soft palate have been operated on during the first year of life. The operation that he always performs is that which was introduced by Langenbeck, but it has also been associated with the names of Fergusson and Smith. It is important to remember that this operation does not merely consist in suturing the edges of the cleft, but a muco-periosteal flap is raised from the bones so as to allow the edges to come together. The mortality of his cases is noteworthy, for there has been no death in either series. With this may be contrasted the mortality of the flap operation. The operative mortality of the turnover flap operation is given at 12·5 per cent., and from this the advocates of that operation deduct 10·9 per cent., which they claim is the death-rate of children of that age, and as a result they obtain a mortality of 1·6 per cent. Such a method of calculating the mortality is, of course, absurd, and the fact remains that the operation death-rate of the flap operation is over 12 per cent., but how much more the real death-rate is cannot be ascertained. Mr. Berry then presented five cases which had been operated on by him, and in one case 15 years had elapsed since the operation. The patients all read or recited and the excellent articulation was obvious.

Mr. J. T. J. MORRISON (Birmingham) proposed a vote of hanks to Mr. Berry for his paper and for the convincing demonstration.

Mr. C. W. CATHCART (Edinburgh), in seconding the vote of thanks, said that while reading the reports of the recent debate in London he had felt in doubt as to which was the better method, but Mr. Berry's paper and demonstration had been convincing.

Mr. H. GILBERT BARLING (Birmingham) said that the flap method was not new; it had been used by Lawson Tait many years ago. It should be of great interest to keep a record of a hundred children with hare-lip from birth and follow them up so that we might know what mortality there was in such cases quite apart from operation. In his own operations he had often found that he had had some little trouble in closing a small hole left at the junction of the hard and soft palates.

Mr. FRANCIS W. GOYDER (Bradford) said that hitherto he had always employed the flap operation, but as a result of the paper he would have to change. He considered that the height of the palate had much to do with the defects of articulation in children with cleft palate.

Mr. W. MORLEY WILLIS (Nottingham) said that it could not be denied that the flap operation had a very high mortality, and this mortality was still more striking when it was compared with the absence of mortality in the other operation.

Mrs. F. M. DICKINSON BERRY (London) said that from her experience with feeble-minded children she did not think that a high arched palate had anything to do with a nasal voice.

Mr. BERRY, in reply, said that he considered that mobility of the soft palate was the most important factor for clearness of voice.

Mr. W. J. GREER (Newport, Monmouth) contributed a paper on

Fibromatous Tumours of the Mesentery.

He commenced by saying that these tumours were very rare; the first case was reported in 1824. Nothing is known of their etiology, the structure is fibrous, but in some cases it is possible that some malignant elements are present. The case which he had to report occurred in a man, 54 years old, who for nine weeks had noticed that there was a swelling in the abdomen near the umbilicus; it was smooth on palpation and dull on percussion. The tumour at the operation was readily enucleated and the patient recovered. On examination the tumour was found to consist of fibrous tissue. The operation death-rate of these tumours is very high—namely, 22 per cent. The largest tumour successfully removed weighed 40 lb. These tumours grow rapidly and they are not adherent to the abdominal wall, and that fact is of some assistance in the diagnosis. The operation may be very simple, but in some cases there is no small risk of injury to the blood-vessels of the mesentery.

Dr. ALEXANDER MACLENNAN (Glasgow) read a paper on

Fracture of the Scaphoid Bone.

He said that this fracture was not at all rare, for it was comparatively common, but it was usually not diagnosed, and it was generally called "sprained wrist." The mode of production was simple; it was produced by a fall on the flexed wrist, though it might also be produced by a fall on an over-extended wrist. A transverse fracture is the usual type. The diagnosis is generally made by means of X rays, for there is no essential deformity, though sometimes a swelling may be felt over the dorsum of the wrist. Crepitus is rarely present. The treatment should be massage, and as a rule operative treatment should be reserved for cases with obvious deformity. At the operation it may be found necessary to remove one or both fragments, and sometimes to wire the fragments. Rest for three months may be required. Skiagrams were shown exhibiting the broken bone.

Mr. JOHN PATRICK (Glasgow) pointed out that it was not very rare for the scaphoid bone to be formed from two centres, and there was a risk of mistaking a divided scaphoid for a broken bone. Therefore it was always advisable to examine both hands before making a diagnosis of fracture.

ANATOMY AND PHYSIOLOGY.

FRIDAY, JULY 28TH.

President, Professor THOMAS H. BRYCE (Glasgow).

Professor E. M. WACE CARLIER (Birmingham) delivered a paper on

The Physiology of Some of the Allyl Compounds.

The investigation of which this paper was the outcome was directed to determine if the world-wide reputation of the onion and the leek as therapeutic agents was justified. The experiments were conducted with different allyl compounds, and their effects were noted on frogs. Briefly, Professor Carlier's findings were that all the allyl compounds depress the respiratory centre and kill the animal by finally abolishing its activity. All the compounds investigated produced a fall of blood pressure. The isothiocyanate, C_3H_5CNS, proved the most toxic, and its toxic action was in all probability due to the isothiocyanate moiety, since phenyl isothiocyanate is also toxic. With the sulphide $(C_3H_5)_2S$ it is probably the allyl moiety which produces the effect, as ethyl sulphide is comparatively innocuous. The popular belief in the medicinal value of the active principle of the onion received no confirmation from any of the experiments.

Professor W. H. THOMPSON (Dublin) and Dr. D. FRASER HARRIS (Birmingham) took part in the discussion which followed the reading of the paper.

Kidney with Double Ureters.

Mr. J. E. S. FRAZER (London) gave a demonstration of Specimens of Kidney with Double Ureters. Two examples were exhibited, and the various degrees of the malformation commonly met with were discussed. Only a single opening into the bladder was present in both the cases demonstrated, but Mr. Frazer pointed out that the method of development of the metanephric bud would account for complete separation, and even for cases in which two kidneys existed on one side of the body.

Some further remarks on these anomalies were contributed by the PRESIDENT.

Demonstration of Dissections of the Orbit.

Dr. S. E. WHITNALL (Oxford) exhibited and demonstrated a very beautiful series of Dissections of the Orbit. These specimens illustrated many important and novel points in the anatomy of the globe of the eye and the lacrymal apparatus. A series of normal lacrymal glands was demonstrated, and Dr. Whitnall pointed out that in no case had he met with a complete separation of the two parts of the gland. Some dissections were made of the lacrymal sac and the tendo oculi internus; these preparations had a useful practical bearing on the surgery of the lacrymal sac, and Dr. Whitnall demonstrated that the main insertion of the tendo oculi passed behind the sac, the anterior attachment being comparatively unimportant. Other specimens shown were: (*a*) Dehiscence of the median orbital wall; (*b*) the external palpebral ligament and its real attachment to the tubercle on the malar bone; (*c*) the relation of the anterior ethmoidal cells to the orbital wall and lacrymal sac; (*d*) the capsule of Tenon displayed from the front. One specimen of more than usual interest showed absence of the ophthalmic artery and its replacement by an anastomosis with the middle meningeal artery. Dr. Whitnall also demonstrated dissections of the cavernous sinus made by removing the dura mater and displaying the sinus from its inner aspect; preparations of the remains of the retractor bulbi muscle in man; specimens showing the relations of the levator palpebræ superioris, and a cast of the orbit.

Dr. Whitnall was congratulated on the beauty of his preparations, and upon the many practical points in ophthalmic surgery which they demonstrated.

Mr. A. C. T. WOODWARD (Birmingham) read a paper entitled

Observations on the Foramina of Fibulæ in Man and Apes.

He discussed the typical condition and the departures from the normal which he had found in the examination of a large series of bones. By the aid of a model he demonstrated the production of the permanent direction of the foramen in typical cases.

The PRESIDENT joined in the discussion which followed, and expressed the hope that the model would help to make clear a point which was always rather a difficult one to explain to students.

The remaining papers on the programme being entirely devoted to physiological subjects, Professor BRYCE resigned the chair in favour of Professor CARLIER, who acted as President until the termination of the meeting.

Colour-Blind Margin of the Blind Spot.

Professor J. B. HAYCRAFT (Cardiff) gave a demonstration to show the nature of the Colour-blind Margin of the Blind Spot, explaining the mechanism of the instrument he had devised for charting the limitations of this area. He pointed out that in carrying out the tests it was necessary to secure an equal luminosity for all the colours employed, and he showed the method he had used for ensuring this. All colours so arranged passed first to white or grey before they became invisible at the blind spot, and this colourless margin could be readily mapped out for different eyes. Several charts were shown and commented on.

In the discussion which followed this paper Dr. F. W. EDRIDGE-GREEN (London) referred to the great utility of the method of securing uniform luminosity of the colours to be tested.

Demonstration of Rescue Apparatus Employed in Mines.

Dr. FRASER HARRIS (Birmingham) gave an interesting demonstration of Various Forms of Rescue Apparatus Employed in Mines, and discussed the results of a series of experiments carried out on a band of volunteers at the experimental mine attached to the University of Birmingham. These experiments were carried out under very severe conditions, and the hardihood of the volunteers who submitted themselves to the investigations was very much to be admired. The mine was flooded with smoke, its temperature was raised, its humidity was increased, and in every way the surroundings were made as realistic as was possible. In this atmosphere hard physical work was done, bags of sand, representing men, were dragged about, and all the stages of an actual mine rescue were rehearsed under peculiarly severe conditions. Dr. Fraser Harris drew attention to several practical defects in the types of apparatus employed, and pointed out that the comfort of the miner and his prejudices had to be considered in any scheme for actual work in times of emergency. All these details cannot but be of the greatest utility to the practical man, for when the apparatus is required it is in times of vital urgency, and no hitch that can be eliminated by careful experimental methods under realistic conditions must be overlooked. Dr. Fraser Harris pointed out the importance of a condition of syncope, which came on in some cases without any warning, so that the man simply fell out and was liable to be left behind in the darkened mine; and he suggested that men should be carefully selected for work in times of actual emergency.

Professor THOMPSON and Professor CARLIER joined in the discussion, and Dr. Fraser Harris was congratulated on the utility of the work which he had brought before the meeting.

Professor W. H. THOMPSON (Dublin) gave a paper on

The Nutritive Effects of Beef Extract.

The experiments, which were carried out in association with Dr. W. Caldwell and Dr. J. A. Wallace, were a continuation of those brought before the Association at its last annual meeting, and extended their scope to the study of the effects of beef extract on man. Two subjects were given a known diet to which a home-made beef-extract was added; at the termination of the experiment it was found that both subjects had gained in weight (in the one case an increase of 280 grammes, and in the other 503 grammes). Commercial beef-extract gave a lower proportion of increase (216 and 108 grammes respectively).

In the discussion which followed Dr. E. P. CATHCART (Glasgow) questioned the actual method in which this increase of weight was brought about, and suggested that a stimulating effect of the extract might account for the result found.

Professor RICHARD ANDERSON (Galway) also joined in the discussion.

Dr. EDRIDGE-GREEN (London) read a paper on

Tetra-chromatic Vision.

He pointed out that persons with tetra-chromatic vision constituted a border-line class in the subjects of defects of colour vision. Special provisions should therefore be made in carrying out any test for their fitness to pass examination for colour-blindness. Many of the tests at present employed

did not act uniformly on the tetra-chromatic, for there was no certainty of their acceptance or rejection under the conditions of the examination. He pointed out their special difficulty in dealing with blues, and demonstrated how tests could be arranged which determined their exact visual defect and eliminated the large element of chance which was present in the common forms of colour-blindness tests.

Professor HAYCRAFT and Professor ANDERSON discussed the paper, and Dr. EDRIDGE-GREEN replied.

DERMATOLOGY.

FRIDAY, JULY 28TH.

President, Dr. JAMES GALLOWAY (London).

Among the cases of dermatological interest shown before the meeting were the following;—

Dr. A. DOUGLAS HEATH (Birmingham): Chronic Lichen Planus in a man 25 years of age; Sycosiform Lupus in a man of 62 years, who had had it for 20 years; Molluscum Contagiosum of the Forehead in a girl, 19 years old, of six months' duration; Bazin's Disease on the legs of a girl (von Pirquet's test had been positive); and Ichthyosis Verrucosa in a boy 9 years old.

Mr. E. GILBERT SMITH (Birmingham): Lupus Vulgaris in a man of 23, who had had it for three and a half years (he had had 1/10000th of a minim of tuberculin weekly since Christmas, and he had much improved); Lupus Erythematosus in a woman, 73 years old, who had had it for 20 years; another case of the same disease in a woman of 28 of two years' duration, growing worse; and a case also in a woman of 44 years who had been benefited by X rays.

Dr. G. H. LANCASHIRE (Manchester) read a paper on

An Unusual Case of Cutaneous Pigmentation.

The patient was a woman, aged 31 years, who had had since childhood a pigmented area on the neck. She was a brunette. About last Christmas pigmented freckles appeared round this area, and in the course of the next four months spread down the neck to the left shoulder and upper part of the left arm in the deltoid region, and also on to the front of the chest wall to just beyond the middle line. Lancinating pains came on frequently during both the day and the night, and each paroxysm of pain appeared to be succeeded by the deposit of freckles in a fresh area. The patient appeared to be in good health, with no signs of organic disease. A medicine containing bromide was prescribed, and locally menthol oil was applied. The pains soon subsided, and fresh pigment ceased to be deposited. Fairly rapid absorption of the pigment which had previously been deposited soon set in. Dr. Lancashire pointed out the resemblance in the general features of this case to herpes zoster.

Dr. H. G. ADAMSON (London) suggested that the condition was in part congenital.

Dr. J. H. SEQUEIRA (London) suggested that the pigmentation might have been due to some hot applications to the part.

Dr. ADAMSON read a paper on

A Case of Sporotrichosis.

He mentioned that the disease was very little known in this country, though it was not unlikely that it was more common than might be thought, for it was by no means improbable that many cases were undiagnosed, as it gives rise to ulcerations which have a very great resemblance to those resulting from gummata. He gave a *résumé* of the literature of the subject, and he pointed out that the lesions were not confined to the skin, but in some cases might also be found affecting the mucous membrane of the throat; it might affect the eye and deposits might occur in the testis. The organism is easily grown and can then be recognised readily, but it is rarely possible to find the organism in smears. The disease occurs in the rat and in the dog, and it is much more common in North America than in this country. For a long time the disease has been known there, and it was called pseudo-glanders, and it was recognised that it could be caught from horses. Cultures grow readily on glucose-agar or on potato. The swelling is made up mainly of mycelium, singly or in bundles, and giant cells are present. The size of the nodules is generally about that of a marble or a little larger. The nodules break down and form ulcers. The diagnosis must not be allowed to depend on examination of the pus from an ulcer, for the organism may not be discoverable, but a culture should always be made. In the treatment large doses of iodide of potassium exert a very beneficial effect.

Dr. R. CRANSTON LOW (Edinburgh) showed a wax model of a case of Sporotrichosis, and also a culture which had been made from the pus from the same case. He also exhibited several lantern slides showing the appearance of sections of the nodules. In appearance a culture of sporotrichosis is midway between ringworm and actinomycosis. The patient inoculated his finger a year ago, and in a week the condition had commenced to spread upwards, the lower lesions having a tubercular appearance, while the upper lesions had a syphilitic appearance. The diagnosis is really made from the culture, but it is important to take the culture before any iodide of potassium has been administered, for a single dose of the iodide may be sufficient to destroy the fungus.

Dr. R. STOPFORD TAYLOR (Liverpool) read a paper on

Some Practical Observations on the Treatment of Eczema.

He considered that eczema was due to the action of a local irritant, but that it was frequently associated with disease of one or other internal organ, and it was kept up by the original or another irritant. He described the form of dressing which he employed. He takes a piece of wetted lint, and then puts the ointment or paste on the smooth side of the lint and covers it with a piece of butter-cloth, which is placed next the skin, and sometimes a piece of gutta-percha tissue is placed outside all. In acute cases this dressing may need changing twice daily, but in chronic cases less frequent dressing will be quite sufficient. He laid stress on the importance of not allowing any interval to elapse between one dressing and another. The wet lint and the butter-cloth are employed because they allow drainage.

Dr. LOW expressed the opinion that many eczemas are seborrhœic in origin, and therefore he had a high opinion of the value of sulphur in the treatment of these forms of the disease.

Dr. ADAMSON did not consider that eczema was microbic in origin. In treatment the main point was to protect the part from external irritants.

The PRESIDENT showed some lantern slides illustrating some interesting cases. The first case was that of a woman who had suffered from syphilis in early life. She developed gangrene of the finger-tips of both hands; the gangrene followed a syphilitic affection of the blood-vessels. A section of the posterior tibial artery from a similar case was exhibited showing the thickened wall. The vein in a similar condition was also shown; it is often not recognised that the veins are affected equally with the arteries. The President also showed a slide of a case of Dermatitis Repens in which he had found that there was very definite disease of the wall of the blood-vessels.

Dr. J. GOODWIN TOMKINSON (Glasgow) read a paper on

Pruritus Vulvæ.

He referred especially to a case of a pregnant woman who suffered very severely from pruritus of the vulva. He maintained that the disease is not merely a neurosis, and that this is shown by the pigmentation of the skin which is present. In the case mentioned the itching was so intense as to interfere with sleep, and it was affecting her mind. The ordinary sedatives had no effect in relieving the itching. At last he applied X rays, with the result that the itching was completely cured.

DISEASES OF CHILDREN.

FRIDAY, JULY 28TH.

President, Dr. OTTO J. KAUFFMANN (Birmingham).

The proceedings in this section opened with a most interesting demonstration on

The Treatment of Scoliosis

by Mr. PAUL B. ROTH (London), who stated that there were six different kinds of curves occurring in scoliosis which might be represented graphically by certain signs. He exhibited several cases of different varieties of scoliosis and demonstrated on a patient the particular exercises employed. There were ten different exercises, the actual carrying out of which took about 20 minutes. In a paper read later Mr. Roth gave further details of a series of 1000 consecutive cases of scoliosis, from a study of which he had formed the

following conclusions: 1. Scoliosis was almost essentially a disease of females, 84 per cent. of the cases having occurred in that sex. 2. It was a disease of adolescence; 86 per cent. of cases were between 6 and 20 years old. 3. The frequent occurrence of scoliosis in members of the same family pointed to hereditary transmission. 4. The bad position assumed in writing, a delicate constitution, and too rapid growth were largely responsible for very many cases. 5. Difference in the length of the leg was not a common cause of scoliosis, having been present in only 21 of the 1000 cases. 6. Pain was a frequent symptom. 7. Flat-foot was a very frequent complication. 8. Attention to dress before any treatment was commenced was absolutely essential. 9. Treatment should never be commenced until a record of the osseous deformity had been made. 10. Treatment by posture and exercise entirely arrested the increase of bony deformity in all but 5·5 per cent. of observed cases, and in 3·3 per cent. slightly decreased it. Cure of the bony deformity could not be expected, but in 83 per cent. of cases a permanent practical cure was brought about. He did not use mechanical supports of any kind.

In the discussion which followed Mr. G. HEATON (Birmingham) asked how far bicycles could be regarded as a cause of scoliosis in young women, and whether instruments should ever be employed.

Dr. R. B. MCVITTIE (Dublin) emphasised the importance of medical supervision of school children.

Mr. ROTH replied that he regarded bicycling as useful in scoliosis, and that he had never met with a case in which instrumental supports were necessary.

Dr. F. E. BATTEN (London) read a paper on

The Epidemiology of Acute Poliomyelitis,

in which he brought forward four propositions: 1. That poliomyelitis was an infective disease, transmissible from man to monkey and from monkey to man. The virus had not yet been stained nor seen under the highest power of the microscope. It was obtained from the mucous membrane of the nose of a monkey which had suffered from the disease, and was obtained in an active condition six months after the date of infection. The virus was strikingly similar to that of rabies. 2. That poliomyelitis was an epidemic disease was proved by the numerous epidemics recorded during the last 30 years in Sweden, Norway, Germany, Austria, France, America, and Australia. In the northern hemisphere epidemics always had the greatest prevalence during July, August, and September, and children during the second and third year of life were most commonly affected. Infection through schools had occurred, but by no means frequently. 3. That the disease occurred in an epidemic form in England was shown by the report of an epidemic of 8 cases at Upminster in 1908 (F. Treves) and an epidemic of 37 cases at Bristol in 1909 (Parker). During 1910 epidemics were reported at Carlisle, where the disease had been made notifiable, and at other places. 4. Poliomyelitis being an infective disease should be treated as such, and the infected person as well as the contacts should be isolated. The period of incubation was probably less than six days; the period of isolation of the infected should not be less than three weeks. The disease was not so infective as scarlet fever or diphtheria, and the isolation of contacts should have a marked effect in diminishing its incidence. There was some experimental evidence to show that the administration of urotropin tended to prevent infection and diminish the virulence, if not to destroy the virus.

Dr. R. D. RUDOLF (Toronto) commented on the tendency of the disease to vanish with the appearance of cold weather, arguing the probability of an animal agency in carrying the disease.

Dr. L. G. PARSONS (Birmingham) described an epidemic of 32 cases observed in London in 1909, and stated that the cold weather of that summer had proved no bar to the spread of the disease.

Dr. R. H. MILLER (London) asked how far epidemics should be regarded as water-borne.

Dr. BATTEN replied to the various speakers.

Professor STOELTZNER (Halle) read a short paper on

Oxypathy and Uric Acid,

in which he stated that oxypathy was as common in children as gout was rare.

Mr. H. TYRRELL GRAY (London) read a paper on

Indications for the Employment of Spinal Anæsthesia in Abdominal Surgery.

He considered that the value of spinal anæsthesia lay largely in the fact that its employment was an adaptation of the principle of "nerve blocking" over a large area. Experience had shown that with proper selection and in competent hands spinal anæsthesia was as safe as general anæsthesia. The question at issue was, not the relative merits of the two methods as anæsthetics, but rather a consideration of which principle—that of nerve blocking or of the suspension of the activity of the higher centres—was the best suited to any particular case. A few general principles were considered. (*a*) Age. In early life spinal anæsthesia was of the greatest assistance to the surgeon. It might be accepted that the younger the child the more suitable was the case for spinal anæsthesia. (*b*) The physique of the child was an important factor in deciding between the methods. (*c*) State of health of the patient. The following conditions peculiar to the abdomen were dwelt on. With spinal anæsthesia muscular relaxation was so complete that thorough access to the different regions of the abdomen was possible with a far smaller incision than under general anæsthesia. The intestines were found comparatively collapsed, and did not exhibit the same tendency to protrude from the wound as under general anæsthesia. Manipulation was consequently minimised, the rapidity of operation increased, and there was less tendency to resulting distension. This latter was a most important point. It was in acute abdominal lesions that spinal anæsthesia was most often indicated in young children. These lesions were roughly classified into three groups: 1. Infective lesions of the peritoneum. Here the chief indications for spinal anæsthesia were the degree of toxæmia, the age and physique of the patient, the degree of intestinal distension, and the degree of urgency for maximum speed with the minimum exposure and violence. 2. Intestinal obstruction. In most such cases, especially in intussusception, operation in children below two years of age should be done under spinal anæsthesia. 3. Injuries. If collapse from hæmorrhage was profound, spinal anæsthesia was usually contra-indicated. This did not apply to collapse from shock. The frequent necessity for extensive exploration in these cases would often render spinal anæsthesia advisable. In perforating injuries, the main indications for its use were based on the situation of the wound, the nature of the instrument, and the condition of the intestine.

Mr. S. G. BARLING (Birmingham) dwelt on certain of the risks and uncertainties of the method, which had been tried in Birmingham but given up.

Dr. R. MILNE (London) read a paper on

Measles: its Treatment and Prevention.[1]

His method consisted in destroying the germs of the disease by sterilising the pharynx, mouth, and nose with carbolic oil, and inunction of the whole body with eucalyptus oil. The method was equally applicable to scarlet fever. Dr. Milne described the success of his treatment at Dr. Barnardo's Homes.

Dr. J. BRUCE-BAYS (Peterborough) questioned the utility of preventing school children catching measles.

Dr. W. P. KENNEDY (Bath) and Dr. A. CANT (Coleshill) having spoken, Dr. MILNE, in reply, said that in over 800 cases of measles and scarlet fever treated he had had no complications and no deaths.

The business of the section concluded with a paper by Mr. F. W. GOYDER (Bradford) on

Modifications and Extensions of Owen's Operation for Hare-lip,

in which he described the various steps of this operation, which had been devised in order to supersede the vertical scar operation, which he considered to have many disadvantages. The ideal to be aimed at, in his opinion, was to have symmetrical nostrils, the lip must be even, thick, and longer at its free border than at its attachment, the scar should be inconspicuous, and the line of suture broken and not straight. The modifications he recommended were believed to result in these improvements, and were performed without any loss of tissue whatever.

[1] See THE LANCET, April 22nd, 1911, p. 1070.

ELECTROTHERAPEUTICS AND RADIOLOGY.

FRIDAY, JULY 28TH.

President, Dr. HUGH WALSHAM (London).

The proceedings were commenced by Mr. J. HALL-EDWARDS (Birmingham) who read a paper to open a discussion on

The X Ray Treatment of Ringworm.

He said that whilst ringworm of the scalp is amenable to ordinary treatment there is perhaps no disease in which so many and varying methods have been adopted with so small an amount of success, and up to the present we have no routine method at our command. During the last few years the disease has been brought into special prominence from the fact that its existence entails a monetary loss to the various school boards, inasmuch as the Government grant depends upon the regular attendance of the pupils. In some of our large cities special ringworm schools have been opened, and in a few a determined campaign against the disease has been started. Whilst the disease is far less common in this country than it is upon the continent, it is more common than is usually believed to be the case. Where a careful examination of the heads of the children is made the disease is found to exist in many unsuspected instances. It is generally agreed that epilation, in which both the diseased hairs and the spores are got rid of at the same time, is the best way of treating the disease. To bring about epilation by the older methods is both difficult and dangerous. In the X rays, however, we have at our command a method which is safe and certain. When efficiently and carefully carried out a cure can be secured in from six to eight weeks, as against 27 months, which was the average as calculated by Sabouraud. The objections which have from time to time been raised against X ray treatment are: that it necessitates special and expensive apparatus; that its proper performance requires special knowledge; that the application of the rays to the head is dangerous; and that the hair may not grow again. Although the initial outlay for the apparatus is great, it is more than compensated for by the immense saving in time which results in its use. Secondly, if treatment is to be successful special knowledge is always necessary. As to the method being dangerous, no case of permanent injury has been reported out of the hundred of thousands that have been treated. During the last two or three years our methods of measuring the dosage have been vastly improved and the special "treatment tubes" rendered more efficient. In choosing apparatus for radiotherapy it is of paramount importance that the group should be so arranged that the output of radiations shall be constant both in intensity and quality.

Dr. REGINALD MORTON (London) thought that while a few cases of partial baldness had undoubtedly happened in the more or less remote past of X ray chronology, such accidents were now of such rarity as to be negligible, and he thought that the time had come for those dermatologists who did not approve of the X ray treatment of ringworm to cease dangling these ancient errors before our eyes. So far there was no evidence to show that the method had any influence upon the development of the juvenile brain. He fully concurred in Mr. Hall-Edwards's statement that the X ray method was the best, safest, and easiest means of epilation known at present.

Dr. J. A. CODD (Wolverhampton) also agreed that the X ray method was the best and safest under existing conditions. The hair should be cut short beforehand. He doubted whether the use of antiseptics did much good.

Dr. J. DELPRATT HARRIS (Exeter) had found heads with dark curly hair the most difficult to epilate successfully, and of the different varieties of tinea the pustular form was the most difficult to cure.

Dr. G. HARRISON ORTON (London) advised care and the use of antiseptic ointment while waiting for the hairs to fall out; also to be very careful to avoid exposure to direct sunlight, which with the X ray produced severe reaction at times.

Mr. HALL-EDWARDS, in the course of his reply, spoke strongly against the practice of shaving the head. The hairs should be left long enough to be pulled out.

Dr. FRANZ NAGELSCHMIDT (Berlin) read a paper on

The Diathermic Treatment of Circulatory Disorders.

This electrical application is one by means of which several ampères of current can be made to traverse the whole body. So far as the circulatory system is concerned, its chief effect is to cause a dilatation of the capillaries and small arterioles, which is followed by a fall in blood pressure amounting to several millimetres of mercury. He quoted a number of cases in which high tension was rapidly relieved, and it was found after a series of applications that the reduction of blood pressure acquired a degree of permanence. Good results had also been obtained in angina pectoris, presumably due to the dilatation of the coronary arteries, and with a course of treatment the paroxysms became less severe and frequent.

Mr. HALL-EDWARDS thought the term "high frequency" ought to be abolished in this connexion in favour of the term "diathermy," which described it more accurately.

Dr. W. B. KNOBEL (Belbroughton) read a paper on

The Differences in the Appearance of Phthisical Chests as shown by the X Rays Before and After Open-air Treatment.

Dr. Knobel is fortunate in having his cases under observation for long periods of time and at all stages of the disease. He considered the relative dulness of an apex, for instance, and its failure to "light up" properly on inspiration to be the earliest sign of phthisis, and in many cases this could be made out before any definite physical signs were obtainable. He also brought out an important fact that in cured or arrested cases the X ray appearances were not necessarily improved, this being due to the presence of the fibrous tissue effecting the repair. At the same time there were differences that could be detected by skilled examination. The paper was illustrated with a series of lantern slides.

The PRESIDENT agreed that the dull apex which refused to brighten up properly on inspiration was the earliest and most certain sign of the advent of phthisis. This sign could be made out before any clinical signs could be elicited.

Mr. HALL-EDWARDS spoke of the value of instantaneous radiography in getting a record of the earliest infiltration, especially of the bronchial glands.

Dr. HARRISON ORTON pointed out the necessity for being in a darkened room for at least ten minutes before looking at a chest, and this was particularly necessary for those who were not engaged in this class of work.

Dr. F. HERNAMAN-JOHNSON (Bishop Auckland) read a paper on

The Treatment of Certain Diseases of the Alimentary Tract by X Rays, Combined with the Internal Administration of Metallic Silver.

He said that rays sufficiently penetrating to reach the interior of the alimentary tract are of small value therapeutically; their very quality of "hardness" allows them to pass through the tissues with a minimum of disturbance. The discovery of "secondary X radiation," announced by Sir J. J. Thompson at the British Medical Association annual meeting in London last year, has, however, made it possible to convert hard rays into soft, physiologically active radiations. Silver, for example, when excited by a hard bulb gives off rays which, judged by the amount of body tissue required to absorb them, closely resemble the *beta* rays of radium. These secondary rays are, so to speak, *specific* to a given metal; thus, the same metal always gives off the same quality of ray, no matter what the nature of the primary beam. Precipitated silver—a slate-coloured, tasteless powder—can be taken orally without danger. Suppose it is desired to treat a lesion of, say, the ascending colon. By means of a "bismuth meal" and the fluorescent screen we can ascertain how long food takes to reach the part. For the bismuth meal is now substituted a "silver meal" (℥ii argent. precip. in a pint of bread and milk). By properly timing an X ray exposure we can produce a radium-like radiation in the interior of the gut at the site of the disease. An application of 10 minutes three times a week, tube 10 inches from skin, penetration 8–9 Wehnelt current in secondary 0·4 milliampère, appears to be well tolerated; but no hard-and-fast rule can be laid down. Exposures should be made from varying angles. Good results have accrued in ulceration of the cæcum, duodenal and gastric ulcer, and tumour of the pylorus, possibly malignant. That a definite secondary radiation is produced under the above conditions can be demonstrated by photographic experiments. As regards its therapeutic activity, we cannot actually see into the bowel, but if an emulsion of precipitated silver in olive oil be injected beneath a cancerous nodule in the skin, involution

takes place much more rapidly than under ordinary X ray treatment.

Mr. MAURICE R. J. HAYES (Dublin) had employed a similar method in a case of cancer of the rectum. He placed the ointment of oxide of zinc *in situ* and then irradiated the part. The case was improving, but still under treatment. He had also employed the same method in the treatment of an obstinate rodent ulcer.

Mr. HALL-EDWARDS referred to experiments with secondary radiation from metal discs which had been published previously.

LARYNGOLOGY, OTOLOGY, AND RHINOLOGY.

FRIDAY, JULY 28TH.

President, Mr. FRANK MARSH (Birmingham).

Professor ONODI (Budapest) and Dr. ADOLPH BRONNER (Bradford) opened a discussion on

The Diagnosis and Treatment of Conditions of the Accessory Nasal Sinuses Giving Rise to Oculo-Orbital Symptoms.

Professor ONODI first described the oculo-orbital symptoms in manifest and latent accessory sinus disease. Next he dwelt upon the diagnostic value of central scotoma, enlargement of the blind spot, narrowing of the field of vision, the ophthalmoscopic appearances, and the unilateral symptoms of oculo-orbital involvement. He gave the indications for treatment in manifest accessory sinus diseases. Further treatment in latent accessory sinus disease by bleeding and relief of pressure was mentioned. He concluded with a reference to post-operative visual disturbances and blindness. Professor Onodi exhibited a series of photographs of specimens illustrating the anatomy and pathology of the subject under discussion. The collection of photographs exhibited, it was announced, had been presented by Professor Onodi to the University of Birmingham.

Dr. BRONNER said that the commonest affections of the accessory nasal sinuses giving rise to oculo-orbital symptoms were: (1) empyema, following rhinitis, often due to scarlet fever, measles, influenza, erysipelas, and typhoid fever; (2) diseases of the bone, secondary to empyema, due to syphilis or tuberculosis; (3) growths; and (4) wounds. There were often congenital defects of the bone which facilitated the spread of disease from one sinus to another, or to the brain and orbit. Transillumination and X rays were useful for diagnosis, especially the latter in cases of frontal sinus disease. X ray treatment should be tried in some cases. In cases due to syphilis energetic treatment was necessary. In tuberculous cases tuberculin might be injected. Vaccine, and, if possible, an autogenous vaccine, or serum treatment should be tried in all severe cases. In many cases several of the accessory nasal sinuses were involved, and the treatment of one sinus alone was useless. In empyema of the maxillary antrum the most trustworthy method of diagnosis was to wash out the antrum through the nares. As all, even the most trivial, nasal operations could give rise to severe local and general affections, the patient should always remain in bed and be watched for a few days. If there is a growth of the maxillary antrum, or much diseased bone, as in a case of tuberculosis, the upper jaw should be removed. These operations are most successful. In empyema of the frontal sinus the pain over the region affected may be due also to disease of the maxillary antrum. When the frontal sinus is affected, the pain is more severe and intermittent. The upper or inner wall of the orbit is often painful on pressure. If the orbit is affected an extensive operation should be performed, as in most cases the anterior ethmoidal cells are also diseased. If there is optic neuritis, or cerebral symptoms, the posterior wall of the frontal sinus should be opened up and the brain exposed. If the symptoms are not urgent it is always advisable to try intranasal treatment first. There is always a danger of disease of the diploë after the external operation on the frontal sinus. In empyema of the ethmoidal cells there is often pain on pressure on the inner wall of the orbit with crackling noise. Periostitis of the orbit is often mistaken for disease of the lacrymal sac. Operation should be performed intranasally and, if necessary, extranasally. A large incision should be made extending below the lacrymal sac. In empyema of the sphenoidal sinus often there are no symptoms. In all cases of obscure retrobulbar neuritis with slight unilateral optic neuritis and meningitis the sphenoidal sinuses should be carefully examined and explored. The posterior ethmoidal cells are also frequently involved. This is very important because of the position of the optic nerve. Central scotoma may be due to congestion of the veins of the optic nerve or to toxins. Meningitis and cavernous sinusitis are more frequent than disease of the orbit.

Dr. P. WATSON-WILLIAMS (Bristol) demonstrated a suction syringe for the diagnosis of sinusitis of the maxillary antrum. He stated that the operation which he had devised for treatment of suppuration of the frontal sinus and the adjacent cells was not more extensive than that devised by Professor Killian: it was another method of obtaining the same end. Once the operation was commenced one must continue and cannot change from one operation to the other. The early recognition of nasal accessory sinus disease was important.

Mr. H. TILLEY (London) considered that the association of nasal sinus disease with eye symptoms was overstated. In the majority of cases referred to him in hospital practice he was not able to help the ophthalmic surgeon. As regards vaccine treatment, provided an autogenous vaccine could be obtained, it was of value in a recent case with a pure infection. Vaccine treatment, in his experience, was not of value in chronic cases of mixed infection. He recommended the tincture of iodine in a saline solution for washing out the antrum. After some experience he had given up the intranasal method of treating suppuration of the maxillary antrum and had gone back to the operation through the canine fossa.

Mr. W. S. SYME (Glasgow) discussed the relationships and the part played by the sphenoidal sinus in producing the symptoms under discussion.

Dr. N. C. HARING (Manchester) was desirous of having cleared up the point whether oculo-orbital changes occurred in very slight cases. In his experience he had only seen them in cases in which the nasal disease was very gross. Should a case be due to tuberculosis a combination of human and bovine tuberculin he considered to be a more trustworthy test; of course, the result might be evidence of tuberculous disease in some part of the body other than the antrum of Highmore.

Mr. B. SEYMOUR JONES (Birmingham) spoke of latent disease of the accessory sinuses and of cases presenting ocular symptoms with no obvious nasal disease. If the eye symptoms had persisted for some four or six months ocular relief was difficult; he therefore urged an early investigation of the nose.

Dr. G. F. C. WALLIS (Shrewsbury) considered that a very large majority of the cases of sphenoidal sinus disease was associated with a contracted field of vision.

Dr. DAN MCKENZIE (London) inquired how they were to decide whether any disease of the sphenoidal sinus existed in the cases with ophthalmic symptoms, which might be referred to them, without exposing the sphenoidal sinus.

Dr. W. JOBSON HORNE (London) expressed the opinion that sphenoidal sinus disease was more often diagnosed than it existed. He fully agreed with the speaker who said that vaccine treatment was only of service in recent cases with a pure infection and in which an autogenous vaccine was obtainable. Those cases they could cure without a vaccine. He urged a careful investigation of the large posterior ethmoidal cell, the opening of which was in juxtaposition to that of the sphenoidal sinus, before arriving at a diagnosis of disease in, and before laying open, the latter cavity.

Dr. A. BROWN KELLY (Glasgow) had examined a large number of cases referred to him on account of ocular symptoms without finding a nasal condition to account for the same.

Dr. H. J. DAVIS (London) also narrated an experience similar to the previous speaker.

Dr. L. H. PEGLER (London) and Mr. H. H. B. CUNNINGHAM (Belfast) also took part in the discussion.

The PRESIDENT summed up the discussion. One question, he said, that had been raised was whether they should lay open and explore the posterior ethmoidal and sphenoidal cells in cases which presented no nasal but oculo-orbital symptoms. He considered that they ought not to go to that extent. Vaccines were no good without sufficient drainage; if there was sufficient drainage then vaccines were not required. The departures from the normal anatomy were intricate, hence their difficulties and the dangers resulting from blindly curetting the regions.

Professor ONODI replied. He urged the importance of examining the eye for scotoma and enlargement of the blind

spot. The optic nerve at times passed through the sphenoidal sinus or through the sphenoidal and the posterior ethmoidal cells. The blood-vessels of the optic nerve were associated with the blood-vessels of the sphenoidal sinus and the posterior ethmoidal cells, and therefore infection might readily spread to the optic nerve. For these reasons he considered it better to open the sphenoidal sinus, although some cases might recover without that operation.

Dr. BRONNER, in his reply, said that many cases could not be diagnosed owing to a narrowing of the nostril due to deflection of the nasal septum and other intranasal conditions; possibly that accounted for some of the negative results of the nasal examination of cases referred to them by ophthalmic surgeons.

Dr. DAN MCKENZIE read a paper entitled

Submucous Resection of the Nasal Septum.

One indication for the operation in addition to the relief of the nasal obstruction was the removal of the effects secondary to the obstruction. When sepsis followed the operation it not uncommonly occurred in the form of follicular tonsillitis. In the removal of the vomerine portion, he advised against any twisting manipulation of the part. In 130 cases he had had 16 perforations of the septum. Perforations led to adhesions far back. Perforations did not, in the majority of cases, happen at the operation itself, but subsequently. He mentioned the troublesome sequelæ to the operation.

Mr. SYME inquired about attempts to repair perforations.

Dr. JOBSON HORNE said that the operation had been in vogue for some five or six years, and the time had arrived, he considered, for a stock-taking of the results. He thought the excellence of the results had been prematurely stated in the past.

Dr. BRONNER and Mr. TILLEY did not look upon a perforation as a tragedy or a disaster.

Dr. PEGLER agreed with what had been said about perforating the septum of the nose.

Dr. A. WYLIE (London) concurred with the views expressed by Dr. Jobson Horne.

Time did not permit of further discussion.

Dr. HUGO FREY (Vienna) gave a lantern demonstration of coloured photographs of sections illustrating the Anatomy and Suppuration of the Internal Ear.

MEDICAL SOCIOLOGY.

FRIDAY, JULY 28TH.

President, Dr. GEORGE REID (Stafford).

Discussion of various methods of carrying out the medical inspection of school children occupied the section at its concluding session.

Dr. S. BARWISE (Duffield, Derby) gave some notes on

School Medical Work in Derbyshire.

He said that finding only a small percentage of the cases revealed by medical inspection obtained treatment, the attempt was made to form a provident club for the whole county. There were 90,000 children on the roll, and circulars were addressed to the parents asking them if they would be prepared to pay 1*d.* per month, or 8*d.* per year in families where there were two or three children, to insure for the examination of their children's eyes, the provision of spectacles, the provision of preventive dentistry, and the treatment of ears, and of adenoids and tonsils. The education committee was prepared to add to the sum thus obtained sufficient to pay for the cost of treatment. The replies to the circular showed that only 40 per cent. of the parents of the county were willing or able to contribute the suggested sums, and it was felt that the number was insufficient to justify any further action in the direction of a complete scheme. A portion of the county having a school population of 20,000 and enjoying better wage conditions was then tried, but the percentage of favourable replies was very little better. A club was about to be started in a limited area, round Claycross, the school children numbering 2000. Treatment would be provided by whole-time officers, as general agreement amongst private practitioners had not been obtained. Dr. Barwise said that he and his committee were satisfied that a provident basis was the proper one on which to provide treatment.

Mr. J. PRIESTLEY (Stafford), in a paper on

General Aspects of School Medical Treatment,

made the preliminary point that it would be quite utopian to hope that every school child could be examined with the microscopic care of a life assurance doctor. Supposing the school inspection staff were doubled or trebled, and each child given a life assurance examination, he doubted whether 1 per cent. more remediable cases would be found than were found now. At any rate, an absolutely complete and searching examination was out of the question in the seven or eight minutes' inspection of each child allowed to them. The illnesses discovered at medical inspection were limited to a few conditions which did not immediately disable the child. All the other illnesses to which childhood was heir escaped the view of the school medical inspector, for the reason that they incapacitated at once, and the children were to be found at home. The prevalent diseases which did come to the knowledge of the school doctor were: (1) pediculosis and skin diseases; (2) adenoid obstruction with deafness and ear discharges; (3) teeth; (4) defects, mainly optical, of the eye; (5) a few orthopædic troubles with which might be associated hernias and cleft palate; (6) stammering, &c.; (7) a few cases of educational difficulty, such as word-blindness; (8) all but the very worst grades of mental deficiency and imbecility; and (9) various grades of debility. It would be noted at once how heterogeneous these things were and how remote several of them were from the daily experience of the general practitioner; they were specialists' work. What were the conceivable methods of dealing with this array of ailments? First, the family doctor doing what he could himself and passing on the patient to various specialists for the things he could not do. On this the obvious comment was, though it would be unfair to press it too far, that the family doctor, where he came in at all, had already been at work and had not called attention to these conditions, or, at any rate, had not succeeded in securing treatment. The drawbacks to treatment through hospitals, which constituted the second alternative, were that hospitals were often too far away from the schools; it was inconvenient to have to attend separate institutions for different ailments; hospitals were intended for more serious and complex cases. After a period of hesitation, in which he inclined to the view that the ideally perfect plan would be to link up the general practitioner in the work, he had come to the conclusion that the school clinic and a special school doctor would do the work more thoroughly, intelligently, and economically. It was with a feeling of sadness that he had reached this conclusion, for he had felt resentment at the growing tide of specialism, and regretted the displacement of the family doctor, who knew his patient if he did not very completely know all his patient's diseases. But the tendency to specialism was the tendency to division of labour; they could no more stem one than the other. There was much to be said for the special school doctor. The overwhelming argument in favour of the school clinic was its simplicity of administration and the saving of time to all concerned. The question who should staff the clinic was a subordinate one. He was in favour of treatment being in other hands than those that managed inspection. There should be, however, mutual assistance and friendly coöperation. The director of a school clinic might well be a specialist in children's diseases or a general practitioner who had made a special study of school inspection questions. It must be recognised that the school clinic was only immediately practicable in towns; in the country it was, for the moment, out of the question. Mr. Priestley refrained from going into the question of whether treatment should be free of cost to the parents or not.

Dr. G. A. AUDEN (Birmingham) dealt with

Medical Certificates to Justify Absence from School.

He referred to the difficulty that a certain number of excuses for non-attendance on medical grounds were obtained by parents who had wilfully withheld salient facts. A case of substitution had even come to his notice. There were also a certain number of certificates given without due consideration of the facts of the case, and even without personal inspection of the child who was certified. Children were frequently excluded from school on medical grounds on a rule-of-thumb principle. The child's home conditions had not been taken into account, and it had been deprived of the advantages of school life to be condemned to spend the day

in a sunless alley—an environment in many cases more detrimental to the child's health than attendance at school would have been. Dr. Auden mentioned that in Birmingham large numbers of children had been excluded from school by certificate on account of myopia, but he was glad to say that since a special class for these children had been established medical practitioners had come to appreciate the position, and now, instead of certificates of exclusion, suggestions were received that a particular case was suitable for the special class.

In the subsequent discussion the PRESIDENT gave some particulars of the inauguration of a school clinic in Sheffield, culled from a paper by Dr. Ralph P. Williams, school medical officer of Sheffield, who was unable to be present to read his paper.

Dr. E. H. SNELL (Coventry) urged that only after very careful consideration was a local authority justified in undertaking medical treatment of school children. There were too many existing agencies for treating disease, and a large amount of overlapping. Nevertheless, it must be admitted, having regard to practical experience, that there were certain ailments of school children which were not adequately dealt with through existing agencies. Among these were affections of the eyes, ears and throat, teeth, and ringworm. In his own district most of the cases found their way to the hospital, and there was some difficulty when the hospital asked for a subscription from the local authority, and the oculist engaged at the hospital objected to doing public work for nothing. The council then decided to employ its own oculist and also an ear and throat specialist.

Dr. R WALLACE HENRY (Leicester) thought it would be unfortunate if medical treatment schemes were pressed forward too rapidly in view of the new insurance legislation. It was probable that in a few years women and children would be brought within the scope of the Insurance Bill. Dr. Henry denied, on the basis of experience in Leicestershire, that general practitioners were not in a position to undertake school medical work.

Dr. J. B. BRIERLEY (Manchester) and Dr. ELIZABETH J. MOFFETT (Stafford) put in a plea for clinics.

Dr. F. E. WYNNE (Leigh, Lancs) protested against the exclusion from this work of the general practitioner. He was the proper person to do it, and Dr. Wynne hoped to see school clinics staffed by the general practitioners of each district. Of a large number of children inspected by him 50 per cent were satisfactorily treated by general practitioners, who were more competent to do the work than a young person just turned out of the hospital or the public health laboratory The latter were supposed to be specialists in eye, ear, and throat work and mental diseases at the age of 24 and at a salary of £250! Dr. Wynne also touched on the question of how far the various remedial measures now being pressed forward would bring about the survival of the unfit.

Dr. J. C MCWALTER (Dublin) also enlarged on this point, and the readers of papers having replied, the proceedings of the section terminated.

NEUROLOGY AND PSYCHOLOGICAL MEDICINE.

FRIDAY, JULY 28TH.

President, Dr. EDWIN GOODALL (Mental Hospital, Cardiff).

Mr. R. V. STANFORD, M.Sc., Ph.D. (Cardiff), read a short paper on the

Need for Chemistry in the Investigation of Mental Disease.

Mr. Stanford devoted his paper to a plea for the desirability of chemical research in mental disease. Chemistry will show us the mechanism of the results of clinical and pathological investigation, and the importance of the subject cannot be overestimated. A wide field for research in this respect has been opened up, but not yet actually entered on. Mr. Stanford spoke from the standpoint of the pure chemist, and declared that the expert chemist has a significant part to play in the developments which mental science is yearly making.

Dr. HENRY DEVINE (Long Grove Asylum, Epsom) and the PRESIDENT discussed the paper, both remarking on the advisability of having highly skilled chemists attached to mental institutions where research on modern lines is being prosecuted. The President said that he was struck by the general vagueness and inaccuracy in the employment of what are really chemical terms that vitiated the work of many who are engaged in research in connexion with mental disease.

Dr. DEVINE then read a short paper on

The Significance of Some Confusional States,

pointing out the analogies between day dreams and reveries, and many confusional conditions, and illustrating his remarks by appropriate clinical instances.

Dr. WINIFRED MUIRHEAD (Morningside Asylum) read a communication on

The Wassermann Reaction in the Blood and Cerebro-spinal Fluid in Insanity, and Examination of the Spinal Fluid.

The paper may be summarised as follows: 1. The lecithin and cholesterin antigen has been found a more sensitive antigen than crude extract of ox liver or guinea-pig liver. 2. Excess of globulin in the cerebro-spinal fluid in various psychoses appears, because of its transient nature, to be a product of metabolic change; in those cases where the condition persists the cause might be inflammatory change or marked destructive cell change. 3. The presence of globulin does not coincide in every case with an increase of the quantity of proteid present or the converse. The deduction is that we are dealing with more than one proteid in the cerebro-spinal fluid in insanity. 4. There appears to be no true relationship between excess of globulin in the cerebro-spinal fluid and an increase of lymphocytes. 5. There is evidence that the active principle for the Wassermann reaction is attached to the globulin molecule. 6. In all cases of syphilis and metasyphilis of the central nervous system the spinal fluid showed an increase of globulin with an increase in the quantity of the proteid, as estimated by Esbach's solution, in nearly all cases in a marked degree, and this condition is constant. In nearly all cases a lymphocytosis is also present.

The paper was discussed by Dr. MACKENZIE WALLIS, Dr. G. M. ROBERTSON (Morningside Asylum), Dr. W. J. MIDELTON (Bournemouth), Dr. J. G. SOUTAR (Gloucester), and the PRESIDENT.

Dr. WALLIS read a paper on

Metabolism in the Insane,

consisting mainly of a *résumé* of work already accomplished, and of suggestions for future research.

Dr. MUIRHEAD, Dr. DAVID BLAIR (Lancaster County Asylum), and the PRESIDENT discussed the paper.

Dr. M. D. EDER (London) read a paper on

A Case of Obsession and Hysteria Treated by the Freud Psycho-analytic Method.

A young clerk of 25 had constant pains at the back of the neck during two years. He was depressed and melancholic and was unable to carry out his work. Psycho-analysis, including a series of word-association tests, and an analysis of dreams showed that the patient had certain obsessions and phobias. He had some dislike of going into crowds. Since a child he had been unable to eat in public; for instance, he could not take a meal at a restaurant or a friend's house. He disliked washing himself and never bathed. There were well-marked homosexual tendencies (not practised); ordinary sexual intercourse and marriage were regarded as revolting; and sexual feelings were evinced towards a sister. Psycho-analysis traced the origin of the pain and of these phobias to repressed wishes dating back to childhood or associated with his work. Treatment which lasted three months effected a cure. Similar cases are very numerous; it does not suffice to dub these patients "degenerates." This particular patient, who is quite typical, was a very gifted young man, with noble aims and capable of fine work.

Dr. T. GWYNNE MAITLAND (Sutton) made a few remarks on the paper.

Dr. E. R. SCHUSTER (Aachen) read a paper on

Douche Massage in Diseases of the Central Nervous System.

Douche massage is a process which, coming originally from France, has been practised for many years at Aix-la-Chapelle, Germany, mostly for complaints such as gout, chronic articular rheumatism, and chronic neuralgias, among these especially for sciatica. It has also been successfully employed as an additional form of treatment in sensory disturbances and motor paralyses, arising, for

instance, from tabes, spinal myelitis, arteritis, or gummatous lesions in the brain and spinal cord. The method is briefly as follows. The patient sits in the basin of the bath. The douche consists of a strong stream of thermal water issuing from a mobile tube of 5–10 mm. diameter and a temperature of 35°–37° C. This powerful stream, of a pressure of about 1–1½ atmospheres, is applied for 10 to 20 minutes gradually to all parts of the body, beginning with the feet, whilst massage by hand is being made use of at the same time. After this application the patient remains in the bath (which should reach up to his neck) for another 10 to 15 minutes. This treatment, which may possibly be considered somewhat drastic if applied to severely affected cases of the central nervous system, can easily be modified to suit individual requirements. By the douche no dangerous change in the bodily equilibrium or in the blood pressure can be brought about, as has been proved by Dr. Schuster's special studies with Recklinghausen's tonometer. Patients also with heart disease and persons of advanced years who have been suffering from arterio-sclerosis, emphysema, varicosis, or even venous thrombosis have been put through this treatment, not only without any danger, but with most satisfactory results. In some cases of locomotor ataxia very painful hyperæsthesia has been considerably relieved and sometimes cured, the treatment being applied in a very mild form. For patients suffering from motor paralysis douche massage is prescribed in medium strength. In hemiparesis or paraparesis of not too old-standing, paralysed muscles, as a rule, regain their normal functions quicker than after treatment by electricity or simple massage. Douche massage offers a very useful addition to the customary and recognised methods of treatment employed in diseases of the central nervous system.

Dr. F. E. BATTEN (London) said that douche massage coupled with mercurial inunction, in syphilitic cases, was very beneficial, and English medical men thoroughly appreciated the value of the treatment as carried out at Aix-la-Chapelle.

The PRESIDENT also discussed the paper.

OBSTETRICS AND GYNÆCOLOGY.

FRIDAY, JULY 28TH.

President, Professor EDWARD MALINS (Birmingham).

Dr. E. HASTINGS TWEEDY (Dublin) read a paper on

The Cause and Cure of Eclampsia.

He stated that during his seven years' mastership at the Rotunda Hospital 74 cases of eclampsia had been treated, with a mortality of 8·11 per cent. This extremely low death-rate for the disease in question could only be explained on one of the following assumptions—viz.: (1) that the disease is of a milder type than formerly; (2) that there is greater laxity of diagnosis; and (3) that the treatment is more satisfactory. As regards the first proposition it was impossible to believe that throughout seven successive years a mild type of the disease should persist. Laxity of diagnosis certainly could not be cited as the cause, as very stringent precautions were made only to include true and undoubted cases in the statistics. All deaths associated with convulsions occurring after the sixth month of pregnancy were diagnosed as eclampsia. Deaths before the sixth month were only catalogued according to the pathological findings. No woman who had previously suffered from fits, epileptic or otherwise, was counted as an eclamptic. An unconscious toxic woman with albuminuria after the sixth month was considered to be suffering from the disease, but no convulsions were recognised unless they were associated with albuminuria. The third suggestion must therefore be the correct one. Treatment certainly had a very important bearing upon the ultimate issue of a particular case. The introduction of morphia in the treatment of this disease by Sir William Smyly was an instance in point. During the period of his assistant mastership at the Rotunda Hospital the speaker had been impressed with the fact that medicines or food should not be placed in the mouth of an unconscious woman, and in 1896 he advocated the treatment of eclampsia by gastric lavage, cupping to the loins, and the administration of purgatives by the stomach tube. He then emphasised the importance of the "side" position to allow the escape of mucus, and he was a firm believer in the use of morphia. He now propounded the theory that food was the primary cause of the toxæmia and heart failure, and that the milk and whey so frequently administered to eclamptic patients were distinctly harmful. The disease is possibly due to some degeneration of the gastric and intestinal mucosa. It is well known that degeneration of the renal, pancreatic, and hepatic epithelium occurs during pregnancy, and it would be somewhat remarkable if changes did not occur in the cells lining the alimentary tract. It is also known that pregnant women do not drink sufficiently, they often bolt their food (especially eclamptics), and the majority suffer to a more or less extent from various "cravings." The speaker suggested that an anaphylactic condition was developed. The association of morbid symptoms with the ingestion of milk or whey suggested the elimination of all food in the treatment of eclampsia, and he was now able to produce a series of 29 successive cases with no mortality extending over a period of two years nine months. The treatment now advocated is: (1) the suppression of all food, even after consciousness has returned; (2) the exhibition of morphia in repeated doses until the respiration falls even to 6 or 7 per minute; (3) gastric lavage and efficient purgation; (4) intestinal lavage with sodium bicarbonate, using one to one and a half pints of fluid at a time until the return is quite clear; and (5) the assumption of the lateral position. Should spasm of the glottis occur the attendant must draw the head and shoulders of the patient over the end of the bed and turn the face towards the floor. This manœuvre is most efficacious and emphasises the importance of a skilled assistant being always present. Benefit is sometimes obtained from the use of oxygen, linseed meal poultices to the loin, and infusions of plain water. Laking of the blood need not be feared from the latter. Accouchement forcé should be avoided and forceps are very rarely required. Chloroform should only be administered in doses of 12 to 15 minims from time to time to aid the performance of gastric lavage or infusion, as suggested by Stroganoff. In conclusion, Dr. Tweedy remarked that no disease requires more careful and thorough treatment and need of skilled attention.

Dr. A. W. RUSSELL (Glasgow) deplored the calamities that so frequently attend the treatment of eclampsia. He regarded preventive measures as most important. Personally, he had a profound distrust of morphia, and did not favour chloroform. He thought that some other anæsthetic should be administered if necessary, and mentioned details of a case in which Cæsarean section had saved the lives of both mother and child.

Dr. R. C. BUIST (Dundee) thought that it was impossible to lay down any one theory to explain the disease. "Toxæmia" is a word only, and in relation to eclampsia is but little understood. He agreed with the free use of morphia, and quoted Veit's work.

Professor PAUL STRASSMANN (Berlin) congratulated Dr. Tweedy upon his results, and asked how his theory would explain the frequency of the disease in primiparæ and twin pregnancies. He insisted on the demonstration of albuminuria in all cases of eclampsia.

Dr. THOMAS WILSON (Birmingham) congratulated the author of the paper on the excellent results of his comparatively long series of cases. He insisted that the treatment of eclampsia and albuminuria are very different things. He was interested in Dr. Tweedy's theory of causation, and especially applied it to the severe post-partum cases. Here it certainly could not arise from fœtal or placental toxæmia. He referred to the suggestion that the breasts may be the underlying cause, and cited a remarkable instance where amputation of both breasts was followed by recovery.

Dr. F. EDGE (Wolverhampton) asked for details of the milk supplied to the eclamptics in Dr. Tweedy's cases that terminated fatally.

Dr. E. SMALLWOOD SAVAGE (Birmingham) asked if any previous gastric trouble—e.g., atonic dyspepsia—had been noted in any of Dr. Tweedy's cases. He had frequently noted "retraction" or "splashing" in the examination of obstetrical patients.

Dr. R. J. JOHNSTONE (Belfast) was glad to hear that chloroform was not advocated as a routine method of treatment in eclampsia. On the other hand, he was not prepared to admit that accouchement forcé if properly performed was so deadly, as Dr. Tweedy had stated. He also referred to a successful case of renal decapsulation occurring in his

practice. The operation is very easy, and in his case the benefit was immediate.

Dr. TWEEDY, in reply, referred to the series of 400 cases published by Stroganoff and remarked that in the treatment of the actual convulsion he and that author were at one. He considered it a great error to give salines and thought that sodium bicarbonate is infinitely better. He also thought that the occurrence of eclampsia in primiparæ and twin pregnancies helps to strengthen his theory. Possibly a certain degree of tolerance to the toxins is acquired in subsequent pregnancies which is absent in primiparæ.

Dr. J. NIGEL STARK (Glasgow) read a paper on

The Dangers of Fibromyomata of the Uterus in the Later Years of Life.

He observed that these dangers are not sufficiently appreciated by the profession, and that a much larger number of women die from fibroids, directly or indirectly, than is generally thought to be the case When a woman reaches the menopausal age many practitioners advise against operation for this condition. Too often cessation of the bleeding is waited for, a cessation that may never occur. He therefore urged that operative measures be employed more frequently, and brought forward the following reasons in support of his contention: (1) the future behaviour of any individual growth cannot be foretold; (2) there is no certainty against serious degenerations; (3) various complications may ensue if the neoplasms are allowed to remain; and (4) operations for fibroids are not so serious at the present day as formerly. The speaker then proceeded to detail some of the complications and degenerations that may affect fibromyomata in later life. Sepsis and necrosis are not at all an uncommon event, and a neoplasm that has remained small and quiescent may only give presence of its existence by this complication. Details were furnished of a case where a tumour had been known to exist for 20 years. A foul vaginal discharge and hæmorrhage necessitated operation. Double phlebitis supervened and caused the death of the patient. Had an operation been performed 20 years previously, when the growth was healthy, without doubt the patient's life would have been saved. In fact, necrosis is one of the most dangerous and frequent accidents that may occur to a fibroid in the later years of life. Two-thirds of all such cases occur between the ages of 40 and 70. Another not infrequent accident is retention of urine with all the sequelæ of cystitis, pyelitis, &c. This may arise from increase in size of an intrapelvic tumour or from prolapse of a fibroid into the pelvis. Tumours in which calcareous degeneration has occurred have a special danger in that they may produce friction of intestine or omentum and be the exciting cause of a carcinoma. Details of two such cases were given. Again, the mere prolongation of bleeding long after the menopause has a very deleterious effect and may produce such a profound degree of anæmia as to preclude any operative measures for its relief. Finally, there is always the possibility of malignant disease supervening upon a fibroid neoplasm. Carcinoma of the body of the uterus develops in 2 per cent. of all fibroids that come under treatment.

Dr. WILSON communicated a paper on

Dysmenorrhœa due to Very Small Fibroids.

He stated that in some cases of dysmenorrhœa palliative measures are of little avail, and that it is necessary to perform a radical operation to restore the patients to health and prevent the acquisition of drug habits or similar ills. He had an experience of eight cases in which it had been necessary to remove or explore the uterus for dysmenorrhœa. In several instances he had been surprised to find very small fibromyomata present. These neoplasms were too small to diagnose by the usual methods of examination, but their association with the menstrual pain was too frequent to be a mere coincidence. He suggested, therefore, that they bore a direct causal relationship to the dysmenorrhœa. In two instances very small submucous fibroids had been found near the fundus. In a third case an interstitial growth, 7 mm. in diameter, was exposed in the anterior wall of the uterus at the level of the os internum. Dr. Wilson proceeded to give details of cases in support of his thesis. The first patient quoted was a woman of 40 who had begun to menstruate at the age of 17. The periods were always associated with much pain, and at 24 the uterus was dilated and curetted. No relief was obtained, and at 28 she appeared prematurely old and ill. Curettage was again preformed with but little benefit. At 32 she was admitted to the General Hospital, Birmingham, and the uterus was removed by the abdominal route. A small fibroid was found at the level of the isthmus. Recovery was rapid, and two years later the patient was well and strong. At the present time, six years after the operation, she is in excellent health and has had no return of abdominal pain or discomfort. At the time this operation was performed the relationship between the minute fibroid and the dysmenorrhœa was not appreciated. The occurrence of other cases, however, established the fact, and the history of a patient operated upon in 1910 conclusively proves the connexion. A single woman of 32 complained of severe griping pain on the second day of each period, necessitating rest in bed. A very small tumour was palpated in the posterior wall of the uterus and vaginal cœliotomy was performed. In the left posterior wall of the uterus a small fibroid of the size of a hazel-nut was removed. The uterine wall was sutured with catgut and the patient rapidly recovered. The after-history is perfectly satisfactory and she now writes that she "never has trouble from the pain I used to dread so much." In conclusion, Dr. Wilson remarked that the pain in these cases is not comparable to that produced by a polypus. The ideal treatment is obviously hysterotomy and myomectomy, but he thought that hysterectomy will frequently be performed in the future because the fibroids are so small and cannot be found.

Professor STRASSMANN observed that 30–40 per cent. of all patients with fibroids complain of severe dysmenorrhœa. He could recall an instance where the abdomen was opened to explore for the cause of dysmenorrhœa, and 10 or 12 minute fibromyomata were discovered. He believed that hysterotomy was the right procedure in future in all incurable cases of dysmenorrhœa.

Dr. TWEEDY thought that from a practical point of view the degenerations of uterine fibromyomata after the menopause were not of great importance. What was important, however, was the "cancerous" change referred to by Dr. Stark, and he considered that it was criminal to treat a patient with fibroids palliatively when symptoms developed after the menopause. He agreed with Dr. Wilson in that small fibroids were very apt to be missed, and said that in view of the details brought forward the right course in all persistent cases of dysmenorrhœa was to operate. He suggested that the uterus should be split sagittally and re-sutured.

Dr. RUSSELL thought that Dr. Tweedy had not laid sufficient stress upon the dangers of degenerative changes in fibroids. All recent work tended to show the importance of early operative interference.

Dr. BUIST agreed that all patients with fibromyomata ought to be kept under observation, and that the orthodox teaching that the symptoms associated with fibromyomata cease at the menopause is wrong. The mere involution of a fibroid may cause trouble. He was very interested in Dr. Wilson's paper and considered it important, in that it justified further possibilities of examination in the case of patients with dysmenorrhœa. Hitherto, after dilatation of the cervix and curetting one had to be satisfied with palliative measures, but now it was possible to suggest vaginal hysterotomy.

Mr. J. W. BELL (London) advocated hysterectomy for recurrent dysmenorrhœa due to fibroids on account of the possibility of recurrence or "seedling" tumours.

Dr. STARK, in reply, remarked that at the present time far too many deaths result from uterine fibroids. Furthermore, deaths after the menopause were not uncommon from this cause apart from carcinoma.

Dr. WILSON, in reply, said that the difficulty experienced in most cases was to find the fibroid. Hysterotomy and myomectomy were without doubt the right treatment, but if he had to perform hysterectomy he would remove the ovaries also. He considered that the patients thereby passed through a better menopause.

Dr. C. E. PURSLOW read notes upon a case of

Tuberculous Elephantiasis of the Vulva,

and illustrated his remarks by specimens and photographs. The patient, aged 37, was admitted to the Queen's Hospital under Dr. Purslow's care in May, 1910, when she said that the vulvar symptoms had been in existence for three years. In 1904 she had undergone laparotomy for tuberculous peritonitis at the hands of Mr. Christopher Martin at the Women's Hospital, and in July, 1895, while still under Mr. Martin's care,

an ulcer developed on the left labium majus. This was thought at the time to be venereal, but no further specific symptoms developed, and later the glands in both groins suppurated, leaving extensive scars in the inguinal regions. On admission to the Queen's Hospital, as stated, under Dr. Purslow, it was found that both labia majora and minora, clitoris, and mons veneris were involved in a diffuse hypertrophy. The papillæ of the dermis were much enlarged, and the whole formed a soft, oozing swelling. A mass of suppurating glands was present in each inguinal region. The condition was aggravated by the use of X rays and various local applications, and therefore the parts were excised. Microscopically there was a great increase in fibrous tissue. Near the periphery the tissues were œdematous, and there was a tendency to shed the superficial layers of the epithelium. The changes were those of chronic hypertrophy. From a survey of the literature Dr. Purslow was of the opinion that this case was probably tuberculous in nature. A fortnight before the reading of his paper the patient presented herself with commencing recurrence of the condition in the area round the previous excision. The prognosis is usually bad.

Mr. CHRISTOPHER MARTIN (Birmingham) quite agreed with the view that the lesion was probably tubercular in origin. When he first saw the case he thought that it was a combination of syphilis and tubercle. The failure of all anti-syphilitic remedies had proved the absence of syphilis.

ODONTOLOGY AND STATE MEDICINE.

FRIDAY, JULY 28TH.

President, Professor FRANK EARLE HUXLEY (Birmingham).

The final meetings of the Odontology Section were, as determined last year in London, combined with those of the State Medicine and Industrial Diseases Section. The PRESIDENT occupied the chair. Four papers were read consecutively, and a discussion then took place on the whole subject of "The Teeth in Relation to Public Health."

Dr. JAMES WHEATLEY (Shrewsbury) communicated a paper on

The Prevention of Dental Caries from a Public Health Standpoint.

He believed that the physique of the nation would be vastly improved by the eradication of dental caries, a matter which needed as much, if not more, attention by the authorities than even that of tuberculosis. There were abundant evidences that dental caries was on the increase in these islands, one reason being that no public body had, until quite recently, felt the necessity of dealing systematically with the subject. He gave some advice regarding the feeding of children to this end, and condemned the use of bread soaked in milk, patent foods, newly baked bread, and food taken in a liquid or minced form. He emphasised the value of the habit of mastication and the use of fresh fruit as the last item of the meal, and pointed out that oral breathing should be treated and corrected. He deprecated the use of sweets, and gave a list of "cleansing foods" such as fresh fruits, raw vegetables, meat, fish, bacon, and toasts and crusts of bread made from wholemeal flour.

Mr. A. HOPEWELL-SMITH (London), in a paper on

The Abuse of Sweetmeats,

alluded to the value of sugar—cane sugar—as a food and the enormous increase in the manufacture of sweetmeats in recent years in this country, and computed the number of confectioners in Greater London as being over 4500. He inveighed against the common practice of exposing sweatmeats for sale in dusty, dirty streets, and in shops with open windows and doors where they could be freely contaminated by the house-fly and other pests. The artificial colouring and constituents of the commoner sweets were described, together with their relative solubilities. The main feature of the paper dealt with many new and original experiments carried out *in vitro*, undertaken by him to ascertain whether and in what ways the oral secretions are altered in their nature, chemical reactions, and amounts by the use of sweetmeats, to compute the reactionary variations between the salivas of immunised and non-immunised persons, and to determine whether caries of enamel could be artificially produced in the laboratory by placing typical sweetmeats on the free surfaces of human teeth. It was thus shown by means of diagrams, bacterial cultivations, &c., that some sweets, such as acid drops, barley sugar, sugarless chocolate, &c., were bacteriophobe, and chocolate, toffee, caramel, &c., bacteriophile. Parents should not allow children to indulge in sweatmeats; if they must eat them, then only those made from pure sugars free from adulterations should be employed at, and not between, meals. He concluded by stating that, in his opinion, confectionery factories and the wares of sweetmeat vendors should be placed under State control.

Mr. C. E. WALLIS (London) spoke on the subject of

Infant Feeding.

The poorest of the children attending the London County Council Schools had better teeth than those of a higher type. The teeth were not necessarily clean, but he considered 40 or 50 per cent. of mouths showed perfect dentition—on account of the fact, he believed, that they could not afford to pay for luxuries. He considered cider harmful to the teeth.

The detergent effect of the crust of bread formed the main theme for Dr. J. SIM WALLACE (London) to describe the good effects by mastication of bread.

The Bread Question.

He compared white, standard, and stone-milled breads, and pointed out that all were equally efficient in cleansing the teeth and preventing the initiation of dental caries. He protested against the use of bread soaked in milk and bread and marmalade, and narrated some experiments which he had conducted to ascertain the acidity of the saliva when these materials were taken into the mouth and chewed in the usual way.

In the ensuing discussion Dr. WOODS HUTCHINSON (New York) disputed some of the statements that had been made, and said that "decay" of the teeth was no worse to-day than 150 years ago. The use of sugar in America and amongst the soldiers in the Philippines was believed to counteract the tendency for the consumption of alcohol. Candies helped to build up the bodies of the young, and he personally was not afraid of the effects that bread was said to have upon the teeth.

Professor BOSTOCK HILL (Birmingham), while agreeing very largely with what had been said, believed that it was rare to find sweetmeats actually contaminated with substances such as arsenic.

Dr. C. W. HUTT (Warrington) asked a question, and Mr. A. S. UNDERWOOD (London) protested that, from the evidence of human skulls which he had examined, caries of the teeth was actually on the increase. A great deal of immunity existed among the aboriginal races of mankind.

The PRESIDENT spoke about the abuse of sweetmeats, and after Mr. H. S. STEYNOR (Malvern) had described a case dealing with the subject, the readers of the various papers replied; and subsequent to the passing, with acclamation, of Sir Victor Horsley's resolution submitted to the meeting on the opening day, the session was closed. That resolution was as follows:—

That the Section of Odontology request the Council of this Association to urge upon the Board of Education the need of pressing the local authorities to establish school clinics as being the only means whereby the dental and medical requirements of the elementary school children can be adequately and economically treated.

OPHTHALMOLOGY.

FRIDAY, JULY 28TH.

President, Mr. HENRY EALES (Birmingham).

Professor JOHN BERRY HAYCRAFT (Cardiff) demonstrated a delicate method of mapping out the blind spot of the retina and the new observations of the character of that spot which he had obtained by his instrument. The feature of his observations was the variation of the area of the blind spot according to the colour of the object exhibited. Working with colours of equal intensity or luminosity, he found that the blind area was smallest with grey and of gradually increasing size with blue, yellow, and green, and largest with red. The order in which the colours are placed in this observation was the same as that found in mapping the perimetry of the field. He laid stress upon the necessity of equal luminosity of colour objects, and showed how he had obtained these by means of Abney's rotating sectors.

Mr. J. H. TOMLINSON (London) showed his "Scotomograph." This instrument enabled the fields to be taken in the dark—a matter of particular necessity in determining small scotomata and variations of the blind spot. The delicacy of the instrument could be shown by the manner in which the

main retinal vessels could be mapped out for a considerable length.

Dr. F. W. EDRIDGE-GREEN (London) said that the intensity of the colour of the object with which a test was made greatly altered the bounds of the periphery of colour vision. Given a colour of sufficient intensity, it was possible to trace colour vision to the extreme periphery. He did not agree with Professor Haycraft that Abney's rotating sectors was a satisfactory instrument for obtaining colours of equal intensity.

Mr. T. HARRISON BUTLER (Coventry) said a disability arose in the case of Mr. Tomlinson's scotomograph from the liability of the eye under examination to undergo dark adaptation. This, he thought, would render the instrument unsuitable for ordinary practical purposes of examining patients, though its scientific value might be great.

Professor HAYCRAFT, in reply, said he had recognised the points brought forward by Dr. Edridge-Green, and in his experiments had used colours of the same size which were matched for equal intensity with yellow; this he found satisfactory.

Mr. TOMLINSON, in reply, said that it was possible that with extended observations, such as his instrument would permit, they would have to readjust their canons of perimetry.

Mr. A. F. MACCALLAN (Cairo) read a paper on

Egyptian Ophthalmic Hospitals.

Ophthalmic relief work, he said, had extended considerably in the past year; two built hospitals were in operation, three others were being built, and the money for two more was obtained. Thus seven of the 14 provinces would have a well-built and equipped hospital. That was an advance; but the need was even greater than the provision. About 97 per cent. of fellahin had some form of eye disease, chiefly trachoma, with resultant trichiasis. The demand for treatment could be gauged by the fact that at the three hospitals at work in 1910 more than 8000 such cases were seen, but their staff and space only permitted 2000 to receive the necessary treatment of operation. A policy of extension was desirable, and should be carried out on the lines of the travelling hospitals founded by Sir Ernest Cassel. With it would come the development in each province of a system of small travelling hospitals, one for each police district. To these the permanent hospitals would act as a base, to which serious cases would be sent. This policy had been started in one province at the instance of H.E. Moheb Pasha.

Professor R. A. REEVE (Toronto) asked what precaution was taken against trachoma in case of cataract operations.

Mr. N. BISHOP HARMAN (London) asked what degree of bad vision constituted blindness in Mr. MacCallan's returns.

Mr. HARRISON BUTLER said that during his work at Jerusalem he found nearly every cataract patient had trachoma; it did not prevent successful operation unless there was an intercurrent catarrh.

Colonel HENRY SMITH, I.M.S., did not agree that trachoma was no drawback to operation unless it was of the smallest degree; he was accustomed to take particular precautions in flushing the conjunctiva with fairly strong antiseptic lotions.

Captain A. E. J. LISTER, I.M.S., agreed with Colonel Smith.

Mr. MACCALLAN, in reply, said that in his figures those whose vision did not exceed detection of fingers at the distance of 1 metre were counted as blind. As regards trachoma contra-indicating intra-ocular operation, he agreed with Mr. Butler that it did not constitute a bar; nevertheless, he was accustomed to use efficient antiseptics.

Miss AMY SHEPPARD, M.B. (London), read a paper entitled,

Extraction of the Lens in its Capsule, with Special Reference to Colonel Smith's Operation.

The paper "was intended to suggest that extraction of the lens in its capsule was the operation of election in the great majority of cases of operable cataract, excepting those of children and young people, and a few very hypermature senile ones. It was indispensable in that it was the only safe and effective operation in immature cases." The paper was based on personal observation of 650 such extractions of which Miss Sheppard had performed 260 under the supervision of Colonel Smith at the Civil Hospital, Amritsar, Punjab, between February and April last. The stages of the operation were described in detail, and also the manner in which the lens was dislocated by the pressure of the point of a squint-hook applied to the lower quadrant of the cornea. Certain points of importance were dwelt upon, such as the necessity for a clean cut of the cornea by a single sweep of the knife; a jagged cut from a sawing movement tended to delay healing; the necessity for a large incision to permit escape of the large encapsuled lens; the necessity for a skilled assistant to manipulate the brow and upper lid of the patient. On the differences manifest between this operation and that performed with capsulotomy it seemed that replacement of the iris was rather more difficult, and there was a greater tendency to a wide and ill-shaped coloboma. Escape of vitreous occurred in from 5 per cent. in skilled hands to a variable and larger percentage in unskilled hands. One pupil had 21 losses in the first 100 eyes and only four in the last 100. The advantages claimed for the operation were lesser liability to irido-cyclitis from the irritation of retained lens cortex, or incarcerated fragments of capsule; complete absence of "after-cataract" and the risks attached to needling operations; that it was the only operation effective in the removal of immature cataract.

The PRESIDENT said one serious objection that almost precluded the use of the operation in ordinary practice was the necessity for a highly skilled assistant. Miss Sheppard's suggestion that it was the only satisfactory method of dealing with immature cataract did not agree with his experience. For many years he had performed Förster's operation and had found it most excellent. By this means over 200 cataracts had been artificially matured, and subsequently removed with rather more ease than an ordinarily ripened cataract.

Colonel SMITH wished to thank Miss Sheppard for the trouble, time, and expense she had expended in investigating the operation under discussion. In commenting upon certain criticisms that had been advanced by Colonel Herbert in the press, he (Colonel Smith) would remark that Herbert's experience had been in Bombay, whilst his was in the Punjab; the people and the governments differed, and that affected the possibility of getting satisfactory statistics of the subsequent history of patients. He hoped at no distant date to publish such statistics. Capsulotomy operations, he maintained, were unsurgical, for the whole of the cataract was not removed. The capsule had no utility save as a covering for the lens. In his operation iritis was very rare; it was common in capsulotomy operation for these two reasons. To leave fragments of the lens or capsule made the operation as incomplete as would be the leaving a fragment of stone in the bladder after a lithotopaxy.

Professor REEVE agreed with the President that Smith's operation was not the only satisfactory means of dealing with immature cataract. He had practised McKeown's irrigation method with very safe and satisfactory results. It had enabled him to reduce materially the time of blindness which afflicted these patients.

Dr. J. O. MCREYNOLD'S (Dallas, Texas) said the attitude of Americans who had had opportunity of studying Colonel Smith's method was interesting. They had not adopted it as a regular practice, though some had secured very satisfactory results by the method, others had modified it, one devising a method of rupturing the ligament by means of a special instrument passed within the anterior chamber.

Dr. J. GRAY CLEGG (Manchester) said he had done Smith's operation upon six cases in the past few weeks. He found the necessary pressure far less than he had anticipated; the operation was safest when the incision was very large, even to nearly half the cornea. Recovery was not so uncomplicated as the statistics indicated, perhaps because he could keep touch with his cases satisfactorily, which could not be done in India. His conclusion was that the complications of this operation were chiefly during operation and not after; nevertheless, the patients remained rather longer in hospital than when capsulotomy was done.

Mr. A. W. ORMOND (London) took strong exception to the statement made by Miss Sheppard that intracapsular extraction was the operation of election. He could not allow that any operation that necessitated the mutilation of the iris was a perfect operation. Iridectomy might facilitate operation, but the difference in the ultimate comfort to the patient of a clear round pupil and a coloboma of even the most superior order was striking.

Major ELLIOTT said he had studied this operation at Jullundur, and paid a warm tribute to the work and personality of Colonel Smith and the manner in which he put his experience and resources at the disposal of any inquirer. In his view, what they most wanted at the present time was not further eulogies or descriptions of the operation, but statistics of the operative and post-operative results for an extended period and on a sufficiently large scale. Statistics were an absolute necessity. The after-results of capsulotomy operations were well known and constantly increasing in weight; the same must be had for the intra-capsular operation. He thought the advocacy of a one-sweep cut of the cornea was dangerous; two or three movements of the knife need not produce a jagged edge nor delay healing. With regard to the alleged danger of retained capsule and cortex, he denied the terrors of such conditions unless the capsule was entangled in the wound. He did not agree with Mr. Ormond that the "simple" extraction was the proper operation. Iridectomy should be done; there must be an open sluice-gate for the escape of aqueous.

Captain LISTER said he had traced 98 cases in which there had been escape of vitreous during operation, and the condition of these eyes showed that a small loss was not dangerous. It was certainly much less dangerous than a similar accident in capsulotomy operation, and, he thought, because no lens matter remained to set up irritation. He acknowledged that climatic conditions had immense influence in affecting sepsis. His experiences in the warm, moist climate of Calcutta was not nearly so good as in the clean, dry air of the Punjab.

Miss SHEPPARD, in reply, said a skilled assistant was desirable, not absolutely essential. Iridectomy was usually performed but not invariably. She drew attention to the statistics of cataract extraction for the whole of India. There were 14 per cent. of losses from all causes.

Mr. LEONARD J. C. MITCHELL (London) presented a report on

The Use of Carbondioxide Snow in Ophthalmic Work.

He said that the work reported in his paper followed upon the exhibition of the use of the snow and the paper read thereon by Harman and Morton at the last meeting of the Association. His method of handling the liquid gas and the preparation of the solid pencil did not differ materially from theirs, and he insisted that elaborate and costly apparatus was wholly unnecessary and even troublesome. He had used the snow in the treatment of: 1. Rodent ulcers with great satisfaction; he emphasised the necessity of making the maximum application to the growing edge of the ulcer. 2. Trachoma, for which its use had been widely tested at the Royal London Ophthalmic Hospital. The application brought on a smart vascular reaction in the whole conjunctiva, and the beneficial results were attributable to this inflammatory reaction. It was desirable to carry the freezing to a point just short of destroying conjunctiva tissue. 3. In spring catarrh an absolute cure was obtained in a long-standing case by three applications of 15 seconds. 4. In lymphatic nævi of the conjunctiva excellent results were obtained.

Mr. C. DEVEREUX MARSHALL (London) said the use of carbondioxide snow was a most interesting method of treatment, and the results obtained therefrom most satisfactory.

Colonel SMITH said the essential factor in the treatment of trachoma was the production of hyperæmia.

Mr. BISHOP HARMAN read a paper on

The Blind and the Census of 1911.

He said that in earlier Census papers the term "blind" was used without qualification in the schedule. In the paper issued this decennial year a new description was employed, "totally blind." The addition of the adjective, he held, had destroyed the usefulness of the Census so far as enumeration of the blind was concerned, both by unduly limiting the inquiry and by presenting a conundrum of no little difficulty to those who had to fill in the Census paper. A census of the blind had no interest or utility unless it bore a real relation to the number of those "blind for the practical purposes of life." If it gave any reliable indication of those people then it had a real utility. A list of the "totally blind" had no such use. To-day social and industrial conditions increased the number of those who were blind for practical purposes. Employers' Liability Acts had increased the risks of employment of those whose sight was seriously defective and diminished their chances of employment in competition with the normal-eyed. These conditions gave rise to a demand for special workshops for blind persons, and it was necessary on this account to have a reliable enumeration of those blind for practical purposes. He said that with this view a deputation, of which he was a member, had waited upon the Registrar-General asking for a two-fold enumeration: (1) blind; (2) partially blind. But the issue of the Census proved they had not succeeded. In the London County Council blind schools he had oversight of 326 blind children; he had inquired of their parents the nature of their returns on the Census papers and 312 had replied. Their returns were as follows: Totally blind, 83; partially blind, 120; no entry made, 109. He pointed out that it was remarkable that more than one-third of the parents made the return of "partially blind," just the return that their deputation had begged of the Registrar-General. No suggestion of this mode of return had been made to the parents, so that their action proved the need for, and the naturalness of, the provision they had desired. Analysis of the condition of the eyes of these 312 children from the detailed case papers gave the following comparison of the parents' returns with the real state of affairs:—

—	Blind.	Partially blind.	No entry.
Parents' returns	83	120	109
Analysis by N.B.H.	153	143	16

The totally useless and even misleading nature of the official Census returns is obvious from such a comparison. It is even more remarkable when the state of these children is considered individually. Take, for example, those who, according to the analysis, should have been returned as blind. Of the 153 so returned, 59 had no perception of light, 33 some perception of light, and 61 could detect hand movements or fingers from 10 cm. up to 1 metre. Of those given in the analysis as "partially blind," no more vision was permitted than the ability to see some letter of Snellen's type at any distance the child liked and under the most favourable condition (with the exception of such cases as retinitis pigmentosa). Of the children for whom the parents made no return, only 16 could under any reasonable enumeration be omitted from the schedule of the blind, and these were myopes for whom no accommodation could be found in the myope school. Mr. Bishop Harman urged that all those surgeons who had care of blind schools, or who were able to trace the blind who had been trained in them, should endeavour to obtain similar returns to those he presented, so that a large body of evidence might be gathered to present to the Registrar-General. He suggested that the Council of the Association might fittingly take evidence by a special committee.

The PRESIDENT said that the figures Mr. Bishop Harman had presented were most impressive; he regretted that he had not given due notice for the bringing forward of a motion on the subject.

Mr. C. W. HUTT (Warrington) said the chief medical officer of the Board of Education should be approached on the matter.

Dr. A. HUGH THOMPSON (London) asked what were the limits of Mr. Bishop Harman's group of "partially blind."

Mr. CHARLES WRAY (London) complimented Mr. Bishop Harman upon a satisfactory completion of a very difficult piece of inquiry work. He thought that any rigid term of definition for the "partially blind" dangerous; none could include all those who were "blind for practical purposes."

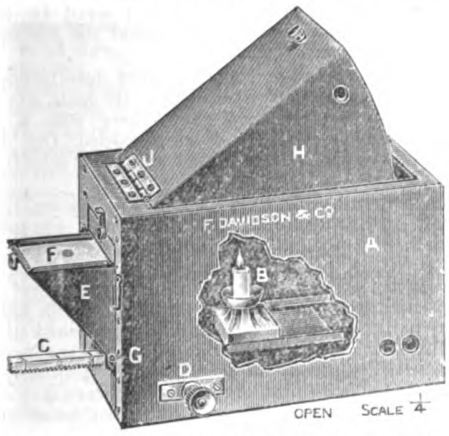
Dr. CLEGG said that restriction of the field of vision was as important a condition of partial blindness as loss of visual acuity.

Mr. BISHOP HARMAN, in reply, said that he agreed with both Dr. Thompson and Mr. Wray that any rigid definition of "partial blindness" was impossible. For certain purposes, such as Census returns, no definition was necessary; the terms "blind" and "partially blind" were sufficiently definitive for the ordinary citizen to appreciate their meaning, and to secure an average correct return.

Mr. BISHOP HARMAN exhibited a

New Photometer for the Use of School Medical Officers.

The instrument was based upon the well-known grease-spot photometer of Bunsen, which, although a standard instrument for the laboratory bench, was unsuitable for use in school class-rooms. In the instrument shown (see accompanying illustration) the standard sperm candle (B) was enclosed within a box measuring 8 × 5 × 3 inches. The top (H) could be raised to form a chimney



and the front swung outwards to form a platform (E), within which was a reflector, and on the top a sheet of thin paper (F) to form the grease-spot screen. The candle was moveable forwards, nearer, or farther from the reflector by means of a ratchet and thumbscrew (C and D). When it was desired to measure the illumination of any part of a class-room—say, that falling upon any of the desks—the box would be placed in position, with the chimney up, the screen out, and the candle lighted. Then the candle would be racked forward until the spot (F) appeared faintly illuminated; this was the indication that the light within the box, under the particular conditions of position and reflection, just exceeded in power that falling upon the screen from without. The value of the illuminant could then be read off in foot-candles upon the racked bar (C) which protruded gradually with the forward movement of the candle. The screen within the platform (E) is tinted green so as to absorb the red rays in the candle flame. Usage of the instrument shows that it is handy, gives a sufficiently wide range of measurement, and that it is accurate within the necessity of school work. The photometer is made by Messrs. F. Davidson and Co., of 29, Great Portland-street, London, W., and it is inexpensive.

PATHOLOGY.

FRIDAY, JULY 28TH.

President, Professor R. FRAZER CALDER LEITH (Birmingham).

Mr. G. PERCIVAL MILLS (Birmingham) read a paper, illustrated by lantern slides, on

The Action of Radium on Healthy Tissues,

in which he stated that to investigate this subject a single application of radium was made to the livers of mice through the anterior abdominal wall, and the animals killed for examination at various subsequent intervals. It was found that the part of the liver immediately beneath the applicator was severely damaged, being in a condition closely akin to coagulation necrosis. Apart from this small area of intense action, however, the rest of the liver showed interesting changes. There were two separate inflammatory reactions, named respectively the early and the late reaction. The *early reaction* affected all the tissues of the liver; it began immediately after irradiation, reached a maximum in about three hours, and could hardly be distinguished after 24 hours. It consisted in cloudy swelling of the liver cells, associated with hyperæmia and infiltration with interstitial cells, both diffusely and in clusters round the veins. This rapidly subsided, and by the end of a week all signs of it had completely disappeared. The *late reaction* affected only the interstitial tissues, the liver cells being unaltered. It began about 14 days from irradiation, and continued with slight variations in intensity up to 113 days, when the last mouse of the series died. It consisted in hyperæmia and cellular infiltration, in which the connective-tissue cells took a prominent part. This infiltration was present in all sections taken after 14 days from the irradiation, and seemed to increase gradually but steadily as time went on. Moreover, in the later sections some increase of fibrous tissue was observed, giving the appearance of an early cirrhosis. In two of these sections, also, giant cells were found. These were very similar in appearance to some observed by Mr. Mills in two cases of epithelioma which had been treated unsuccessfully by radium and then excised. It appeared, then, that a single exposure to radium had set up a progressive inflammation lasting at least four months, and becoming so chronic as to result in a certain degree of fibrosis.

Professor A. S. F. GRÜNBAUM (Leeds) in discussing the paper, regretted that the experiments were carried out on mice, as he thought rodents such as mice and rats were particularly susceptible to the action of X rays and radium rays, and also that mice which died natural deaths in the laboratory often showed changes somewhat resembling those described by Mr. Mills. He would like to know—presuming that the radium was applied through the skin—how Mr. Mills knew which part of the liver it had been applied to, as the position of the liver varied during breathing. He also thought that some of the changes described were compatible with bacterial invasion of a tissue the vitality of which had been lowered by the application of the radium. He had found guinea-pig's skin very resistant to the passage of radium rays and the liver more so, and would like to know why the skin was not affected. He thought that in work of this kind a very large number of controls were necessary, especially when working with mice.

Professor G. SIMS WOODHEAD (Cambridge) was interested in this matter from the general etiological point of view. Here there was evidently something which, in conjunction with other toxins and micro-organisms, might help them in the study of the causes of cirrhosis. He thought that they could not look upon those photographs as of individual specimens. They must be taken as a whole, and if that were done he thought they had some evidence that the primary changes in cirrhosis were those associated with the parenchymatous tissues, changes that were followed by interstitial changes. He thought that Mr. Mills had added to our facilities for the study of cirrhosis. He would like to ask whether the giant cells shown were not lymph spaces or channels in which were embedded cells or nuclei.

Mr. MILLS, in reply to Professor Grünbaum, stated that he recognised the area of application to the liver by the small burn which was always evident at one place on the liver. As regards the giant cells, he certainly thought that they looked like active cells and not nuclei in coagulum.

Dr. LEONARD FINDLAY (Glasgow) then read a paper on

The Origin of Pulmonary Anthracosis: An Experimental Study.

He said that it was generally taught that tuberculosis in childhood is primarily abdominal, though Koch always maintained that it was by the air-passages in the adult and child alike that the tubercle bacillus entered. Calmette holds that it is by the intestine that the tubercle bacillus gains entrance to the body, and that this is the course of events even in pulmonary tuberculosis of the adult, in opposition to the earlier and usually accepted work of Arnold, which showed that it was always by inhalation that pigmentation of the lung was produced. Dr. Findlay reminded the meeting that so much controversy had been aroused by Calmette's work that a committee of the Société de Biologie investigated the matter, and reported that it was unable to verify the passage of pigment to the mesenteric glands after a single feeding of Chinese ink, but that daily feedings extending over a period of nine days or longer resulted in the passage of pigment through the intestinal walls to the mesenteric glands, judgment being reserved on the question of the production of pulmonary anthracosis from the intestinal lymphatics. He then referred to further work on the same subject by various continental and English observers, particularly mentioning Whitla, who emphatically denied the possibility of infection by the air-passages, and who in his Bradshaw lecture described experiments where

ligation of the œsophagus absolutely prevented pigmentation of the lung, and, conversely, where blocking of the bronchus did not prevent pigmentation of the corresponding lung, provided the œsophagus was patent. All these observers supported their contentions by the results of intraperitoneal injection of Chinese ink. Dr. Findlay then detailed his own experiments, which were for the most part carried out on adult rabbits. The pigment was administered by inhalation, by ingestion into the stomach, and by injection into the peritoneal cavity. In the first case lamp-black obtained from a turpentine lamp was passed by means of a suction pump through a closed cage in which the animals were confined, but in some experiments, bearing in mind the fact that a certain degree of pigmentation is normally present in adult animals reared in towns, iron carbonate in the form of a fine powder was sprayed into the cage by means of an insufflator, and its presence in the tissues subsequently tested for by the Prussian-blue reaction. In the feeding experiments lamp-black or iron carbonate was made into an emulsion with water and olive oil, and administered through a stomach tube. Intraperitoneal injections were only performed in a few instances, when Chinese ink was employed. Dr. Findlay summarised his experiments by stating that six adult rabbits and two adult guinea-pigs were allowed to inhale soot-laden air for periods varying from 30 minutes to eight hours, with the result that pulmonary anthracosis was demonstrable, either macroscopically or microscopically in all. Three adult rabbits after ligature of the œsophagus were similarly allowed to inhale soot-laden atmosphere for seven hours, three hours, and half an hour respectively. In every instance an excess of pigment was detected in the lungs. Two rabbits were placed in the inhalation chamber after occlusion of one of the bronchi. Post-mortem examination showed pigmentation of one lung, but no excess of pigment in the lung corresponding to the occluded bronchus. Three animals caused to inhale iron carbonate, both œsophagus and bronchi being patent, showed conclusive evidence of the penetration of the iron salt into the alveoli and to the alveolar walls. Eleven animals fed with either Chinese ink, lamp-black, or iron carbonate failed to show any signs of penetration of either pigment or iron salts to the lung tissue. Five rabbits inoculated intraperitoneally with Chinese ink or soot showed no abnormal amount of pigment in the lung tissues. These experiments led Dr. Findlay to form an opinion directly opposed to that put forward by Calmette and Whitla. In no instance was he successful in producing pulmonary anthracosis by feeding or intraperitoneal inoculation, but in every inhalation experiment, so long as the bronchi remained patent, he successfully accomplished this end. His experiments, in addition to showing the mode of entrance of the pigment, demonstrated the manner of its spread. In animals killed immediately after a single short inhalation the pigment was found chiefly in the alveoli and bronchioles. Animals repeatedly used for inhalation experiments showed proportionately more pigment in the alveoli, also pigment in the pulmonary tissue and in the bronchial glands. In two cases where the animals had been kept alive for long periods after the inhalation the bulk of the pigment was aggregated in masses around large vessels, having travelled along lymph tracks, and accumulated in the adenoid tissues. Dr. Findlay then pointed out that Shingu has shown that dust is present in every child's lung in Berlin after the age of 2½ months, and that the amount is directly proportionate to the age of the child; while Cobbett and Beitzke have pointed out that the same holds good with regard to all adult animals which have lived in a town for any length of time, and suggest that possibly some of the previous workers have erroneously regarded this degree of natural anthracosis as abnormal anthracosis experimentally produced. And in conclusion Dr. Findlay suggested that the results of his experiments lend no support to the view that the tubercle bacilli invading the lung have obtained entrance by way of the intestine.

Dr. R. SAUNDBY, President of the Association, stated that pulmonary anthracosis was rare in the Birmingham district and so he was very interested in Dr. Findlay's experiments. He would like further information on the subject.

Professor SIMS WOODHEAD was extremely interested in the subject raised by Dr. Findlay, as he himself had studied this matter carefully some time ago, and had seen a number of the experiments carried out by Dr. L. Cobbett. As regards pigment, there was, he believed, no doubt as to the channel by which it reached the lung. It was not perhaps sufficient to argue that because pigment got through in a certain direction the bacilli should pass in the same direction. Briscoe's experiments on the hyaline cells of the alveoli were very important in connexion with what Dr. Findlay had said, as were also those of Dr. W. Hunter, who demonstrated the ready passage of such large bodies as the red blood corpuscles from the peritoneal cavity to the lymph spaces in the lungs. This was quite a different matter from passage from the alimentary canal.

Dr. WILLIAM H. WYNN (Birmingham) asked Dr. Findlay whether he found in his experiments that the apices of the lungs were chiefly affected.

Dr. FINDLAY replied, and gave a short description of the technique employed in his experiments. He could not satisfy Dr. Saundby's request, but knew there was a lot of anthracosis around Glasgow. As regarded Dr. Wynn's question, he always found the lung uniformly coloured with the soot.

The PRESIDENT congratulated Dr. Findlay on the way in which he had brought his interesting experimental results before the section, and particularly on the beautiful slides by which he had illustrated them. His experiments lent strong support to the inhalation theory of the origin of pulmonary anthracosis, an origin which had been generally accepted and had remained unquestioned till 1905, when Vansternberghe and Gruscz published the results of their experiments performed in Calmette's laboratory, from which they concluded that the previously prevailing opinion was wrong, and that pulmonary anthracosis arose through ingestion and not by inhalation. Discussion on the paths of entrance of the tubercle bacillus, to which such experiments bear a close relationship, attracted much attention. Fresh results by other workers along the same lines and by the same kind of experiments appeared in 1907 and 1908, which in the main supported the inhalation method and opposed the conclusions of Calmette and his pupils. The most noticeable exception in this country was provided by Whitla and Symmers, who, writing in the *British Medical Journal* in July, 1908, upheld the findings of the Calmette school. But Cobbett, from a study of the portals of entry of the tubercle bacillus, opposed them strongly in papers published in the *British Medical Journal* in 1909 and in the *Journal of Pathology and Bacteriology* last year. He (the President) hoped that Dr. Findlay's experiments, which seemed to have been carefully carried out, would give the *coup de grâce* to the ingestion hypothesis. They did a good deal to re-establish the inhalation method of origin upon its old firm foundation. Shingu had found dust in the lungs of every child older than two and a half months which he had examined, and was led to believe that the amount of the pigment present in any lung was directly proportional to the age of individuals living under similar circumstances. Bacteriologists find some degree of pigmentation in the lungs of all the animals which have lived for some time in the laboratory. It thus becomes probable, as Cobbett and Findlay both contend, that the supporters of the ingestion theory have been misled by the pigment existent within the lungs of their experimental animals before the date of their pigmentation experiments. Dr. Findlay, though denying an alimentary path of entrance to inert pigment particles, did not deny it to the tubercle bacillus. He held only that his experiments lent no support to such a path of entrance, rightly arguing, however, that the tubercle bacillus as a living organism might behave in a somewhat different fashion from the lifeless pigment particles with which he had experimented.

Professor GRÜNBAUM discussed what he called

Post-operative Drowning,

and drew the attention of surgeons to the ill-effects of indiscriminate saline transfusion.

Professor SIMS WOODHEAD wished to ask Professor Grünbaum whether he was dealing with washing out, say, the peritoneal cavity, or passing isotonic saline into the veins. The subject was one of extreme interest and importance, especially in relation to the question as to whether the expert should superintend the perfusion himself or should allow his assistant to do the work without his direct superintendence. It had to be borne in mind that in animals the tissues and organs were healthy, and that they would be able to withstand much more than would tissues and organs, usually damaged, of patients.

Dr. MONTAGU PHILLIPS (Liverpool) and Dr. ERNEST E. GLYNN (Liverpool) then read a paper on

The Comparative Value of Microscopical Methods of Demonstrating Spirochæta Pallida,

and drew their conclusions from some 50 cases of primary and secondary syphilis, and also from numerous gland punctures. The material was obtained by first cleaning the sore with absorbent wool, rubbing it with wool, and then swabbing with wool soaked in methylated spirit. At the end of four minutes the spirit was wiped off, and the clear serum which exuded was collected in a capillary tube. They never used scrapings. Their methods of examination were:—1. Dark ground illumination. 2 Staining by Giemsa. Films stained overnight in 1 part Giemsa's reagent to 8 parts of water, the long method being found more satisfactory than the more rapid process. 3. Indian ink method of Burri. Their conclusions were:—

1. Microscopical examination is a great aid in the diagnosis of primary syphilis, but it is not infallible.
2. Failure to find spirochætæ is more frequent when the sore cannot be reached owing to phimosis.
3. Spirochætæ are more constantly present in condylomata and mucous patches, and far less constantly present in papular secondary skin eruptions than in primary sores.
4. Gland puncture is not of much diagnostic value; typical enlarged indurated syphilitic glands gave negative results in more than half of the cases in which spirochætæ were easily demonstrated in the primary sore.
5. Dark ground illumination is undoubtedly the best method of examination; it is the simplest and least open to pitfalls; it is the quickest not only in the preparation of the film, but also in the detection of spirochætæ after the actual microscopical examination has begun. It is the most reliable, frequently giving positive results when other methods are negative, and the different varieties of spirochætæ can be more easily distinguished.
6. The Indian ink method, properly performed, appears to be more reliable than Giemsa's, though enough observations have not been made to ascertain if this is always so.
7. The collection of serum from the syphilitic lesions by the application of spirit is free from certain objections which occur in other methods.

Dr. W. D'ESTE EMERY (London), in discussing Dr. Phillips's and Dr. Glynn's paper, agreed with them in their conclusions as regards the superiority of the dark ground illumination method. He thought that the reason they found more spirochætæ with this method than by Giemsa was that all the spirochætæ do not always stain. He preferred Leishman's method to Giemsa's stain.

Dr. J. M. BERNSTEIN (London) drew attention to the importance of the early recognition of the spirochæta pallida, in view of the fact that better results were obtained by modern methods of treatment when applied at the earliest possible occasion.

Dr. J. DALE (Birmingham) gave testimony to the value of Burri's method and dark ground illumination when working with spirillosis of the hen and in rabbit syphilis. In syphilis of the testicle in rabbits he found spirochæta pallida in 100 per cent. of cases in which there were signs. He considered the dark ground illumination method infallible, and reminded the meeting that spirochætæ were not always present in primary sores all the time, and that when they were not found by this method they were probably not present.

Dr. GLYNN replied, and agreed with Dr. Emery that many of the spirochætæ pallidæ in a field were not stained by Giemsa's method; and further, that they were often not to be found in sores that had been dusted with mercurial powders.

Dr. GLYNN then read a paper on

A Case of Cirrhosis, Adenoma, and Carcinoma of the Liver,

in which paper were also described two other cases of alcoholic multilobular cirrhosis of the liver terminating in cancer. In the title case the distribution of the cirrhosis and carcinoma was unusual, for the left lobe was enormously hypertrophied, the cirrhosis slight, and the adenomata few; whereas the right lobe showed marked multilobular cirrhosis, adenomata were frequent, and in two portions diffuse cancer was present. Microscopically there were various grades between hyperplasia, adenomata composed of tubules and trabeculæ, and carcinoma of the spheroidal-celled type. The veins were filled with growth and numerous hæmorrhagic and anæmic infarctions had occurred.

Dr. P. B. RIDGE (London) read a paper on

A Case of Chorion Epithelioma,

in which he stated that the case was of interest owing to the fact that it had been impossible to discover any primary lesion, although many sections had been cut from various parts. He showed the uterus and appendages in a jar, and drew the attention of the meeting to the large thrombi in some of the uterine vessels. Sections of these thrombi had been cut without finding anything. He then described another very similar case he had met with, and mentioned that the correct diagnosis was not arrived at for some time, as the patient was thought to be suffering from infective endocarditis. Both these cases occurred in women who had been pregnant.

Dr. EMERY said he was very interested in Dr. Ridge's paper, as he had had a case in which the diagnosis of infective endocarditis had been made. Numerous blood cultures were taken without growing any organism; B. coli were found in the urine, but an autogenous vaccine had no beneficial effect on the patient's health; and finally chorion epithelioma was diagnosed. He thought it was very necessary to cut serial sections of all material before giving a diagnosis.

Dr. BERNSTEIN wished to know whether sections of the thrombi were cut in Dr. Ridge's case. He reminded the meeting that chorion epithelioma was not necessarily associated with pregnancy or even with the female sex, and there were quite a number of cases in the literature of deciduoma malignum in man. He considered that the difficulty of a microscopical diagnosis in chorion epithelioma was due to the fact that these growths frequently destroy themselves by bleeding into themselves. He contended that the terms chorion epithelioma and deciduoma malignum were misleading.

The PRESIDENT, in closing the work of the section, congratulated all the speakers on the excellency of their papers, and he particularly wished to thank Dr. Emery and Dr. Rolleston for their papers. He thanked the officers, especially Dr. Wynn, for the splendid way in which they had done their work.

Professor SIMS WOODHEAD proposed, and Dr. GRÜNBAUM seconded, a hearty vote of thanks to the President, which was accorded with acclamation.

The PRESIDENT thanked the section and adjourned the meeting till next year.

STATE MEDICINE AND INDUSTRIAL DISEASES.

FRIDAY, JULY 28TH.

President, Professor ALFRED BOSTOCK HILL (Birmingham).

Dr. R. J. COLLIE (London) read a paper entitled

A Few Observations upon 17,000 Consecutive Medical Examinations, Conducted Chiefly for the Public Service.

He said that it was obvious that the standard of pass for the different branches of a public service must vary with the nature of the proposed occupation of the employee. Perfect vision, for instance, was necessary in the case of all firemen, as well as very full development of the muscular system, whereas for clerical work a large number who had visual defects which were remediable by the use of lenses were passed, provided they procured suitable glasses. In the case of electric car drivers the eyes were specially tested for visual acuity, the standard being perfect vision. They were subjected to a lantern test, as well as Holmgren's test for colour blindness, and were also examined for tobacco amblyopia. In testing the eyes for visual acuity with the ordinary spectacles supplied for this purpose by opticians, it was astonishing how small a deflection of the head to one side enabled the candidate to use his second eye, which was apparently covered. Many years ago he had large pieces of aluminium attached to the ordinary circular discs, and he was satisfied that those eliminated the possibility of error. It was apparent that a preliminary medical examination must, in view of the Workmen's Compensation Act, from a commercial point of view, be distinctly to the advantage of the employer of labour. The percentage of rejections was over 10. A somewhat stringent examination was insisted on for banks and large mercantile firms, and judicious and far-seeing employers were gradually realising the necessity of such examinations even in much smaller commercial undertakings. In regard to examinations of employees for sickness and accidents, employees who had been on the sick list for 28 days from any cause were sent to him in his official capacity for examination and report. That was found to be a considerable check upon the temptation to malinger or to unduly prolong illness after accidents or sickness. For instance, a man who had been drawing sick pay for nearly two years, a

the date of the passing of this 28-day rule, explained that he was weak and had a pain in his back, that the weather affected it, and that he was unable to work. Dr. Collie satisfied himself that the man had no physical disability, and pointed out to him that as he had not given notice of his injury a year ago he could not claim under the Employers' Liability Act; that the alleged accident happened prior to the passing of the Workmen's Compensation Act of 1906; that he (Dr. Collie) believed he was never really ill, and that he was to return to duty forthwith, otherwise he would report him unfit for duty, in which case he would be dismissed without compensation. The man returned to work, and had never complained since of his back or of any other portion of his anatomy. The 28-day rule, though by no means equal to systematic re-examination at set intervals, certainly enabled him to keep an eye to some extent generally upon the health of the staff. For instance, a tramway driver a little time ago was discovered to be suffering from aortic regurgitation, and a school attendance officer from locomotor ataxia, when they presented themselves on the expiration of 28 days' sick leave on account of a slight injury in the first case and a sprained ankle in the second. That the adoption of that method of medical inspection had been eminently satisfactory was proved by the statistics of one department alone, where some 1400 men were employed. All were medically examined before entering the service and all were entitled to medical attendance by district medical officers paid by capitation grant. It was found that prior to the institution of the independent medical inspection after 28 days the total number of days men were on the sick list amounted in one year to 14,400, whereas subsequent to the institution of the new rule that number was reduced to 9600—a reduction in a well-organised and disciplined small force of no less than 4800 days in one year, the percentage of reduction being 33⅓. During the corresponding periods the total number of men sick for more than 28 days was reduced by the somewhat surprising figure of 50 per cent. It was the duty of medical men to help the State to count amongst her citizens the maximum number of elements capable of working. In a large number of cases which eventually came before the courts introspection and subjective sensations were unwittingly fostered, and a traumatic neurosis was brought into being which was of psychogenic origin and did not rest upon the physical injury itself, but upon the idea of the injury, which in its turn was dependent upon the personal equation and the personality of those who were associated with the claimant in the lawsuit. Experience taught that closely similar injuries attributable to like accidents present one kind of clinical picture and run one kind of course amongst those who make no claim for compensation; but they presented a very different picture and ran a very different course amongst those who embarked upon the troubled sea of litigation. That difference was highly significant of the influence of litigation in magnifying pain and perpetuating incapacity.

Dr. A. H. BYGOTT (Barking) said that at present in the case of Friendly Societies when a second opinion was required one was often sought from a rival practitioner with very unsatisfactory results; in cases possessing a nervous basis the question of hypochondriasis was a very important one, and it was very difficult to know what to do with them.

Mr. E. H. HELBY (Birmingham) suggested as a means of dealing with cases of prolonged malingering that it should be made legal for the employer to demand, and the Court to order, that the workman should be treated at the employer's expense in certain scheduled institutions.

Dr. J. G. MCBRIDE (York) said that as medical inspector of the North-Eastern Railway Company he did not find much malingering among the regular staff, but chiefly among the casuals, such as dock hands, of whom numbers were employed.

Mr. W. F. DEARDEN (Manchester) said that malingering was more prevalent in case of accident than disease; there were several reasons for that. There were more industrial accidents than disease, and workpeople were not yet quite so conversant with obscure symptoms of industrial poisoning and disease as they were with the effects of accident, but he ascribed the main reason to the barrier raised by the particular function of the certifying surgeon.

Dr. W. SALISBURY-SHARPE (London) said that one of the difficulties causing loose and vague certification by club doctors was the demand of the societies for an instant certificate on the first interview when disease was often in an undeveloped form and an accurate diagnosis impossible.

Dr. COLLIE, in replying, said that it was his practice to induce doubtful functional nerve cases to enter a hospital, and he never had any difficulty in inducing employers to pay the actual out-of-pocket expenses of the hospital.

The work of the section was concluded with a paper on Industrial Diseases in Birmingham communicated by Dr. R. W. EDGINTON.

THERAPEUTICS AND DIETETICS.

FRIDAY, JULY 28TH.

President, Sir ROBERT M. SIMON (Birmingham).

A discussion was held on

The Scope of Immune and Normal Serum in Treatment.

Dr. T. J. HORDER (London) reviewed various diseases in connexion with the use of vaccines and antitoxins, expressing the general conclusion that antisera were more appropriate in the early or acute and vaccines in the later or more chronic stages. The difficulty of the subject was due largely to the need of correlation between the results of laboratory experiments and clinical observations. There was considerable scope for extension in the use of normal serum both as a curative agent and as a "control" against the use of "specific" sera. The properties of normal serum were described, both of animal and human origin, together with its use in the treatment of certain infective conditions. Dr. Horder then passed on to define the scope of immune serum, both antitoxic and bactericidal. He adverted to the neglect of serum administration which had followed the introduction of vaccine-therapy, which, he said, was unjustifiable. He emphasised the value of immune sera at the outset of acute infections, adding that high grades of immunity were essential to success. Commenting on the employment of univalent and polyvalent sera, he drew attention to the reversion in favour of univalent antistreptococcus serum in S. pyogenes infections, concluding with a recital of results.

Dr. E. C. HORT (London) referred to the various "hyperæmia" methods of treatment (congestion, poultices, &c.) as equivalent to normal serum-therapy, iodine applications representing in addition the effects of antiseptic lymph in circulation. Foreign sera locally applied exercised a restraining influence on inflammatory changes, relieving pain in ulcer of the stomach or duodenum. Exposed ulcers, as on the leg, healed in two or three weeks after remaining open for 15 to 20 years. Suppuration was arrested and healthy granulation induced. Remarkable healing effects followed the use of this agent in chronic sinuses and wounds other than those connected with bone. Mr. Warren Low used serum with great benefit to wash out mastoid sinuses. It was a valuable agent in promoting the healing of bedsores and especially of sinuses connected with the digestive organs, such as biliary and gastric fistulæ. This exhibited the antilytic power of serum. Its anti-hæmorrhagic power was seen when injected in hæmophilia and purpura or internal hæmorrhage from any cause, since it hastened the coagulation period and counteracted the influence of toxins. Oral administration was satisfactory, normal horse or sheep serum being employed which was sterile and atoxic. Serum also possessed a very pronounced antitoxic power.

Dr. E. W. GOODALL (Homerton) said there were very acute cases of purpura, mostly after scarlet fever, fatal in from 36 to 48 hours in which an appropriate serum would be welcomed. In bad cases of angina (cellulitis of neck) he had employed antistreptococcus serum daily in doses of 30–40 c.c., preferably by subcutaneous injection, but not with uniform results. He cited one case of acute erysipelas, however, where this agent had a really remarkable effect.

Dr. E HOBHOUSE (Brighton) cited an instance of apparently marked improvement in septicæmia, but the patient succumbed a few days later to purpura. He had also seen an unusually severe and acute erysipelas quickly recover after the use of a polyvalent antistreptococcus serum.

Dr. J. HADDON (Hawick), Dr. GEORGE W. ROSS (Toronto), Dr. T. D. MANNING (Weymouth), Dr. H. W. GARDNER (Shrewsbury), Dr. A. T. COLEMAN (Leicester), and Dr. OTTO F. F. GRÜNBAUM (London) also spoke.

Dr. D. J. A. CHOWRY-MUTHU (Wells) read a paper on

Continuous Antiseptic Inhalation in the Treatment of Pulmonary Tuberculosis.

Opening with some considerations as to the causes and conditions of pulmonary consumption, he went on to trace the development of modern treatment through simple exposure in the open air and graduated exercise till he arrived at the supplementary method of antiseptic inhalation, to which he attributed the chief beneficial effects and most rapid stages of improvement. The method is claimed to have a very ancient origin, volatile aromatic substances having been employed before the days of Hippocrates in Greece or of Susruta in India, being recorded by Charaka earlier than the Bhuddist era, 500 B.C. Galen praised the efficacy of sulphur and advised residence near Vesuvius, whilst Laennec mentions the use of vapours from aromatic plants, balsams, &c., in affections of the chest. The discovery of micro-organisms as the exciting cause of disease gave a fresh impetus to the inhalation treatment, and many new forms of apparatus and materials for inhalation came into vogue. Though opinions have varied as to the efficacy of the method, it has received new impulses by the work of many well-known physicians in recent times, and has been steadily prosecuted in the Mendip Hills Sanatorium. During the past 13 years formaldehyde had been the basis of the inhalant, successful cases being reported at the Tuberculosis Congress of London in 1903. Since that time the method and ingredients had been elaborated, two principal modes being employed: 1. The open method, formaldehyde being vapourised over a lamp in a closed chamber for an hour or less. 2. The continuous method, carried out by the aid of a mask fitting closely and conveniently over the respiratory orifices. The combinations employed were:—

A. Formalin, 2½ per cent.; chloroform, ℥i.; menthol, gr. x.; ol pini pumiline, ♏x.; sp. vin. rect. ad ℥i.

B. Formalin, 5 per cent.; guaiacol, 12½ per cent.; chloroform, ℥i.; menthol, gr. xv.; ol pini pumiline, ♏xv.; sp. vin. rect. ad ℥i.

C. Guaiacol, ℥ii.; chloroform, ℥i.; menthol, ♏xv.; ol pini pumiline, ♏xv.; terebene, ℥i.; sp. vin. rect. ad ℥i.

About ten drops sprinkled on the cotton-wool in the mask at half an hour or an hour's interval. The inhalation is commenced for a period of two hours, which is gradually extended to four, six, eight, and even nine hours daily, being reduced again as improvement occurs. This is in early uncomplicated cases. Should the patient's condition require confinement to bed, the inhalation is continued all day and as far into the night as possible, being suspended by degrees as improvement occurs. Treatment commences with A solution, then B, C being employed chiefly at night. Three hundred patients have been so treated with excellent results. Where dyspnœa or hæmoptysis occurred the treatment was suspended for a time. 52 per cent. made a complete recovery and resumed work. All stages of the disease were so treated. Dr. Chowry-Muthu adduced a number of reasons for attributing the main improvement to inhalation, and cited some specially satisfactory cases and incidents.

TROPICAL MEDICINE.

FRIDAY, JULY 28TH.

President, Sir FRANCIS LOVELL, K.C.M.G. (London).

The first item on the programme for the day was a communication by Dr. ANDREW BALFOUR (Khartoum) on

The Rôle of the Infective Granule in Certain Protozoal Diseases,

which he said was intended to be more of the nature of a demonstration of microscopical specimens than a paper. Dr. Balfour's view is that in certain protozoal infections, and more especially in spirochætosis and trypanosomiasis, what may be termed the "infective granule" plays an important rôle. It constitutes a stage in the life-cycle of the parasites, a stage hitherto in a large measure overlooked or unrecognised; it explains to some extent latent infections, and possibly clears up the somewhat obscure mechanism of relapses. Furthermore, the recognition of such a granule or spore may well modify our views in respect to prophylaxis and treatment, and may also lead to new discoveries as regards the histopathology of some of these protozoal diseases. These remarks, Dr. Balfour said, apply alike to humannd a animal infections. His own work had been confined to fowl spirochætosis and to syphilis, but Captain W. B. Fry, R.A.M.C., of the Khartoum Laboratory staff, had made important observations on trypanosomiasis, and indeed witnessed what Dr. Balfour terms "granule shedding" in the case of trypanosomes before he (Dr. Balfour) had seen it occurring in spirochætosis. He laid no claim to being the first to realise the possible importance of such granule infections. After referring to the historical aspect of the subject, he went on to explain that his discoveries did not consist in the recognition of the infective granule, but in finding out that it is shed by the living parasite both naturally and when the parasite is under the influence of some toxic drug, such as salvarsan, which intensifies the phenomena, and which led Dr. Balfour to observe it in the case of the fowl spirochæte. Some description was then given of the various microscopical specimens he had to show to the Section relating to: 1. Fowl spirochætosis; spirochætæ in the fowl or chick. The phenomenon of these spirochætæ shedding granules is greatly intensified by salvarsan; they are resistant and not easily killed by that drug. Some appear to enter the red cells. These granule inclusions undergo development and pass through a state of schizogony, and finally the schizonte breaks up into tiny merozoites which are discharged into the blood stream. Their further history remains unknown. 2. Syphilis; treponema pallidum, a granule shedder. Salvarsan greatly stimulates this action. It is probable that these granules cause tissue irritation, are responsible for latent infections, for failures in therapeusis, and for the tertiary lesions of syphilis. 3. Trypanosomiasis. Captain Fry has shown that T. brucei and T. evansi shed living granules; they become plasmodial masses, out of which eventually trypanosomes are developed. Dr. Balfour concluded by saying that his observations appeared to justify Dobell's views that the spirochætæ are best placed in a group by themselves, *the spirochætoidea*. Closely allied, however, are the trypanosomes, and whether we call them protozoa or not, he believes that granule shedding will be found to be a phenomenon presented by many of the pathogenic, and possibly by some of the non-pathogenic, protista, to use a non-committal term and yet sufficiently descriptive.

Professor W. J. R. SIMPSON (London) then opened a discussion on

The Sanitation of Villages and Small Towns in the Tropics, with Special Reference to Efficacy and Cheapness.

He said there was no surer way of getting a scheme for improving the sanitary condition of a place rejected than the submission of costly estimates. These estimates were not prepared by the sanitary officers, but it was very advisable that the latter, to protect themselves, should possess a fair knowledge of the cost of sanitary appliances and the price of labour. No elaborate schemes were needed for villages and small towns. As a rule, their sanitation was simple and inexpensive if properly carried out. There were no hard-and-fast methods, cheap and efficient, applicable to all villages or towns alike. In some localities biting and non-biting flies, bugs, fleas, or mosquitoes have to be contended against, while in other places there were none, or but few. Efficacy and cheapness depend primarily on the sanitary policy adopted; secondly, on a thorough grasp of sanitary matters in their general, microbial, and entomological bearings, and a due perception of their respective values; and thirdly, on their systematic and regular application to local circumstances. It was a common policy to let things drift and to postpone action until disease broke out; this gave neither efficiency nor cheapness. Fortunately, there had been signs of late that this old procrastinating policy was passing away and a more active one was being adopted; this was due perhaps partly to the teachings of the schools of tropical medicine, and partly to the influence of the Colonial Office which was now more concerned than formerly about public health matters in the colonies. Sanitation seldom keeps pace with our knowledge which has been acquired by experience and research. The field of preventive medicine was rich in its triumphs and discoveries, but the value of these was lost if the knowledge was not applied, or only applied indifferently, for the improvement of the public health. One of the most obvious things in the tropics to the observer was the repetition of the same insanitary conditions in many different localities. A removal policy, after insanitary conditions had arisen, had been largely adopted

as the sanitary policy of the day, and had been responsible for much inefficiency and ultimately for great expenditure. This was especially true with regard to new trading centres which, begun on the old insanitary lines, grew rapidly into unhealthy areas. In some places excellent regulations existed, but they were seldom put into force. The usual practice was to allow conditions inimical to health to arise, and then, under the stimulus of an epidemic or a rising death-rate, to remove those conditions in haste, no matter what the cost might be. A sanitary policy may, for want of adequate knowledge, be wrongly directed and fail, causing in the end unnecessary expense to rectify it, leading to reaction and hindering sanitary progress. An active policy needs adequate guidance and advice, without which there is risk of failure. The obnoxious system of asking for sanitary advice after the works have been completed, instead of before they were begun, is not only responsible for most of the mistakes, but also for most of the unnecessary costliness of sanitary measures. This seeking of advice at the wrong time may possibly arise from the fact that the medical man in a case of sickness is called in after the patient is ill, and it is not realised that his functions in preventive medicine are of a different kind, and that his advice is required at a different time. He is sometimes called in by the executive after the completion of a scheme which his conscience compels him to condemn, and consequently he incurs the displeasure of those in power; any alterations he may suggest are almost certain to turn out costly. He is thus placed by a wrong system in an antagonistic position as regards the other executive officers, and this in turn leads to a hesitancy on their part to consult him in the future. It is very advisable that his relations with these officers should be of the most cordial description, and that his advice should be appreciated by them. One sanitary officer had summed up the situation by saying "it is not fault finding but fault prevention that should be aimed at." The preventive policy should apply to European and native quarters alike. There is some risk that most attention may be paid to the isolated European quarters, and that those of the native may be neglected. "It is unnecessary here," said Professor Simpson, "to enter into the various details of an active preventive policy. It is essential, however, to recognise that the general, microbial, and entomological aspects of sanitation should fit into one another, each being interdependent on the other. In the application of sanitary measures continuity of effort is necessary, both for efficiency and cheapness; but this continuity will not be obtained locally, nor will the regulations be enforced when the medical and other officers are changing unless the conditions are periodically inspected by a higher sanitary authority which has an influential position in the councils of the Government."

Dr. W. T. PROUT, C.M.G. (Liverpool), said that those who were familiar with sanitary matters in the tropics knew the difficulty of getting estimates beforehand for the proposed works. It was a good policy to try to remain always on good terms with the executive officers, and to endeavour to induce them to regard sanitary questions from the proper points of view. The mass of ignorance and prejudice among the native races was well known to all those who had served in the tropics. We must look to the education of the younger generation in sanitary knowledge to remove these obstacles to progress by teaching the natives the simple principles of hygiene. There was a danger in allowing the executive officers in the colonies to have too much control over sanitary measures. There should always be a large preponderating medical and sanitary influence.

Dr. A. J. CHALMERS (Colombo) thought that the question before the Section was far too large to be discussed at one sitting. He agreed that it was necessary, if progress were to be made, to educate the native. This was being done in Ceylon, for the native teachers were brought in turn each year to Colombo for a three weeks' course of instruction in hygiene by simple kindergarten methods. When they return to their schools they teach the children by the same kindergarten methods the elements of sanitation. Examinations, oral and practical, are held annually, and if sufficient knowledge of the subject is shown the school obtains an extra grant from the Government. He thought it was also necessary to interest the native doctors, the irregular practitioners of the tropics, in sanitation. He urged the association of the religious portion of the community with public health matters. It was essential that sanitary officers should at all times be on good terms with the Public Works Department. It was his opinion that one of the greatest troubles in the East was the spread of tubercle, due in part to overcrowding in insanitary dwellings. Sanitary measures, if enforced, might be expected to reduce the ravages of this disease.

Dr. BALFOUR (Khartoum) alluded to the want of British-trained sanitary inspectors in our colonies and dependencies. These officers should form the backbone of the sanitary service. Everything depended on such men being honest, tactful, independent, fearless, and trustworthy. They should correspond to the non-commissioned officers in the British army. If British certificated sanitary inspectors were sent out to the colonies an additional course of training beforehand in anti-mosquito measures and other special work needed in the tropics would be necessary.

Dr. M. CAMERON BLAIR (North Nigeria) spoke of the difficulties of effecting improvement in sanitary conditions in a Mahomedan community. They should utilise, as far as possible, the religions of the natives in advancing the standard of public health among them. The Khoran, unfortunately, gave no help whatever in this direction. He thought it was impossible, for financial reasons, to obtain trained British sanitary inspectors in the tropics. They must be content to do the best they could with native inspectors, some of whom were quick to acquire the necessary knowledge.

The discussion was continued by Lieutenant-Colonel A. H. NOTT, I.M.S. (Calcutta), Dr. DAVID GALLOWAY (Singapore), Dr. R. H. KENNAN (Dublin), and Major R. W. H. JACKSON, R.A.M.C. (Plymouth). After which Professor SIMPSON replied. He said he had purposely in his address avoided details of sanitary work, but had made his remarks as general as possible, so as to be adapted to all parts of the world. Many of the hindrances and difficulties to sanitary progress might be overcome by common-sense and tact. After Professor Simpson had replied, Dr. CHALMERS suggested that the Council of the Association should be asked to approach the Colonial Office requesting it to instruct its officers to investigate the sanitary condition of each colony, and to present a scheme for the improvement of existing insanitary conditions. After a brief discussion, in which Dr. CAMERON BLAIR, Dr. PROUT, and the PRESIDENT took part, Dr. CHALMERS withdrew his proposal, and the matter was postponed till the next meeting of the Section. When this had been agreed upon, Mr. JAMES CANTLIE (London) proposed that the Schools of Tropical Medicine should be asked to include in their course of teaching the instruction of certificated sanitary inspectors in work which would fit them to act in tropical countries. This proposal was seconded by Dr. PROUT, and among those who spoke upon the subject were Dr. K. S. WISE (British Guiana) and Dr. BALFOUR, the latter emphasising the great need for such trained inspectors in the colonies; though they might cost money, he said, their work would lead to a saving in the end, not only of money, but of life and of health. Finally this proposal, like the previous one, was postponed for consideration till the next meeting of the Section.

Dr. H. P. COLE (Alabama), of the United States Public Health and Marine Hospital Service, read a paper on

Transfusion in Pellagra.

Pellagra, he said, was a subtropical malady associated sometimes with acute or chronic disease. He then sketched out its geographical distribution in the United States, and briefly referred to the various forms in which the disease was met with. Some cases ran a rapidly fatal course. In these it had been thought that transfusion might be of service. Some of the cases brought to him for hospital treatment were quite beyond help, and in some instances the patient had died on his way to the hospital. The treatment by transfusion was only tried in severe cases, many of which from the nature of their attack were expected to die. He admitted that the method of treatment was as yet only in the experimental stage, but the results, so far, were very encouraging. Of 30 severe cases in which transfusion had been employed only 13 died, some of the latter being in a hopeless state when the treatment was undertaken. Excluding these cases, an astonishing improvement was noticed in the patients, a few days after the transfusion, in their mental condition and a

gradual increase in body-weight, one case indeed gaining 30 lb. in 11 weeks. Recovery was established in a period varying from one to four months. The results of the treatment compared very favourably with those obtained by other means, and should therefore receive a further extended trial.

After a few observations by Dr. F. M. SANDWITH (London) Dr. L. W. SAMBON (London) gave a *résumé* of his work on the etiology of pellagra, and the facts on which he based his theory that it was an insect-borne disease.

Mr. JAMES CANTLIE (London) took the opportunity of informing the Section that Dr. Sambon would shortly resume his inquiry into the etiology of pellagra in Italy, and Austria, and other parts of the European Continent, funds for the purpose having been generously provided, it was understood, by Mr. H. Wellcome.

Dr. W. YORKE, Director of the Runcorn Research Laboratory, read a paper on

The Mechanism of the Production of Suppression of Urine in Blackwater Fever.

Suppression of urine being a by no means infrequent sequel of blackwater fever, and the symptom being an extremely grave one, the mechanism of its production was a problem of considerable practical importance. Whether, on the one hand, the occurrence of hæmoglobin free in the blood plasma, and its subsequent elimination by the kidneys, are sufficient to produce suppression of urine through mechanical blocking of the renal tubules; or, on the other hand, whether a nephritis or nervous inhibition of glomerular secretion is to be regarded as the essential factor in the development of this condition in blackwater fever was a question which had not been definitely settled. With the object, therefore, of throwing further light on the subject Dr. Yorke undertook his investigations. For this purpose he carried out a number of experiments and observations on rabbits, the results of which may be summed up as follows. In certain circumstances the mere passage of hæmoglobin through the kidneys of a healthy animal is sufficient to cause suppression of urine owing to occlusion of the lumen of the renal tubules by plugs of granular material derived from the hæmoglobin. The process is considerably facilitated by any factor which tends to lower the blood pressure of the animal, and as a result the secretion of water by the Malpighian capsules. On the contrary, when the blood volume is sustained by the injection of saline solution and by feeding the animal on moist food a large amount of hæmoglobin (41 grammes) may be injected without any tendency to suppression of urine. It appears that Dr. Yorke's observations have an important bearing upon the treatment of suppression of urine in blackwater fever in man. He points out that on the earliest sign of any diminution in the volume of urine voided radical measures must be adopted. The patient should be given large quantities of fluid by the mouth if possible or by the rectum, and cardiac stimulants, such as digitalis and caffeine, administered. Should these not produce a copious flow of urine recourse ought at once to be had to large intravenous injections of normal saline solution. Dr. Yorke's experiments indicate that it is useless delaying the adoption of these measures until suppression has actually commenced. At this stage it is improbable that any procedure will be adequate to displace the casts. This is in agreement with clinical observation that late intravenous saline injections usually fail to relieve suppression. When suppression has once developed and continued, even for a short period, the injury done to the kidneys is such that the result must of necessity be almost invariably fatal. Dr. Yorke, during the reading of his paper, showed a number of lantern slides illustrating his microscopical preparations.

This paper, having concluded the business of the Section, Dr. PROUT proposed a vote of thanks to the President, and after Sir FRANCIS LOVELL had replied the meeting terminated.

THE PATHOLOGICAL MUSEUM.

THIS was no mere collection of isolated examples of morbid anatomy, for a real attempt had been made to represent the morbid changes illustrative of a few definite diseased states, and the attempt had materialised into *un fait accompli*. It is true that to a few the value of a museum specimen lies in the specimen itself as a piece of dead abnormal tissue, just as a rare stamp may be of interest to a philatelist, but to most practical workers it only becomes of value in association with the clinical history and other data. To these latter museum specimens are made to live again and teach important lessons, and to this group belong the organisers of the Birmingham Museum. It would be impossible to do justice to the entire collection, but we may discuss a few of the groups perhaps with advantage.

In the Section of Medicine there was a comprehensive series illustrating affections of the pancreas, for the most part the result of the work of the Leeds school. A specimen from a diabetic man, aged 46, was atrophied and fibrosed, and the ducts had been opened to expose numerous white calculi. Acute hæmorrhagic pancreatitis and fat-necrosis here became realities in the presence of so well preserved and lifelike specimens. One specimen of fat-necrosis was said to have been consequent on obstruction of Wirsung's duct by bile mud, in a case of suppurative cholecystitis and gall-stones, and several pieces of omentum were shown with typical fat-necrosis.

A satisfactory attempt had been made to illustrate visceral syphilis, and amongst this collection were two fine examples of the rarely seen condition—syphilis of the lung. These showed ulceration of the air passages and marked perivascular and peribronchial fibrosis of the pulmonary tissue and pleura, with occasional miliary gummata; the man died suddenly from hæmoptysis, and the nature of the disease might easily be overlooked in similar conditions. There was also an example of a fibrous stricture of the œsophagus, suggestively syphilitic, and numerous ulcerations of the intestines, not to forget a syphilitic stricture of the rectum in a man, aged 45, showing extreme fibrosis and thickening of the coat for some 3 inches. The man had died from rupture of the distended colon, and the only other case we recollect seeing also came from a man who died from traumatic rupture of the sigmoid (instrumental). Visceral syphilis of the less common types is an extremely difficult lesion to diagnose with certainty, but many of the chronic fibrotic lesions of syphilitic origin will be more easily distinguished in the future with the aid of Wassermann's reaction, which was readily obtained in the post-mortem blood of the rectal case mentioned above. Mention must be made of a piece of lung with a large honeycombed tumour of the size of an orange, which, though simulating actinomycosis, was actually tuberculous; and also an uncommon specimen of infective endocarditis from a woman, aged 25, in which the pulmonary orifice was the seat of an extensive mass of vegetations.

A magnificent collection had been loaned by the Cambridge committee for the study of special diseases consisting of specimens and skiagrams illustrating the morbid changes found in the joints of cases of "so-called rheumatoid or osteo-arthritis, and chronic gout." Skiagrams and casts and macerated specimens from individual cases enhanced the value of this exhibit, and though there is some difference of opinion as to nomenclature there can be none as to the anatomical changes. Here were to be seen exemplified the atrophic and hypertrophic varieties of rheumatoid arthritis in all stages—the early fibrillation, with velvety appearance of the cartilages, the lipping of the cartilages, the overgrowth of the synovial fringes—in one case so extensive as to recall the condition of tuberculous synovitis—the formation of osteophytes and the advanced condition of atrophy and ivory eburnation of the apposing surfaces of the joints with pseudo-ankylosis from the extreme osteophytic overgrowth. Also the less universally recognised condition of true bony ankylosis.

Some fine examples of gout, most of which seem to have arisen in the infirmaries of the metropolis, demonstrated the heavy deposits of urates in the synovial bursæ (prepatellar bursæ and those of the phalanges), and also the ankylosis sometimes associated therewith, and some kidneys had been preserved in gelatin in which the pyramids were permeated with white streaks of urates. A small granular kidney with streaks of urates in section was especially interesting, as was also a larynx showing a tophaceous deposit on a vocal cord. It must be remarked that gouty deposits are not uncommon in the joints of many people at autopsy in whom there have been no symptoms of such, but unfortunately the examination of joints is not part of the usual routine of an autopsy.

Several examples of Charcot's disease were to be found in the various sections described, showing by photographs, radiograms, and macerated specimens the hypertrophic variety with osteophytic overgrowth and enlargement occurring in the knee and elbow, and the atrophic destructive variety as exemplified in the shoulder.

In the section devoted to Diseases of Children some of the anatomical causes of jaundice were demonstrated. A specimen of congenital obliteration of the bile ducts had come from a child aged 6 months, and there were three examples of multilobular cirrhosis (the typical "hobnail" or "gin-drinker's" liver), the alcoholic etiology of which has been for some time now recognised as requiring revision, if not as entirely erroneous. The most typical specimens of this have been seen in very young children and in patients who have certainly never partaken of alcohol. The fatty degeneration of liver in acid intoxication was demonstrated and also the same process in delayed chloroform poisoning. An unusual type of tuberculoma of the liver and spleen was indistinguishable from the lymphomata found in Hodgkin's disease, though experimental proof was forthcoming in an adjoining exhibit of the viscera of the guinea-pig which had been inoculated with some of the diseased tissue and which died with typical tuberculosis.

The brain and heart of a girl who died from chorea showed extensive subarachnoid and ventricular hæmorrhages in the former, and a ring of fine and recent vegetations round the mitral valves, a condition often occurring, but seldom seen, in the post-mortem room. A rare complication of posterior basic meningitis (meningococcal) was shown in the form of pericarditis. Pericarditis of the tuberculous variety was illustrated by two specimens; one from a child aged 2, who died from tuberculous meningitis, showed universal adhesions of the pericardium. A rare specimen was a metastatic osteo-sarcoma of the heart secondary to growth of femur in a girl, aged 15; and as a curiosity was shown the hypertrophied heart of a child, aged 6, whose kidneys were typically granular and only weighed ¼ oz. each.

The hæmorrhages into the various viscera and beneath the dura occurring in acute leucocythæmia were represented in specimens from various cases.

There were many examples of the unusual condition of congenital fœtal goitre, and side by side with these some specimens of hygroma of the neck, and a unique specimen of a false aneurysm of the internal carotid artery in a boy, aged 5, which simulated retropharyngeal abscess with fatal results. The effects of inherited syphilis on a child, aged 9 months, was shown as multiple cerebral thrombosis with patches of softening.

In a series illustrating some of the typical forms of pulmonary tuberculosis in childhood we were pleased to note one specimen drawing attention to the tuberculous enlargement of the glands at the bifurcation of the trachea, which, according to the notes on this case, may sometimes be the primary seat of pulmonary tuberculosis. The importance of these glands, so often left inflamed after whooping-cough, measles, &c., is, we think, seldom sufficiently appreciated.

Pyelonephritis of childhood is little known, so it was clinically valuable to see two kidneys from children, aged 3½ months and 7½ months respectively, who had died from this condition, which is due to B. coli infection; the urine is in these cases acid, and it contains pus cells and B. coli, and the true diagnosis is often overlooked. The condition is so important and so much commoner than is supposed that we were pleased to see these specimens and have the account of the cases.

Finally, amongst the children's diseases we have to note the numerous examples of hypertrophic stenosis of the pylorus, and four examples of primary cancer of the suprarenal body with metastases in one case in the calvarium.

In the Surgical Section there was a collection of hypernephromata about 40 in number, forming a unique collection of that peculiar tumour which arises from the adrenal body itself or from adrenal rests in the kidney tissue and which presents the structure of the normal adrenal tissue. They were mostly from adults, though one had come from a child of 4; some were malignant and enormous and had invaded all the neighbouring viscera, even the inferior vena cava, and had fungated through the abdominal wall; others were benign and small and confined within the capsule of the kidney. One such small growth was found accidentally in a man who died from advanced carcinoma of the tongue, whilst another had been found in a man who died from carcinoma of the stomach—strange examples of multiple malignant growths in the same patients. Where symptoms had existed they included pain and hæmaturia, though often no symptoms are recorded. The exhibit showed the extraordinary malignancy manifested at times by such growths, and after seeing it their existence will always be borne in mind by the observer in diagnosing early renal disease.

Amongst some examples of general cystic disease were two from patients who had both reached the advanced age of 43 years.

An instructive exhibition was formed by a large collection of malignant growths of the alimentary tract which had been removed by operation, appended to most of which were the after-histories of the cases, showing that where the growths had been excised the patient was free from recurrences often to the time of recording (15 months in some). Cancers of the transverse colon were shown from several cases in which no recurrence had occurred in 15 months, and from one patient, aged 78, were obtained two separate growths (columnar-celled carcinomata) which had caused stricture of the transverse colon and which had not recurred six months after removal. In this group, for comparison, were placed three specimens of hyperplastic tuberculosis of the cæcum which simulated cancer. There were many specimens of gastric ulcers that had been successfully excised, and one extreme example of idiopathic dilatation of the colon in a boy aged 12. There was a carcinoma of the appendix from a man aged 40, and a sarcoma of the same tissues from a boy aged 17, who two and a half years after appendicectomy is still quite well. The diseases of the breast included many specimens of tuberculous mastitis and of Paget's disease, and one example of streptotrichosis from a girl aged 24. A hydatid cyst which was removed from its attachment to the transverse colon of a woman aged 27, where it formed a cystic and freely moveable tumour reaching from the pubis to above the umbilicus, is sufficiently interesting to be noted.

In the Obstetrical and Gynæcological Section there was, perhaps, the finest collection of fibromyoma ever collected in one spot. These were of all varieties, from all parts of the uterus, of all sizes, and in all stages of degeneration; fibroids associated with pregnancy, which in some cases had gone on to a normal termination, but in others had become impacted, and yet in others had undergone necrobiosis. Red degeneration was abundantly represented, and all other varieties of retrograde changes, including hyaline, mucoid, lymphangiectatic, œdematous and cystic changes, and many examples of true calcification, some specimens being of stony hardness, like the celebrated specimens said to be found in graveyards. A large myoma with lymphangiectatic cysts weighed 26 lb., and histologically was of that type which so simulates sarcoma that the question can only be determined by the after-history of the patient. Another myoma with cystic degeneration, weighing 56 lb., had been successfully removed from a woman aged 58. There were also fibroids undergoing a true sarcomatous change, and others associated with cancer of the uterus or with complications of the appendages. Examples of adenomyomata and sarcomata of the uterus were so numerous that one might have been misled into thinking the conditions were fairly common. The sarcomata had come from single and married females.

Pathological changes associated with pregnancy were represented by hydatidiform moles, in one case actually shown with the fœtus, and the malignant variation of this—the chorion-epithelioma—which latter were shown to the number of about a score. There were examples of early chorion epithelioma and of metastases, in one case in the thyroid gland. One case had come from a married woman who had had no children, and another from a woman in the early stages of her first pregnancy, though she had been married ten years; but the majority had come from multiparous women. A case of tuberculosis of the cervix, which produced a cauliflower-like mass, diagnosed from the curettings, was from a multipara aged 41, and another from a multipara aged 37 was associated with a doubtful carcinoma, though 18 months after hysterectomy the patient was quite well. An example of pyometra, associated with B. coli, was from a multipara aged 55. We can only mention the specimens illustrative of the pathology of tubal mole and of epithelioma of the vulva associated with leucoplakia, and the interesting medico-legal specimen of a pregnant uterus pierced with a crochet needle, which could not be felt on examination, but had been removed with the uterus and its three months' fœtus with satisfactory results. The possibilities of vaginal operations were illustrated by Professor Strassmann's specimens, which included some enormous tumours and some illustrations of a uterus bifidus which had been reduced to a single fundus by operation with subsequent pregnancy on

two occasions, though no data were forthcoming as to what would have happened had the original conditions remained.

The Dermatological Section was a veritable picture gallery, and here were collected some 200 beautiful wax models made by Dr. R. Cranston Low and Miss Rae of Edinburgh and Dr. G. G. Stopford-Taylor and Dr. R. W. MacKenna of Liverpool, which were life-like reproductions of many skin affections. Especially interesting was a cast of an arm showing sporotrichosis, a disease less heard of in this country than on the continent. This parasitic disease was fully illustrated by cultures and microscopical preparations of the sporothrix itself and by histological specimens from experimentally produced lesions in animals. It may be that with a widespread knowledge of this infection it will be more frequently recognised in our hospitals.

The Section of State Medicine was full of specimens of general interest. Tuberculosis was exemplified thoroughly both in man and animals. Tubercle bacilli were pictured in specimens of dust obtained from the Birmingham pavements; pure cultures of bovine and human tubercle bacilli were shown and numerous specimens from cattle, pigs, birds, and fish. Amongst a large collection of specimens of parasitic diseases of man and animals there were a hydatid cyst of the human ovary and a striking example of "gad-fly" larvæ attached in numbers to the mucosa of a horse's stomach. Also the heart of a pig with swine erysipelas showing valvular verrucose endocarditis and resembling the infective endocarditis of man. Fat necrosis occurring in the sheep and the mesentery of the pig were of much interest to the human pathologist, as were also the kidney of an ox with sarcomata therein and a leukæmic pig's spleen, but the most striking specimen of all was one of secondary chloroma on the surface of a pig's kidney, with the green colour of the growth well preserved.

In the Odontological Section were collected specimens to illustrate the pathology of retained teeth, microphotographs, and specimens illustrating that vexing condition pyorrhœa alveolaris, the etiology of which still leaves much to be desired. Mr. A. Hopewell-Smith had prepared an interesting exhibit showing the solubility, or, as it appeared, the insolubility, of the various commoner sweetmeats, including the common acid drop, chocolate, "bull's eyes," &c., and also plate cultures of the "caries" bacteria obtained from each of these, but it must be noted that solubility in saliva is a far different thing from solubility in water.

In the Section of Radiology and Radium Mr. J. Hall-Edwards had arranged a striking collection. The diagnosis of abnormal and pathological conditions of the abdominal viscera with the aid of X rays is now a routine procedure, and in the case of the hollow viscera bismuth is a valuable aid. Mr. Hall-Edwards had been conducting some experiments on kittens with bismuth meals, and some of his radiograms were shown. Dilatation of the œsophagus made a striking picture in comparison with malignant stricture. Hour-glass stomachs and dilated stomachs were numerous, and one example of a prolapsed transverse colon showed the bismuth shadow reaching down to the pubis in the erect position of the patient. An interesting series of plates illustrated the use of bismuth paste in mapping out psoas abscesses before and after treatment. Amongst numerous calculi in the urinary tract were some radiographs of calcareous glands and phleboliths resembling calculi, but distinguished from them by radiographing with a ureteral catheter in position so that the shadows were seen to be outside the ureters. One radiograph of osteomyelitis of humerus showing a distinct central rarefaction was prominent amongst a valuable collection of bone and joint lesions, as were an oxycephalic skull, and some examples of cervical ribs.

INTERNATIONAL DENTAL FEDERATION.

THE opening meeting of the Eleventh Annual Session of the International Dental Federation, or permanent bureau for the organisation of international dental congresses, was held on August 1st in the theatre of the Royal College of Surgeons of England, Lincoln's Inn-fields, under the honorary Presidency of Sir Henry Butlin.

Mr. W. B. PATERSON, the President of the Federation, delivered an address, in the course of which he referred to the work of the Federation in connexion with the public dental hygiene movement, mentioning the establishment in Germany of 120 school dental clinics, and instituting comparisons between the energy displayed in that country and the slowness shown in England in grasping the dental problem in its best, simplest, and most economical method of solution—viz., the school clinic; a slowness which he attributed entirely to different financial conditions and systems of control existing in the two countries. He was grateful to the Chancellor of the Exchequer for turning the minds of people to the financial aspects of the health question, even if he had borrowed from Germany his ideas on compulsory thrift, thus ably seconding the scope of the Medical Inspection Act of 1907, which was working a silent revolution throughout the country, and which in the end must result in the most beneficial effects upon the health of the people. On the subject of dental education Mr. Paterson explained that the methods of teaching operative dentistry was the question that would engage the attention of the delegates from the different leading dental schools throughout the world. Dental pedagogy was then introduced for the first time into the work of the education committee of the Federation. Referring to the exclusion of dentists not possessing medical qualifications in addition to their dental diplomas from meetings of the International Medical Congress in 1913, Mr. Paterson said that the Federation regretted the action of the Congress Executive Council at Budapest; but in view of the intimate relationship existing between dental affections and general systemic disease, he regarded the separation of dentistry from medicine as of a temporary character.

Mr. Paterson then introduced the leading delegates and the accredited representatives of foreign Governments to Sir Henry Butlin—viz., Dr. E. C. Kirk (Dean of the Dental Faculty of the University of Pennsylvania), Professor Jessen (Strassburg), Dr. Brophy (Chicago), Dr. Weiss (Habana), Dr. Etchepareborda (Buenos Aires), Dr. Aguilar (Madrid), Dr. Grevers (Utrecht), Mr. Van der Hoeven (Hague), Dr. Godon and M. Francis Jean (Paris), Dr. Rosenthal (Brussels), Chevalier Guérini (Naples), Dr. Daubry (St. Petersburg), Dr. Schaeffer Stuckert (Frankfort-on-Main), the Secretary-General, who presented the recently completed transactions of the International Dental Congress of 1909.

Mr. NORMAN G. BENNETT, honorary secretary of the British Dental Association, extended a welcome to the members of the Federation, and invited them to attend the association's annual meetings which followed immediately upon the Federation's.

Sir HENRY BUTLIN, in an eloquent speech, expressed the pleasure that he felt in presiding over the Federation's opening meeting within the walls of his College. Possessing such an admirable odontological museum as the College did, and so many interesting dental exhibits in the work of John Hunter, he could conceive no more fitting place for the meeting of such a body of dental experts. Sir Henry Butlin then proceeded to discuss cancerous affections of the tongue, with especial reference to possible predisposing dental causes. Of leucoplakia as a preceding local condition of cancer in persons predisposed by gout, rheumatism, or syphilis, he was quite certain. Of the exciting causes of leucoplakia, he placed tobacco smoking first. He asked the members present to recall frictional conditions resulting from rough metal stoppings, or edges of teeth leading to leucoplakic patches, and he asked for information respecting the qualities of red vulcanite, as used in plates, which might have a similar irritating tendency. In conclusion, Sir Henry Butlin showed the well-known and classical specimens of teeth prepared by John Hunter in illustration of transplantation, as also several examples of pathological neoplasms and affections of the dental periosteum.

At the conclusion of the honorary President's very interesting address a hearty vote of thanks was, on the motion of Mr. PATERSON, carried with acclamation by the largely attended meeting.

The succeeding meetings of the Federation and its committees on Hygiene, Education, Documentation and Bibliography, and Dental Terminology were held at the University of London.

A visit to the Barnet factory of the Dental Manufacturing Company was paid by the Federation for the purpose of witnessing, among other interesting demonstrations, the methods of preparing and mixing the ingredients of red vulcanite rubber.

THE LANCET.

LONDON: SATURDAY, AUGUST 19, 1911.

The Incidence of Anthrax.[1]

IT has long been a matter of comment by our continental critics that so small a proportion of the research work carried out in this country is directly done at the instigation of the State, and that the expenses incidental to such research are defrayed either by private enterprise or by large commercial undertakings. Whether this condition of affairs, leaving as it does individual workers wholly unfettered by red tape, tends to produce more valuable results or not is a matter upon which we do not feel called upon to pronounce an opinion; but the fact remains that many most valuable results have been, and are being, obtained by workers whose devotion to research has been rendered possible by the munificence of one or other of our great City companies. The Goldsmiths and the Grocers have for many years past expended large sums annually in the promotion of research, and at the present moment we have before us a report published by the Worshipful Company of Leathersellers on "The Incidence of Anthrax amongst those Engaged in the Hide, Skin, and Leather Industries, with an Inquiry into Certain Measures aiming at its Prevention." This report has been drawn up by Dr. CONSTANT PONDER, the bacteriologist to the Company's technical college, who has recently been engaged in investigating industrial anthrax, and its perusal satisfies us that considerable progress has been made in the attempt to render innocuous to the workman the infected hides which reach this country in such large numbers.

Dr. PONDER, in one of the opening passages of the report, refers to VIRGIL'S description of cattle anthrax in the Third Georgic, and points out that even in ancient times it was recognised that the incautious handling of infected hides might have terrible results:—

> "Ardentes papulæ atque immundus olentia sudor
> Membra sequebatur."

He proceeds to discuss fully such subjects as the animals that commonly suffer from anthrax, the localities in which the disease is commonest and the seasons in which it occurs, the symptoms of the disease in animals, and the conditions under which the infection is conveyed, together with the collection, cure, and shipment of hides and skins. From his multifarious investigations Dr. PONDER draws several interesting and important conclusions. Some 40 per cent. of all the cases of anthrax in British leatherworkers are due to handling Chinese or East India goods. The cutaneous infection is the most common, 82 per cent. of the cases exhibiting pustules on the head or neck. No case of pulmonary anthrax infection, such as occurs amongst the Bradford woolworkers, has been reported amongst those working in hides and skins, and only two cases of the intestinal form have occurred in the last seven years. Speaking generally, infection is contracted either at the wharf and dockyard or in the tannery, these two localities combined giving a percentage incidence of 50. The point in Dr. PONDER'S report which is well brought out, and upon which great stress is laid, is the fact that the infective material—i.e., the anthrax spore—is most likely to be found in discharges dried upon the fur, or in blood spilled when the animal was flayed and likewise dried upon the fur, and at the cut ends of subcutaneous capillaries; so that the most urgent economic problem that presents itself is how to destroy the anthrax spores when protected by a thin layer of blood, mucus, or fæcal material without at the same time destroying the commercial value of the hides in which the infection occurs. Having elicited these facts, the report next deals with the measures aiming at the prevention of industrial anthrax, and in this connexion Dr. PONDER has carefully studied the many and varied methods, having for their object the destruction of the infective material, which have been suggested from time to time by workers at home and abroad. Perhaps the most ingenious method is that suggested by BREKLE, which attempts to take advantage of the fact that at a temperature of 43° to 44° C. existing anthrax spores germinate, but no new ones are formed. BREKLE would expose the hides and skins to this temperature for 48 hours and then plunge them into a liming pit with sufficient milk of lime to destroy all the resulting vegetative forms. This method, however, would hardly commend itself to the leather trade, for if the disinfectant used is present in sufficient concentration to destroy the anthrax spores the hide itself is ruined for commercial purposes. More promising lines of inquiry are opened up when it is shown that no case of anthrax infection has ever been traced to wet, salted hides, and Dr. PONDER strongly recommends that all hides and skins should be imported into the country in the wet, salted state. This is a plan which has much to recommend it from the point of view not only of the leatherworkers themselves, but also of the brokers and even of the shippers, but pending the introduction of regulations enjoining this practice active disinfection would seem to be necessary. On a previous occasion[2] we have commented upon the work carried out by Dr. F. W. EURICH on behalf of the Anthrax Investigation Board in Bradford, and his attempts to render wool innocuous by steeping the bales before they are opened in formaldehyde solution, but when dealing with hides and skins the use of formaldehyde becomes impracticable, since it so injures the consignments as to prevent them being turned into good leather.

Dr. PONDER finally gives his support to the method suggested by Mr. SEYMOUR JONES, the chairman of the International Commission for the Preservation, Cure, and Disinfection of Hides and Skins. This method practically converts the goods into the "wet salted" state, and consists

[1] A Report to the Worshipful Company of Leathersellers on the Incidence of Anthrax amongst those Engaged in the Hide, Skin, and Leather Industries, with an Inquiry into Certain Measures aiming at its Prevention. By Constant Ponder, M.D. Cantab., D.P.H., Bacteriological Assistant at the Leatherseller's Company's Technical College, Bermondsey, London; Second Student, John Lucas Walker Trust. Published by the Worshipful Company of Leathersellers, London. 1911. Price 2s. 6d.

in treating the hides for 24 hours in a soak containing 1 per cent. of formic acid and 0·02 per cent. mercuric perchloride, and then transferring them to the ordinary brine pit. Under laboratory conditions this method is capable of destroying the infection on hides, and, equally important, does not interfere with the due action of the subsequent processes to which the hide is subjected in its transformation into leather. It is further pointed out that the method is so simple in application that it could readily be employed at the port of shipment.

Vaccine Therapy in Gynæcology.

THE treatment of puerperal septicæmia by means of antistreptococcic serum, from which so much was anticipated on its first introduction, must be held to have proved disappointing. A committee appointed by the American Gynecological Society reported upon 352 cases treated with serum among which the mortality was about 20 per cent., while among the cases treated in other ways the death-rate only amounted to some 5 per cent. It is difficult to believe that this conclusion really represents the truth of the matter, since it is probable that only the worst cases and those which failed to respond to other measures were treated by serum, but it serves to show how hopeless it is to attempt to prove the value of therapeutic measures of this kind by statistics. It is especially difficult when dealing with the many varying diseases which may result from the action of the streptococcus, since there is at the present time no agreement among writers on the subject as to how many varieties of this organism exist. Some maintain that they are all practically the same, while others have enumerated as many as 18 different species. It is obvious that statistical results, referring as they often must do to diseases not in reality due to the same organism, can have but little value. Not only may the diseases produced by streptococci be of very varying nature, but it is at the present time uncertain that the same strain of organism is always involved in the production of what appears to be the same disease. Possibly this is the explanation of the fact that one brand of serum may fail in any given case, while another of different origin may succeed. For this reason, if no result follows the use of a serum, another kind whenever possible should at once be tried. Further difficulty in carrying out this mode of treatment is offered by the fact that the serums keep very badly and therefore must be used freshly prepared. A fallacy only too often present in some, at any rate, of the recorded cases is the absence of proof that the streptococcus, and that organism alone, was the offending agent. Obviously, unless it is certain that the case is one actually due to the presence of the streptococcus in the blood or in the tissues, the use of an antistreptococcic serum can be of no avail, nor can any beneficial result which may be obtained be attributed with certainty to the action of the serum. It must be remembered, too, as Sir ALMROTH WRIGHT has pointed out, that the method of preparing many of these sera is far from perfect, and that the quantity of protective material which many of them possess is very problematical, while they may even contain bacterial products which may produce effects other than those desired.

The disappointing results following the use of antistreptococcic serum, more especially in cases of puerperal fever, led not unnaturally to the method of treatment by vaccines being received with a considerable amount of hopefulness. It is true that cases of generalised infection, such as occurs in general septicæmia, do not appear at first sight to belong to the class of case likely to be benefited by the use of a vaccine. Inasmuch as in these cases large numbers of bacteria must be already circulating in the blood, producing an intoxication, it would appear irrational to expect from the introduction of further bacteria anything more than an aggravation of the intoxication. The good results, however, which have in some cases followed their use appear to show that even in such instances they may prove of value. It must be remembered, too, that according to WRIGHT'S views the antibacterial elements, or so-called bacteriotropic substances, are manufactured in the tissues at the seat of inoculation. In the case of an inoculation, therefore, the vaccinating elements will come in contact with the tissues in a more concentrated form than if they were introduced into the blood stream and diluted by the whole volume of the circulating blood. It would, therefore, seem not irrational to assume that a patient, even when suffering from general septicæmia, might derive benefit from the use of a vaccine. In answer to the further objection that the degree of intoxication will be increased, may be urged the fact that the local toxic effect upon the tissues and the elaboration of antibacterial substances are inexplicable unless we assume that the toxic bodies are retained *in situ* at the seat of inoculation. The question seems, therefore, one which trial and experience alone can decide. The report of a committee appointed by the American Gynecological Society to investigate the results of vaccine-therapy in gynæcology was published in the last volume of its Transactions. The committee considered the whole matter very fully, and its report contains some valuable conclusions. In cases of chronic gonorrhœal infections it found that satisfactory results appear to follow this mode of treatment, and especially was this the experience in treating the vulvo-vaginitis of little girls. The committee endorses the view that vaccine-therapy has a definite place in the treatment of chronic gonorrhœal affections in the female, and states that in many cases it appears to be more efficient than local antiseptic treatment. While, as a general rule, in cases treated by vaccine-therapy the best results are obtained when the vaccine is prepared from the actual organism present in the body, in cases of gonorrhœa equally good results appear to be obtained by the use of a stock preparation comprising a dozen different strains. The practitioner will, however, be disappointed unless he remembers that in some cases of chronic discharge, produced primarily by the gonococcus, the organism has quite disappeared, and the persistence of the discharge is due to the presence of staphylococci, often of a low grade of virulence. In such cases naturally a gonococcal serum will prove of no avail. In the treatment of infections of the urinary tract, such as the pyelitis and pyelonephritis of pregnancy, useful results are obtained, but they appear to be much the same as those following ordinary symptomatic treatment—namely, the alleviation of the symptoms without the complete disappearance of the organism from the urine until

the termination of the pregnancy. Vaccine treatment has been carried out in some chronic infections of the generative tract by a few observers, but the results are too few to be of much value. In cases of local suppuration following on pelvic inflammation good results might be anticipated by the use of appropriate vaccines, and encouraging examples have been reported.

When we consider the circumstances existing in cases of acute generalised infection, which may be present in any case of puerperal septicæmia, it is obvious that the remedy must be capable of dealing with such conditions as general peritonitis or general blood infection. It is, therefore, not surprising that the results obtained are far from encouraging. Further, as there appear to be so many different varieties of streptococci it is necessary to use a vaccine prepared from the particular organism present; this requires time for its preparation, and time in such cases is a most important element in the success of the treatment. It may be said, then, that while cases in which the infection is in any way localised are likely to derive great benefit from vaccine-therapy, the outlook in cases of general infection is not nearly so hopeful. At the same time the question is one which still is open for solution, and it is one which can only be decided by continued and searching trials. It is possible that better results may be attained from a suggestion made by WRIGHT. As we have mentioned already, the rationale of vaccine-therapy is found in the exploitation of the unexercised immunising capacities of the uninfected tissues, the antibacterial substances being elaborated by the tissues into which the vaccine is injected. If this be so, may it not be possible to obtain a summation effect in cases of general infection by simultaneous inoculations at several different sites? The value of such a procedure is for the future to decide, but it would seem to hold out much promise, especially in cases where an immediate and rapid effect is required, as, for example, in cases of such general infection as occurs in puerperal septicæmia.

Fashion and Progress in Operative Surgery.

WE complete this week a comprehensive, though necessarily abbreviated, report of the scientific proceedings at the various sections of the recent meeting of the British Medical Association at Birmingham, and take the opportunity to refer in some detail to the Address in Surgery. This was delivered by Mr. JORDAN LLOYD, who took as his opening theme the changes which have occurred in the surgical outlook between the several occasions on which the Association has met in Birmingham. Each time that the annual meeting has been held in that city the surgical orator has dealt with some current questions. At the first meeting, in 1856, LANGSTON PARKER delivered the address, and dealt with the treatment of cancers with caustics, advocating this method of treatment, not merely for small and superficial cancers of the skin, but for all cancers, of whatever size and location. The great argument which he advanced in favour of this method was the inutility of operations with the knife performed for the removal of the disease. Although it cannot be denied that caustics can sometimes effectively remove small superficial cancers, especially some forms of rodent ulcer—and, indeed, the recent employment of carbonic acid snow shows that similar methods are considered trustworthy—yet few surgeons would now venture to treat a malignant growth of any size with caustics, and the method finds its chief exponents in the ranks of quacks. There are some who will still remember the lecture on Cancer Cures by SPENCER WELLS in the "sixties," and his exposure of the danger, pain, and uselessness of caustic methods. In the 55 years which have passed by since LANGSTON PARKER delivered his address operative surgery has made immense strides, and the extension of the operations performed for malignant disease has been followed by a greater percentage of recoveries, so that hardly anyone ventures to dispute the efficacy of operative surgery in cases which have not progressed too far, while no surgeon would consider that he had done his best for a cancerous case, unless the lesion were quite a superficial one, by trusting to a caustic application. We know more and we can do more.

Sixteen years elapsed before the Association met again in Birmingham, when OLIVER PEMBERTON, who delivered the Address in Surgery, selected for notice, as among the conditions which he regarded as of prime importance in surgery, surgical aneurysms and lateral lithotomy. Surgical aneurysms appear to have been more common at one time than at present, if we may judge by the attention paid to their treatment, though we know of no statistics which can fully decide the matter. At all events, at present in this country, aneurysms which may be called surgical are extremely rare, and their treatment is simple and well established, though much ingenuity has of recent years been displayed in devising new methods of dealing with them. It is, at all events, certain that no surgeon of to-day would consider surgical aneurysms as a subject suitable for a full dress oration to a large congress in plenary assembly. The condition does not play a sufficiently important part in ordinary life, while the opportunities for elaborate technique offered by its treatment are quite surpassed in the vast possibilities of modern operative procedure. PEMBERTON in his next subject, the performance of lateral lithotomy, dealt with an operation which has practically ceased to exist. At one time it was of immense importance; it was looked upon as the operation which best displayed the skill, the knowledge, and the dexterity of the surgeon, and the publication of a series of cases without a death was a legitimate source of pride to some surgeons. Yet now it is certain that a large majority of our younger surgeons, and even some who are approaching middle age, have never seen the operation performed. Some of the smaller text-books of operative surgery are omitting to describe it; for instance, it is not to be found in the last edition of TREVES and HUTCHINSON'S "Student's Handbook of Surgical Operations." Lateral lithotomy has had to give place partly to the suprapubic operation and still more to lithotrity as practised by BIGELOW. Lateral lithotomy was ingenious and effective; in skilled hands it gave remarkable results,

and the mortality from it was very small. Yet in spite of its merits, and in spite of its results, it is dead.

In 1830 LAWSON TAIT delivered the Address in Surgery at Birmingham. The more recent date makes the fact less obvious in his stirring words that fashions change as surgery progresses, but none the less some of TAIT'S most dogmatic teaching is now not acquiesced in. It is needless to follow Mr. JORDAN LLOYD through the other examples which he brought forward of operations and methods no longer in vogue that have had their day and ceased to be. We may feel sure that in their turn many of our operations and our methods on which we pride ourselves will be superseded and will pass into the realms of the forgotten. Some must survive, and amongst these we may with confidence place the modern treatment of wounds; the details will be modified, the methods will be changed, but the intention of excluding germs from the wound will still persist. This, however, will be rather the perpetuation of a principle than the maintenance of a technique. Few probably will be the exact methods now employed which will be able to withstand the gnawing tooth of time. Thus a survey of some of the successes of the past should arouse in us a feeling of humility and a feeling of pride. We recognise in the establishment of unchangeable principles the genius and industry of our forerunners; we perceive in the oblivion that has fallen upon the very exploits with which they were most well pleased the fact that some of our own finest technical work will die, or will at any rate be superseded by its legitimate developments. As the world progresses surgery will progress. New conditions must bring new problems to the surgeon, but new discoveries will furnish him with new weapons against them.

Annotations.

"Ne quid nimis."

THE SUN IN POISONOUS DOSE.

IT is not often in this country that sunshine becomes a monotony, but there is little doubt that a good many people, quite apart from any agricultural or industrial avocations, would just now regard with relief a cloudy and rainy day. Insolation has its glories for medical science, inasmuch as not all the carbolic acid in the world can furnish such a supply of germicidal power as does the sun. Sunlight completely destroys the vitality of most disease producing organisms. These intense chemical effects of sunshine cannot, however, be without great influence upon the human organism, the question of germs apart. Posology must play its part even with sunshine, and with overdoses bad effects may well be a probability. It is an interesting coincidence that labour troubles of no mean magnitude have broken out during an unwonted spell of sunshine. Of course, we are not regarding the strikes as caused by the heat, as the reasons for the prevailing unrest have many of them been obvious for many months. But it is not at all improbable that the heat has played its part in the form which the manifestations have taken. Let us remember that the failure of the white races to colonise certain tropical tracts has been attributed to the excess of light which there prevails, and not to the heat or humidity. The white man in the tropics gradually becomes disinclined to work under the influence of the actinic agencies of the sun; he grows neurasthenic, and finally breaks down. The widespread discontent of the labouring classes reached an acute stage during a period of excessive and intense light which promises to break all existing records. Have the forces of the potent sun, consequent upon a long period of chemically active sunshine, altered the energies of the body and mind of the worker, as in the case of the would-be coloniser in the unsuitable tropics? In an admittedly bad state of affairs, has an overdose of sun proved a poison? In other words, should sunshine, like so many good things, be doled out on posological lines, lest it poison the individual? When the dark days of winter come we shall yearn again for some of this "poison," knowing, however, full well that then the doses, even when continuous, are less potent; but it is quite possible that the instinct is a sound one which makes many of us, inhabitants of what should be a temperate zone, almost resent unbroken heat.

THE SCOPE OF A MEDICAL MAN'S AUTHORITY.

IN another column will be found a letter with this title, over the initials "M.D.," which describes how the writer, after being called in to attend a footman, treated him at the house of his mistress, as the man refused to be moved to the nearest infirmary. The somewhat unlooked-for circumstance connected with the case consists in the mistress being now disposed to criticise the medical man on the ground that he has instituted a precedent under which her servants, if they become ill, will in future insist upon being nursed in her house, to her inconvenience. The point has apparently been suggested to the lady by her friends, who can hardly have included a lawyer among them, or he would have been careful to explain to the mistress that the authority which she exercises over her domestics arises out of her contract with them. They are not the servants of the medical practitioner whom she calls in to attend them, or whom they may employ, and his authority over them is limited to recommendations which, so far as he is concerned, they are at liberty to disregard. In the case put forward by "M.D." we have no doubt that he gave sound advice to the footman when he told him that he "must" go into the nearest infirmary, and when he declined, as we understand, to sanction his taking a journey of 150 miles. The man, however, could have insisted upon going home, provided that he were capable of taking the necessary steps to do so, and his medical attendant could not have prevented him from going any more than he could lawfully have forced the infirmary upon him. The servant's employer is in a different position. As to the precise extent of the mistress's authority upon such an occasion we have no intention to advise, but, except that it should always be exercised with due regard to the dictates of humanity, we have no doubt that the lady could not be compelled to keep her footman in the house owing to the mere fact of his preferring to remain there. The absolutely forcible removal of a sick servant might be a step from which a master or mistress would shrink, but there are degrees of insistence open to them which go beyond any pressure that a medical attendant can exert or can be asked to attempt. The case described would seem to have been one for more or less authoritative persuasion on the part of the employer, and if we assume that the medical man was ready to take the responsibility of saying that treatment in the infirmary referred to would be adequate, and that removal to it would not entail risk or undue suffering to the patient, there is no reason why such persuasion should not have been exercised. After all, however, the prolonged illness of a servant such as

that described is not an incident of frequent occurrence even in large establishments, and the mistress referred to will probably have ample time to consider a course of procedure to meet the next occasion before it arises. Let us hope that the footman was duly grateful for the consideration accorded to him and that his mistress will have no reason to regret her kind treatment of him.

ARTERIAL LESIONS IN ANCIENT MAN AND THEIR LESSONS.

FEW pathological conditions have given rise, perhaps, to more diverse views as to their etiology and significance—and, as a consequence, to more conflicting rules of conduct—than arterio-sclerosis and allied arterial degenerations. This condition has been held up as the pathological "horrible example" by antitobacconists, total abstainers, diet faddists of all kinds, contemners of athletics and of the wear and tear of modern life. Apart, therefore, from its antiquarian interest, a paper by Dr. Marc Armand Ruffer describing his examinations of the Arterial Lesions found in Egyptian Mummies [1] deserves thoughtful consideration for the sidelight it throws on ultra-dogmatism in support of preconceived controversial theories. Dr. Ruffer first describes the procedure of dissection and the preparation of the specimens for the microscope. It appears that the embalmers of the twenty-first Dynasty removed not only the viscera but the aorta and most of the muscles of the body, packing the spaces thus created with mud, sand, or rags. Sometimes sawdust mixed with a resinous material of unknown nature (but certainly not bitumen) was used. It was only rarely that a portion of the aorta or one of the large arteries was left behind, but fortunately the posterior peroneal artery, owing to its deep situation, often escaped the embalmer. The isolating of the arteries is a very disagreeable process, for the hard black material lining the walls of the cavities after removal of the packing is not removable by water, but has to be taken away mechanically, thus creating an irritating dust. The packing does not appear to contain pathogenic microbes, for no inflammation ever followed the numerous cuts and scratches. The arteries, when dissected out, are placed for 24 hours in a solution containing carbonate of soda 1 per cent. and formol 0·5 to 1 per cent. They are then immersed for some weeks in glycerine, to which a few drops of formol have been added. Calcified artery is decalcified in Marchi's solution for 24 hours and cut in the usual manner. Dr. Ruffer gives a description of specimens from 24 subjects, consisting of aorta, brachial, anterior and posterior tibials, posterior peroneal, femoral, profunda, radial, ulnar, and palmar arch. The results of the examination are given and points of interest noted as follows: (1) that the muscular coat may be changed almost wholly by calcification, following on degeneration of the muscle fibre, into a magma of no particular structure; (2) that the disease very often seems to pick out the point of origin of the smaller arteries. Dr. Ruffer considers that there can be no doubt that the condition is exactly the same as is seen at the present day—namely, calcification following on atheroma, and that, in spite of the 3000 years that have elapsed since death, the lesions are still recognisable by their position and microscopical structure. "The earliest signs," he says, "of the disease are always seen in or close below the fenestrated membrane—that is, just in the position where early lesions are seen at the present time. The disease is characterised by a marked degeneration of the muscular coat and of the endothelium. These diseased patches, discrete at first, fuse together later, and finally form comparatively large areas of degenerated tissue, which may reach the surface and open out into the lumen of the tube." The correspondence of the disease to that recognised at the present time is obvious. In Dr. Ruffer's opinion, therefore, "the old Egyptians suffered as much as we do now from arterial lesions identical with those found in the present time. Moreover, when we consider that few of the arteries were quite healthy, it would appear that such lesions were as frequent 3000 years ago as they are to-day." As to causation, Dr. Ruffer considers that tobacco can certainly be eliminated, as this drug was not used in ancient Egypt. While alcoholic beverages played a part in Egyptian social life, Dr. Ruffer holds that it is clear that the Egyptians, as a race, are not, and never have been, habitual drunkards. Moreover, Dr. Ruffer has found the disease just as common in over 800 post mortems of Mussulmans who had certainly never touched alcohol in their lives. This fact has led him to call in question the importance of alcohol as a cause of arterial disease. As to the "increased wear-and-tear" theory of modern life, there is no evidence that old Egyptians worked too hard, either mentally or physically; the time tables of workmen which have been discovered show that the Egyptian navvies of ancient times toiled practically the same hours as the Egyptians do now. In Dr. Ruffer's opinion, too, the theory that the wear and tear of human life has increased is a myth, the fact being, he says, that our life is easier and that we work less than our ancestors did. Meat, too, is something of a luxury in Egypt, and Dr. Ruffer's experience in Egypt and the East has not strengthened the opinion that meat eating is a cause of arterial disease. Finally, he holds that strenuous muscular exercise can also be excluded as a cause, for there is no evidence that ancient Egyptians were greatly addicted to athletic sports, though they liked watching professional acrobats and dancers. In the case of the priests and priestesses of Deir-el-Bahari, which formed the greater proportion of those whose mummies were examined, it is highly improbable that they were addicted to much muscular exercise.

[1] Arterial Lesions found in Egyptian Mummies (1580 B.C.–525 A.D.). By Marc Armand Ruffer, Journal of Pathology and Bacteriology, Vol. XV., 1911.

THE CONDITIONING OF WINE.

ONE of the most delicate wines is claret, and it is its delicacy which, justly we think, has brought it the *sobriquet* of a temperance wine. It contains least alcohol, acidity, and sugar amongst wines, but it easily spoils, and according to recent researches the element which spoils it is oxygen. The quicker it spoils by this agency the more delicate as a rule is the wine, and a good claret is not a wine to be left more than many minutes exposed to the air before it is consumed. There are some people who do not understand this, or do not appreciate the horrid result of their action, for they will re-cork an unfinished bottle. If this were done under an atmosphere of nitrogen there would be no complaint, for if oxygen is carefully excluded the wine remains sound and palatable. When wine, in fact, is left in an inert atmosphere, and for choice nitrogen appears to be the best atmosphere for the purpose, clarification rapidly takes place and the wine soon begins to assume a character with which good bottling and long keeping endow it. Fermentation ceases, the organisms die and retire to the bottom with a sediment which is desirably eliminated. It is not improbable that the maturing process of a wine in bottle is due to the small quantity of oxygen in the air first being absorbed, leaving only inert nitrogen which fails to support the vitalities of the organisms normally present in the wine. When the activities of the organisms thus cease the wine assumes in a quite short time all the qualities of a matured sound article. This view is expressed with such

confidence that the proposal has seriously been made to pump an atmosphere of nitrogen over wine stored in bulk.

EPIDEMIC DROPSY IN CALCUTTA.

IN the latter part of 1909 and during 1910 a considerable outbreak of epidemic dropsy, or beri-beri, occurred in Calcutta. Major E. D. W. Greig, of the Indian Medical Service, was deputed to inquire into its causation, and has now furnished a first report.[1] The main conclusions arrived at are that no specific cause is to be found in the blood or œdematous fluid in cases of epidemic dropsy, which disease closely resembles "ship beri-beri," that it is not infectious, and that it is a disease of nutrition, being induced by a "one-sided dietary." During the investigation of the distribution of cases in Calcutta it was found that the better-class European quarter escaped altogether; it was also found that two populous wards inhabited by Hindus were but slightly affected in comparison with those around them. On further inquiry it appeared that these two wards were very largely inhabited by a community of Hindu merchants, known as Marwaris. These people consume much less rice than the Bengali population generally, taking wheat (*áta*) and pulse instead. On further inquiry it was found that the few cases of epidemic dropsy that did occur in these wards were among Bengalis (rice eaters), not among Marwaris. This was a very significant fact, as the sanitary conditions of both sets of people in these wards were similar, and were no better than in the native quarters of Calcutta generally. Chemical analysis and histological examination showed that in the process of "polishing" carried out in the mills at Calcutta and elsewhere certain constituents essential to nutrition are removed from the rice, and that the *áta* habitually eaten by Bengalis is also so finely sifted that it is deprived of these ingredients even more than rice itself. Pigeons were fed on "polished" rice, such as is consumed by the people affected, and were found to lose weight and to suffer from characteristic polyneuritis, while control pigeons fed on a mixture of wheat and pulses kept up their weight and remained in good health. Analyses have shown that the amount of phosphoric anhydride in unpolished rice is about twice as much as is present in polished samples. Further, the two severe outbreaks of epidemic dropsy in Calcutta that have occurred in 1877–79 and 1907–09 have synchronised with a high price of food grains, and with a fall in prices they have come to an end. It has to be remembered that the two prominent features of epidemic dropsy—viz., swelling of the feet and breathlessness—may be produced by ankylostomiasis and by over-indulgence in alcohol; to sustain the diagnosis of beri-beri, therefore, each case must be carefully examined. Also, the treatment of food grains by "polishing," and the removal thereby of portions containing physiologically important constituents of food, only forms part of a general problem, the "one-sidedness" of a dietary; this may be brought about in other ways—e.g., by an exclusive consumption of fine, starchy, wheat flour, such as fine *áta*. This inquiry substantiates the conclusion arrived at by Fraser and Stanton in their investigation of beri-beri causation in the Federated Malay States (1909), that the polishing of rice in steam mills removes substances essential for the nutrition of nervous tissue—viz., phosphorus compounds. Chemical analyses by Mr. D. Hooper, who was associated with Major Greig, showed that unpolished rice contained 0·6 to 0·8 per cent. phosphorus pentoxide, while the polished grains contained only 0·40 to 0·45 per cent., and the polishings (koorah) contained over 3 per cent. The phosphorus and the fat are concentrated in the outer layers, while the nitrogen is distributed throughout the grain; the same holds good in the case of wheat. This inquiry is still progressing, but that the phosphorus content of the dietary is the predominant factor in causation appears to be proved. Prevention would consist in improving the dietary value, either by using unpolished food grains, or by adding rice and wheat bran removed in the cleaning process, or by substituting for part of the rice consumed some other grain rich in phosphates, such as *mung dal* (*Phaseolus radiatus*); the addition of fresh meat would also be of value. Major Greig concludes by observing that the present mode of estimating diet values by determination of the quantities of protein, fat, and carbohydrate requires further investigation.

BRUIT SYNCHRONOUS WITH THE HEART SOUNDS HEARD OVER A PULMONARY CAVITY.

AT a meeting of the Société Médicale des Hôpitaux of Paris on April 7th M. G. Variot and M. Henri Dumont showed a woman, aged 22 years, who had a very rare bruit. She was admitted into hospital for pulmonary tuberculosis. There was marked depression of the chest on the left side below the clavicle. In the first, second, and third intercostal spaces was a slight undulation corresponding to the pulsations of the heart. On percussion there was in front on the left side slight dulness at the apex, and below this more marked dulness which extended from the median line across the chest to merge into dulness at the base. On the left side behind there was slight dulness at the apex and dulness at the base below the inferior angle of the scapula. On the right side percussion was normal in front, but there was slight dulness at the apex behind. The apex beat was in the fourth intercostal space and above it a faint systolic murmur of variable intensity was heard. At the apex of the right lung, in front and behind, fine and crackling râles were heard. On the left side respiration was harsh and slightly blowing and there were some splashing sounds. A bruit of a metallic character, with its maximum at the inner border of the scapula behind and in the third intercostal space in front, was distinctly heard. It was also heard at a distance of three metres from the patient, but with a different timbre. It sounded like the "tic-tac" of a large watch or of a clock, and was synchronous with the pulsations of the heart. It was heard at night by the other patients in the ward. The bruit was very variable; the patient said that it was absent on certain days, but it rarely disappeared for an entire day; usually it reappeared after some moments. The patient said that it disappeared when she had palpitations of the heart and when she stopped breathing. On compressing the thorax with the hand at the level of the third intercostal space the bruit was modified and its rhythm was changed; on increasing the pressure it disappeared entirely. Its intensity varied from moment to moment; it was more distinct when the mouth was opened than when it was shut, as a result of resonance in the upper air passages. Finally, it varied in rhythm; sometimes it was simple "tic," but usually it was double—a "tic-tac"; several times it was observed to take the form of a long and two short sounds ("tic tac-tac"). There was abundant thick, greenish-yellow expectoration containing numerous tubercle bacilli, but there was no pyrexia. Radioscopy showed that the diaphragm was two or three centimetres higher and moved much less on inspiration on the left than on the right side. The greater part of the left lung, especially at the apex, was opaque; there was a clear zone only opposite the third intercostal space. The opacity was such that it was impossible to distinguish the

limits of the shadow of the heart which merged into that of the shadow of the lung. However, it could be stated that the heart had been dragged to the left by adhesions, for there was no shadow on the right of the spine corresponding to the right auricle. There were certain opacities on the right of the spine which seemed to correspond to swollen bronchial glands. On the right side the apex of the lung was opaque, but much less so than on the left side. Dr. Variot and Dr. Dumont suggested that the bruit was produced by the passage of air bubbles through a layer of fluid contained in a tuberculous cavity; hence its metallic character. They explained the synchronism with the heart by pleuro-pericardial adhesions by means of which the cardiac pulsations caused the pressure of the air in the cavity to vary so that air passed in and out. A somewhat analogous phenomenon has been described by Barth and Roger in their Traité d'Auscultation. They refer to a bruit heard at a distance from the patient which they compare to the quacking of a duck. They attribute it to an aneurysm projecting into a pulmonary cavity with a narrow orifice, and driving out air with each pulsation. Hence the bruit ceases when the patient stops breathing, as the air in the cavity is not renewed. However, this explanation was not applicable in the present case, for there was certainly no aneurysm. The physical signs heard over a large cavity which contains fluid and which communicates freely with a bronchus are capable of much variation. The murmur described above is rare, but is occasionlly heard when there is an extensive excavation on the left side. It has been attributed by some observers to conduction of the heart sounds through the cavity.

ALCOHOLISM, BIOMETRICS, AND DIALECTICS.

THE heated controversy provoked last year by the memoir of Professor Karl Pearson and Miss Ethel Elderton on "The Influence of Parental Alcoholism on the Offspring" has spent its energy. Professor Pearson, however, is too doughty a fighter to be silenced by the indifference of the spectators to the outcome of the contest, and, in default of other channels for giving publicity to his views, he has returned to the attack in a fresh pamphlet in the series of frankly polemical publications which he issues under the expressive title of "Questions of the Day and of the Fray." It is hardly necessary to say that Professor Pearson's treatment of his critics—Sir V. Horsley and Dr. Mary Sturge are the culprits—is vigorous, and it is only fair to admit that the passages which he quotes from his opponents show that they also have been able to contribute their share of strong language. In all controversy conducted in this spirit there is, of course, some risk that the cloud of invective may obscure the real issues, but in this particular instance the discussion has become so hopelessly befogged that such an explanation seems insufficient and we are forced to look for some deeper source of confusion. Professor Pearson's latest pamphlet may perhaps help us in this quest, for it brings out rather more clearly than has yet appeared the extraordinarily nebulous character of the data about which all this pother has been raised. To illustrate this point it is sufficient to take a single instance of the matters in dispute between the biometricians and Sir Victor Horsley. They fail to agree, it appears, about the "alcoholism" of a woman who figures in the report of the Edinburgh Charity Organisation Society, from which Professor Pearson obtained a large part of the material for the original memoir. In describing the habits of this interesting lady, Sir Victor Horsley, we learn, used the words "drinks but never seen to be drunk," whereas according to Professor Pearson the report had it "not teetotal but never seen the worse for drink." Professor Pearson sees in this change of terms a proof of Sir Victor Horsley's wickedness, but the ordinary person will perhaps be prepared to admit an alternative inference, and will see in the charge of perversion and in the facts that have given rise to it nothing more than a proof of the undesirability of making medical diagnoses on such remarkably slender evidence. It is to be feared, however, that this is not the sort of conclusion that some of our investigators are likely to admit. Biometricians—some at any rate—appear to be under the impression that data which imply medical diagnoses are better collected by people who are unbiased by medical knowledge. Professor Pearson himself would seem to lean to this view, for he thinks it worth his while in this pamphlet to retail a lurid story about a family of his acquaintance in which one member died from what "a most distinguished medical man" described on the death certificate as cancer of the stomach, and another was operated on by "a not less distinguished surgeon" for appendicitis, whereas, we are apparently to understand, a due appreciation of the family tradition would have shown that in both instances the trouble was due to a hereditary liability to have "something go wrong in the gall-bladder." It is a pity that a writer of Professor Pearson's eminence should use "arguments" of this kind, which can only discredit the scientific methods of which he is the recognised exponent.

CULTIVATION OF THE SPIROCHÆTA PALLIDA.

AN important advance in our knowledge of the bacteriology of syphilis is reported in the *Journal of the American Medical Association* of July 8th by Dr. Hideyo Noguchi, writing from the laboratories of the Rockefeller Institute for Medical Research, New York. He claims a success, which has hitherto been denied to investigators, in the discovery of a method for the pure cultivation of the treponema pallidum. Previous researches have, it is true, been partially successful, but in all these there has been some weak point in the chain of evidence. In some cases the micro-organisms cultivated have proved incapable of setting up characteristic lesions after inoculation into animals; in others a successful animal experiment has been performed, but with cultures which contained portions of the infected tissue with which they were inoculated, so that the lesions set up in the animal may possibly have been due to spirochætæ surviving in the human tissue used for inoculation of the culture media. Dr. Noguchi's method was to inoculate his media, not from human lesions, but from the artificially infected testicular tissue of the rabbit, which contains very many spirochætæ. The only medium which has proved suitable is serum water to which a piece of sterile rabbit tissue (preferably kidney or testicle) has been added. Liver tissue is not so good; it contains bacteria, and its large content of carbohydrate tends to rapid acidification of the cultures. The serum water, in test tubes, is rendered suitable for anaerobic cultivation by a layer of paraffin oil poured upon its surface. After the first cultivation strict anaerobiosis is not essential; and the organism can in subcultures be transferred to solid media such as gelatin or agar. The first growths are usually contaminated by other bacteria, but Dr. Noguchi has contrived two means of separating these from the spirochætæ. In the first the spirochætæ are grown through filters which retard the passage of other organisms, while the second method depends upon the fact that in stab cultures the spirochætæ grow away from the line of puncture into the surrounding medium while other bacteria fail to do so. Finally, there is the fact that the spirochætæ cultivated by these methods are pathogenic in so far that after inoculation into the rabbit's testicle they produce characteristic histological changes and are found growing freely in the infected tissue. It remains to be seen whether the same technique will enable bacteriologists to

grow the spirochæta pallida in pure culture when taken direct from suitable lesions in man; in these experiments the original spirochætæ were, as has been said, derived from experimentally infected rabbits.

THE HYGIENIC ASPECT OF PLAYGROUNDS.

THE President of the Board of Education has appointed a departmental committee to inquire and report (*a*) whether it would be consistent with due regard to educational and hygienic considerations that the minimum standard of playground accommodation for new public elementary schools prescribed in the building regulations of the Board of Education—viz., 30 feet per head of accommodation—should be modified or adjusted according to the size, design, or situation of schools, the proximity of recreation-grounds or open spaces, the density of population, the cost of land, or otherwise; (*b*) how far it is possible or desirable to define more precisely the standard of playground accommodation which the Board of Education will require under the code of regulations for public elementary schools in the case of existing schools or to regulate the practice of the Board of Education in dealing with cases in which the playground accommodation is considered to be insufficient. The committee will consist of Mr. L. A. Selby-Bigge, C.B., principal assistant secretary of the Elementary Education Branch of the Board of Education (chairman); Sir George Newman, chief medical officer of the Board of Education; Mr. J. C. Iles, H.M.I., divisional inspector for the North-Western Division; Mr. F. H. B. Dale, H.M.I., divisional inspector for the Metropolitan Division; Mr. A. B. McLachlan, of the Local Government Board; with Mr. L. J. Morison as secretary.

A NEW DIAGNOSTIC SIGN OF ORGANIC NERVOUS DISEASE.

IN the *Interstate Medical Journal* for July there is an article by Dr. Charles Gilbert Chaddock, of St. Louis, entitled "A Preliminary Communication concerning a New Diagnostic Nervous Sign." Dr. Chaddock has been struck by the ready occurrence of the Babinski phenomenon when the same form of irritation that has elicited it from the sole of the foot is applied to the skin just beneath the external malleolus, while no response can be obtained from other skin areas of the lower extremity. In cases, however, where irritation of almost any area of skin over the lower extremity calls forth the extensor toe response, the external inframalleolar area does not distinguish itself in any way. Impressed by these observations, Dr. Chaddock has been in the habit of commencing examination of the skin reflexes in patients by investigating the nature of the response from the above-mentioned region. His method is to scratch the skin with a moderately pointed nail-file. In some cases the merest touch is sufficient to excite the sign; in others, rather severe scratching may be required. He has found that the most sensitive point is usually over a slight depression just in front of the lower margin of the external malleolus. From an examination of a series of 245 cases, including normal individuals as well as a great number of all sorts of nervous cases, Dr. Chaddock is satisfied that irritation of the external malleolar area causes no reaction normally; in pathological cases extension of the great toe, or of all the toes, or fan-like separation of them, obtained from this area, is indicative of organic disease of the spino-cortical reflex paths. He concludes that the external malleolar sign is usually present when the ordinary Babinski toe response is present; that it is often present when the latter is absent; that it may precede, coexist with, or outlast, the latter, and that its presence or absence is of considerable help in the interpretation of doubtful movements obtained by stimulation of the sole of the foot. In his experience no case presenting an extensor response from the sole has failed to present also the external malleolar sign, but reference is made to a case where this occurred in the experience of a colleague. Dr. Chaddock adds in a footnote: "Subsequent observations show that even plantar flexion of the toes excited from the external malleolus is as significant as extension or fanning of them; that in cases of unilateral capsular lesions the external malleolar sign often occurs on both sides—on the paralysed side with Babinski, on the unparalysed side without Babinski (homologous motor fibres). It has been found pure and unilaterally in two cases of cerebro-spinal meningitis (epidemic) and in a case of tuberculous cerebro-spinal meningitis. It has been found in one case (no nervous lesion apparent) from the ankle where the foot had been dislocated forward creating an arthritis, which suggests some possible relation between this sign and arthritic ankle clonus." All who have had occasion to examine the skin reflexes of the lower extremity must have observed how frequently an extensor response is obtainable in pathological cases from other parts of the foot than the sole. Dr. Chaddock considers, however, that he has found a definite specificity in the external malleolar area, and the observation is peculiarly interesting and worthy of investigation. If it be shown, as the author thinks, that flexion of the toes from this area is "as significant as extension or fanning," then the "reflex" is not comparable to the toe phenomenon of Babinski. The significance of its unilateral occurrence in cerebro-spinal meningitis and bilateral occurrence in hemiplegia is not, perhaps, apparent; in the latter instance the homolateral pyramidal fibres are always a variable quantity. Whether the "reflex" bears any relation to stimulation of the extensor brevis digitorum muscle, direct or otherwise, is not referred to by Dr. Chaddock.

PROTEIN HYPERSENSITIVENESS.

AMONG the manifold phases of the problem of infection and morbidity in tuberculosis the phenomenon of protein hypersensitiveness is an interesting one. We have received a copy of a pamphlet of Dr. K. Krause containing the results of investigations which he has made in the Saranac Laboratory for the Study of Tuberculosis. He divides the inquiry into three parts. The first deals with "active sensitization." Dr. Krause concludes that practically any parenteral route by which a quantity of tuberculo-protein can be introduced into the guinea-pig will specifically sensitise the animal. Sensitisation may be obtained with equal facility by way of the peritoneal cavity, the skin, the subcutaneous tissue, the cerebral subdural space, and (although he did not try the method) possibly by intravenous injection. He found that sensitisation can be produced with an amount of tuberculo-protein that is represented by 0·00005 gramme dry weight. He gives details of his experiments which will prove interesting to those versed in laboratory methods. The second part of the investigation deals with the relation of tuberculo-protein hypersensitiveness to the tuberculin reaction and to tuberculin immunity. His experiments led him to two conclusions—(1) once sensitiveness to tuberculo-protein is acquired by a non-tuberculous animal the repeated absorption of more protein tends only to increase this condition; and (2) tolerance to tuberculo-protein cannot be attained in the non-tuberculous animal by gradually raising the dosage or diminishing the intervals of time between doses. Dr. Krause's remarks on these two points are involved, but, if they are followed, will prove of value to other observers. The third subject dealt with in this pamphlet is hypersensitiveness

to tuberculo-protein and immunity to infection. After giving details of the investigations the following conclusions are reached:—1. Sensitisation of non-tuberculous guinea-pigs with tuberculous protein does not alter their resistance to experimental tuberculous infection. 2. Sensitisation to tuberculo-protein and relative immunity (increased resistance) to infection can occur coincidently in the same animals. 3. Resistance to infection is markedly lowered during the period that a sensitised animal is suffering from symptoms of anaphylactic shock. In order to fully appreciate the value of these investigations a study of the whole of Dr. Krause's remarks are necessary, but we have sufficiently indicated the nature of the work he has accomplished. The treatment of tuberculosis by tuberculin and similar products has lately attracted much attention, and any fresh information is to be welcomed.

THE CHOLERA EPIDEMIC.

(FROM THE BRITISH DELEGATE TO THE CONSTANTINOPLE BOARD OF HEALTH.)

SINCE the date of my last letter on this subject[1] there has been a considerable extension of the cholera epidemic. It is most seriously prevalent at this moment in various parts of the Turkish Empire and in southern Italy. Russia has so far not suffered to anything like the same extent as at a corresponding date in preceding years; indeed, the extent of the recrudescence of the disease there is almost insignificant. Sporadic cases of cholera are reported from Austria, Hungary, France, Bulgaria, Montenegro, and Persia, but in none of these countries is there any sign of an epidemic.

Cholera in Russia.

Between June 6th and 20th (Old Style) 14 cases of cholera with 1 death were reported to have occurred in the town of Nikolaievsk, in the Samara government; 1 death in the government of Vitebsk; and 1 case at Kozmodemiansk in that of Kazan. On June 25th there was a case in Baku; on the 26th 3 cases at Nikolaieff (apparently in the Kherson government); and between June 26th and July 1st (all these dates are Old Style) there were 17 cases of cholera and 5 deaths in the towns of Novorossiisk, Baku, Nikolaieff, Astrakhan, and Tsaritsyn. Finally, between July 3rd and 9th 18 cases and 5 deaths were recorded in the governments of Kherson, Samara and Astrakhan, and in the town of Saratof.

It would almost look as though the virulence of the cholera germ, which has caused such widespread havoc in Russia in the last few years, were becoming exhausted; but time alone can show whether this surmise is not too good to be true.

Cholera in the Turkish Empire.

Cholera reappeared in Samsoun, on the Black Sea (whence no cases had been reported since November last), on May 28th. Since then the returns have been as follows:—

From	May	28th	to	June	2nd	...	...	77	cases,	45 deaths.
,,	June	3rd	,,		10th	...	...	90	,,	112 ,,
,,	,,	11th	,,		18th	...	...	33	,,	30 ,,
,,	,,	19th	,,		25th	...	...	12	,,	8 ,,
,,	,,	26th	to	July	2nd	...	...	3	,,	3 ,,
,,	July	3rd	,,		9th	...	...	3	,,	1 ,,
,,	,,	10th	,,		16th	...	...	1	,,	1 ,,
,,	,,	17th	,,		23rd	...	...	4	,,	2 ,,
,,	,,	24th	,,		30th	...	...	2	,,	2 ,,

It is interesting to note that the earliest cases here occurred among labourers employed on the railway which is being constructed from Samsoun to Sivas. These men were encamped on a spot lying between the river Merd-Irmak and a canal, and between the latter and the aqueduct which carries the river water to be distributed to the town. They seem to have contaminated this water, and there was thus a sudden and general extension of the disease throughout the town. As soon as this water-supply was cut off and other measures taken to stamp out the disease among the labourers in question, the cases in the town fell suddenly from a maximum of 27 in one day to 2 or 3 per day.

On July 1st cholera reappeared in the neighbourhood of Zunguldak (near which are large and important coal mines); up to July 30th some 21 cases with 11 deaths have been recorded here. In Smyrna, where, it will be recalled, cholera reappeared on April 26th, the following cases and deaths have been registered:—

From	April	26th	to	May	14th	...	...	9	cases,	7 deaths.
,,	May	15th	,,		21st	...	...	2	,,	0 ,,
,,	,,	22nd	,,		28th	...	...	13	,,	7 ,,
,,	,,	29th	to	June	4th	...	...	11	,,	5 ,,
,,	June	5th	,,		12th	...	...	2	,,	2 ,,
,,	,,	12th	,,		18th	...	..	43	,,	18 ,,
,,	,,	19th	,,		25th	...	..	19	,,	16 ,,
,,	,,	26th	to	July	2nd	...	...	40	,,	22 ,,
,,	July	3rd	,,		9th	...	...	46	,,	39 ,,
,,	,,	10th	,,		16th	...	...	19	,,	7 ,,
,,	,,	17th	,,		23rd	...	...	20	,,	13 ,,
,,	,,	24th	,,		30th	...	...	27	,,	18 ,,

The totals here are placed at 251 cases, with 156 deaths.

Information respecting the epidemic in the interior of Asia Minor is lacking in completeness, but there have been outbreaks of greater or less severity in a large number of places. In the western portion of the peninsula the disease has been most active in various villages near the Dardanelles, at Kutaia, Broussa, Moudania, Panderma, Eski Shehir, Simav, Seraikeui, Merzifun, Denizli, and elsewhere. In the eastern portion it has been present in Sivas, Tokat, Yuzghat, and some other places. In none, however, does it appear to have caused, as yet, a very high mortality.

The disease has also spread to the vilayets of Bagdad and Basra. In the former there were 7 cases and 6 deaths in Bagdad itself between July 11th and 30th; 21 cases and 14 deaths at Amara between May 29th and July 25th; 2 cases in the neighbourhood of Amara between July 10th and 25th; 80 cases and 76 deaths at Medjri Kebir from July 3rd to 12th; 23 cases and 14 deaths at Medjri Saghir from July 3rd to 12th; 8 cases and 3 deaths at Kemit between July 10th and 17th; and 1 fatal case at Decas on July 12th. All these places are on or near the Tigris. The totals in the Bagdad vilayet are put at 142 cases, with 114 deaths. In the Basra vilayet 76 cases, with 49 deaths, were recorded between June 8th and July 29th; of these, 69 cases and 44 deaths occurred at Basra itself between July 17th and 29th, and 7 cases with 5 deaths at Ozeir between June 8th and 13th. Ozeir, it should be added, is a centre of pilgrimage for the Jewish inhabitants of Mesopotamia and elsewhere, as the prophet Ezra is buried here (whence the name of Ozeir). It was among such pilgrims that the cases of cholera occurred. There have been no further cases since the dates mentioned.

In European Turkey the revival of cholera has so far been almost confined to Constantinople itself. The principal exception, an important one in view of the actual situation on the Montenegrin border, is the appearance of the disease at Ipek, in northern Albania. Between July 10th and 13th 17 cases and 32 deaths were reported there; between the 14th and 16th there were 10 cases and 15 deaths; between the 16th and 18th 39 cases and 36 deaths; on the 20th 30 deaths; and on the 21st and 22nd 58 deaths. (These dates are Old Style dates.) There have also been several cases at Diakova in the same region.

In Constantinople itself cholera reappeared at the end of May. It seems to have been imported from the Black Sea coast, and some of the earliest cases occurred among persons who had arrived in the capital by steamers which had called at Samsoun, where, as shown above, cholera was already prevalent. The following official figures have since been published:—

From	May	21st	to	July	11th	...	...	21	cases,	13 deaths.
,,	July	11th	,,		17th	...	...	9	,,	4 ,,
,,	,,	18th	,,		24th	...	...	20	,,	7 ,,
,,	,,	25th	,,		31st	...	...	132	,,	69 ,,
,,	August	1st	to	August	7th	...	...	181	,,	100 ,,

A certain number of these cases have occurred among the troops garrisoning the capital; but the majority have been among the civil population. It will be recalled that the disease was largely spread last autumn by the movements of troops in different parts of the country; but greater precautions have been taken in the present outbreak. As was

[1] THE LANCET, May 27th, p. 1459.

the case last year, the infection seems to be widely spread in all parts of Constantinople and some of the neighbouring villages on the Bosphorus.

Cholera still prevails more or less in the Yemen, but it is difficult to obtain exact information as to its extent. It is certain that it was epidemic in several places in the interior in May and June; among others at Zeidieh, Badjil, Harounieh, Cournieh, &c. Some cases also occurred in June at Salif (nearly opposite to Camaran), where there are extensive salt works, the property of the Public Debt Administration. At Confudah, a port of some importance, 50 cases, with 39 deaths, were registered between May 21st and 25th. At Hodeidah, the principal port of the Yemen, the disease has prevailed intermittently. Early in June a regiment arrived here from Sanaa, the capital of the Yemen, and in the course of about ten days no less than 116 cases of cholera, with 63 deaths, are stated to have occurred among the men. The infection spread to some extent to the general population, but did not apparently cause an epidemic. Other infected regiments and transports have arrived at the Camaran lazaret, where they have undergone disinfection and quarantines of various lengths. In the village of Camaran itself a few cases have also occurred, but most of these seem to have been imported from the mainland. The pilgrim season has now begun, and pilgrim ships are constantly arriving at the Camaran lazaret. So far, fortunately, the pilgrims have escaped the disease here.

Cholera in Italy.

On June 9th the presence of cholera in Italy was first notified; 2 cases were then stated to have occurred at Serrastretta and 1 at Lungro between June 1st and 5th. It is said that the infection was imported to Italy by emigrants from Asia Minor and Constantinople, passing through Italy on their way to America. For some time before the official notification was made large numbers of cases of gastro-enteritis were observed at Naples and elsewhere, and the presence of cholera was widely rumoured before it was officially declared. In Naples 7 cases and 3 deaths from cholera were stated to have occurred between June 11th and 15th; the numbers rapidly rose, and early in July some 30 or 40 cases were being registered daily. In the province of Naples, also, the disease soon became epidemic, as also in those of Caserta, Salerno, and Palermo, while later cases in small numbers were reported from the provinces of Avellino, Campobasso, Caltanisetta, Messina, Livorno, Trapani, and Rome (1 case at Civita Vecchia). The town and province of Palermo, in Sicily, have also become infected, and the figures here have been considerable. At Palermo several cases occurred in the local lunatic asylum. The rumoured appearance of the disease at Venice was subsequently denied. This year's epidemic in Italy bears many points of resemblance to that of last year.

Cholera in Austria-Hungary.

In June an imported case of cholera was declared to have occurred at Graz (as already reported by your Vienna correspondent, THE LANCET, June 24th, p. 1735). On June 6th a suspected case was seen on a ship arriving at Trieste from Naples. On July 17th two suspected cases were reported from the provinces of Weissenberg and Abonj, but these were later stated not to have been cholera. On July 9th a clockmaker in Trieste died from Asiatic cholera, and several other cases subsequently occurred here. Early in July the disease appeared at Skaljari, near Cattaro, on the Adriatic. In an official statement issued by the Austrian Ministry of the Interior on July 24th it is declared that since May 24th (the date apparently of the first case in Graz) 17 cases of cholera with 10 deaths had occurred in Austria; of these, 2 occurred at Graz, 11 at Trieste, and 4 at Cattaro. The latest news from Trieste shows that fresh cases are still developing there.

Cholera in France.

Eight cases of cholera are reported to have occurred at Marseilles. Some of these were imported; but at least 4 appear to have been of indigenous origin. None have occurred since July 20th.

Cholera in Bulgaria.

So far as is known the only case of cholera that has been seen in Bulgaria was one which was reported on July 16th as having occurred in the village of Kaludjik, near to Shumna.

Cholera in Montenegro.

At the end of July the appearance of cholera in Cettinjé was officially reported. One confirmed case and one suspected case were observed there on July 29th.

Cholera in Persia.

Up to the present the only occurrence of cholera reported from Persian territory has been that of 2 fatal cases of the disease at Mohammerah, on the Shatt-el-Arab, below Basra. Both occurred in the week ending July 29th.

Constantinople, August 7th.

REPORT ON EGYPT AND THE SOUDAN IN 1910.[1]

THIS annual report takes up the parable of events in Egypt from the dastardly assassination of the Coptic Prime Minister, Boutros Pasha, and the strained relations which ensued between the Muhammedan and Coptic Egyptians. The ill-judged and obviously premature attempts to conciliate the Nationalist party by giving additional powers and responsibility to the native officials at the expense of the good government of the country led to much discontent among the European officials, and culminated in the official pronouncement in the House of Commons that there can be no hope of further progress in Egypt until the political agitation against the British occupation has ceased. Those who desire to see Egypt ruled by the Egyptians must be made to understand that that time has not yet arrived and is not within sight, for it is idle to talk of that country being governed by really representative institutions so long as only 600,000 of the population of 11,000,000 can read and write. The patriots who clamour unceasingly for the removal of English rule and profess that they themselves are competent to administer their country would do better to utilise their influence in the direction of extending the boon of education to their own brethren. In Egypt's long history there have been but few occasions when the natives of the land have not lived under foreign sway, but if now they are to rule themselves it is surely not too much to ask as a preliminary that the majority should be able to read and write their own tongue.

Among the increased ordinary expenditure of the current year there is a sum of rather more than £15,000 voted to the Public Health Department, chiefly due to the approaching completion of the new lunatic asylum at Khanka, near Cairo; this asylum will be opened this year with 240 beds and will be gradually extended to 1000 beds, thus providing eventually asylum accommodation for 2150 insane persons in the two institutions. A grant of £10,000 has also been made for the rebuilding of the Government hospital at Kena in Upper Egypt, for the present hospital is in unsuitable, insanitary premises above the elementary school, and reconstruction is badly needed. A grant of £15,000 has also been provided for an addition to the Cairo Infectious Hospital, well situated in the desert, so that in future paying patients may be admitted. Europeans and others suffering from small-pox, measles, diphtheria, or typhus have now to be nursed at home or are admitted to a small block attached to the German Hospital in the town.

During last year 57,000 cattle were treated with serum against cattle plague with a total death-rate of 1·8 per 1000; this measure is now popular among the peasants. The mortality among the average prison population of nearly 13,000 is only 1·4 per 1000, and there were during the year only 16 deaths from infectious diseases. It has been decided to substitute bread made from maize instead of wheaten bread in all the prisons, and so effect an economy of about £10,000 a year. Evidently there is no official belief in the view that this change of diet may increase the cases of pellagra among the prisoners.

The total number of Egyptian pilgrims who went to the Hedjaz amounted to 17,500, besides an almost equal number of foreigners who passed through Egypt on their way to Mecca. Of the Egyptian pilgrims, 45 contracted cholera and 32 died, but the disease was arrested at the quarantine stations and failed to get an entrance into Egypt, in spite of menace from Russia, Italy, Tripoli, Asia Minor, and the Red Sea. The long-deferred rebuilding of Kasr-el-Aini Hospital

[1] The late Sir E. Gorst's Report on Egypt and the Soudan in 1910. London. 1911. Pp. 96. Price 10d.

is definitely promised in this report "as soon as the necessary financial provision can be made." Every important medical visitor to Cairo of recent years has urged the need of this step, and it is to be hoped that the authorities will no longer delay. Bubonic plague in Lower Egypt and pneumonic plague in Upper Egypt have both established a firm foothold, so that in 1910 there were 1397 certified cases, compared with 522 cases during the year 1909.

The dispensaries and societies which are trying to combat infant mortality are continuing to instil into the poorest mothers some of the elementary principles of care and cleanliness, and are beset with crowds of patients both in Cairo and in Minia.

The School of Medicine continues to flourish, and now includes 220 students, having quadrupled its numbers during the last 12 years. Several junior posts on the teaching staff have recently been filled by Egyptians who were sent to England to complete their education. There are now 59 students training in various subjects in Europe, mostly in England, besides a considerable number of others who migrate on their own account, for whom the Egyptian Government is in no way responsible.

The Egyptian army was called upon on no less than 15 occasions to operate against tribal foes in the Soudan or to support the civil power. The patrols called out had to fight in desert, mountain, bush, and high grass against fanatical Arabs, savages armed only with spear and bow, and sometimes Nubia billmen, furnished with firearms, which they use with dangerous precision. It is satisfactory to note that malaria has claimed fewer deaths among the soldiers, and that two malarious districts, Kassala and El Obeid, are markedly healthier. The latter ought to be reached next year by the railway, which is being laid south of Khartum, and has already justified its existence financially, while the Abyssinians have expressed a desire for improved telegraphic and trade communications on their frontier. With internal peace, an increasing population, satisfactory public health, and promising trade the Soudan now seems to stand at the threshold of a new era. On the other hand, the telegraph department complains pathetically that communication was interrupted 30 times during the year by elephants, giraffes, and hippopotami!

With the exception of a small outbreak of diphtheria south of Dueim, there was no epidemic of infectious disease in the Soudan during the year. The most important event of 1910 was the re-occupation of the Lado Enclave by the Soudan Government on the death of King Leopold II. of Belgium. This has thrown on the Government the responsibility of administering an area of 17,000 square miles, or about twice the size of Lower Egypt, with a population, mostly of savage tribes, estimated at 50,000. The new territory is well stocked with elephants, but the country is not yet open to shooting parties, partly because of the sleeping sickness, which is a portion of our inheritance from the Belgians. Prompt measures have already been taken to confine this scourge to certain districts of the Lado Enclave, and to prevent its spreading to other parts. During 1910 sleeping sickness made its first appearance in the Soudan, two cases being discovered at Raga and one doubtful case at Wau, among natives who had recently arrived from the French Congo.

Two British medical officers have been detailed to study kala-azar in the Eastern Soudan, where they find that most of the cases are sporadic and occur in males under 20 years of age. The work of Dr. A. Balfour and his colleagues at Gordon College is hardly mentioned in this report, on the grounds that their fourth report is now forthcoming, for which the world of medical science is again indebted to the generosity of Mr. H. S. Wellcome.

It is difficult to close this appreciation without recording our hope that the new Agent and Consul-General in Egypt, Viscount Kitchener, who goes to his task next month in closer touch with scientific and bacteriological knowledge than any of his predecessors, will add fresh lustre to his name by supporting endeavours to rid Egypt and the Soudan from many forms of epidemic and endemic disease.

THE Archbishop of York has accepted the office of President of the Twenty-seventh Congress of the Royal Sanitary Institute, which will be held in York in July, 1912.

ASYLUM REPORTS.

Norfolk County Asylum (Annual Report for the Year 1910).—The chief event of the year in the history of this asylum has been the opening of the nurses' home. The home has been erected at a cost of £134 per bed and has the commendation of the Commissioners in Lunacy. It is entirely separate from the asylum and is of different architecture, the idea being that nurses when off duty should enjoy surroundings altogether different from those of their work. To judge from the description of the home, from an accompanying illustration, and from its plans the nurses should be very comfortable in their new quarters. The daily average number resident at the asylum was 1017. The total admissions for the year were 236, of which number 107 were men and 129 women. This is a record number in the history of the asylum. Hereditary defect was ascertained in 40 per cent. of the cases, mental stress in 22 per cent., and intemperance in 4 per cent. There were discharged 100 persons, and of these 68 were recoveries, a rate of 30 per cent. on the admissions. Deaths numbered 117, being 11·50 per cent. on the daily average number resident. Deaths from consumption and senile decay each gave a percentage of 17 of the total number of deaths, while general paralysis accounted for 9·4 per cent. Post-mortem examinations were made in 76 per cent. of the deaths.

County Borough of Leicester Asylum at West Humberstone (Annual Report for the Year 1910).—At this asylum the average number resident was 727. The admissions numbered 191, and among these 24 were ascribed to heredity, 23 to intemperance, and 42 to mental stress. The discharges numbered 49, the percentage of recoveries on the admissions being 32·28. There were 65 deaths, the rate of mortality estimated upon the average number resident being 8·9. Of the 788 patients remaining in the asylum at the end of the year only 29 were deemed curable.

Kesteven (Lincolnshire) County Asylum (Annual Report for the Year 1910).—The average daily number on the registers of this asylum was 430. There were admitted 78 cases; of these, 18 only were in a good state of bodily health, while 34 were considered in fair health and 26 as feeble or much run down. In 50 per cent. of those admitted a hereditary predisposition was ascertained, and in 20 per cent. some stress, either sudden or prolonged, was given as the cause of the attack. Twenty-four patients were discharged, of whom 18 had recovered. Twenty-nine patients died, giving a rate calculated on the average number resident of 6·74 per cent. Post-mortem examinations were held in 80 per cent. of the deaths. The Commissioners report that on inquiring into the temperature of the water in which patients are bathed one attendant informed them that he bathed his patients in water at 94°, another at 60°, and a third at 100°. The Commissioners draw the moral that bathing regulations should be framed and hung up in every bathroom.

Sunderland Borough Asylum (Annual Report for the Year 1910).—The average number resident at this asylum was 400, or 14 more than in the previous year. 111 patients were admitted. Among the exciting causes of mental breakdown alcohol still keeps its place. Another exciting cause which figures high in the list is adolescence. Dr. J. Middlemass, the medical superintendent, points out the extreme risk which the children of recovered patients of this latter class run. He is of opinion that in at least half the cases sent to the asylum there is an inherited constitutional tendency to an attack of insanity. While much can be done by care to avoid those causes which are known to operate towards developing the latent weakness, it is becoming recognised that something potent in the form of enlarging the present powers of detention will have to be adopted. It is reasonable to suppose that if the causal factor of heredity could be arrested the amount of insanity would in a generation or two be reduced to much smaller proportions. Sixty-five patients were discharged, and of these 50 had recovered, the rate being 45 per cent. on those admitted. The deaths numbered 36, the percentage of deaths on the admissions was 32·4, on the average number resident 9·0, and on the total number under treatment 7 1. In every case a post-mortem examination was held. A verandah for treatment has been erected and has been found

useful for mental symptoms as well as for those of pulmonary tuberculosis.

Royal Edinburgh Asylum at Morningside (Annual Report for the Year 1910).—The average number resident during the year at this asylum was 752. The total number of admissions was 195. Alcoholic excess appears to have existed as an etiological factor in 12·3 per cent. of the admissions. Among males the percentage of so-called alcoholic insanity was less than it has ever been before, although among females it has steadily risen during the last three years, and last year was 11·2 of the total admissions of women. Dr. G. M. Robertson, the physician-superintendent, notes that, in spite of the acute political excitement of recent years, no cases can be attributed to it. "Judging by their effects on the brain of the ordinary man, the interest taken in politics, and the disturbance it produces, must both be of the most shallow and superficial nature." Seventy patients were discharged recovered and 59 unrecovered, the recovery rate being 36 per cent. of the total number of admissions. The deaths numbered 60, which is 8 per cent. of the average number resident. Post-mortem examinations were made in 36 instances. In administrative matters Dr. Robertson has endeavoured to remove all features peculiar to asylums and to convert the institution into a hospital for the treatment of a special disease. Insanity is very frequently associated with physical exhaustion, and its treatment should therefore be conducted by a staff and by methods similar to those employed for the treatment of other diseases.

Brighton County Borough Asylum at Haywards Heath (Annual Report for the Year 1910).—The average daily number resident was 842. Admissions numbered 259, of whom 117 were males and 142 were females. Ninety persons were discharged, of whom 35 were males and 55 were females. Of the males 17 had recovered, being a percentage of 30·4 on the admissions. Of the females 26 had recovered, being a percentage of 31·7 on the admissions. The deaths numbered 51, the rate on the average daily number resident being 6·1 per cent. The mean age at death for both sexes was 58·7 years—for males 55·0, and for females 61·8. In only 50 per cent. of the deaths were post-mortem examinations held.

Cumberland and Westmorland Lunatic Asylum (Annual Report for the Year 1910).—The daily average number of patients resident at this asylum during 1910 was 853. 179 patients were admitted, of whom 174 were direct admissions. Twenty-eight of those admitted had been previously treated in the asylum, and 24 of these had recovered at the time of their last discharge. The average time these had remained away from the asylum was 4 years 11½ months. In causation, heredity was the commonest factor and was ascertained in 38 cases, or, including epileptic heredity, in 41 cases. Alcoholic excess was a factor in 21 cases, and mental stress preceded the attack in 16 cases. Discharges numbered 105, there being 68 recovered, 20 relieved, and 17 not improved. The recovery rate on the direct admissions was 39·1 per cent. Of the recovered, 17 were at the asylum for less than three months, 23 from three to six months, 6 from six to nine months, and 11 for more than a year. Fifty-three of those who recovered were brought to the asylum within three months of the onset of the attack. Dr. W. F. Farquharson, the medical superintendent, points out that the earlier a patient is brought under treatment, removed to a new environment where he can have the services of specially trained nurses, and withdrawn from the well-meant attention of relatives and neighbours, the more speedily does recovery take place. Seventy-eight patients died during the year and the rate, calculated on the daily average number of patients resident, was 9·1 per cent. In every case a post-mortem examination was made.

THE BRITISH FIRE PREVENTION COMMITTEE.—A special commission of officers of this committee has left London for Paris to study the fire preventive and fire service arrangements of the French capital and its suburbs. The commission, for whom an extensive programme of work has been prepared by the French Government, comprises the chairman, Mr. Edwin O. Sachs, Mr. Ellis Marsland (honorary secretary), Mr. Horace Folker (honorary treasurer), Lord Londesborough, Mr. H. Dyer, Mr. Percy Collins, Lieutenant Spencer, R.N., and Mr. Boyce-Podmore.

Public Health.

ANNUAL REPORTS OF MEDICAL OFFICERS OF HEALTH.

Bombay.—According to the report on public health administration in Bombay for 1910, presented by Dr. J. A. Turner, the executive health officer, there has been a notable improvement in respect to the mortality from plague, cholera, and phthisis, though a slight increase has occurred in the number of deaths under the heads of small-pox, measles, fevers, diarrhœal and respiratory diseases. The total number of deaths was 34,933, giving a death-rate of 35·72 per 1000 on a population of 977,822; this was the number of inhabitants as determined by the census of 1906, and no correction has been applied for any increase in the five years that have since elapsed. After deducting deaths of new arrivals, and adding deaths in sanatoriums outside the city of persons belonging to Bombay, the corrected death-rate is 35·13 per 1000. The actual number of deaths is, indeed, smaller than in any year during the past decade, with one exception, the main cause being decrease in plague mortality. Out of the total ratio of 35·72, the most important item is that of respiratory diseases, causing 8·39, compared with a ratio of 10·30 for 1900–1909; plague caused 3·73, a notable reduction on 14·17, the decennial average; fevers accounted for only 3·18, also a satisfactory figure compared with 5·37 for the decennium; phthisis (2·33) and diarrhœa (2·20) were also less fatal. The zymotic death-rate of 9·89 compares favourably with that of the preceding three years (11·90), and still more with that of the decennium (24·33). There was a considerable increase in small-pox and measles over the preceding year, but variations from year to year are of small consequence unless maintained. Amongst the variety of races inhabiting Bombay a considerable difference exists in regard to mortality ratios; compared with the general rate of 35·72, we find for Mussulmans it was 51·10, for native Christians 48·73, and for Jews 36 33; while for Eurasians it was 32·47, Buddhists 31 69, Hindus 32·41, and for Parsis only 27·30. The European ratio of 18 50 is obviously hardly comparable, as the conditions of life here are so different. The high mortality among Mussulmans (chiefly from phthisis, respiratory and nervous diseases) is ascribed to their density of population, their ill-ventilated houses, and the *purdah* system of seclusion for their women. Native Christians suffered especially from fevers, diarrhœal and respiratory diseases, and small-pox. The most noticeable feature of the public health during the year was the reduction of plague mortality to 3·73 per 1000, the lowest ratio since 1896; the disease has not decreased in virulence, as the case-mortality stands at 88·52 per cent., a figure exceeded in three years only since 1896. March, April, and May were the months of chief incidence (915 deaths in April); in December there were only 32 deaths. Small-pox was epidemic from February to May, its spread as usual having been aided by continual importations from outside, especially by pilgrims returning from Jeddah. Arrangements have now been made to vaccinate pilgrims, when possible, before leaving India for Mecca, and a specially trained nurse has been deputed to vaccinate females. Great benefit will doubtless result from this important step in advance. A great deal of anti-malarial work has been carried out, in the way of inspection of wells, applying pesterine, and in some instances filling in or closing them; stocking with small fish to eat the larvæ has been tried, but without success, though further trials are to be made. The matter is a difficult one to deal with as religious prejudices in many cases come in the way. Malarial fever accounted for 293 deaths, a ratio of 0·29 per 1000, being slightly in excess of the quinquennial average (0·26).[1] Among the chief administrative measures undertaken were anti-plague inoculations, of which 5043 were performed; the destruction of more than half a million rats; and the formation of semi-permanent health camps. Dr. Turner advises the municipality to erect suitable refuse destructors; the rapid disposal of town sweepings is of the greatest importance in eastern cities, and there can be no doubt that Bombay would be well advised to adopt this method. Motor vans for the removal of town refuse

[1] In addition 2630 deaths are returned under "Ague and Remittent Fever." What are these, if not malarial? And what does "malarial fever" include without them?

have been introduced with satisfactory results, being actually less expensive to work than the old bullock carts. We regret to learn that, in spite of all that has been written and said within the last few years about town planning, great numbers of new buildings are being erected in the northern part of Bombay in a crowded and insanitary manner, and without proper means of access. No protest has been made apparently against the erection of such buildings on land which is not properly laid out. Bombay is now the third city under British rule in point of population; its health conditions are a matter of imperial interest. Dr. Turner has a very difficult task, and we wish every success to his strenuous efforts for the public good.

VITAL STATISTICS.

HEALTH OF ENGLISH TOWNS.

IN 77 of the largest English towns 7072 births and 5770 deaths were registered during the week ending August 12th. The revised estimate of the population of these towns in the middle of this year is 16,157,797 persons. The annual rate of mortality in these towns, calculated on this revised estimate, which had been increased from 11·8 to 15·9 per 1000 in the four preceding weeks, further rose to 18 6 in the week under notice. During the first six weeks of the current quarter the annual death-rate in these towns averaged 14 0 per 1000, while in London during the same period the mean annual death-rate did not exceed 13·6 per 1000. The recorded annual death-rates in the 77 towns last week ranged from 7·3 in Barrow-in-Furness, 8·0 in Stockton-on-Tees, 8 9 in King's Norton, and 9·2 in Bournemouth, to 26·4 in Aston Manor, 28·0 in Stoke-on-Trent and in St. Helens, 29·7 in West Bromwich, and 38·1 in Dewsbury. The 5770 deaths from all causes in the 77 towns last week exceeded the number recorded in the previous week by no fewer than 830, and with one exception was the highest number recorded in any week during the current year. These 5770 deaths from all causes included 2103 which were referred to the principal epidemic diseases, against numbers increasing from 268 to 1340 in the six preceding weeks, and included no fewer than 1927 from infantile diarrhœa, 60 from whooping-cough, 50 from measles, 24 from diphtheria, 23 from scarlet fever, and 19 from enteric fever, but not one from small-pox. The mean annual death-rate from these epidemic diseases was equal to 6·8 per 1000, against 2·3 and 4·3 in the two preceding weeks. The deaths of infants under two years of age attributed to diarrhœal diseases in the 77 towns, which had increased from 70 to 1168 in the six preceding weeks, further rose last week to 1927, and caused the highest annual rates of 11·7 in Wigan and in Dewsbury, 12·2 in West Bromwich, 12·4 in West Ham, 13·1 in Stoke-on-Trent, 14·0 in St. Helens, and 16·0 in Aston Manor. The deaths referred to whooping-cough, which had increased from 43 to 57 in the four preceding weeks, further rose last week to 60; 26 deaths were registered in London and its suburban districts, 4 in Liverpool, 3 in Leeds, and 3 in Cardiff. The fatal cases of measles numbered 50, and were 3 less than the number returned in the previous week; 15 deaths were recorded in London and its suburban districts, 4 in Liverpool, and 3 each in Wolverhampton, Nottingham, Manchester, and Salford. The deaths from diphtheria, which averaged 41 in the three preceding weeks, declined last week to 24, and included 9 in London and its suburban districts, 3 in Sheffield, and 2 each in Stoke-on-Trent, Salford, and Bradford. The 23 deaths referred to scarlet fever were 9 in excess of the number in the preceding week, and included 7 in London and its suburban districts, 5 in Liverpool, 2 in Birmingham, and 2 in Coventry. The deaths attributed to enteric fever, which had been 11, 11, and 8 in the three preceding weeks, rose to 19 last week, and included 5 in London, 2 in Bradford, and 2 in Leeds. The number of scarlet fever patients under treatment in the Metropolitan Asylums and in the London Fever Hospital, which had steadily increased from 982 to 1433 in the 17 preceding weeks, had further increased to 1442 on Saturday last; 159 new cases of this disease were admitted to these hospitals during the week, against 199, 209, and 191 in the three previous weeks. These hospitals also contained at the end of last week 823 cases of diphtheria, 256 of whooping-cough, 238 of measles, and 38 of enteric fever, but not one of small-pox. The 1619 deaths from all causes in London last week showed an increase of 275 upon the number returned in the previous week, and included 90 which were referred to diseases of the respiratory system, against 115 and 91 in the two previous weeks. The deaths attributed to different forms of violence in the 77 towns, which had been 173 and 223 in the two preceding weeks, declined to 162 last week, and 373 inquest cases were registered. The causes of 26, or 0 5 per cent., of the deaths registered in the 77 towns during the week under notice were not certified either by a registered medical practitioner or by a coroner. All the causes of death last week were duly certified in Manchester, Sheffield, Leeds, Bristol, West Ham, Bradford, Hull, Nottingham, and in 52 other smaller towns; the 26 uncertified causes of death last week included 6 in Birmingham, 4 in Liverpool, and 2 in Grimsby.

HEALTH OF SCOTCH TOWNS.

In eight of the principal Scotch towns, having an estimated population of 1,710,291 persons in the middle of this year, 793 births and 471 deaths were registered during the week ending August 12th. The annual rate of mortality in these towns, which had been equal to 14 9 and 13·8 per 1000 in the two preceding weeks, rose to 14 4 last week, and was equal to the mean rate in these towns during the first six weeks of the current quarter, but was 0 4 per 1000 above the mean death-rate during the same period in the 77 large English towns. The annual death-rates in the Scotch towns last week ranged from 12·2 and 12·5 in Edinburgh and Aberdeen to 16·0 in Perth and 21·5 in Greenock. The 471 deaths from all causes in the eight towns last week were 19 in excess of the number in the previous week, and included 99 which were referred to the principal epidemic diseases, against 73 and 62 in the two preceding weeks; of these 99 deaths, 70 resulted from diarrhœa, 11 from measles, 9 from whooping-cough, 5 from diphtheria, 2 from enteric fever, 1 from scarlet fever, and 1 from small-pox. The mean annual death-rate from these epidemic diseases in the eight towns last week was equal to 3·0 per 1000, the mean rate last week from the same diseases in the 77 English towns having been 6·8. The deaths from diarrhœa, which had been 40 and 33 in the two preceding weeks, rose last week to 70, and included 59 of infants under two years of age; 49 deaths occurred in Glasgow, 6 in Edinburgh, and 6 in Greenock. The 11 deaths referred to measles were equal to the number in the previous week, and included 4 in Glasgow, 3 in Aberdeen, and 3 in Leith. The 9 fatal cases of whooping-cough were 2 in excess of the number returned in the preceding week, and included 5 in Glasgow and 3 in Paisley. The 5 deaths attributed to diphtheria were equal to the average in the three preceding weeks, and included 2 in Glasgow. The fatal cases of enteric fever were registered in Glasgow and Edinburgh, that of scarlet fever in Glasgow, and that of small-pox in Dundee. The deaths referred to diseases of the respiratory system in the eight towns, which had been 48 and 32 in the two preceding weeks, rose to 39 last week, but was 8 below the number in the corresponding week of last year. Of the 471 deaths from all causes in the eight towns last week, 143, or 30 per cent., were recorded in public institutions, and 22 were attributed to different forms of violence. The causes of 13, or 2·8 per cent., of the deaths in the eight towns last week were not specified or not certified; in the 77 English towns the proportion of uncertified causes of death during the week did not exceed 0 5 per cent.

HEALTH OF IRISH TOWNS.

In the 22 town districts of Ireland, having an estimated population of 1,149,495 persons in the middle of this year, 595 births and 377 deaths were registered during the week ending August 12th. The annual rate of mortality in these towns, which had been 16·8, 16 4, and 16·8 per 1000 in the three preceding weeks, rose to 17·1 per 1000 in the week under notice. During the first six weeks of the current quarter the annual death-rate in these towns averaged 16·3, whilst the mean rate during the same period did not

* Including membranous croup. † The death-rates are corrected for variations in sex- and age-constitution of the populations of the several boroughs, the population of England and Wales being taken as the standard. ‡ Deaths from "typhus fever" and "other continued fevers" are not now distinguished in the Registrar-General's weekly returns; these two columns are therefore omitted from the Table.

exceed 14·0 per 1000 in the 77 English towns, and was equal to 14·4 in the eight Scotch towns. The annual death-rate last week was equal to 20·7 in Dublin (against 18·7 in London), 16·3 in Belfast, 9·5 in Cork, 11·5 in Londonderry, 13·6 in Limerick, and 20·9 in Waterford; whilst in the 16 smallest of these Irish towns the mean annual death-rate did not exceed 15·4 per 1000. The 377 deaths from all causes in the 22 Irish towns last week showed an increase of 6 upon the number returned in the previous week, and included 117 which were referred to the principal epidemic diseases, against 87 and 83 in the two preceding weeks; of these 117 deaths, 106 resulted from diarrhœal diseases, 4 from scarlet fever, 3 from enteric fever, 2 from measles, and 2 from whooping-cough, but not one from small-pox or from diphtheria. These 117 deaths from the principal epidemic diseases were equal to an annual death-rate of 5·4 per 1000, the mean rate from the same diseases in the 77 English towns was equal to 6·8 per 1000, whilst in the eight Scotch towns it did not exceed 3·0. The deaths attributed to diarrhœal diseases, which had been 70 and 66 in the two preceding weeks, rose to 106 last week and included 94 of infants under two years of age; 47 deaths were registered in Dublin, 42 in Belfast, and 3 in Cork. The 4 deaths attributed to scarlet fever were 3 in excess of the number in the previous week, and included 3 in Dublin and 1 in Belfast. Of the 3 fatal cases of enteric fever, 2 occurred in Dublin and 1 in Belfast. The 2 fatal cases of measles were recorded in Dublin and Newtonards, and those from whooping-cough in Dublin and Belfast. The deaths referred to diseases of the respiratory system in the 22 towns, which had been 44 and 20 in the two preceding weeks, rose last week to 38. Of the 377 deaths from all causes in the 22 town districts last week, 85, or 23 per cent., of the deaths occurred in public institutions, and 4 deaths were attributed to different forms of violence. The causes of 14, or 3·7 per cent., of the deaths registered in the 22 towns last week were not certified either by a registered medical practitioner or by a coroner after inquest; the proportion of uncertified causes of death during the week under notice did not exceed 0·5 per cent. in the 77 large English towns, and was equal to 2·8 in the eight Scotch towns.

VITAL STATISTICS OF LONDON DURING JULY, 1911.

IN the accompanying table will be found summarised complete statistics relating to sickness and mortality in the City of London and in each of the metropolitan boroughs. With regard to the notified cases of infectious diseases, it appears that the number of persons reported to be suffering from one or other of the nine diseases specified in the table was equal to an annual rate of 5·1 per 1000 of the population, estimated from the unrevised returns of the recent Census to be 4,522,628 persons in the middle of the year. In the three preceding months the rates were 4·1, 4·3, and 4·4 per 1000 respectively. The lowest rates last month were recorded in Paddington, Stoke Newington, the City of London, Lambeth, Battersea, and Lewisham; and the highest rates in Holborn, Finsbury, Poplar, Southwark, Camberwell, and Greenwich. The prevalence of scarlet fever showed a marked increase over that recorded in either of the two preceding months; the greatest proportional prevalence of this disease was recorded in Fulham, Holborn, Poplar, Southwark, Camberwell, Greenwich, and Woolwich. The number of scarlet fever patients under treatment in the Metropolitan Asylums Hospitals, which had been 1018, 1128, and 1206 at the end of the three preceding months, had further risen to 1400 at the end of July; the weekly admissions averaged 200, against 127, 160, and 162 in the three preceding months. Diphtheria also was considerably more prevalent than in any other recent month; among the various metropolitan boroughs this disease was proportionally most prevalent in St. Pancras, Holborn, Southwark, Bermondsey, and Greenwich. There were 839 diphtheria patients under treatment in the Metropolitan Asylums Hospitals at the end of last month, against 801 and 771 at the end of the two preceding months; the weekly admissions averaged 120, against 97, 100, and 102 in the three preceding months. The prevalence of enteric fever showed a slight increase over that recorded in either of the two preceding months; the greatest proportional prevalence of this disease was recorded in Paddington, Fulham, the City of Westminster, St. Pancras, Poplar, and Deptford. The Metropolitan Asylums Hospitals contained 47 enteric fever patients at the end of July, against 22, 35, and 33 at the end of the three preceding months; the weekly admissions averaged 9, against 5 and 6 in the two preceding months. Erysipelas was proportionally most prevalent in Hammersmith, Hackney, Finsbury, the City of London, Bethnal Green, and Stepney. The 16 cases of puerperal fever notified during the month included 2 in Wandsworth and 2 in Camberwell. Of the 6 cases notified as cerebro-spinal meningitis, 2 belonged to Camberwell and 1 each to Islington, Poplar, Southwark, and Wandsworth.

The mortality statistics in the table relate to the deaths of persons actually belonging to the several boroughs, the deaths occurring in institutions having been distributed among the several boroughs in which the deceased persons had previously resided; the death-rates from all causes are further corrected for variations in the sex- and age-constitution of the populations of the several boroughs. During the four weeks ending July 29th the deaths of 4105 London residents were registered, equal to a corrected annual rate of 12·4 per 1000, against 16·7, 13·2, and 11·7 per 1000 in the three preceding months. The death-rates last month ranged from 8·4 in Lewisham, 8·9 in Stoke Newington, 9·0 in Wandsworth, 9·9 in Hampstead, 10·4 in Hackney, and 10·6 in Battersea, to 14·6 in Southwark, 15·9 in Bermondsey, 16·2 in the City of London, 16·5 in Shoreditch and in Stepney, and 18·9 in Finsbury. The 4105 deaths from all causes included 71 from measles, 16 from scarlet fever, 37 from diphtheria, 36 from whooping-cough, 4 from enteric fever, and 276 (among children under two years of age) from diarrhœa and enteritis. No death from any of these diseases was recorded last month in the City of London; among the metropolitan boroughs they caused the lowest death-rates in Paddington, Hammersmith, the City of Westminster, St. Marylebone, Wandsworth, Camberwell, and Lewisham; and the highest rates in Finsbury, Shoreditch, Bethnal Green, Stepney, Southwark, Bermondsey, and Greenwich. The 71 deaths from measles were 54 fewer than the corrected average number in the corresponding period of the five preceding years; this disease was proportionally most fatal in Chelsea, Hampstead, Shoreditch, Bethnal Green, and Stepney. The 16 fatal cases of scarlet fever were less than one-half the corrected average number; of these 16 deaths 2 belonged to Islington, 2 to Finsbury, 2 to Poplar, and 2 to Wandsworth. The 37 deaths from diphtheria were slightly in excess of the corrected average for the corresponding weeks of the five preceding years; the greatest proportional mortality from this disease was recorded in Hampstead, St. Pancras, Poplar, Southwark, Deptford, and Lewisham. The 36 fatal cases of whooping-cough were 45 below the corrected average number; this disease was proportionally most fatal in Hammersmith, the City of Westminster, St. Marylebone, Hackney, Bermondsey, and Battersea. The 4 deaths from enteric fever were 7 fewer than the average, and included 2 in Paddington, 1 in Fulham, and 1 in Lambeth. The deaths from diarrhœa and enteritis among children under two years of age caused the highest death-rates in St. Pancras, Finsbury, Shoreditch, Bethnal Green, Stepney, and Greenwich. In conclusion, it may be stated that the aggregate mortality in London last month from the principal infectious diseases (excluding diarrhœa) was 42·3 per cent. below the average.

THE SERVICES.

ROYAL ARMY MEDICAL CORPS.

Lieutenant (on probation) Hugh G. Monteith, from the seconded list, is restored to the establishment (dated July 29th, 1911).

Colonel F. J. Jencken, administrative medical officer of the Colchester District, has been selected as Administrative Medical Officer of the Fourth Division at Army Manœuvres. Colonel T. M. Corker, principal medical officer of the British forces in Egypt, has arrived home on leave of absence. Lieutenant-Colonel J. F. Donegan, in medical charge of the Military Hospital at Parkhurst, Isle of Wight, has been transferred from the Southern to the Eastern Command. Major E. M. Morphew, commanding the

Station Hospital at Roorkee, Meerut Division, has arrived home on leave of absence from India. Captain R. N. Hunt, in medical charge of the effective troops at Bordon, has embarked for a tour of service at Cairo. Captain J. W. West has been transferred from the Military Hospital at Rawal Pindi to the Murree Cantonment. Captain J. E. Hoar, on return home from a tour of service in the Madras Presidency, has been placed in Medical Charge at Ballykinler Camp. Captain W. R. Galwey, from the Station Hospital, Lahore, has taken up duty at Dalhousie. Captain G. G. Tabuteau, from Jhansi, has been selected to command the Station Hospital at Jutogh, Simla District. Captain A. C. Osburn, in medical charge at Bedford, has joined for duty at the Military Hospital, Colchester, on relief by Lieutenant-Colonel J. Poynder. Captain J. H. Spencer, from Ambala, has been appointed to the Station Hospital at Kasauli.

INDIAN MEDICAL SERVICE.

Colonel H. Hendley, principal medical officer of the Sirhind and Jullundur Brigades, has been selected to succeed Colonel D. ffrench-Mullen as Deputy Principal Medical Officer of His Majesty's Forces in India, with effect from August 7th. Lieutenant-Colonel A. H. Nott has been granted six months' leave of absence home from India by the Home Department. Major P. Dee has been permitted by the Secretary of State for India to return to duty within the period of his leave. Major G. McI. C. Smith has been appointed Civil Surgeon of Ludhiana. Major N. P. O'G. Lalor, Deputy Sanitary Commissioner in Burma, has been placed on special duty by the Government of India in connexion with the investigation and prevention of malarial fevers. Major G. H. Stewart has been transferred from Taunggyi to Rangoon, and appointed to officiate as Sanitary Commissioner of Burma, in succession to Major N. P. O'G. Lalor. Captain A. G. Coullie has been appointed Specialist in Advanced Operative Surgery to the Third (Lahore) Division. Captain J. Proctor has taken up civil medical employment in Bengal Presidency and has been appointed to the Medical College Hospital at Calcutta. Captain A. E. J. Lister, surgeon to His Excellency the Commander-in-Chief of India, has arrived home on leave of absence. The services of Captain R. D. Saigol have been placed permanently at the disposal of the Government of India. Captain G. F. I. Harkness, civil surgeon at Wana, has been granted two months' privilege leave of absence. Captain J. Anderson has been appointed to officiate as an Agency Surgeon of the Second Class nd posted as Civil Surgeon of Dera Ismail Khan. Lieutenant A. McD. Dick has been appointed Specialist in Advanced Operative Surgery in the Burma Division.

TERRITORIAL FORCE.

Royal Army Medical Corps.

1st South-Western Mounted Brigade Field Ambulance, Royal Army Medical Corps: Major George R. Swinhoe, whose resignation has been anounced, is granted permission to retain his rank and to wear the prescribed uniform.

Attached to Units other than Medical Units.—Lieutenant Charles J. I. Krumbholz to be Captain (dated April 21st, 1911). Robert Donald to be appointed Lieutenant (dated July 28th, 1911).

By the permission of the Officer Commanding Royal Army Medical Corps depot at Aldershot the sports of the 1st London Division, Royal Army Medical Corps, Territorial Force, were held on the Queen's ground, Aldershot, on August 12th, when the following units competed: 1st, 2nd, and 3rd City of London Field Ambulances, 1st General Hospital, and 1st City of London Sanitary Company. Amongst those present were: Surgeon-General G. W. Robinson, C.B., P.M.O.; Colonel P. B. Giles, C.B., A.M.O., 1st London Division; Lieutenant-Colonel J. Harper, Lieutenant-Colonel R. R. Sleman, Lieutenant-Colonel J. Norwood Brown, and Colonel C. E. Harrison, C.V.O The Miles Challenge Cup, presented by Major E. Miles, is awarded to the Field Ambulance scoring the most points in certain events at these annual sports. The 3rd Field Ambulance were the holders of the cup. When the sports started it seemed likely that the 1st Field Ambulance would not be able to attend, as owing to the exigencies of military service they had been kept at work until the afternoon, greatly to the disappointment of the men, who had only lost the cup last vear by the narrow margin of five points. But instead of giving up they started, under the hot sun, on their long march from Frith Hill, and arrived with their tents and baggage late in the afternoon, by which time seven of the events which counted for the challenge cup had already been decided, but there were seven events left for competition, including the more important and technical competitions requiring knowledge of the special work of the Royal Army Medical Corps. The aspect of the competition changed as soon as the 1st Field Ambulance, under Lieutenant-Colonel Sleman, arrived, as this unit succeeded in securing the cup by a considerable margin, winning in succession the tug of war, the operating tent and bell tent pitching, the harnessing competition, and gaining second place in the riding and driving, being only half a point behind the 2nd Field Ambulance. The 2nd Field Ambulance, commanded by Lieutenant-Colonel Norwood Brown, and the 3rd Field Ambulance, commanded by Lieutenant-Colonel Harper, were second and third respectively in order of merit. Great credit is due to Staff-Sergeant E. May, the sports secretary, for the admirable arrangements made, and the success of the afternoon is largely due to him.

Correspondence.

"Audi alteram partem."

THE INCIDENCE OF TUBERCULOSIS.

To the Editor of THE LANCET.

SIR,—The data appearing over the signature of J. Tertius Clarke, M.R.C.S. Eng., medical officer, Lower Perak, F.M.S., in your issue of July 15th (p. 187) are presented at a very opportune moment. They are of distinct value in connexion with the unification of our knowledge of tuberculosis and its varied manifestations among men and animals. We have much to learn concerning the ubiquity of the tubercle bacillus, and I am looking forward with pleasure to the perusal of the appendices to the report of the Royal Commission on Tuberculosis which you also announce. I am confident from the interim reports of this Commission that their data will give us many details to fill some of the broad gaps found in articles dealing with the intercommunicability of the disease and the variations in type of the causative organism.

The results of Park and Krumweide, as reported in the *Journal of Medical Research* for October, 1910, give us much information, although they drew no conclusions from the data which they presented. Upon analysis we find that of the 1042 cases which they tabulate (436 of which are reported for the first time) 26·8 per cent. of the children dying from tuberculosis under 5 years of age yield an organism of the bovine type, while children from 5 to 16 years of age yield the bovine organism in 25 per cent. of the cases. The percentage of cases giving the bovine type of organism after 16 years of age would indicate that a change in type may, and probably does, occur from the bovine to the human type, through residence in the human system in from 18 to 20 per cent. of the fatal human cases.

Is it not possible that the tubercle bacillus has a mean temperature and environment in which it attains its highest virulence, while any variation above or below this mean, or any variation unfavourable to its growth, leads to a certain attenuation, and this degree of attenuation is maintained so long as the new conditions are constant? A parallel condition is observed with anthrax vaccine and is the basis upon which the protective inoculation of animals is founded.

I am of the opinion that the mean temperature and environment giving the greatest virulence to the tubercle bacillus is found in the bovine. When the temperature is increased above or below this mean we have an attenuation—e.g., in birds (temperature 108° F.) and in the human being (temperature 98½° F.). (The bovine temperature varies from 101 to 103° F.) Some of my experiments have confirmed the transmutation of the organism from one type to another but have not been conducted in sufficient numbers to warrant their publication at this time. I anticipate being able to

devote more attention to this phase of the tuberculosis problem in the near future.

I am, Sir, yours faithfully,

CHAS. H. HIGGINS, Pathologist.

Biological Laboratory, Ottawa, August 1st, 1911.

THE NEED FOR INTERNATIONAL MEDICO-POLITICAL CONFERENCES.

To the Editor of THE LANCET.

SIR,—I venture to believe that the time has come when British medicine has much to gain from conference on medico-political matters with its brethren of other nationalities—much, perhaps, to lose for want of such conference. The likeness of the present crises in Germany and England, and theal ready expressed wish of some French medical men for a meeting of representatives of the French and English professions to discuss the legislative proposals now made in this country, taken in conjunction with such considerations as the community of interest and responsibility of all national branches of the profession, their broad national humanitarian rather than merely national outlook, the similarity of interference by various Governments with professional affairs, the obvious danger to all of mischievous limitations of the liberty of one, and the consequent necessity for community of action, not only in their own interests, but in the interests of mankind in general, point clearly, it seems to me, to the above conclusion. On the wider and more remote advantages of such meetings I do not dwell. In practical politics the "dreamer of dreams" is generally a dangerous man. But it can scarcely be doubted that the closer union of policies, the more intimate association of interests by all the national divisions of a calling, essentially one increasingly pre-eminently intellectual, and therefore increasingly pre-eminently influential, must in the long run tend to promote a better world-wide international feeling—to foster the growing desire for international peace.

A more immediately important consideration, however, of such remote policy is the avoidance of anything which could ultimately lead to undesirable results. There seem to me to be sound historical reasons against "an international medical association" on the lines indicated for "Labour" by certain Socialistic propagandists. Such associations tend to become "antinational," and have, indeed, been advocated with that very idea in view. Each nation in medicine should preserve intact its own laws and customs specially adapted to its own public, without international trammels to limit its liberty and progress. What is wanted is a committee of representatives, not too numerous, from all the civilised nations, of medicine, embodying the best brains of the profession throughout the world—a body, in fact, not very unlike the committee which constitutes the Peace Conference at the Hague. By means of such a body all important medico-political problems arising in one country could be submitted for consideration and advice to the world-wide experience of the profession. It can scarcely be doubted that the result would be of value. Advice so obtained need by no means necessarily be acted on, but could scarcely fail to beneficially affect action or to add immense weight to action taken in accordance with it. Possibly the International Medical Congresses held annually in different countries might afford the most convenient occasions.

The idea seems to me at least one which is well worth considering. Some day or other such conferences will almost certainly take place. Why not soon? The occasion seems to ask for them.

I do not suppose that many people are making the profound mistake of thinking the present crisis is a merely passing incident. It is only a beginning. No one who reflects reasonably upon the vast powers which a century of medical labour has built up in all lands will imagine that vote-needy politicians are going to pass it by with eulogistic indifference. As well expect a signed blank cheque safe during the evening visit of a burglar. The profession, I believe, has got to put its bolts and bars in order, and the sooner it does so the better, and not in one country only but in all. It is perhaps amusing, but it is scarcely reassuring, to see democracy stepping eastwards to take tips from autocracy, for the tips are not likely to be favourable to individual rights. Let those who prize liberty take all possible steps to protect it.

I am, Sir, yours faithfully,

Exeter, August 6th, 1911. W. GORDON.

SMALL-POX IN THE UNITED STATES: A DANGEROUS DOCTRINE.

To the Editor of THE LANCET.

SIR,—In THE LANCET of July 22nd, on p. 236, you discussed an article on "Small-pox in the United States" published in the Public Health Reports of June 23rd. In the discussion you quoted the sentence, "That the community is protected by vaccination may be true for certain localities, but that the protection thus afforded is general can hardly be maintained," and construed it to be an assertion that it cannot be maintained that the protection afforded by vaccination is of general application.

You misconstrued the meaning of the author. The intended meaning was that, while vaccination had been practised in certain localities in the United States, and the people in these localities, therefore, possessed the protection which vaccination affords, the practice of vaccination had not been sufficiently general throughout the country as a whole to warrant the assumption that the community at large enjoyed this protection. The community at large could not be said to be protected by vaccination, not because vaccination did not protect, but because a large proportion of the people had never been vaccinated.

I shall be glad if you will publish this letter.

I am, Sir, yours faithfully,

Washington, D.C., August 7th, 1911. JOHN W. TRASK.

RUBELLA OR MEASLES?

To the Editor of THE LANCET.

SIR,—I am glad to see that my friend, Dr. Donald Hood, from his own wide experience has independently reached the same conclusion I announced some years ago—that rubella and ordinary measles are identical diseases. In my book on School Hygiene, published in 1885, I wrote, pp. 259-60: "Under the name of roseola, rubella, or rose rash, a form of disease has been described which is believed by some to be specific in nature, and by others is apparently confused with that rather mysterious disorder known as rötheln, or German measles. I have had the opportunity of studying one or two epidemics, and am thoroughly satisfied that we have merely to deal with a miniature or aberrant type of measles, as the following evidence will prove. Whilst nearly all the 30 cases which came under my observation on one occasion at Rugby School were most insignificant in character, a few ran gradually up to the type of true measles, which was reached in absolute perfection in two instances. These patients presented all the usual symptoms attendant on true measles in rather aggravated degree; there were copious eruption, high fever, and troublesome bronchial irritation, resulting, so far as careful inquiry could make out, from precisely the same infection which had barely disturbed the constitutional equanimity of the other victims of the epidemic."

I am, Sir, yours faithfully,

ROBERT FARQUHARSON, P.C., M.D.

Aboyne, N.B., August 7th, 1911.

A QUESTION IN EUGENICS.

To the Editor of THE LANCET.

SIR,—Does not Dr. Robert Jones in his letter of August 3rd confuse vasectomy with castration? The case he quotes was probably one of the latter, for the former has not the baleful effects Dr. Jones describes. Eugenists are agreed that castration for purposes of sterilisation is inadmissible. Dr. Jones's other contentions, in which he appears to take up the disastrously selfish position of the individual against the race, are sufficiently replied to by Dr. C. T. Ewart in the same issue.—I am, Sir, yours faithfully,

MACLEOD YEARSLEY, F.R.C.S. Eng.

Queen Anne-street, W., August 14th, 1911.

ANTISEPSIS AND ASEPSIS.

To the Editor of THE LANCET.

SIR,—"There is no such thing as an aseptic method; it is the result which should be aseptic." So says Mr. H. Alexis Thomson (THE LANCET, August 12th, p. 441), and so have I been saying for more years than I care to count.

Is it not high time that men should show some common sense in this matter and cast off prejudice?

I am, Sir, yours faithfully,

GEORGE GRANVILLE BANTOCK.

Pinner, Middlesex, August 11th, 1911.

SALVARSAN ("606") AND MERCURY IN THE TREATMENT OF SYPHILIS.

To the Editor of THE LANCET.

SIR,—Since I am not writing over my signature I must refrain from any comment on the recent discussion in your paper. It has been marked on both sides by general and sweeping statements. My object in writing is to call attention to a particularly curious assertion by Mr. H. W. Bayly in your issue of August 12th. Talking of the Wassermann reaction, he says: "Probably ..... and myself have greater opportunities for extended investigations on this subject than other workers in this country." That is hardly fair on the other workers. If Mr. Bayly had investigated *this* subject he would have found that his statement was inexact; surely if he looks about the country Mr. Bayly will find people who have actually tested more cases than he has and have even had longer experience in the bacteriological study of syphilis.

I am, Sir, yours faithfully,

August 16th, 1911. BLANK.

THE SCOPE OF A MEDICAL MAN'S AUTHORITY.

To the Editor of THE LANCET.

SIR,—I am at present attending a footman with subacute rheumatism at his mistress's house. Owing to pericardial complication he has been in bed for five weeks, and is slowly convalescing. At the outset I told him he must go into the nearest infirmary, some ten miles away, and he flatly refused. I could not with his then inflamed joints send him to his home 150 miles away, with the result that his mother was wired for, and she (a monthly nurse) has nursed him all through. His mistress told me yesterday I had created a precedent, and now whenever her servants became ill they would just insist on remaining for treatment at her house. Some friends staying with her have just raised this point. Can I, the medical attendant, *enforce* the removal of this patient (or that of any other servant under similar circumstances) to a neighbouring hospital against their will? I was under the impression I could not, and I presume I was justified in the course I took. If the point is of sufficient importance would you kindly insert this letter in your correspondence columns? Thanking you in anticipation,

I am, Sir, yours faithfully,

August 5th, 1911. M.D.

*** We deal with the points in an annotation.—ED. L.

REPORT ON BREAD VALUES.—Dr. J. M. Hamill's report to the Local Government Board on the nutritive value of bread made from different varieties of wheat flour has been issued. He states that the records of experimental work consulted and of other writings do not permit any conclusive statements to be made regarding the exact relative value in nutrition of different varieties of flour. He says, however, "the notion, for example, that ordinary high grade and naturally white 'patent' flour is practically devoid of protein or nitrogenous constituents, whereas the latter are abundantly present in bread made from wholemeal and 'entire' wheat flours is erroneous." He adds that the differences are relatively of no great magnitude, and may be neutralised by imperfect absorption from the digestive tract, and that "there are commonly wider differences in protein content and energy value between 'patent' flours obtained from different wheats than between the 'patent' flour of a given wheat and the corresponding wholemeal."

THE INTERNATIONAL EXHIBITION OF HYGIENE AT DRESDEN.

(BY A SPECIAL CORRESPONDENT.)

EVERYONE who is working to diffuse amongst the people a knowledge of hygiene is offered a magnificent opportunity this year of seeing with his own eyes how attention to the laws of health can improve the physique of the individual and consequently of the nation, and of learning how to bring this knowledge of the usefulness of hygiene clearly, attractively, intelligently, and convincingly before the minds of the layman and the unlearned. For in the Dresden exhibition, which remains open till the middle of October, these things are all set out as never before, with a profusion of beautiful and well-chosen casts, models, pictures, diagrams, and preparations intended to popularise the knowledge of the foundations of health, and to convince everyone that attention to the laws of hygiene will increase his or her children's growth and regularise their development. While the prevention of disease, particularly tropical and infectious disease, is lavishly demonstrated, the keynote of the exhibition is the awakening of the people to the measures they can usefully take in their everyday life to raise their standard of ordinary health, and so to strengthen their physical frames and increase their daily output of work, not without thought for the greater combined power (as the Romans said "corroboration") that their individual improvement will give their nation, and the more numerous posterity their thus enhanced vitality will leave behind them.

Such statements are best explained by concrete examples. In the section for care of the teeth are two pictures, one a slightly altered replica of the other. In the first a charming lady with a friendly smile and beautiful teeth wins your regard; the other is like unto it, but, alas! two of her front teeth are black, and the charm has gone. I should think no girl, and hardly any boy, who passes it will forget the lesson. In the section dealing with the effects of alcohol the experience of a large insurance company is quoted. The company found that amongst a thousand teetotallers the regular number sick was two, as against five for every thousand who took alcohol, a result not quite so conclusive as it sounds. The diagram, or something like it, we have all seen before. But it became much more impressive when beside it was shown a nice coloured picture of two hospital wards, in one of which were merely the two sick teetotallers, and in the other the five alcoholics. It is quite well to tell us that houses should be properly lighted and that streets should therefore not be too narrow for the heights of the houses. It is more striking when you see, as here, good pictures emphasising the darkness of the lower rooms in the high and narrow streets of old Dresden, and the brightness of all the dwellings in the wide streets of new suburbs. This lesson is accentuated by a neighbouring exhibit of the same plants in the same soil in the three divisions of a glass case, one shielded from light by black curtains, one by white calico blinds, and the third open to sunlight. We have all seen tables of the relative fertility of families of men in different employments, but when you are shown that from 20 fathers who are farmers or foresters 25 rifles come to the country's army, but from 20 fathers who are living on their means or are well-to-do only 15 rifles are pictured, the statistics seem to acquire a far more real importance.

These examples come from the popular section called "Der Mensch," "Man," which is the *clou* of the whole exhibition. That it is so one recognises at once in the preface to the catalogue, written by the president of the directors, Geheimer Kommerzienrat K. A. Lingner—an appreciation of the relation of hygiene to the life of the State, than which I have never read a better. If one may judge from the numbers of the throng which is always packing this pavilion the lesson is being absorbed. Here I may say that the average number of visitors to the exhibition for the first two months was 30,000 per day, though the school holidays had not yet commenced. The plan of this section is particularly well thought out and complete. First the simple cell. Forty microscopes show unicellular organisms and the building up of cells into simple tissues and complex structures. Then the development of bones in the fœtus is

shown, and then the skeleton—the muscles, not in mere lecture diagrams as we know them, but in pictures. Respiration, digestion, excretion, the nervous system, the ear, the nose, the eye—each has its roomy subsection. There are machines that work and show the range of sounds a man can hear, the blending of red, blue, and green light into white, binocular vision, and so on. Then the foods a man uses are shown, the plants from which they come, their proximate principles, the relation of price and energy value of each, and the adulterations. Then we have displayed clothing, said to begin with the need for protecting the organs of generation from flies and insects—a thing like a finger of a glove from one savage nation, a fly-mat for a woman from another; then the materials of clothing, their origin (silk-worms, &c.) and their manufacture (tanning and weaving); then we see the damage that may be done by badly devised clothing, and here the exhibition of the corset was a specially thronged subsection, containing plaster casts of a woman who has worn no stays, of another who tight-laces, and of others with the anterior thoracic and abdominal walls removed. In this section are shown on a model the contraction of toes by tight boots, and varicose veins from garters. Next come houses—how to build, warm, light, and ventilate them; and beds, how to make and how not to make them, all in models, among which can be seen the old press bedstead. Alcohol and tobacco and the harm they do are illustrated by pictures of drunkards from the great painters, while the reduction of offspring in families of drunkards, the higher proportion of epileptics among them, and the lessened food value of barley when made into beer instead of being eaten are all illustrated.

Then come important diseases. One is met by "the English disease," which turns out to be rickets. There is a room for tubercle, where are found statistical statements of death-rates, pictures of the bacillus and massive cultures thereof, spitting-pots, preparations of tuberculous organs, and pictures of sanatorium life; another room is used to illustrate small-pox and vaccination; another shows venereal diseases, with many wax models of specific skin eruptions. Then follow plague, typhoid, and other acute infectious diseases. Another gallery shows the care of infants—how to hold and how not to hold them in their baths, and how to feed and clothe them. Here we have a plaster cast to show spinal curvature in a girl carrying her school books in her hand. Wax models of anthrax lesions, of washerwomen's eczema, and of "phossy jaw," bring home the realities of diseases of occupation.

The grounds are about 60 acres, there are numerous cafés and restaurants, and many bands play. There is a "stadium" for physical drill displays and athletic competitions, a swimming bath, an Abyssinian village, Moorish dancing, and a panorama of the Bavarian Highlands. So that it is quite possible to spend the whole day in the exhibition without any chance of being bored. The cost is from £8 to £10 to get to Dresden, and 25*s.* or 30*s.* a day when there, and I cannot recommend to any medical officer of health a more profitable holiday for a week. But there is so much to see that it will mean hard work, and a fortnight would be better.

The outline I have drawn gives little idea of the fulness and detail of this comprehensive exhibition.

(To be continued.)

MANCHESTER.

(FROM OUR OWN CORRESPONDENT.)

No Fee, No Evidence.

A CASE of some interest to medical men occurred recently in the Manchester County Court. An injured workman was seeking compensation from his employers, and counsel stated that the man's case depended on the evidence of a medical man who had been subpœnaed to attend the court. The medical man attended, but he refused to give evidence until his fee of 4 guineas was forthcoming. The counsel stated that as the workman was not able to pay the fee he would withdraw the proceedings and leave the court to deal with the case. The judge said that although the medical man could be brought into court by subpœna he was entitled to his fee, and until he was paid the court could not compel him to give evidence. The employers called several medical men on their behalf, and on their evidence the judge decided that the claim could not succeed.

Hospital Sunday Fund.

The total sum raised was £3500, which has been distributed amongst the medical charities as follows:—Royal Infirmary, £875; Children's Hospital, £456 11*s.* 4*d.*; Sick Poor and Private Nursing Institution, £302 10*s.* 8*d.*; Ancoats Hospital, £282 17*s.* 7*d.*; St. Mary's, £265 13*s.* 5*d.*; Hospital for Consumption, £247 13*s.* 3*d.*; Salford Royal, £204 17*s.* 11*d.*; Hospital for Incurables, £180 2*s.* 10*d.*; Royal Eye, £180 0*s.* 7*d.*; Northern, £153 17*s.* 10*d.*; Victoria Memorial Jewish, £95 17*s.*; Hospital for Skin Diseases, £88 4*s.* 7*d.*; Ear Hospital, £44 12*s.* 6*d.*; Christie, £32 6*s.*; Dental, £28 19*s.*; Greengate Dispensary, £23 19*s.* 1*d.*; Hulme Dispensary, £23 5*s.* 2*d.*; Chorlton-on-Medlock Dispensary, £12 1*s.* 4*d.*; and Lock Hospital, £1 9*s.* 11*d.*

Salford School Children.

At its last meeting the Salford education committee was called on to consider a report on the appointment of an additional medical officer for the examination of school children. In consequence of the large number of re-examinations which have become necessary it is impossible for the medical officer to carry out the ordinary examinations at the schools in accordance with the requirements of the Board of Education. The work is increasing greatly. The opinion was expressed that the extra responsibilities should not be placed on the shoulders of the education authorities unless it were the intention of the Board of Education to give them extra financial assistance. It was agreed that the health and cleanliness of the children had improved considerably since the examinations had taken place. Ultimately, the question was referred back to the elementary education sub-committee.

Report on the Outbreak of Ptomaine Poisoning at Bacup.

A full report has now been issued by Mr. E. Sergeant, county medical officer of health of Lancashire, on the occurrence of the serious outbreak of ptomaine poisoning in the Borough of Bacup which I referred to in my letter in your issue of August 5th. Of the total attacks in the administrative county—205 in number (males 98, females 107)—175 were found to be due to potted meat and 30 to roast pork. Of these cases 188 occurred within the Borough of Bacup. In every case the suspected food came originally from the same source in Bacup. The infected food was remarkably virulent, for of the 207 persons known to have partaken of it only 2 escaped illness, and cases appeared in 96 households. The time which elapsed before the first appearance of illness after the consumption of either potted meat or roast pork varied from half an hour to 65 hours, and even the consumption of less than an ounce in weight gave rise to the characteristic symptoms: severe abdominal pain, vomiting, and profuse diarrhœa, and in some cases great prostration. Of the five deaths all were due to potted meat. Examination of fatal cases showed that the blood and organs in each case contained the bacillus of the Gärtner type usually recognised under such circumstances. The cause of the food infection has not so far been satisfactorily elucidated, but one condition set out in the report must be viewed with suspicion. "It appears that the shopkeeper, in order to provide a cooling place for his cooked food, made an entrance from his cookhouse into an adjoining stable by breaking through a portion of the partition wall, and in this place, which had a loft above containing pigeons and was only separated by a wooden partition from another part of the premises used as a stable for one horse, all the suspected food in question was cooled, excepting the roast pork which, it is stated, was stored in the cookhouse, and therefore partially under the influence of the stable air, until removed to the shop next day. Several samples of air, &c., from this unique storehouse have been examined bacteriologically, but up to the present time no bacteria of the Gärtner type have been found."

Women and Inebriate Homes.

At the meeting of the Lancashire Inebriates Board, held at Preston, the chairman of the Langho Inebriates Home gave instances of the irreformable character of some of the women committed to this institution. This shows the futility of existing legislation, which requires that such a

person must again "qualify" for admission to such a home by undergoing three short terms of imprisonment before she can be re-committed. London, it seems, sends women to the homes earlier in their decadent career, with a better chance of recovery. The chairman expressed the wish that Lancashire would do likewise. Of the 210 women committed to the home, 64 came from Manchester and 50 from Liverpool.

Rochdale and Compulsory Notification of Phthisis.

The local health authorities at Rochdale have proposed that phthisis should be made a compulsorily notifiable disease. The Local Government Board held an inquiry in Rochdale on July 18th, at which the town clerk stated that one of the reasons which had led to the proposition was that voluntary notification had broken down. In 1905 37 cases were notified voluntarily, 11 were notified in 1909, and 20 in 1910. It is proposed to form a joint committee of the health authorities and the Rochdale board of guardians. Nurses are to visit the cases notified and the authorities to contribute to the cost according to the rateable value.

August 15th.

WALES AND WESTERN COUNTIES.

(FROM OUR OWN CORRESPONDENT.)

The Pecuniary Position of Cardiff Infirmary.

IN addition to the National Memorial to King Edward VII., which is taking the form of a complete scheme for the prevention and treatment of tuberculosis in the Principality, there is being raised in Cardiff a memorial fund, the proceeds of which are to be given to the Cardiff Infirmary. Seven successive years in which the expenditure of the institution has exceeded the income has resulted in a debt of about £20,000, upon which sum interest has to be paid. There has already been subscribed to the memorial fund over £19,000, so that the current indebtedness of the governors has practically been wiped out. The average yearly expenditure is about £15,000, and when the new wings now in course of erection are completed with their additional 82 beds, it is expected that that amount will be increased to £20,000. It is proposed, therefore, that the memorial funds shall be applied to augment the capital which is already invested by the governors. In recent years the contributions of workpeople, both in Cardiff and in the adjoining districts, have been collected under an organised system, and in 1910 they yielded £4700. The general subscriptions amounted to £2900, or nearly £150 less than the sum derived from the same source in 1900, although between the two dates named the population of Cardiff has increased by nearly 20,000 persons. When it is remembered that the infirmary serves not only the inhabitants of Cardiff, who numbered at the last census 182,000, but a population in the colliery districts of Pontypridd and the Rhondda valleys of over 200,000 persons, it is difficult to understand why there should be such a comparatively small subscription list.

Medical Treatment of School Children in Cardiff.

In the annual report of the Cardiff school medical officer, Dr. E. Walford, an account is given of some of the methods by which children found defective on medical inspection receive treatment. Many of them attend the out-patient department of the infirmary, where they are attended free by the ophthalmic surgeons and dentists. In other cases they are attended by dentists, with seven of whom arrangements have been made to attend school children at reduced fees, extractions being performed for 6*d.*, and stoppings for 2*s.* each tooth in cases where only one visit is necessary, and 2*s.* 6*d.* where more than one visit is required. In April, 1910, Dr. Walford wrote to the ophthalmic surgeons in the town, asking them if they would be willing to attend the school children who were found to have defective vision. Two of the surgeons agreed to attend such children at a reduced fee of 7*s.* per consultation and prescription. Arrangements have also been made with opticians to supply spectacles at a reduced rate. All these charges are apparently paid by the parents and not by the education authority, although the report is not very clear on this point. Minor ailments are treated by the school nurses at the City Hall under the direction of the medical inspectors. This arrangement has been sanctioned by the Board of Education, and presumably is acquiesced in by the practitioners of the town. There is at present no special provision in Cardiff for carrying out the cleansing section of the Children Act, but this defect is to be remedied by the erection of a cleansing and disinfecting station.

The Sanitation of Pembrokeshire Schools.

The sanitary authorities in the western counties of Wales have notoriously neglected their duties in so far as the inspection of dwelling houses are concerned, and the remedying of unsatisfactory conditions that have been brought to their notice. That they have paid little or no attention to the sanitary condition of the elementary schools is apparent from the report of Dr. Thomas Evans, formerly school medical officer of Pembrokeshire and now medical officer of health for the county borough of Swansea. In no less than 40 of the Pembrokeshire schools there is no supply of water, either for cleansing or for drinking purposes, and in 83 there is none for drinking. The sanitary conveniences in many schools are very unsatisfactory, and altogether there is ample evidence of the need for a thorough inspection of the school buildings in the county.

Spotted Fever in the West of England.

At the last meeting of the Holsworthy (North Devon) urban district council a resolution was passed by the casting vote of the chairman: "That an emergency is caused by an epidemic of cerebro-spinal fever and poliomyelitis (anterior) and this disease shall be notified in the district for six months from August 19th." The Stratton and Bude urban district council, the Stratton rural district council, and the Holsworthy rural district council have also made the disease notifiable for six months. Dr. R. J. Reece, of the Local Government Board, in addressing the Holsworthy rural district council, stated that there were probably about 30 cases in that district. Some of the cases have proved fatal, and it is stated that two deaths occurred in adults.

A Double Tragedy.

Mr. C. W. Young died at his residence, Newcomin Cottage, Dartmouth, on August 7th, after an operation for appendicitis. His widow, who had been so anxious for her husband's recovery as to be not always rational in her actions, took hydrocyanic acid and died a few hours after her husband. A verdict to the effect that "Death was due to prussic acid whilst temporarily insane" was returned by the coroner's jury. Mr. Young, who received his medical education at Charing Cross Hospital, qualified as L.R.C.P. Lond. and M.R.C.S. Eng. in 1895, taking the D.P.H. of Cambridge in 1899. After holding resident appointments at Charing Cross Hospital and the Stockton and Thornaby Hospital Mr. Young practised at Luton (Beds) and was on the honorary staff of the Bute Hospital, Luton. He afterwards went to Dartmouth and was appointed an honorary surgeon to the Dartmouth (Devon) Cottage Hospital. Mr. Young was very popular in Dartmouth, and much regret is felt there at his death and at the tragic decease of Mrs. Young. Both bodies were interred at Luton.

August 15th.

SCOTLAND.

(FROM OUR OWN CORRESPONDENTS.)

Small-pox in Lochee, Dundee.

THE medical officer of health of Dundee, Dr. Charles Templeman, gave a report of the outbreak of small-pox in Lochee at a meeting of the public health committee on August 1st. The first cases occurred in a family of perfectly cleanly habits, residing in an isolated tenement, but the father had only been imperfectly vaccinated and two of the children not at all. The father, mother, and these two children were attacked. The father died in hospital two hours after admission. Three other children who had been properly vaccinated were not attacked. On the following day two women who resided in the same tenement and had visited the infected family were found to be suffering from small-pox and were removed to hospital, where one of them died. On July 28th another case occurred in a tenement in the same street of a young girl who had visited a relative in the first infected tenement. There are at present six cases in hospital and 23 persons in the reception-house. Dr. Templeman

remarked that during the outbreak his experience had been that the early cases were always regarded as chicken-pox, and as the season was approaching at which small-pox was most apt to appear in epidemic form he suggested that the committee should recommend the town council for the following year to add chicken-pox to the list of diseases which were compulsorily notifiable. He had not been able to ascertain where the infection primarily came from, but this confirmed his suspicion that the disease was being spread by mild cases which had been missed, probably regarded as chicken-pox. It was agreed to recommend that chicken-pox should be made compulsorily notifiable for the next twelve months.

Increase of Tuberculosis in Aberdeen.

Dr. Matthew Hay, medical officer of health of Aberdeen, says that during the quarter 29 tuberculous cases were admitted to the City Hospital. The pavilion for tuberculous cases has been constantly full, and there has always been a large number in waiting. The erection of a new shelter in connexion with the pavilion will provide for an additional 45 male cases and for 8 or 10 female cases, increasing the accommodation for tuberculous cases by one-half.

Inadequate Accommodation at Kingseat Asylum Hospital.

In his report to the asylum committee of Aberdeen district lunacy board Dr. John Macpherson, Commissioner in Lunacy, says that the hospital accommodation at Kingseat Asylum is unfortunately proving too limited and will become more so as time goes on. Excluding the isolation wards, 90 of the 93 beds in the building were occupied, and several patients who would otherwise have been in hospital were being treated in villas. In bringing this question of accommodation to the consideration of the district board, it was necessary to explain that within recent years a perceptible change had taken place in the type of patients admitted to all the asylums in the country. Persons in weakly physical health and those suffering from the infirmities of old age were now being sent to asylums in proportionately larger numbers than formerly, and the strain upon the hospital section of asylums was universally felt. It was evident therefore that the district board must sooner or later face the necessity of erecting hospital accommodation for the institution. The asylum committee also considered the question of the assistant medical officership at Kingseat, and reported that it had before it two applications for the vacant post from lady graduates in medicine. The committee resolved again to advertise the post at a salary of £120 per annum, with board, as formerly offered, and suggested that in the meantime the medical superintendent should engage a locum tenens.

Typhus Fever in Lewis.

At a meeting of the Lewis district committee, held at Stornaway on August 7th, the report of Dr. D. Murray, district medical officer of health, on the recent outbreak of typhus fever in the township of Borve, was submitted. Eighteen cases were notified, occurring in six families, and there were three deaths. The report states: "There is no cause for surprise in this epidemic; the strange element in the situation is that typhus fever should ever be absent from Borve. The village is an exaggerated microcosm of the worst sanitary features of the Island of Lewis—a congeries of the blackest of black houses, huddled together in a manure-laden swamp. In many cases the sleeping apartment of one house is cheek-by-jowl with the byre end of the next, the manure in the latter at a much higher level than the bedroom. In Borve—as elsewhere—there is some evidence of progress in the building of a better class of house; but the great majority of the dwellings outrage the most elementary sanitary principles." They are built on sites which are impossible to drain, and are consequently sodden and reeking with the products of the byre—a most fertile breeding-ground for fever and other diseases. "The remedy can be briefly stated. The great majority of the present houses should be condemned and a better class built on healthier sites." It appears that sites for crofters could be got on the common grazings, but not for cottars. Typhus fever, however, has no respect for persons, be they crofters, cottars, or squatters, and unless the inhabitants are all removed to healthier sites—which are plentiful in the neighbourhood—we may be sure, as Dr. Murray says, that outbreaks of virulent infectious diseases, perhaps in a more extensive and aggravated form, will recur from time to time. The chairman of the Lewis district committee remarked that some years ago negotiations for better housing had fallen through, owing to the fact that, in addition to the crofters' houses, there were also houses occupied by squatters, who are not tenants of the estate, and have no legal standing in the community; and to provide sites for them would be to give them a recognition which the proprietor, in view of the provisions of the Crofter's Act, did not feel justified in giving them. On the occasion of one of his visits to Lewis, Lord Pentland visited Borve and saw for himself the sad condition of affairs there, and on a later occasion he (the chairman) accompanied Mr. Coles, of the Congested Districts Board, to Borve and had a conference with the people. He had no doubt that if new sites were offered, and a little financial assistance given, there would be no difficulty in getting the public to erect new houses. It was agreed to send a copy of Dr. Murray's report to the Scotch Office and to the Local Government Board, in the hope that they will see their way to assist the local authority in carrying out some improvements.

August 15th.

IRELAND.

(FROM OUR OWN CORRESPONDENTS.)

Infantile Mortality in Dublin.

A FEW months ago a committee was appointed at a public meeting in the Mansion House, Dublin, to attempt to reduce the high rate of infant mortality in Dublin. It is reported that there are now 35 voluntary health visitors working under the committee, while some 20 more are being trained for the work. Over 100 nursing mothers are visited on an average each month. The Countess of Aberdeen has offered to supply pasteurised milk free in suitable cases to mothers and babies. Diarrhœal diseases are very prevalent in Dublin this year, probably as a result of the unusually hot weather. In the three weeks ending August 5th the deaths of children under one year of age were respectively 31, 46, and 53. The Women's National Health Association has employed eight nurses temporarily to assist the Poor-law medical officers in dealing with disease in children.

The Dublin Hospitals and the Insurance Bill.

The Board of Superintendence of Dublin Hospitals, a body which supervises the work of those hospitals in Dublin that are in receipt of Government grants, in its annual report presented last week takes occasion to remark on the effect the Insurance Bill, if passed, may be expected to have on the finances of the Dublin hospitals:—

> Hitherto (the report states) the public have looked on the labouring man disabled for work as a fit object for charity. They have subscribed and left legacies to hospitals because it was known that through the wards of the hospital and the special dispensaries attached to them lay the smoothest, shortest, and most economical road to recovery. It is unlikely, should the State arrange for the care of the labouring classes when incapacitated by sickness, that the charitably inclined will continue to subscribe to the same extent. ..... It is not too much to say that a club doctor, responsible for the health of a large number of workpeople, will, in a great majority of the cases, have to call on the hospitals or their dispensaries for help. On what terms will this be given? If the voluntary aid system is abolished, it must mean a suitable remuneration for all medical service. We are of opinion that a system on such a foundation would not work as well or as economically as does the present one.

Royal Institute of Public Health.

The Congress of the Royal Institute of Public Health was opened on August 15th in Trinity College, Dublin, when a reception was held by the President, Lady Aberdeen. The presidential address followed. There was a fairly large attendance. The Congress meets every day until August 21st.

The Lane-ways of Dublin.

A potent source of disease in the poorer parts of Dublin is to be found in lanes and courts. There are some 894 streets, alleys, courts, lanes, and roads in the city of Dublin, which are not under the charge of the corporation, and in these refuse collects in great quantities. The corporation apparently has no power to spend money in removing such material, though it has power to compel the owners of these properties to keep their premises in such condition that they should not be a source of disease. The nuisance, however, is

by no means confined to lanes not in charge of the corporation, for the public streets in the poorer quarters are little better kept, in spite of the fact that some £50,000 a year is spent in the cleansing of the streets of Dublin.

Appointment of a City Bacteriologist for Dublin.

Matters have come to a deadlock as regards the appointment of a city bacteriologist for Dublin, as the Local Government Board persists in its refusal to sanction the appointment of the gentleman elected by the corporation. At a meeting of the corporation a few days ago the town clerk read a letter from the Local Government Board stating that they could hold out no hope that they would alter their decision in refusing to regard Dr. Russell as a person possessing the proper qualifications for the post of city bacteriologist. The letter added that the fact that Dr. Russell had passed the examination for a Diploma in Public Health could not in itself be taken as entitling him to be regarded as a bacteriologist under Section 15 of the Prevention of Tuberculosis (Ireland) Act. In a previous letter the Local Government Board had given as a reason for refusing its sanction that Dr. Russell, being a dispensary medical officer, had his time already fully occupied. The corporation has now decided to make no appointment.

The Apothecaries' Hall of Ireland.

The annual meeting of the members of the Apothecaries' Hall of Ireland took place on August 1st. The Governor, Dr. Caleb J. Powell, occupied the chair. The meeting was the largest that has taken place for many years, and the greatest interest was taken in all matters discussed. After the annual report had been read the following appointments were made:—Governor: Dr. Edward Magennis. Deputy-Governor: Dr. J. C. McWalter. Representative on the General Medical Council: Lieutenant-Colonel F. G. Adye-Curran, A.M.S. Registrar: Mr. H. W. Mason. The following were elected Directors: Lieutenant-Colonel Adye-Curran, retired. J. D. Crinion, O'C. J. Delahoyde, B. B. Kennedy, T. G. McGrath, R. P. McDonnell, H. W. Mason, J. J. O'Sullivan, C. J. Powell, J. Shaw, G. S. Stritch, J. A. Whelan.

Sanitation of Portadown.

At a meeting of the Portadown town council held on August 8th a letter was read from the Castleisland Linen Company, calling the attention of the council to the fact that it was discharging sewage into the Garvaghy river, which was causing the company great loss and was also a serious menace to the health of their workers. The water now coming down the river Bann at Portadown was practically undiluted sewage, and it was alleged that the council had filled the wharf of the company with sewage matter. The water in the river was at present in such a state as to be not only a danger to the health of the company's employees, but worse than useless for business purposes. The medical officer of health (Mr. J. L. Rowlett), who was present, said it was a shame and a disgrace that there should be four deaths of children within the week which could have been prevented by proper sanitary accommodation. The matter was referred to the sanitary committee. Portadown has recently and wisely obtained a good water-supply, but it will need to undertake a sewerage scheme as well.

Monaghan and Cavan Asylum Board.

The question of asylum accommodation in Ireland is rapidly becoming a serious one. When an institution is common to two adjacent counties there is apt to be a decided difference of opinion how to provide for an increasing number of lunatics. In the asylum common to Monaghan and Cavan there are at present 920 inmates, of whom 505 are chargeable to county Cavan and 415 to county Monaghan. The board met on August 10th to decide how additional accommodation could be provided to relieve the present congested state of the asylum. The representatives of county Cavan proposed that steps should be taken at once to supply additional accommodation, provided, however, that if any definite proposal were brought before the joint committee by the Cavan representatives at the September meeting it should receive consideration before proceeding further. The Cavan representatives proposed as an amendment that, in the event of no guarantee being forthcoming at the September meeting, an inquiry should be held by the inspectors or some other governing body, who should then proceed to consider the adjourned question of providing such additional accommodation. On a division the seven Cavan members voted for the amendment and the eight Monaghan representatives for the motion, which was carried, and a committee was appointed to make inquiries with regard to the building best suited to the purpose.

Sad Death of a Belfast Practitioner's Son.

Very wide sympathy is felt for Dr. T. K. Wheeler at the drowning, on August 12th, of his eldest son, Mr. T. K. Wheeler, a medical student of very great promise of the Queen's University of Belfast. Mr. Wheeler, who was spending his holidays at Islandmagee on the county Antrim coast, was bathing, when his strength gave way and he sank, despite the heroic efforts of Dr. Charles Dickson to save him. Mr. Wheeler was not only an excellent scholar, but a good cricketer and footballer, and he was a member of the Belfast University contingent of the Officers' Training Corps.

PARIS.

(FROM OUR OWN CORRESPONDENT.)

Preventive Measures Against Cholera.

THE appearance of cholera in Italy has for some weeks given rise to fears as to the possibility of its extension in epidemic form to France. As a matter of fact this has not as yet occurred; most of the cases announced by the press—at Marseilles, at Paris, at Montpellier, at Armentières—are proving to be cases of cholera nostras or cholerine, such as are observed every year about this time. But there are cases of cholera at Marseilles and Montpellier which, it must be admitted, do resemble true cholera in that they have occurred in subjects coming from Italy, and consequently suspects. Bacteriological examination of the stools has given suspicious, though not absolutely conclusive, results. Nevertheless, the most careful precautions have been taken; all the sanitary posts are watchful and the Pasteur Institute has just sent to Marseilles a supply of Dr. Salembéni's anticholera serum, of which Dr Döpfer and Dr. Salembéni himself will supervise the application. The lazaret of Frioul has been got ready to receive travellers in cases where quarantine is deemed necessary. The system of surveillance adopted by the authorities—both French and Italian—is based on the principle of minimising the restraint imposed on travellers. Only actual experience can determine whether it is adequate. At Ventimiglia and at Modane the traveller coming from Italy into France is not subjected to any inquisition; his name is taken and also his destination as shown by his railway tickets. The mayor of that place is then advised by telegram, and immediately on the traveller's arrival he is visited by the district physician, who subjects him to a discreet examination, and on the occurrence of the first alarming symptom makes a bacteriological examination of the stools. If cholera is officially recognised the subject is at once isolated, and those of his entourage are placed under supervision. If experience proves that this procedure is adequate it must be admitted that it is the most humane method and the least vexatious one for the public, but it needs for its perfect execution the goodwill of both traveller and medical man, two human factors upon which it is impossible always to count. The traveller who may happen to resent as unjustifiable and vexatious the supervision to be exercised over him on his arrival at his destination can very easily elude it when he has learnt the *modus operandi* of the system, by taking, before reaching the frontier, a ticket for some place other than his actual destination, since it is the ticket that gives him away. For instance, he can take a ticket for Toulon, and on his arrival in the station there can immediately book for Paris, where there will be no advice of his coming. It is essential, therefore, that the surveillance to which the traveller will be subjected on his arrival at his destination shall not be such as to inspire opposition, and that there shall be no fear that he will be exposed to unnecessary and vexatious examinations and to circumstances that will subject him to the annoying curiosity and the distrust of the inhabitants. It is to be hoped, then, that no medical man on whom this duty shall fall, perhaps a simple country general practitioner appointed by the mayor, will succumb to the temptation to be over-zealous, which would cause travellers to resent his interference and elude the system by

a false declaration. It is easy to see that this method, excellent as are the sentiments that have inspired it, rests on a very fragile foundation. Further, it fails to entail a proper disinfection of baggage and merchandise. The principle of allowing the possible cholera subject to pass and of immediately confining each case as soon as it declares itself is evidently one for the success of which hygienists and sociologists, not to say merchants, ought to hope. But if epidemic cases should break out suddenly in several localities at the same time it is likely enough that the old system of tightly barring the frontiers would be returned to.

Paving and Pastry.

The wood pavements of the streets of Paris are very strongly impregnated with tar, so that while they are being laid or repaired a strong odour of tar pervades the streets. This odour persists for some time after paving operations are finished, especially if the temperature is at all high and the street narrow and confined by tall houses. These facts have given rise to a peculiar action at law which has just come to a serious if satisfactory conclusion. A pastrycook whose shop is situated in the Rue de Buci became a victim last year of the tarred pavement when the authorities ordered the repairing of the street in front of his shop. It was in June, so that the windows were kept open, and all the cakes that were exposed on his counter contracted a disagreeable savour of tar, which aroused considerable discontent among his *clientèle*, who stopped dealing with him. The pastrycook, having thus suffered considerable loss, brought an action against the administration of the city of Paris to recover damages for the injury inflicted on him. The city refused to recompense him, so he summoned the administration before the Conseil d'État, which, after many months of thought and experiment (since the decision would create a precedent that would impose in the future on the city the burden of very heavy charges in similar cases), nevertheless upheld the pastrycook and ordered the city to pay him an indemnity of 1760 francs. The judgment points out that the pastry had really been rendered uneatable by the tar emanations, thus creating an individual injury in excess of the proportion that every individual is called on to suffer in the public interest. The experiments demonstrated that the fatty matters and the butter entering into the composition of the pastry had strongly absorbed the vapour of naphthalene, creasote, and tar disengaged from the street pavement. The injury resulted, therefore, as much from the emanation of vapours as from the dissemination of dust. This faculty of fatty matters, and of objects that contain them in any great proportion, to absorb and retain the most diverse odours, good or bad, with great tenacity, is of course a well-known fact, and is frequently observed in butter and eggs; on the other hand, it is taken advantage of by the manufacturers of perfumes, who use for their extraction from plants lard and the oils. This decision is of considerable interest, small though the incident is that served as its starting point, for every time that wood paving is under operation in Paris the amounts to be claimed by the neighbouring shopkeepers may materially raise the cost of wood-paving. Paris may even have to seek, if not another mode of paving, at least some other means of obviating the rotting of the wood, which is the sole purpose of the use of tar. Possibly the impregnation of the wood with mere dehydrating substances might be worth experimenting with. These facts will be of interest to all cities where wood-paving is employed. The session of the court at which the judges were called on to taste the cakes and decide whether or not they were agreeable to taste must have been a curious tea party.

August 14th.

BERLIN.

(FROM OUR OWN CORRESPONDENT.)

The Question of Nursing.

THE question has been lately much discussed whether there is a decreasing ability of mothers to suckle, and before the Berlin Medical Society Professor Frantz read a paper on the subject. He said that many practitioners believe that a great many mothers are unable to suckle their infants; these views are, according to the author, erroneous. There may be some difficulties in certain cases, but a physiological inability to suckle does not exist. It is always possible to overcome these difficulties by patience, and to produce a sufficient lactation. In the lying-in hospital of the University of Berlin, of which Professor Frantz is the director, the infants are given the breast, as a rule 20 hours after birth, five times daily for ten minutes, but not during the night. For lactation the form of the breast and of the nipple is without importance; suckling is possible with every form of breast. It is essential that the puerpera should receive from the first day nutritious food and be allowed to move in bed. Only tuberculosis is a contra-indication against suckling, but not merely a passing feverish state. In Professor Frantz's hospital in Berlin and formerly in Kiel 100 per cent. of the mothers were able to suckle their infants. Professor Heubner stated that in the infants' asylum under his care 83 per cent. of the mothers were able to suckle till the end of the third month, the time when they must leave according to the rules of the institution. Of the remainder, 17 per cent., in some cases the secretion by-and-by completely ceased; in some cases the lactation was at first very satisfactory, but became after some weeks rather scanty; in another series only 300–400 grammes of milk were secreted from the beginning and no increase could be obtained, so that cow's milk must be added; in the last series the secretion was at first insufficient, but later increased, sometimes only in the third month, so that the cow's milk could then be dispensed with. Professor Heubner was also of opinion that, apart from some exceptions, a physiological inability to suckle does not exist. Dr. Finkelstein said that in private practice the conditions differed from those in public lying-in hospitals or infants' asylums. It would, of course, be of the utmost importance if the necessity for wet-nurses could be done away with, as syphilis is more often conveyed by them than is generally believed. It is, however, often impossible for the practitioner to induce mothers to nurse, and if he insists he would certainly often lose his patient and be replaced by a more complaisant medical man. Also a certain number of infants can by no means be induced to take the breast. In private practice mastitis is more frequent than in asylums, the reason being that the infants are given the breast too often and that the nipples are irritated by a too violent mechanical disinfection. Dr. Kassel and Dr. Keller stated that in their asylums nearly all the mothers were able to nurse, but that sometimes the milk became deficient in the third or fourth week. Dr. Aschoff said that it was, of course, possible for every mother to secrete a certain quantity of milk within the first days, but he did not believe that every woman could nurse her infant, if nursing means providing a sufficient secretion for at least five to six months. In asylums, as stated by Professor Heubner, when the secretion of the mother is so small, they make the infant take the breast of another woman too, but this is, of course, not available in private practice, and a wet-nurse is then required. In his experience 20 per cent. of mothers are unable to produce a sufficient quantity of milk. He wished to draw attention to the erroneous opinion that the quantity of milk is alone of importance. Sometimes infants do not get on even when an abundance of milk is produced, but do so at once when there is a change of wet-nurses, showing that the difference in the quality is also a factor.

Operation for Fat Abdomen.

Dr. Jolly, assistant surgeon to the gynæcological clinic of the University of Berlin, writing to the *Berliner Klinische Wochenschrift*, gives a description of an operation for fat abdomen. He said that this condition must be distinguished from pendulous abdomen, the difference being that in the former there is only an abnormal accumulation of fat in the abdominal wall, but that the fascia and the abdominal muscles are intact, whilst in the latter there is an atony of the abdominal walls so that the intestines are in an abnormal position. The diagnosis is made with the patient in a standing position, when it is possible to see whether the abdominal walls are thin and relaxed or whether there is only a pendulous mass of fat hanging as an apron before the firm abdominal wall. The fat-apron must then be lifted up to see how great a quantity may be removed. A circular and transverse incision is then made on the upper part of the fat-apron and a second on the lower part of it, both circles being convex below. The incision must go down to the fascia, the mass of fat between both incisions being extirpated, and the edges of the large wound sutured with

catgut. The above operation was performed on two women who suffered very much from an enormous accumulation of fat. They were both relieved, the wounds healing by primary union. There are only two instances in international medical literature of similar operations, the one concerning a man operated upon by Dr. Demars and Dr. Marx of Paris, and the other by Dr. Schulz, a Russian surgeon.

Death of Profesor Senator.

The Berlin Medical Society and the profession in general have sustained a heavy loss by the death of Professor Senator, late ordinary professor of clinical medicine at the University and honorary President of the Berlin Medical Society. Professor Senator was born in Gnesen, Province of Posen, in 1834, and after having passed through the curriculum in Berlin became qualified in 1858. On account of his financial position he was compelled to settle at once as a general practitioner in Berlin. But although he soon obtained a rather extensive *clientèle* he used his leisure hours for scientific study, so that in 1868 he was recognised as *privat-docent* for clinical medicine. He served in the German-French war in 1870–71, when he was made chief medical officer to a military hospital. He became in this position a favourite of the late Empress Augusta, who caused him to be appointed chief physician to the Augusta Hospital in Berlin, of which she was the patroness, an appointment held by him until 1888, when he was made director of the medical polyclinic of the University and later of the third medical clinic. Reasons of health compelled him to retire a year ago from active duties and also from the presidency of the Berlin Medical Society, of which, however, he remained honorary president. The career of Professor Senator differs from that of the majority of the members of the medical faculty in that he never was an assistant to any clinical or other university institution, but beginning as a general practitioner became one of the leading men of the Berlin medical faculty. His work concerned especially the diseases of the kidneys and metabolism generally; the number of his essays, books, and other communications is so great that space would not permit of mentioning even the titles here. His handbook on the diseases of the kidneys has become a standard work of German medical literature, and his monograph on diabetes in Ziemssen's handbook is also well known to the profession. On the occasion of his 70th birthday his assistants edited a "Festschrift," where a detailed report of his work was given; there were no less than 185 works mentioned and they have certainly increased to 200 since that time. Since June, 1910, on the occasion of the 50th anniversary of the Medical Society, when he was 76 years old, he dedicated to the society a recently written book on "Polycythæmia and Plethora," and he was indeed busy until recently, when symptoms of cardiac failure developed. He was an excellent clinical teacher, generally liked by the students, and as a chairman of the Medical Society presided over the meetings in an accomplished manner. The number of his patients was enormous, especially from Russia. He was one of the attending physicians to the late Emperor Frederick during his fatal illness.

August 5th.

ITALY.

(FROM OUR OWN CORRESPONDENT.)

The Illness of the Pope.

SINCE July 27th, when I briefly referred to the Holy Father's illness as dating from his exertions, on a day of stifling heat, in celebrating the anniversary of his predecessor's death, the lay press, particularly that of Germany, has been prolific in reporting further complications, till the world has been impressed with the fear that the said illness is of the gravest kind. The facts, derived from a trustworthy source, are these: On the day in question His Holiness was suffering from a slight laryngo-pharyngeal congestion, causing hoarseness and partial aphonia, but he persevered in carrying out the function, till, at its close, he was visibly exhausted, mentally and physically. In the evening the temperature had risen, the cough, previously slight, had become harassing, and the night's rest was broken in consequence. Next morning his body physician, Dr. Petucci, in consultation with Dr. Marchiafava, found the upper bronchi involved, with slightly increased febricula and accelerated respiration. Absolute rest and abstention from "audiences" of every kind kept the symptoms stationary till, on August 6th, an attack of gout in the knee called for immediate treatment. Relief was obtained accordingly, but the august patient found the heat so oppressive that it was thought necessary to change his dormitory to a less sunny exposure. This was done on August 9th with manifest benefit. On the following day, the anniversary of his coronation, the Holy Father had to delegate its celebration to Cardinal Merry del Val, and remained in bed, receiving no visits but those, in the morning and evening, of his physicians. On the morning of June 11th he was quite free from pain in the affected knee; the swelling had diminished; he was able to get out of bed and to make a promenade across the room without support. The othe symptoms, bronchial and laryngo-pharyngeal, had responded satisfactorily to the prescriptions; and nourishment, with a little wine (barolo, to wit, known as the "Piedmontese burgundy"), had been taken with relish. There are no complications of any significance, and the heart has recovered its tone. The one consideration pre-occupying his physicians is the Holy Father's sense of confinement, missing, as he does, the "life on the lagoons" and the fresh breezes which alternate between the Alps and the Adriatic. From year to year his rôle of "prisoner with doors locked on the inside" becomes more irksome; he is getting obese, in spite of exercise in the Vatican gardens or (in unfavourable weather) along one or other of the miles of passages in the Apostolic palace; and his resisting power to occasional illness or to mental fatigue is gradually lessening. For this state of things the remedy is not medical but political; and it remains to be seen whether the *modus vivendi* which appeared on the point of being effected between Leo XIII. and King Humbert may not be brought about between Pius X. and Victor Emanuel III., so that the Holy Father can avail himself of his summer resort on the Alban Hills, or even go farther afield and get rehabilitation, physical and mental, from the "Queen of the Adriatic" herself! As I write the *Osservatore Romano*, the official organ of the Vatican, closes its bulletin with the announcement: "Oggi le condizioni di Sua Santità possono dirsi veramente soddisfacenti." ("To-day the condition of His Holiness may be said to be truly satisfactory.")

The National Monument to Cesare Lombroso.

Verona, it is well known, has been contemplating a monument in commemoration of her distinguished son, the founder of criminal anthropology, the commission for which has been entrusted to one of Italy's best sculptors, Leonardo Bistolfi. All Europe has cordially associated itself with the undertaking, and in its principal nationalities ten committees have been organised to collect subscriptions, while from America, North and South, a similar movement is announced. Japan is the latest accession to the object in contemplation, having formed a committee *ad hoc* consisting of the professor of criminal law in the University of Tokyo, the professor of psychiatry in the same seat of learning, the professor of penal law in the University of Kyoto, the director of the school of foreign languages at Tokyo, and the professor of anthropology at the same University. The Japanese committee, as a first subscription, has collected 1236 francs, the Minister of Justice heading the list with 200 yen (400 francs). Other subscribers are the Minister of the Interior, the Minister of Public Instruction, and the Minister of War.

August 12th.

CANADA.

(FROM OUR OWN CORRESPONDENT.)

The Paratyphoid Infections.

AT the symposium on typhoid fever and water-supplies held in the section of Preventive Medicine of the Canadian Medical Association, which took place recently in Montreal, the typhoid-like infections were discussed at considerable length. Mr. T. A. Starkey, M.B. Lond., professor of hygiene at the McGill University and chairman of the section, has during several years insisted that in all the epidemics of typhoid fever which have come under his observation in Canada the typhoid-like infections have been prevalent and in some instances predominant. Attention

was directed to Professor Starkey's views on this matter in an article dealing with the typhoid epidemic in Montreal which appeared in THE LANCET of April 23rd, 1910. As a matter of fact, Professor Starkey has emphasised this phase of the situation in Canada on several occasions during the past few years. The paratyphoid infections are at the present time being subjected to close investigation by bacteriologists and there is some difference of opinion as to the differentiation of the same. In Canada opportunities for studying the question under favourable circumstances occur frequently, epidemics of typhoid fever are common, the paratyphoid infections appearing to play a prominent part. Owing to the opinions expressed by the members of the Canadian Medical Association with regard to the paratyphoid infections, following the lead of Professor Starkey, it appears certain that more attention will be paid to them.

Antivaccination Movement in Montreal.

There have been some cases of small-pox in Montreal and neighbourhood during the past five or six weeks. Vaccination has not been strictly enforced in the Province of Quebec, and steps have been taken to render the operation obligatory in Montreal and its neighbourhood. These steps have met with strenuous opposition on the part of the antivaccinationists of Montreal, who base their objections on personal right.

Gift to McGill University.

Sir William Macdonald, of Montreal, has made another magnificient gift to McGill University, in presenting to it a large area of land at the back of what is known as the McGill Campus, adjoining the grounds of the Royal Victoria Hospital. The city of Montreal had made an unsuccessful offer for the property, in order to add it to Mount Royal Park. Sir William Macdonald's action has removed a fear that this land might be acquired by speculators for building purposes, and has, furthermore, ensured to McGill University space which is now needed, and which in course of time would have become absolutely necessary for expansion. It is stated that Sir William gave more than $1,000,000 (£200,000) for the property, which, with what he has already given to McGill University, makes up a total of about $5,500,000 (£1,100,000).

The Heat Wave in Canada.

An exceptional heat wave has swept over the United States and Canada. In Toronto, where temperature records have been kept for the past 57 years, the temperature was two degrees higher on July 3rd than had ever been known before. In the afternoon on that day the officially recorded temperature was over 103° F. in the shade. Many persons were prostrated by the heat in Toronto, and the death-rate of young children was greatly increased. In Montreal on July 3rd the highest officially recorded temperature was nearly 95°. Montreal has long had an unenviable reputation for an excessive infantile mortality, and the extreme heat of the week beginning July 2nd greatly intensified it. On July 2nd and 3rd no fewer than 146 children under five years of age died out of a population of 430,000 or thereabouts, an appallingly large proportion. During the same 48 hours 49 adults died, some of them certainly owing to weather conditions.

The Maritime Provinces Medical Association.

Owing to the fact that no matter where the annual meeting of the Maritime Provinces Medical Association takes place, whether in Nova Scotia, New Brunswick, or Prince Edward Island, the attendance is principally composed of Nova Scotia medical men, the President of the Association, in his opening address on July 5th, at Halifax, N.S., suggested that the Association should disband. The committee, on the President's motion, have therefore recommended that the Maritime Medical Association cease to exist after the present session, and that the funds in hand, after paying the expenses of this year's meeting, be divided equally between the Nova Scotia, New Brunswick, and Prince Edward Island medical societies. The result of this action is the better support of the Canadian Medical Association.

Free Advertising for Antituberculosis Society.

The Bill Posters' Association of Canada at its annual convention in Ottawa decided to grant the Anti-tuberculosis Society $25,000 (£5000) worth of advertising space throughout Canada. Consequently the posters of the society will be posted free in all cities and towns of Canada represented in the association.

August 7th.

Obituary.

SAMUEL JONES GEE, M.D. LOND., F.R.C.P. LOND.,

CONSULTING PHYSICIAN TO ST. BARTHOLOMEW'S HOSPITAL.

WE have already announced the regretted death of Dr. Samuel Jones Gee, which occurred at Keswick, where he was staying with his daughter, on August 3rd. He had gone to bed in his usual health, but was taken suddenly ill about 4 A.M. He was able to attract the attention of his daughter who slept in an adjoining room, but he died almost directly. Subsequent examination showed extensive atheromatous degeneration of the aorta and its valves. He was cremated by his own request at Golder's Hill on August 8th. There were present at the cremation Sir Thomas Barlow, representing the Royal College of Physicians of London, Sir William S. Church, Sir Richard Douglas Powell, Dr. Norman Moore, representing the staff of St. Bartholomew's Hospital, Mr. W. Bruce Clarke, and Mr. D'Arcy Power.

Dr. Gee was born on Sept. 13th, 1839. He was educated at Enfield, joining University College, London, in 1854. In 1857 he entered the medical school of University College Hospital. At the intermediate examination in medicine for the M.B. degree at London University Dr. Gee was bracketed with Dr. Charles Hilton Fagge, the well-known obstetrician, as university scholar and gold medalist in chemistry, and he also took honours in anatomy and physiology. This distinguished record was continued in 1861, when he was again bracketed with Dr. Fagge as university scholar and gold medalist in medicine in the final examination for M.B. In 1863 Dr. Gee became a Member of the Royal College of Surgeons of England, and in 1865 proceeded to the M.D. degree at London University, becoming also a Member of the Royal College of Physicians of London in the same year. In 1868 he was appointed assistant physician to St. Bartholomew's Hospital. When the skin department was opened at that hospital in 1869 Dr. Gee was appointed to the post, but in the following year he resigned it to become demonstrator of pathology and morbid anatomy. He was elected to the Fellowship of the Royal College of Physicians of London in that year. In 1871 he was appointed lecturer on pathological anatomy at his hospital. He became lecturer on medicine in 1878 and in the following year was appointed full physician and lecturer on clinical medicine, holding these appointments for 26 years—viz., until 1905—when he passed on to the consulting staff. He was Censor of the Royal College of Physicians from 1893 to 1897.

Dr. Gee was not a prolific writer; solidity rather than ephemeral attraction was his aim. He published two books. The first, on "Auscultation and Percussion," attained the dignity of its sixth edition in 1908. The second, "Medical Lectures and Aphorisms," reached its third edition in 1907. In 1871 Dr. Gee delivered the Goulstonian lectures at the Royal College of Physicans of London, in 1892 the Bradshaw lectures on Signs of Acute Peritoneal Diseases, and in 1899 the Lumleian lectures on Bronchitis, Pulmonary Emphysema, and Asthma. The last two were published in THE LANCET.

Mr. D'Arcy Power writes: "The death of Dr. Gee removes a remarkable personality from the medical profession. Naturally shy and reserved, with no advantages of rank or fortune, and without any marked social qualities, he raised himself almost to the top by the sheer force of intellect. His mind was clear and logical. It worked slowly, but the results at which he arrived were so correct that he was looked upon as a safe guide by all who asked his advice. He was well read in the writings of the Greek physicians of classical times, and although he would have been the first to disclaim any right to the title of a learned physician in the sense that Dr. Greenhill and Dr. Frank Payne were learned, there is little doubt that he moulded his teaching on classical lines. He tried, often very successfully, to put the largest amount of knowledge into the fewest possible words. Both the knowledge and the words were of his own gathering, and they were usually seasoned with a

sparkle of humour which was so subtle that the ordinary student lost it, though it was a source of lasting enjoyment to the university man and to the numerous medical practitioners who accompanied him round the wards. Amongst his colleagues he was held in high esteem for his courtesy, gravity, and the general soundness of his judgment, but he was essentially a lonely man; never very robust, he had no hobbies to bring him into familiar contact with his fellow men; happy in his domestic life and with his books, he preferred to remain at home when each day's work was done."

In 1870 Dr. Gee married Miss Sarah Cooper, a daughter of Mr. Emanuel Cooper, by whom he had two daughters, one of whom survives him. He died, as he would have wished, at a moment's notice, and he left directions that the urn containing his ashes should be placed between those of his wife and elder daughter.

DEATHS OF EMINENT FOREIGN MEDICAL MEN.—The deaths of the following eminent foreign medical men are announced:—Dr. Siegbert Marcuse, a Berlin practitioner who has played an important part in the organisation of professional opinion on the subject of contract practice. He had previously been awarded the Iron Cross when in charge of a field hospital before Metz. Dr. Walter Hesse of Dresden, a well-known hygienist and bacteriologist. Dr. Charpy, professor of anatomy in the Toulouse Medical Faculty. Dr. J. Elvin Courtney, lecturer on neurology in the Denver and Gross College of Medicine. Dr. P. Funaioli, professor of neurology in the Sienna Medical School.

Medical News.

MIDDLESEX HOSPITAL MEDICAL SCHOOL.—The Broderip scholarships have been awarded to E. L. P. Gould and H. Rowntree; the Lyell medal and scholarship to E. L. P. Gould; the Freeman scholarship to H. J. B. Heelas; the Hetley clinical prize to E. W. Hall; the Second Year's Exhibition to T. B. Paul; the Leopold Hudson prize to T. L. Hardy. Prizes have also been awarded as follows: Surgery, W. V. T. Stiles; practical surgery, T. L. Hardy; practical medicine, F. W. Browne; midwifery, A. O. Gray; practical midwifery, P. N. Button; anatomy, T. C. Kidner; physiology, T. C. Kidner; practical anatomy, T. C. Kidner; biology, R. P. S. Mason; embryology, S. W. M. Jones; pathology, O. C. Morphy; bacteriology, T. L. Hardy; forensic medicine, H. J. Shields; practical pharmacy, H. J. B. Hellas; organic chemistry, S. W. M. Jones; inorganic chemistry, A. Selby; physics, J. W. Edgar; histology, S. W. M. Jones; mental diseases, A. Juett; pharmacology, H. A. Lucas.

VISIT TO THE CLAYBURY ASYLUM BY FRENCH MEDICAL MEN.—By arrangement with Dr. F. W. Mott and Dr. Robert Jones, the members of the Twenty-first Annual Congress of Neurologists and Psychiatrists in France and French-speaking countries which met at Amiens last week visited the Claybury Asylum on August 9th and were received by Sir John MacDougall and Mr. T. Chapman, chairman of the Claybury Asylum. They inspected the pathological laboratory of the London County Asylums and made a tour of the wards and grounds of the asylum, accompanied by the officials. At luncheon they were welcomed by Mr. Chapman, who felicitously referred to the advantage of professional interchange of views in regard to the general treatment of the insane and to the friendly feeling obtaining between two great nations. Dr. Charron, the general secretary of the Congress, replied and expressed much satisfaction with the care and treatment of the mentally afflicted by English public authorities. After lunch several interesting cases were demonstrated and discussed, and opinions as to diagnosis, prognosis, and treatment were given by the visitors which should prove helpful. Cases of gross brain disease, of cerebral tumours, lateral sclerosis, anomalous cases of general paralysis, obscure nervous affections, and osteitis deformans associated with mental symptoms were discussed and views exchanged as to the diagnostic value of cyto-diagnosis, the Wassermann reaction, and "606," which had been used in Claybury for general paralysis. The visitors spent a very pleasant day, and such friendly international conferences, arranged informally, tend to help the medical interest in our asylums and must be of advantage to patients placed in these institutions.

A new patent medicine stamp has been issued by Somerset House, designed to make clear that the stamp implies no Government guarantee of any kind. This step has been rendered necessary by the action of certain manufacturers in making it appear that the stamp was a Government guarantee for the nature or value of the patent medicine.

THE NIGHTINGALE NURSING HOME AT DERBY.—Extension buildings to the Nightingale Nursing Home at Derby, costing £10,000, have been opened by the Duke of Devonshire, president of the Royal Derbyshire Nursing Association. The awards gained by members of the nursing staff were distributed at the same time by the Duchess of Devonshire.

LONDON (ROYAL FREE HOSPITAL) SCHOOL OF MEDICINE FOR WOMEN.—Entrance scholarships of the value of £60 for three or five years, and £30 for one year, will be awarded on the result of an examination to be held on Sept. 19th and following days. Forms of entry and all particulars can be obtained on application to the secretary, 8, Hunter-street, Brunswick-square, London, W.C., before Sept. 12th. The session will begin on Monday, Oct. 2nd, when Sir Henry Butlin, P.R.C.S., will deliver the inaugural address at 4 P.M. Mrs. Garrett Anderson, M.D., president of the school, will take the chair. The Fishmongers' Company have awarded an exhibition of the value of £60 for three years to J. E. Hart, a student of the school.

MEMORIAL TO THE LATE PROFESSOR CUNNINGHAM.—The bronze medallion to be erected in memory of the late Professor D. J. Cunningham has now arrived in the School of Physic, Trinity College, Dublin, and will be in its place before the winter session begins. It bears a profile portrait of Cunningham, and the words, "Daniel Johannes Cunningham, Defunctus Adhuc Loquitur." In addition a bronze medal has been struck, bearing a similar design on the obverse, and on the reverse a reproduction of the chimpanzee's brain prepared by Cunningham. The medal will be for competition in the anatomy class of Dublin University each year. The memorials established in Edinburgh are of similar nature. The medallion and medal are designed by Mr. Oliver Sheppard, an Irish sculptor, whose designs for the Bennett and Banks medals received the highest praise some years ago.

THE DISEASES OF ANIMALS ACTS.—The annual reports of proceedings under the Diseases of Animals Acts for 1910 have been issued. The chief veterinary officer, Mr. Stewart Stockman, deals with foot and mouth disease, swine fever, glanders, anthrax, and sheep scab. The laboratory report contains a note on A Trypanosome of British Cattle, which, however, it is not considered probable, gives rise of itself to any serious illness among domesticated animals; also a note on Bracken Poisoning in cattle. Warbles and ticks are also dealt with. The report of the assistant secretary (animals division), Mr. A. W. Anstruther, discusses the geographical distribution of foot and mouth disease, swine fever, sheep scab, glanders and farcy, anthrax, and the measures taken in regard thereto; also the exportation and shipment of horses and regulations as to dogs, and matters relating to the movement of domestic animals generally.

NAIRN TOWN AND COUNTY HOSPITAL.—The medical report of Dr. B. Cruickshank, submitted to the annual general meeting of the Nairn Town and County Hospital on August 3rd, stated that at the date of the last report 9 cases remained in the hospital and 129 were admitted during the year, making 138 cases under treatment. Of these, 88 were cured, 29 relieved, 8 died, and 12 remain in the hospital. Sixty-two cases might be classified as medical and 76 as surgical. Twenty-two surgical operations were performed, and 33 cases were attended as out-patients for dressing, &c. The average number of days in hospital for each patient was 25. The secretary and treasurer submitted his report, which showed that the income amounted to £605 13*s.* 4½*d.*, as against £607 18*s.* 0½*d.* for the previous year. The expenditure was £654 11*s.* 0½*d.*, as against £622 4*s.* 1*d.* The increase in expenditure was due to the salary of the increased staff, expenses connected with the appointment of the new

matron, and repairs to the hospital. Mr. W. Wilton Johns of Nairn was appointed on the medical staff of the hospital.

THE INVESTIGATION OF PELLAGRA.—A Second Field Commission, consisting of Dr. Louis Sambon and Dr. Albert J. Chalmers, has left London for the study of the epidemiology and etiology of pellagra in Hungary, the Austrian Tyrol, Spain, and Southern France. Professor Haase of Memphis, Tenn., U.S.A., Dr. Cole of Atalanta, Ga., U.S.A., and Dr. Martinez of Yucatan, Central America, will join the Commission *en route*. The fullest facilities for the investigation have been granted by the Governments of Austria, Hungary, and Spain. The expense will be generously borne by Mr. H. S. Wellcome, whose name is already honourably identified with the support of physiological research in its relation to the advancement of medical science.

Parliamentary Intelligence.

NOTES ON CURRENT TOPICS.

University of Wales Bill.

THE University of Wales No. 2 Bill has passed through a Standing Committee of the House of Commons and been ordered to be reported to the House. This is the Bill which Sir D. BRYNMOR JONES, with the support of Welsh Members in all quarters of the House, introduced for the purpose of making the medical degrees of the University of Wales registrable under the Medical Acts, and also of giving to the University the right to send a representative to the General Medical Council.

The Nutritive Value of Bread.

The report which Dr. J. M. HAMILL has made to the Local Government Board on the nutritive value of bread made from different varieties of wheat flour has been laid on the table of the House of Commons.

HOUSE OF COMMONS.

WEDNESDAY, AUGUST 9TH.

Importation of Chinese Pork.

Mr. FELL asked the President of the Local Government Board whether he had received the report from his representatives in China on the conditions under which the Chinese pork was produced and packed before shipment to this country.—Mr. BURNS replied: Dr. Farrar has recently returned from China, and his report is in preparation.

THURSDAY, AUGUST 10TH.

Experiments on Living Animals.

Mr. CHANCELLOR asked the Secretary of State for the Home Department how many visits were paid during 1910 to laboratories registered for experiments on living animals by Dr. Thane and Sir James Russell respectively; and how many of the 4939 experiments mentioned in Table IV. A, and how many of the 90,753 experiments mentioned in Table IV. B, were actually witnessed by Dr. Thane and Sir James Russell respectively.—Mr. CHURCHILL answered: During 1910 Dr. Thane paid 153 visits to registered premises and Sir James Russell 141. In addition to these 15 visits were paid by Dr. Whitaker, who was appointed as temporary inspector during the absence of Sir James Russell through illness. Of the experiments mentioned in Table IV. A of the return, Dr. Thane witnessed 30 and Sir James Russell 20. Of the experiments in Table IV. B, Dr. Thane saw 20 and Sir James Russell 59.

The Vaccination of Soldiers' Children.

Mr. W. THORNE asked the Under Secretary of State for War whether he would draw the attention of the officials of the Army Medical Department to the immunity from small-pox enjoyed by children in England and Wales who had been legally exempted from vaccination under the Vaccination Acts, 1898 and 1907, and in Scotland under the Act of 1907; and whether he would issue a new regulation to such officials instructing them to respect the conscientious objections of soldiers in barracks in respect to the vaccination of their children.—Colonel SEELEY replied: As regards the first part of the question, I am not aware of any official statistics on the subject. As regards the second part of the question, the reply is in the negative.

MONDAY, AUGUST 14TH.

National Insurance and Syphilis.

Sir HENRY KIMBER asked the Chancellor of the Exchequer whether, under Section 13, Subsection 4, of the National Insurance Bill, an approved society would be allowed to refuse sickness benefit to insured persons suffering from tertiary syphilis which appeared 20 or even 40 years after infection—e.g., a gumma of cheek appearing after a lapse of 40 years, and tabes or locomotor ataxy appearing after a lapse of 20 years.—Mr. LLOYD GEORGE replied: Matters of this kind will be dealt with in the rules of the society, which will, of course, be framed by the society with the consent of its members, and will have to be approved by the Insurance Commissioners.

Impending Vacancy in the Scotch Prison Commission.

Sir HENRY CRAIK asked the Lord Advocate whether, in view of the impending vacancy amongst the Prison Commissioners in Scotland, steps would be taken to carry into effect the recommendations of various committees, including the Scottish Departmental Committee in 1902, that there should be a medical member on the Board of the Prison Commissioners.—Mr. URE replied: It would be premature to make any statement on the subject. I am aware of the recommendation referred to by the honourable Member, which was made by the Departmental Committee on Scottish Prisons in 1900.

Dairies and Milkshops Orders in Scotland.

Mr. WATT asked the Lord Advocate whether there was now any burghal local authority in Scotland which had not yet appointed one or more veterinary surgeons for the purpose of the Public Health (Scotland) Act, 1897, and the Dairies, Cowsheds, and Milkshops Orders; and, if not, would he say when a veterinary surgeon would be appointed to the staff of the Local Government Board, so that a uniform system and standard of meat inspection might exist throughout Scotland.—Mr. URE wrote in reply: There is not any burghal local authority in Scotland which has not yet appointed one or more veterinary surgeons for the purpose of the Act and Orders referred to by my honourable friend. It is not proposed meantime to appoint a veterinary surgeon to the staff of the Local Government Board for Scotland.

TUESDAY, AUGUST 15TH.

Sanitary Commissioner to the Indian Government.

Mr. MACPHERSON asked the Under Secretary of State for India whether the office of Sanitary Commissioner to the Government of India was established on the recommendation of the Plague Commission; whether that office was now vacant; and whether, in view of the prevalence of plague, cholera, malaria, and small-pox, he would see that this office was not abolished and that an appointment was made to it at once.—Mr. MONTAGU said in reply: The vacancy in the office of Sanitary Commissioner with the Government of India caused by the death of the late incumbent has not yet been filled, and the duties of the post are at present discharged by the Director-General of the Indian Medical Department. The Government of India are disposed to think that the creation of a separate Sanitary Commissioner in 1904 has not fulfilled expectations, and are inclined to revert to the arrangement previously existing. The Secretary of State must reserve his decision until the full statement of the views which the Government of India have promised is before him. The Sanitary Commissioner is merely an advising officer to the Government of India. The responsibility for sanitation in the several provinces rests with the local governments. The office was not created in 1904 on the recommendation of the Plague Commission of 1898. The Plague Commission's scheme was not accepted.

Local Health Committees and Medical Benefit.

Colonel RAWSON asked the Chancellor of the Exchequer to state how present members of Friendly Societies who were over 65, or who were in receipt of medical benefit from their society, and did not become insured persons under the National Insurance Bill, would be able to continue to receive medical attendance after the Bill had passed, seeing that the arrangements with the doctors would now be made by the Health Committees and not by the societies on whom the liability for their sick members rested.—Mr. LLOYD GEORGE wrote in reply: The Local Health Committees will only intervene in the administration of medical benefit so far as persons insured under the Bill are concerned. Those who are insured, but not under the Bill, in societies which become approved societies will not be affected.

Cancer amongst Pitch-workers.

Mr. PERKINS asked the Secretary of State for the Home Department whether, in view of the fact that the spread of cancer among workers with pitch was attributed to the anthracine contained in tar and pitch derived from gas-works, in that tar and pitch derived from blast furnaces was free from anthracine, he would take this fact into consideration in the new Home Office regulations.—Mr. CHURCHILL furnished the following written reply: The fact that blast-furnace pitch is much less liable to give rise to cancer is already recognised in the draft regulations, which have been issued by the Home Office, for the manufacture of patent fuel (briquettes) with the addition of pitch. Factories and workshops in which no pitch other than blast-furnace pitch is used are specifically exempted from the regulations. It is not, however, certain that anthracine is the constituent of ordinary pitch to which the prevalence of cancer in the industry is due.

BOOKS, ETC., RECEIVED.

ALLEN, GEORGE, AND COMPANY, LIMITED, Ruskin House, 44-45, Rathbone-place, London, W.

Voice and its Natural Development. By Herbert Jennings, Author of "The Preventive and Remedial Treatment of Stammering," &c. Price 3*s.* 6*d.* net.

BALE (JOHN), SONS, AND DANIELSSON, LIMITED, London.

Album of Photographs issued by the South Indian Branch of the British Medical Association. Price 10*s.* 6*d.* net.

The Essentials of Food. By Donald Stewart, M.D. Price 3*s.* 6*d.* net.

The Mental Effects of a Child's Environment. By T. S. Clouston, M.D., LL.D., F.R.C.P.E. (Reprinted from "The Child," May and June, 1911.) Price 6*d.*

CHURCHILL, J. AND A., London.

Dental Materia Medica, Pharmacology, and Therapeutics. By Charles W. Glassington, M.R.C.S., L.D.S. Edin. Second edition. Price 6*s.* net.

DENTAL RECORD, THE, Office of, Alston House, Newman-street, London, W.

The Prevention of Dental Caries. By J. Sim Wallace, D.Sc., M.D., L.D.S., Hon. Dental Surgeon to the West-End Hospital for Nervous Diseases. Price 1*s.* 6*d.* net.

The Prevention of Dental Caries. By Stanley Colyer, M.D. Lond., M.R.C.P. Price 6*d.* net.

FISCHER, VICTOR, Budapest.

Surgical Stitching Instrument for the Suture of the Stomach and Intestines according to Dr. Hültl, Principal of the IV. Surgical Department in the Metropolitan St. Stephen's Hospital, Budapest. Price not stated.

Appointments.

Successful applicants for Vacancies, Secretaries of Public Institutions, and others possessing information suitable for this column, are invited to forward to THE LANCET *Office, directed to the Sub-Editor, not later than 9 o'clock on the Thursday morning of each week, such information for gratuitous publication.*

BUTLER, THOMAS HARRISON, M.D. Oxon., has been appointed Oculist to the Coventry School Clinic.

EMRYS-JONES, FRANKLIN, L.M.S.S.A., has been appointed X Ray Expert to the Coventry School Clinic.

HALL-EDWARDS, JOHN, L.R.C.P. Edin., has been appointed X Ray Expert to the Coventry School Clinic.

HALPIN, R. EDGAR, L.D.S. Glasg., has been appointed Dentist to the Coventry School Clinic.

HAWKS, F. S., L.M.S.S.A., has been appointed Certifying Surgeon under the Factory and Workshop Act for the Wigton District of the county of Cumberland.

LAWRIE, D., M.B., M.S. Glasg., has been appointed Certifying Surgeon under the Factory and Workshop Act for the Glastonbury District of the county of Somerset.

MACLENNAN, ALEX., M.B., C.M. Glasg., has been appointed Consulting Surgeon to the East Coast Railway Company for the Glasgow District.

MANNING, HERBERT CAMPBELL, L.R.C.P. Lond., M.R.C.S., has been appointed Assistant School Medical Officer for the County of Dorset.

MARTIN, MARY EDITH, L.R.C.P. & S. Edin., L.F.P.S. Glasg., L.S.A., has been appointed Assistant Medical Officer at Bailbrook House, Batheaston, Bath.

MELROSE, M. M., M.R.C.S., L.R.C.P. Lond., has been appointed Junior House Surgeon at the Miller General Hospital for South-East London, Greenwich.

ROBERTSON, WILLIAM, M.B., Ch.B. Glasg., has been appointed District Medical Officer by the Stroud (Gloucestershire) Board of Guardians.

ROBINSON, JOHN ELLIOTT, M.B., B.S. Lond., L.R.C.P. Lond., M.R.C.S., D.P.H. Camb., has been appointed School Medical Officer for the County of Dorset.

SYMONS, WILLIAM HENRY, M.D Brux., M.R.C.S., L.R.C.P., L.S.A., D.P.H., has been reappointed Medical Officer of Health of Bath.

THOMAS, FRANK LESLIE, M.B., B.S. Lond., L.R.C.P. Lond., M.R.C.S., has been appointed Pathologist to the North Devon Infirmary, Barnstaple.

Vacancies.

For further information regarding each vacancy reference should be made to the advertisement (see Index).

BETHLEM HOSPITAL.—Locum Tenens as House Physician. Salary at rate of 4 guineas a week, with apartments, board, and washing.

BETHNAL GREEN INFIRMARY AND WORKHOUSE, Cambridge Heath, E.—Assistant Medical Officer. Salary at rate of £100 per annum, with board, lodging, and washing.

BIRKENHEAD AND WIRRAL CHILDREN'S HOSPITAL, Woodchurch-road.—House Surgeon. Salary £100 per annum, with board, residence, and laundry.

BIRMINGHAM AND MIDLAND EYE HOSPITAL,—Junior House Surgeon. Salary £70, with board and residence.

BRIGHTON, ROYAL SUSSEX COUNTY HOSPITAL.—House Physician. Salary £100 per annum, with apartments, board, and laundry.

BRISTOL GENERAL HOSPITAL.—House Physician for six months. Salary £60, with board, residence, &c.

BUXTON, DERBYSHIRE, DEVONSHIRE HOSPITAL.—Assistant House Surgeon for six months. Salary £70 per annum, with apartments, board, and laundry.

CANTERBURY, KENT AND CANTERBURY HOSPITAL.—House Surgeon, unmarried. Salary £90 per annum, with board, lodging, and washing.

CARLISLE NON-PROVIDENT DISPENSARY.—Resident Medical Officer. Salary £150 per annum, with apartments (not board).

CARLISLE, CUMBERLAND INFIRMARY.—Resident Medical Officer. Salary at rate of £80 for first six months and £100 for second six months, with board, lodging, and washing.

COLCHESTER, ESSEX COUNTY HOSPITAL.—House Physician. Also House Surgeon. Salary in each case £80 per annum, with board, washing, and residence.

CROYDON GENERAL HOSPITAL.—Senior and Junior House Surgeons. Salaries £105 and £60 respectively, with board, laundry, and residence.

DEVONPORT, ROYAL ALBERT HOSPITAL.—Assistant House Surgeon for six months, unmarried. Salary at rate of £50 per annum, with board, apartments, and laundry.

DUDLEY, GUEST HOSPITAL.—Assistant House Surgeon for six months. Salary £75 per annum, with residence, board, and washing.

ESSEX EDUCATION COMMITTEE, Chelmsford.—Medical Inspector (female) for six months. Salary £125, and necessary travelling expenses.

GUILDFORD, ROYAL SURREY COUNTY HOSPITAL.—House Surgeon. Salary £100 per annum, with board, residence, and laundry. Also Assistant House Surgeon. Salary £75 per annum, with board, residence, and laundry.

HALIFAX, ROYAL HALIFAX INFIRMARY.—Senior House Surgeon, unmarried. Salary £120 per annum, with residence, board, and washing. Also Third House Surgeon, unmarried. Salary £80 per annum, with residence, board, and washing.

HARTLEPOOLS HOSPITAL.—House Surgeon. Salary £100 per annum, with board, washing, and lodging.

HEMEL HEMPSTEAD, HERTS, WEST HERTS HOSPITAL.—Resident Medical Officer. Salary £100 per annum, with rooms, board, and washing.

KINGSEAT ASYLUM.—Assistant Medical Officer. Salary £120, with board, &c.

LIVERPOOL, ROYAL SOUTHERN HOSPITAL.—Three House Surgeons and Two House Physicians for six months. Salary at rate of £60 per annum, with board and residence.

LIVERPOOL, UNIVERSITY OF.—Chair of Pathology. Salary not less than £600 per annum.

MACCLESFIELD GENERAL INFIRMARY.—Senior House Surgeon. Salary £100 per annum, with board and residence.

MANCHESTER, ANCOATS HOSPITAL.—Assistant House Surgeon. Salary £70 per annum, with board, &c.

MANCHESTER CHILDREN'S HOSPITAL, Pendlebury.—Visiting Surgeon. Salary £100 per annum. Also Resident Medical Officer for six months. Salary £40.

MANCHESTER HOSPITAL FOR CONSUMPTION AND DISEASES OF THE THROAT AND CHEST.—Assistant Medical Officer and Pathologist. Salary £60 per annum.

MANCHESTER NORTHERN HOSPITAL FOR WOMEN AND CHILDREN, Park-place, Cheetham Hill-road.—House Surgeon. Salary £80 per annum, with apartments and board.

NEWCASTLE-UPON-TYNE CITY ASYLUM, Gosforth.—Junior Assistant Medical Officer, unmarried. Salary £140 per annum, with apartments, board, and laundry.

NEWCASTLE-UPON-TYNE DISPENSARY.—Visiting Medical Assistant. Salary £160 per annum.

NORTHAMPTON GENERAL HOSPITAL.—House Surgeon, unmarried. Salary £90 a year, with apartments, board, washing, and attendance.

NOTTINGHAM GENERAL DISPENSARY.—Assistant Resident Surgeon, unmarried. Salary £160 per annum, with apartments, attendance, &c.

ORKNEY, PARISH OF ROUSAY AND EGILSHAY.—Resident Medical Officer. Salary £71 per annum.

OXFORD, RADCLIFFE INFIRMARY AND COUNTY HOSPITAL.—Casualty House Surgeon, unmarried, for six months. Salary at rate of £80 per annum, with board, &c.

PRESCOT UNION WORKHOUSE AND INFIRMARY, Whiston.—Resident Assistant Medical Officer. Salary £120 per annum, with apartments, board, washing, attendance, &c.

PRESTON ROYAL INFIRMARY.—Junior House Surgeon, unmarried, for six months. Salary £60 per annum, with board, residence, and washing.

QUEEN CHARLOTTE'S LYING IN HOSPITAL, Marylebone-road, N.W.—Assistant Resident Medical Officer for four months. Salary at rate of £50 per annum, with board, residence, and washing.

QUEEN'S HOSPITAL FOR CHILDREN, Hackney-road, Bethnal Green, N.E.—House Surgeon for six months. Salary at rate of £80 per annum, with board, residence, and washing.

ROCHESTER, ST. BARTHOLOMEW'S HOSPITAL.—House Surgeon. Salary £110 per annum, with board and residence.

RYDE, ROYAL ISLE OF WIGHT COUNTY HOSPITAL.—Resident House Surgeon, unmarried. Salary £125 per annum.

ST. PANCRAS (SOUTH) INFIRMARY AND WORKHOUSE.—Senior Assistant Medical Superintendent and Senior Assistant Medical Officer. Salary at rate of £135 per annum with residential allowances.

ST. PETER'S HOSPITAL FOR STONE, &c., Henrietta-street, Covent Garden, W.C.—Junior House Surgeon for six months. Salary at rate of £50 per annum, with board, lodging, and washing.

SHEFFIELD ROYAL HOSPITAL.—Assistant House Physician, unmarried. Salary £60, with board, lodging, and washing.

SHEFFIELD, UNIVERSITY OF.—Junior Demonstrator in Pathology. Salary £150 per annum.

SOUTHAMPTON, ROYAL SOUTH HANTS AND SOUTHAMPTON HOSPITAL.—House Physician. Salary £100 per annum, with rooms, board, and washing.

SOUTHPORT INFIRMARY.—Resident Junior House and Visiting Surgeon, unmarried, for six months. Salary £70 per annum, with residence, board, and washing.

SOUTH SHIELDS, INGHAM INFIRMARY AND SOUTH SHIELDS AND WESTOE DISPENSARY.—Junior House Surgeon. Salary £90 per annum, with residence, board, and washing.

SUNDERLAND ROYAL INFIRMARY.—House Physician for six months. Salary £80 per annum, with board, residence, and laundry.

WARRINGTON INFIRMARY AND DISPENSARY.—Junior House Surgeon. Salary at rate of £100 per annum, with board, lodging, and laundry.

WEST HAM AND EASTERN GENERAL HOSPITAL, Stratford, E.—Junior House Physician. Salary £75 per annum.

WEST LONDON HOSPITAL, Hammersmith-road, W.—Two House Physicians and Three House Surgeons for six months. Board, lodging, and laundry provided.

WIGAN, ROYAL ALBERT EDWARD INFIRMARY.—Senior House Surgeon. Salary £120 per annum, with board, washing, and apartments.

WORCESTER COUNTY AND CITY ASYLUM, Powick.—Third Assistant Medical Officer, unmarried. Salary £150 per annum and all found.

THE Chief Inspector of Factories, Home Office, London, S.W., gives notice of a vacancy for a Certifying Surgeon under the Factory and Workshop Act at Montgomery, in the county of Montgomery.

Births, Marriages, and Deaths.

BIRTHS.

PAIN.—On August 13th, at Montagu House, Leatherhead, the wife of Basil H. Pain, M.B., M.R.C.S., of a daughter.

WYSARD.—On August 6th, at Ellerker-gardens, Richmond Hill, the wife of Staff-Surgeon A. T. Wysard, R.N. (retired), of San Paulo, Brazil, of a daughter.

DEATHS.

ARCHIBALD.—On June 23rd, 1911, at East Farleigh, Kent, suddenly, of heart failure, W. F. Archibald, M.B., Ch.B. Edin., Surgeon, Royal Navy, aged 28.

EVANS.—On August 10th, John Evans, M.R.C.S., L.D.S., aged 82.

SCANLAN.—On August 12th, at Kerswell, Broadclyst, Exeter, Lieutenant-Colonel James Scanlan, retired, Army Medical Staff, aged 64.

YOUNG.—On August 12th, at Atherstone, Charles Albert Young, M.R.C.S., L.R.C.P., aged 46.

N.B.—A fee of 5s. is charged for the insertion of Notices of Births, Marriages, and Deaths.

Notes, Short Comments, and Answers to Correspondents.

BASEMENTS AND THE LAW.

THE Housing and Town Planning Act, 1909, now regulates the sanitary conditions under which the use of underground rooms for sleeping purposes may be permitted by local authorities. It deals in terms which are explicit and reasonable with a topic not altogether new, and which is of considerable importance in the eyes of those who desire to see the provision of wholesome houses for the people encouraged, so far as this may be done by forbidding the existence of such as are flagrantly and obviously insanitary. In these circumstances a letter which appeared in the *Times* of August 9th, and which, by the way, was signed "A Doctor's Daughter," demands some comment owing to the extraordinary inaccuracy of the main statement of the law contained in it, rather than on account of deductions based upon a mutilated excerpt from the seventeenth section of the Act referred to. This extract was quoted at the end of the letter, and we shall remind our readers of the contents of the body of that document if we mention that it commenced by referring to the Englishman's home as having ceased to be his castle, and proceeded to say that "the Metropolitan Borough (of Marylebone) demands that no one may sleep in a basement (however good that basement may be apparently) if the surface of the floor is more than 3 feet below the surface of the road." The writer followed this surprising summary of the law with allusions to the practice of assigning the basement to menservants as their sleeping quarters in large houses in London, and declared that as a consequence of the legislation described "thousands of servants, particularly male servants, will be thrown out of employment, or people will have to do with fewer domestics because they will not have room to house them. The very people this law is made to help it will mulct of a livelihood altogether." A later passage in the same letter declared: "Even the lady and gentleman may not sleep downstairs nowadays in their own houses, or they might do so to allow the 'lady's lady' and the 'gentleman's gentleman' to occupy their rooms." Other paragraphs assigned reasons for the practice of menservants sleeping in basements, contrasted servants in "the sixties" with those of the present day, and predicted an increase in the number of houses to let in London. Then the writer proceeded to supply the quotation which gave a clue to the source of the prohibition which she had in her mind, the opening paragraph of her letter having left her readers in doubt as to whether her apprehensions had been roused by an Act of Parliament or by a new by-law of the Marylebone borough council. The portion which she cited from Subsection 7 of the section mentioned above was as follows. How she could have got so far without going farther we, of course, cannot say, so will charitably suggest that a friend supplied her with an extract which she did not trouble to verify. Subsection 7: "A room habitually used as a sleeping-place, the surface of the floor of which is more than 3 ft. below the surface of the part of the street adjoining, or nearest the room, shall, for the purposes of this section, be deemed to be a dwelling-house so dangerous or injurious to health as to be unfit for human habitation." Taken as it stands, this would be obviously unreasonable, and would fully justify the recommendation of "A Doctor's Daughter" that "it would be better to inspect basement sleeping accommodation and suggest improvements where necessary, but the subsection does not end there. After a comma, not a full-stop, it continues: "if the room either (*a*) is not on an average at least seven feet in height from floor to ceiling; or (*b*) does not comply with such regulations as the local authority, with the consent of the Local Government Board, may prescribe for securing the proper ventilation and lighting of such rooms, and the protection thereof against dampness, effluvia, or exhalation"; and it further provides that if the local authority fail to make such regulations the Board will make them in its place. Probably few persons in any way interested in house property in London were greatly disturbed by the letter referred to, but as at this time of the year some may read an isolated copy of a newspaper and fail to notice a contradiction or correction, we feel justified in referring to the matter in detail. Modern sanitary legislation may disturb individual owners of property and demand from them expenditure which they may resent, but in instances such as that under discussion the effect obtained is only to diminish profits made by the letting of housing accommodation wholly unfitted for its purpose, and local authorities are to be commended when they enforce the law with vigilance and without fear or favour. Their regulations as a rule are such as their medical officers of health recommend to them, and they are framed under the supervision of the Local Government Board. The regulations in force in Marylebone are before us, and probably correspond with those of many other boroughs in their provisions, from whatever source they may have been derived. In any case, they are obviously directed towards lessening the number of underground dwellings approximating to cellars, or to their use as sleeping places, rather than to interfering with accommodation provided for their male servants by the inhabitants of Portland-place and Harley-street, to whom reference was especially made by the writer of the letter upon which we have commented, a letter which certainly illustrated the errors into which "a little knowledge" may lead the unwary.

A NEW MANUSCRIPT OF ALEXANDER OF TRALLES.

IN the still not entirely searched Escorial Library in Spain there is an eleventh-century parchment Codex in which, after folio 141, are preserved a list of medical prescriptions for wounds which some physician must have copied from Books 13, 14, and 15 of Aetius's "Tatrabiblon." The manuscript bears a revision of the fourteenth century, and the reviser notes twice in the margin that the manuscript he used for the purpose bore the name of Alexander. The author signified was almost certainly Alexander of Tralles, because he stated he had borrowed from Aetius, and therefore the revised Escorial text presents to us Alexander's version of three books of Aetius. Another manuscript in the same library states, as had been suspected previously, that Alexander of Tralles was a Christian.

COMMUNICATIONS not noticed in our present issue will receive attention in our next.

A DIARY OF CONGRESSES.

WE shall publish this diary from time to time that our readers may have under their hands the dates of the approaching scientific Congresses. It is unnecessary to issue the lists of all these functions week by week, and we propose to make only such gatherings as will occur in the immediate future the subject of regular announcement. The following Congresses, Conferences, and Exhibitions are announced for August and September, 1911:—

June 1st–August 31st (Squirrels Heath, Romford).—Town Planning and Modern House and Cottage Exhibition.
August 12th–30th.—E.M.I. (Enseignement Médico-mutuel International) Tour in Scandinavia.
" 15th–21st (Dublin).—Royal Institute of Public Health.
" 21st–23rd (Larvik).—Fourteenth Norwegian Physicians Congress.
" 28th–Sept. 11th (South-East of France).—Eleventh "Voyage d'Etudes Médicales."
" 30th–Sept. 2nd (Berlin).—Third International Laryngo-Rhinological Congress.
" 30th–Sept. 6th (Portsmouth).—British Association.

Medical Diary for the ensuing Week.

LECTURES, ADDRESSES, DEMONSTRATIONS, &c.

POST-GRADUATE COLLEGE, West London Hospital, Hammersmith-road, W.

MONDAY.—10 A.M., Surgical Registrar: Demonstration of Cases in Wards. Dr. Simson: Diseases of Women. 12 noon, Dr. Bernstein: Pathological Demonstration. 2 P.M., Medical and Surgical Clinics. X Rays. Operations. 2.30 P.M., Mr. Dunn: Diseases of the Eye.

TUESDAY.—10 A.M., Dr. Robinson: Gynæcological Operations. 2 P.M., Medical and Surgical Clinics. X Rays. Operations. Dr. Davis: Diseases of the Throat, Nose, and Ear. 2.30 P.M., Dr. Abraham: Diseases of the Skin. 5 P.M., Lecture:—Mr. Bidwell: Surgical Treatment of Obstructive Jaundice.

WEDNESDAY.—10 A.M., Dr. Saunders: Diseases of Children. Dr. Davis: Operations of the Throat, Nose, and Ear. 12.15 P.M., Lecture:—Dr. Bernstein: Clinical Pathology. 2 P.M., Medical and Surgical Clinics. X Rays. Operations. Mr. B. Harman: Diseases of the Eye. 2.30 P.M., Dr. Simson: Diseases of Women. 5 P.M., Lecture:—Mr. B. Harman: Iritis.

THURSDAY.—10 A.M., Surgical Registrar: Demonstration of Cases in Wards. 2 P.M., Medical and Surgical Clinics. X Rays. Operations. 2.30 P.M., Mr. Dunn: Diseases of the Eye. 5 P.M., Lecture:—Mr. Bidwell: Surgical Treatment of Dilated Sigmoid.

FRIDAY.—10 A.M., Dr. Robinson: Gynæcological Operations. Dr. Simson: Gynæcological Demonstration. 2 P.M., Medical and Surgical Clinics. X Rays. Operations. Dr. Davis: Diseases of the Throat, Nose, and Ear. 2.30 P.M., Dr. Abraham: Diseases of the Skin.

SATURDAY.—10 A.M., Dr. Saunders: Diseases of Children. Medical Registrar: Demonstration of Cases in Wards. Dr. Davis: Operations of the Throat, Nose, and Ear. Mr. B. Harman: Diseases of the Eye. 2 P.M., Medical and Surgical Clinics. X Rays. Operations.

LONDON HOSPITAL MEDICAL COLLEGE (UNIVERSITY OF LONDON), Clinical Theatre, London Hospital, Mile End-road, E.

MONDAY.—2 P.M., Demonstration in Clinical Medicine:—Dr. Wall: Pulmonary Diseases.

TUESDAY.—2 P.M., Demonstration in Clinical Medicine:—Dr. Grünbaum: Diseases giving rise to Morbid Renal Excretion.

WEDNESDAY.—2 P.M., Demonstration in Clinical Medicine:—Dr. Hutchison: Abdominal Disease.

THURSDAY.—2 P.M., Demonstration in Clinical Medicine:—Dr. Head: Diseases of the Nervous System.

FRIDAY.—2 P.M., Demonstration in Clinical Medicine:—Dr. L. Smith: Diseases of the Heart.

OPERATIONS.

METROPOLITAN HOSPITALS.

MONDAY (21st).—London (2 P.M.), St. Bartholomew's (1.30 P.M.), St. Thomas's (3.30 P.M.), St. George's (2 P.M.), St. Mary's (2.30 P.M.), Middlesex (1.30 P.M.), Westminster (2 P.M.), Chelsea (2 P.M.), Samaritan (Gynæcological, by Physicians, 2 P.M.), Soho-square (2 P.M.), Gt. Northern Central (2.30 P.M.), West London (2.30 P.M.), London Throat (9.30 A.M.), Royal Free (2 P.M.), Guy's (1.30 P.M.), Children, Gt. Ormond-street (9 A.M.), St. Mark's (2.30 P.M.), Central London Throat and Ear (Minor 9 A.M., Major 2 P.M.).

TUESDAY (22nd).—London (2 P.M.), St. Bartholomew's (1.30 P.M.), St. Thomas's (3.30 P.M.), Guy's (1.30 P.M.), Middlesex (1.30 P.M.), Westminster (2 P.M.), West London, (2.30 P.M.), University College (2 P.M.), St. George's (1 P.M.), St. Mary's (1 P.M.), St. Mark's (2.30 P.M.), Cancer (2 P.M.), Metropolitan (2.30 P.M.), London Throat (9.30 A.M.), Samaritan (9.30 A.M. and 2.30 P.M.), Throat, Golden-square (9.30 A.M.), Soho-square (2 P.M.), Chelsea (2 P.M.), Children, Gt. Ormond-street (9 A.M. and 2 P.M., Ophthalmic, 2 P.M.), Tottenham (2.30 P.M.). Central London Throat and Ear (Minor, 9 A.M., Major, 2 P.M.), Royal National Orthopædic (9.30 A.M. and 4 P.M.).

WEDNESDAY (23rd).—St. Bartholomew's (1.30 P.M.), University College (2 P.M.), Royal Free (2 P.M.), Middlesex (1.30 P.M.), Charing Cross (3 P.M.), St. Thomas's 2 P.M.), London (2 P.M.), King's College (2 P.M.), St. George's (Ophthalmic, 1 P.M.), St. Mary's (2 P.M.), St. Peter's (2 P.M.), Samaritan (9.30 A.M. and 2.30 P.M.), Gt. Northern Central (2.30 P.M.), Westminster (2 P.M.), Metropolitan (2.30 P.M.), London Throat (9.30 A.M.), Cancer (2 P.M.), Throat, Golden-square (9.30 A.M.), Guy's (1.30 P.M.), Royal Ear (2 P.M.), Children, Gt. Ormond-street (9 A.M. and 9.30 A.M., Dental, 2 P.M.), Tottenham (Ophthalmic, 2.30 P.M.), West London (2.30 P.M.), Central London Throat and Ear (Minor, 9 A.M., Major, 2 P.M.).

THURSDAY (24th).—St. Bartholomew's (1.30 P.M.), St. Thomas's (3.30 P.M.), University College (2 P.M.), Charing Cross (3 P.M.), St. George's (1 P.M.), London (2 P.M.), King's College (2 P.M.), Middlesex (1.30 P.M.), St. Mary's (2.30 P.M.), Soho-square (2 P.M.), North-West London (2 P.M.), Gt. Northern Central (Gynæcological, 2.30 P.M.), Metropolitan (2.30 P.M.), London Throat (9.30 A.M.), Samaritan (9.30 A.M and 2.30 P.M.), Throat, Golden-square (9.30 A.M.), Guy's (1.30 P.M.), Royal National Orthopædic (9 A.M. and 3.30 P.M.), Royal Ear (2 P.M.), Children Gt. Ormond-street (9 A.M. and 2 P.M.), Tottenham (Gynæcological, 2.30 P.M.), West London (2.30 P.M), Central London Throat and Ear (Minor, 9 A.M., Major, 2 P.M.).

FRIDAY (25th).—London (2 P.M.), St. Bartholomew's (1.30 P.M.), St. Thomas's (3.30 P.M.), Guy's (1.30 P.M.), Middlesex (1.30 P.M.), Charing Cross (3 P.M.), St. George's (1 P.M.), King's College (2 P.M.), St. Mary's (2 P.M.), Ophthalmic (10 A.M.), Cancer (2 P.M.), Chelsea (2 P.M.), Gt. Northern Central (2.30 P.M.), West London (2.30 P.M.), London Throat (9.30 A.M.), Samaritan (9.30 A.M. and 2.30 P.M.), Throat, Golden-square (9.30 A.M.), Royal National Orthopædic (3.30 P.M.), Soho-square (2 P.M.), Children, Gt. Ormond-street (9 A.M., Aural, 2 P.M.), Tottenham (2.30 P.M.), St. Peter's (2 P.M.)., Central London Throat and Ear (Minor, 9 A.M., Major, 2 P.M.).

SATURDAY (26th).—Royal Free (9 A.M.), London (2 P.M.), Middlesex (1.30 P.M.), St. Thomas's (2 P.M.), University College (9.15 A.M.), Charing Cross (2 P.M.), St. George's (1 P.M.), St. Mary's (10 A.M.), Throat, Golden-square (9.30 A.M.), Guy's (1.30 P.M.), Children, Gt. Ormond-street (9 A.M. and 9.30 A.M.), West London (2.30 P.M.).

At the Royal Eye Hospital (2 P.M.), the Royal London Ophthalmic (10 A.M.), the Royal Westminster Ophthalmic (1.30 P.M.), and the Central London Ophthalmic (2 P.M.), Hospital operations are performed daily.

EDITORIAL NOTICES

IT is most important that communications relating to the Editorial business of THE LANCET should be addressed *exclusively* "TO THE EDITOR," and not in any case to any gentleman who may be supposed to be connected with the Editorial staff. It is urgently necessary that attention should be given to this notice.

It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this office.

Lectures, original articles, and reports should be written on one side of the paper only, AND WHEN ACCOMPANIED BY BLOCKS IT IS REQUESTED THAT THE NAME OF THE AUTHOR, AND IF POSSIBLE OF THE ARTICLE, SHOULD BE WRITTEN ON THE BLOCKS TO FACILITATE IDENTIFICATION.

Letters, whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers—not necessarily for publication.

We cannot prescribe or recommend practitioners.

Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor."

Letters relating to the publication, sale and advertising departments of THE LANCET *should be addressed "To the Manager."*

We cannot undertake to return MSS. not used.

MANAGER'S NOTICES.

THE INDEX TO THE LANCET.

THE Index and Title-page to Vol. I. of 1911, which was completed with the issue of June 24th, were given in THE LANCET of July 1st.

VOLUMES AND CASES.

VOLUMES for the first half of the year 1911 are now ready. Bound in cloth, gilt lettered, price 16*s.*, carriage extra.

Cases for binding the half-year's numbers are also ready. Cloth, gilt lettered, price 2*s.*, by post 2*s.* 3*d.*

To be obtained on application to the Manager, accompanied by remittance.

TO SUBSCRIBERS.

WILL Subscribers please note that only those subscriptions which are sent direct to the Proprietors of THE LANCET at their Offices, 423, Strand, London, W.C., are dealt with by them? Subscriptions paid to London or to local newsagents (with none of whom have the Proprietors any connexion whatever) do not reach THE LANCET Offices, and consequently inquiries concerning missing copies, &c., should be sent to the Agent to whom the subscription is paid, and *not* to THE LANCET Offices.

Subscribers, by sending their subscriptions direct to THE LANCET Offices, will insure regularity in the despatch of their Journals and an earlier delivery than the majority of Agents are able to effect.

THE COLONIAL AND FOREIGN EDITION (printed on thin paper) is published in time to catch the weekly Friday mails to all parts of the world.

The rates of subscriptions, post free from THE LANCET Offices, have been reduced, and are now as follows:—

FOR THE UNITED KINGDOM.		TO THE COLONIES AND ABROAD.	
One Year	£1 1 0	One Year	£1 5 0
Six Months	0 12 6	Six Months	0 14 0
Three Months	0 6 6	Three Months	0 7 0

(The rate for the United Kingdom will apply also to Medical Subordinates in India whose rates of pay, including allowances, is less than Rs. 50 per month.)

Subscriptions (which may commence at any time) are payable in advance. Cheques and Post Office Orders (crossed "London County and Westminster Bank, Covent Garden Branch") should be made payable to the Manager, Mr. CHARLES GOOD, THE LANCET Offices, 423, Strand, London, W.C.

TO COLONIAL AND FOREIGN SUBSCRIBERS.

SUBSCRIBERS ABROAD ARE PARTICULARLY REQUESTED TO NOTE THE RATES OF SUBSCRIPTIONS GIVEN ABOVE.

The Manager will be pleased to forward copies direct from the Offices to places abroad at the above rates, whatever be the weight of any of the copies so supplied.

SOLE AGENTS FOR AMERICA—Messrs. WILLIAM WOOD AND CO., 51, Fifth Avenue, New York, U.S.A

THE LANCET.

LONDON: SATURDAY, AUGUST 26, 1911.

An Address to Students.

IN this, our annual Students' Number of THE LANCET, there will be found as usual an epitome of the educational course which the medical student has to follow if he would terminate his labours by having his name placed on the roll of the General Medical Council. Full information is given as to the various universities and medical schools through whose instrumentality he can receive the training and the degrees or diplomas which are necessary to that end. We are glad to think that the audience whom on this occasion we address has already made a personal choice of the calling of medicine, for in the existing circumstances a great responsibility lies upon anyone who should decide to send a young man or a young woman into the medical profession as a career. We are addressing those who have already started upon their professional life and not those who need instigation as to a momentous decision. In a few weeks several hundreds of students will be added to this number, and will enter at different centres upon the long course of study which will lead, if they display the necessary industry and resolution, to their becoming qualified for the practice of medicine. The exact number cannot yet be guessed at, but it seems probable that it will not be so high an aggregate as in some previous years, and certainly will not promise any excess of medical men to meet the growing needs of the community. During the last 20 years the average number of medical men annually admitted to the Medical Register has decreased in a highly significant manner. The number has fallen from an average of 1462 during the period 1891-1895 to an average of 1152 for 1906-1910, and in the main the admissions to the Register bear a proportion to the number of students who commence a professional career. In England the number of medical students has lately decreased in the manner signified by the figures of the qualified men, the same position not having occurred in any marked manner at any Irish or Scottish medical centre. Although there are possibilities that this growing unpopularity with the class from which in England the recruits to medicine used to be drawn may be undergoing some modifications, it seems unlikely, having regard to the full exposure of the hardships of that life which has recently taken place in the House of Commons in connexion with the National Insurance Bill, that the figures of the new students for 1911 will present a better appearance than those of the immediately preceding sessions. The significance of this is considerable, for it leads to the obvious deduction that those who are choosing the profession of medicine are not entering an overcrowded class. The population of Great Britain and Ireland since 1900 has increased by about 4,000,000, and during these years the numbers of the medical profession on the roll have not increased in any proportional manner. The number of medical men in London is just 115 more than it was ten years ago, and the only increase worth noting among medical men is the addition of 1650 during the decade to the number that have joined the Services or that practise abroad. It is our own belief that the assertions that the medical profession is overcrowded have been made frequently, and possibly are still being made, without a sufficient knowledge of the facts. Badly distributed the *personnel* of the medical profession may have been, and still may be. There are too many men working in the same localities and on the same lines, but there are too few practitioners in certain districts, naturally in hose where the conditions of professional practice have hitherto been terribly unremunerative. Whatever accuracy there may have been in times gone by in the statement that the public in this country was over-supplied with medical men, few people will maintain that this position still exists, though the faulty distribution of the profession remains. To this extent, then, we may congratulate the new recruits to our ranks; they are coming where there is room for them. And we believe also that they are coming where the public desires good service, a position which is practically a new one in this country. The functions of the medical profession wax more responsible daily, and the assistance which medical men are called upon to render to the body politic is becoming more general, as the need of medical service is growing more widely recognised by the public. All this means that the training of medical men as a class will receive close scrutiny in the near future, and the student should understand, from the moment he has chosen medicine as his career, that his life is going to be a strenuous one.

It would be particularly interesting this year to know what are the circumstances which have dictated the selection of medicine as a career to those who are now entering upon it. The choice of a profession is frequently made by a boy's father, and if he is a medical man with a good practice it has hitherto seemed only natural that he should desire his son to follow in his footsteps. It is not unreasonable, also, to assume that there is often a hereditary aptitude for medical practice, and a hereditary willingness to assume its responsibilities. For these reasons until lately a medical man in good practice almost as a matter of course brought up one of his sons to succeed him in his practice, and these hereditary followers of medicine were some of the best recruits which the profession received. We very much doubt whether this proportion of sons of medical men is now being maintained. For 20 years, during which the average number of medical students has gone down, the medical profession, especially in regard to general practice, has had to undergo many drawbacks and even hardships, and it is probable that the number of fathers, who have considered during this 20 years that in placing their children in the medical profession they were giving them the best opportunity which lay in their power of leading a useful life and securing a competence, has considerably decreased. General practitioners have seen in the many-sided development of the profession of medicine changes which necessarily have greatly affected their pecuniary returns, while they have

shared in the rapidly growing expenses of daily life without in many instances being able to demand correspondingly increased fees from their clients. The decision, the very right decision, of the General Medical Council not to permit the use of unqualified assistants threw a heavy burden upon many practitioners, especially upon those who were most oppressed by the unwholesome growth of contract practice. There can be no doubt that a large number of the old-fashioned unqualified assistants were unduly employed; they were placed in positions of responsibility for which they had not received adequate training, and they gave to the public services which were not the services for which the public believed itself to be paying. While, however, the employment of unqualified assistants was abused in this manner, and, alas, in many places, the fact remains that a certain proportion of these assistants were quite properly used, while their remuneration was necessarily at a lower figure than that of assistants who, being duly qualified, had spent a large sum of money upon their medical education. The unfair growth of contract practice was directly responsible for the abuse of unqualified assistants. The public in larger numbers, and (unfortunately) in increasingly substantial positions, began to avail itself of the contract terms which had been originally framed by the medical profession with extreme moderation, being in fact a direct outcome of the organised charity which the profession has always extended towards the public. Consequently many general practitioners found themselves confronted with the situation that part of their income was being paid to them in return for an enormous amount of work under contract that could never be remunerative—more, that could only just be made to pay when the duties were performed in a perfunctory manner and at the least possible cost. Then arose the extremely dangerous position, for medicine and for the public alike, under which thousands of persons were seen in crowded surgeries in a mechanical way, and in an incredibly short space of time, for capitation fees rarely attaining to 5*s.* a year and often dropping to ½*d.* a week. Many medical men manfully struggled in these appalling conditions to do scientific work, but some, disheartened by the conditions, discharged their responsibilities in a manner corresponding to their remuneration—they provided the kind of thing for which they were being paid. In practice of this sort the unqualified assistant was often as good a man as his principal, and when the services of persons whose names were not on the Register became illegal the troubles of the general practitioner, severe already, became accentuated, for he was not able to obtain from the various medical aid associations into whose grip he had fallen any increase of salary to compensate him for an increased outlay in the matter of professional assistance. Representations made to the medical aid associations, pointing out the abuses under which their medical officers suffered, were responded to in many cases by the introduction into the practitioners' districts of salaried medical officers to do the work of the medical aid associations, and at once the practitioners saw that, not only were their professional profits seriously diminished by the fact that persons well able to pay reasonable fees took advantage of terms of contract practice which had never been intended for them, but a grave uncertainty of tenure was introduced into professional life. A medical man could no longer bring up his son to succeed to his practice with any security, for he could no longer rely upon having a practice to which his son might succeed. In the meantime the fees for vaccination and the receipts from midwifery were decreasing for obvious reasons, while the ordinary therapeutic routine of treatment was growing more costly to him who had to supply the drugs and the dressings. All these things, acting and interacting, so altered the pecuniary position of many medical men during the last 20 years that those who have felt their full force have refrained from sending their sons to meet the same experiences. Still the supply of medical men has been kept up. The great promises of the medical life have proved sufficiently attractive to ensure able collaborators. And here we must recall the fact, often though it has been mentioned, that more than any other unit of society the members of the medical profession have inside the fence of their calling a choice of vastly varying careers. The consultant and specialist, the general practitioner, the State official, the officer, the pure pathologist—all are within our fold and have a common professional aim and code, but they lead lives that vary in every detail. Hence the medical profession has so wide an appeal that, despite the dark days through which it has recently been passing, fresh candidates for its trials and triumphs have not been wanting. We congratulate our new adjuvants upon deciding to pursue a calling that promises to all a life of the highest utility, and to some the purest possible delights through knowledge acquired and difficulties surmounted.

The medical profession is entering now upon a most critical phase. We need not here go into any details with regard to the National Insurance Bill, but we may take it for granted that every student has some conception of the position for medicine in the future opened up by that vast measure. Contract practice, under which the evils that have just been enumerated have sprung into such riotous activity, will be extended by the new statute until the relations of the medical profession with about one-third of the populace are affected. The conditions of general practice will probably be profoundly modified in the near future, and it is unlikely that this will be effected without considerable hardship to many men now in practice, though there is promise that other men, and succeeding generations of practitioners, will find their lives altered for the better in many directions; and certainly some of the graver hardships and injustices should disappear. The student now entering into our ranks ought to appreciate these facts from the beginning. As yet he is only in the rear of the fight, while those in the van may suffer to secure a victory possibly in many instances rather for him than for themselves. Some six or seven years hence those who have just joined our ranks, who should by that time have qualified for a place upon the Register, may find the conditions of medical practice satisfactory where at the present moment they are hard to bear; they must remember that they owe a debt of gratitude to those who have brought these things to pass, and they must remember also to learn to play the difficult part that will be required of them. Upon them will

devolve the duty of proving to the public that the medical work of the country under altered conditions can be efficiently performed; on them will fall the troubles of conflict if further modification of those conditions be found necessary. And in no way can they better fit themselves for this outlook than by cultivating a broad view, so that they may appreciate the public as well as the professional side of every social and moral question. In the immediate future a large proportion of the general practice of this country will be conducted in relation to certain bodies set up by the National Insurance Bill and mainly formed of laymen. Provision is made on these bodies—the Health Committees—for medical men, and the presence at the meetings of the county or borough medical officers of health will ensure a right sanitary view being made clear; but the voting power will be with the laity. The medical men must be able to follow, and follow sympathetically, the arguments advanced for the public good; in this way only will they obtain the hearing for the medical side which is essential for the public safety. The high aims of our calling and the enormous amount of practical good that we can do will influence a public whose standards of education are improving, but that the best united work may be done mutual comprehension is needed. The details of medicine must necessarily be hard to explain to the layman, so that it is of the greatest importance that the medical profession should earn the public confidence by manifest sincerity and reasonableness, for in this way his counsels will be accepted. No estimate of professional dignity can be too high, but maintenance of that dignity is made perfectly easy by the proof of good motives and efficient training.

THE STUDENT'S GUIDE.

SESSION 1911-1912.

A PREFATORY STATEMENT.

THE quantity of the subjects which fall necessarily within the scope of our Educational Number has now become very large, and it may be as well, as on previous occasions, to explain the scheme upon which the following guide to a medical career in this country is constructed.

The General Council of Medical Education and Registration, conveniently known as the General Medical Council, is the controlling authority, under the Privy Council, of the medical education of the land. Under the provisions of the Medical Acts various universities and corporations are recognised as being examining bodies whose degrees or diplomas entitle to medical registration, and it is among the duties of the General Medical Council to keep the official register and to ensure by periodical visitations that the tests of the various examining bodies are maintained at a due standard. We begin by describing the powers of the General Medical Council, and go on to give in detail the regulations of the various examining bodies.

But the student must be taught as well as examined, and the systems under which he can obtain instruction do not conform to one pattern. The curriculum of the medical student falls into two parts, the preliminary subjects and the professional subjects, and the two cannot be sharply divided. The extent to which they are allowed to overlap under different schemes of education varies a good deal, while the extent to which they ought to overlap is a perennial subject of debate. The important preliminary subjects are chemistry, pharmacology, physics, biology, anatomy, and physiology, and they are taught in the school proper; the professional subjects, medicine, surgery, and obstetric medicine—under which headings all forms of specialism are included—must be learned in the wards of a hospital. All schemes of medical education require a school and a hospital, but there their uniformity ends.

The first point on which the medical student has to make up his mind is whether he desires a medical degree which will give him the definite title of Doctor or Bachelor of Medicine (coupled in many cases with that of Bachelor of Surgery), or whether he will be content with a diploma certifying him to be a Member or Licentiate of one or other of the great medical corporations and as such entitled to be registered as a medical practitioner. If he desires a degree he must matriculate at a university and go through the course of studies required by the regulations of its medical faculty, and it is well that he should bear this in mind from the outset, for many diplomates, desiring later to becoming medical graduates, have been debarred from doing so through having neglected to pass a university matriculation examination at a time when they were freshly versed in their preliminary "arts" and general studies. It is particularly useful to take the London matriculation examination, which is accessible in several prominent centres, as it opens the door to the medical faculty of any British University. Accordingly we print with some detail the regulations for that standard, if much criticised, test of a good all-round secondary education.

Next we have collected together under their respective headings the chief information concerning the facilities for medical study, both "preliminary" and "professional," and the regulations for examinations at the various teaching centres of the United Kingdom, so, for instance, that a student desiring to pursue his studies and obtain a medical degree at Cambridge, Edinburgh, or Manchester may find under one heading an account of the medical faculty of the University in question, of the hospitals which form its field for clinical instruction, and of the prizes and scholarships which it offers to the student of medicine.

It will be readily seen, however, that it is impossible to adhere rigidly to this plan without a good deal of overlapping and doubling of information, for, as is well known, the medical schools of some universities are served chiefly by hospitals in other centres. Thus the medical students of Oxford and Cambridge almost uniformly pursue their clinical studies in London, whilst any student who has gone through all his training in an improved provincial centre may sit for a degree in Medicine at London University. Again, when we come to consider the corporations which have the power to grant diplomas qualifying their possessors for the practice of medicine we find that they usually have no schools attached to them, but that they examine students who have gone through the curriculum at any recognised metropolitan or provincial school to the satisfaction of their teachers, and in accordance with the regulations of the corporations. The plan we have adopted has been to divide the Guide into the three main headings of England, Scotland, and Ireland, and to deal with medical education in each country as a separate entity, describing first the medical faculties of the universities in each country, and following with an account of the medical corporations having powers to grant diplomas by examination. Under the heading of each university we give a general description of its arrangements for conferring medical degrees, of its facilities for preparing its students for those degrees, particulars of its scholarships and

prizes, and of the hospitals affording clinical instruction and situated in the neighbourhood of the university buildings. Following this plan, the metropolitan medical schools and hospitals are grouped in their proper place as schools of the University of London, although they serve other universities, and the diploma-granting bodies. A similar plan is adopted in dealing with the provincial universities, the hospitals in connexion with each being described; for though these are not officially "schools" of the universities they supply an integral section of the teaching required by their candidates for medical graduation, and so for practical purposes may be looked on as constituent parts of the university system. The link is made all the closer by the common presence of many teachers on the medical staff of a hospital and on the staff of lecturers of the university with which that hospital is connected.

Following the description of medical education at the universities, an account is given of the regulations of the various corporations granting diplomas for the practice of medicine. The schools serving these examining bodies are identical with those already described, with the addition of the principal colonial medical schools. The Student's Guide contains also an account of certain provincial hospitals which afford facilities for clinical instruction, and at which students may take out some part of their course, though they are not officially connected with any teaching centre.

Detailed information concerning all those medical schools and their hospitals naturally forms the bulk of the Students' Number of THE LANCET; but we add to this an account of medical employment in the Naval, Military, and Indian Medical Services and in the Public Health Service. We give also the chief information useful to those desiring a diploma in public health or a special training in tropical medicine, together with an account of the facilities for post-graduate study, a branch of medical education the importance of which is rightly receiving increasing recognition. The Students' Number includes a report upon the system of education in dental surgery.

GENERAL COUNCIL OF MEDICAL EDUCATION AND REGISTRATION OF THE UNITED KINGDOM.

POWERS AND DUTIES OF THE GENERAL MEDICAL COUNCIL.

As there is apparently, even among members of the medical profession, a great amount of ignorance as to the powers and duties of the General Medical Council, we think it well to lay clearly before our readers what the General Medical Council is and also what it is not.

Many of the false ideas on the subject are due to the use of the shortened title, "General Medical Council." The full title is, "General Council of Medical Education and Registration of the United Kingdom." This title is in accordance with the Medical Act of 1858, by which the General Medical Council was established under the Privy Council to enable persons requiring medical aid to distinguish qualified from unqualified practitioners. The Council was thus instituted not primarily for the benefit of the medical profession but to ensure an efficient medical service to the public. It is obvious that by so doing the profession itself gained, in that official sanction was given to reputable practitioners only, while a proper guarantee was afforded to the public that the standard of medical education should always keep abreast of the scientific knowledge of the day. The powers of the Council under which it fulfils these important functions fall under four heads. It is first a registering body: it registers the attainment by students of the degrees or other qualifications that legally entitle them to practise medicine. This duty forms its chief service to the State, as a complete list of practitioners of legal standing, which is embodied in the Medical Register, is thus rendered available for the information of the public. For the purposes of medical education it also registers the entry by students upon their medical studies. Secondly, it assures the public that the education of medical men is kept up to an efficient standpoint by maintaining at the proper pitch the standard of the various medical examinations. Thirdly, it is a penal and disciplinary body, having power to remove from the Register any practitioner adjudged guilty of conduct "infamous in a professional respect." Here again it is the public interest that is first considered, although these powers are for the very material advantage of the medical profession. The last duty of the Council is the codification of pharmaceutical remedies. Reform in the administration of the finances of the Council has of recent years removed acute pecuniary strain from that body, but the day should soon come when the State, recognising the public value of the work of the Council, should be willing to subsidise its efforts. Registrars are appointed by the General Council and by the Branch Councils to keep registers of qualified persons. They are bound by Section XIV. of the Act to keep their registers correctly, a duty which, mainly owing to the apathy of members of the medical profession, can only be performed with difficulty.

It is as well here to put down the advantages, such as they are, of being duly registered. A duly registered practitioner may assume a name, title, addition, or description implying that he is registered under the Act and recognised by law. A duly registered practitioner may sue in the courts of law for the recovery of charges for medical attendance or advice, or surgical attendance or advice, or for the supply of medicine, or for the performance of any operation—provided that he is not debarred from suing by being a Fellow or a Member of any corporation which objects to its Fellows or Members so suing. He may be exempted, if he so desire, from serving on juries, from serving sundry corporate and parochial offices, and from serving in the Militia. Only a registered practitioner can hold appointments in the navy, army, and in sundry Poor-law and other institutions. Only a registered practitioner can sign a valid medical certificate. Removal of the name from the Register debars a man from all the above-mentioned privileges.

The General Medical Council is in no way a medical protection society or a medical defence union. It is not a professional union or a guild charged with looking after the interests of the medical profession after the manner of the old trades guilds, except in so far as it is concerned with the education of medical students. It has no powers over any member of the medical profession except to remove the name of any offending member from the roll of the profession or Medical Register. Practitioners may be removed from the Medical Register (1) if convicted of felony or misdemeanour in England, or in Ireland, or in Scotland of any crime or offence, and (2) on being adjudged by the General Medical Council to have been guilty of "infamous conduct in a professional respect."

The General Medical Council is, we repeat, primarily a body charged with looking after medical education; it is not concerned with medical politics and, as a matter of fact, the time of the Council is almost entirely taken up with considering educational and registration matters, the latter including the penal cases of removal from the Register. The Council at present consists of 36 members, of whom, as will be seen by the annexed list, all but 10 are official representatives of some corporate body. Five members are chosen by the Crown on the advice of the Privy Council, and five others are elected by the members of the medical profession as Direct Representatives.

President of the General Council.—Sir Donald MacAlister, K.C.B. Members of the General Council.—Dr. Norman Moore, chosen by the Royal College of Physicians of London; Sir Henry Morris, Bart., Royal College of Surgeons of England; Mr. Arthur Trehern Norton, C.B., Apothecaries' Society of London; Mr. Arthur Thomson, M.B., University of Oxford; Sir T. Clifford Allbutt, K.C.B., University of Cambridge; Sir George Hare Philipson, M.D., University of Durham; Dr. Frederick Taylor, University of London; Dr. John Dixon Mann, Victoria University of Manchester; Dr. Robert Saundby, University of Birmingham; Dr. Richard Caton, University of Liverpool; Dr. Alfred George Barrs, University of Leeds; and Sir Isambard Owen, University of Bristol. In consequence of the retirement of Dr.

W. Tusting Cocking, the University of Sheffield is at present unrepresented. Sir John Batty Tuke, M.D., chosen by the Royal College of Physicians of Edinburgh; Mr. James William Beeman Hodsdon, Royal College of Surgeons of Edinburgh; Dr. David Neilson Knox, M.B., Faculty of Physicians and Surgeons of Glasgow; Sir Thomas Richard Fraser, M.D., University of Edinburgh; Sir Donald MacAlister, K.C.B., M.D., University of Glasgow; Dr. David White Finlay, University of Aberdeen; and Dr. John Yule Mackay, University of St. Andrews. Sir John William Moore, chosen by the Royal College of Physicians of Ireland; Sir Arthur Gerald Chance, Royal College of Surgeons in Ireland; Dr. Francis George Adye-Curran, Apothecaries' Hall of Ireland; Sir Charles Ball, Bart., University of Dublin; Sir Christopher John Nixon, Bart., M.D., National University of Ireland; and Sir William Whitla, M.D., Queen's University of Belfast. Nominated by His Majesty, with the advice of his Privy Council: Mr. Charles Sissmore Tomes, F.R.C.S., Dr. Arthur Newsholme, Sir Francis Henry Champneys, Bart., Sir David Caldwell McVail, and Dr. James Little. Elected as Direct Representatives: Dr. Langley Browne, Dr. H. A. Latimer, Dr. J. A. MacDonald, Dr. Norman Walker, and Dr. Leonard Kidd. Treasurers of the General Council: Mr. Charles Sissmore Tomes and Sir Henry Morris, Bart.

THE EDUCATIONAL CURRICULUM.

Professional Education.—The course of professional study after registration shall occupy at least five years. The Final Examination in Medicine, Surgery, and Midwifery must not be passed before the close of the fifth academic year of medical study.

Registration and Preliminary Examination of Medical Students.—The following are the General Medical Council's Regulations in reference to the registration of students in medicine:—

Every medical student shall be registered in the manner prescribed by the General Medical Council. The registration of medical students shall be placed under the charge of the branch registrars. Every person desirous of being registered as a medical student shall apply to the branch registrar of the division of the United Kingdom in which he is residing; and shall produce or forward to the branch registrar a certificate of his having passed a preliminary examination as required by the General Medical Council, and evidence that he has attained the age of 16 years, and has commenced medical study at an institution approved by the Council. The branch registrar shall enter the applicant's name and other particulars in the Students' Register and shall give him a certificate of such registration. Each of the branch registrars shall supply to the several licensing bodies, medical schools, and hospitals, in that part of the United Kingdom of which he is registrar, a sufficient number of blank forms of application for the registration of medical students. The commencement of the course of professional study recognised by any of the qualifying bodies shall not be reckoned as dating earlier than 15 days before the date of registration. In addition to the universities and schools of medicine there are many institutions where medical study may be commenced. Applications for special exceptions are dealt with by the Students' Registration Committee, which reports all such cases to the Council.

The Preliminary Examination in General Education, required to be passed previously to registration as a medical student, is as follows:—

1. English language, including grammar and composition. Paraphrasing; questions on English history and geography. 2. Latin, including grammar, translation from unprescribed Latin books, and translation of English passages into Latin. 3. Mathematics, comprising (*a*) arithmetic, (*b*) algebra, including easy quadratic equations, and (*c*) geometry, the subject matter of Euclid, Books I., II., and III., with easy deductions. 4. One of the following subjects: (*a*) Greek, (*b*) a modern language.

In many cases the Council will not accept certificates of pass in Preliminary Examination in General Education unless the whole of the subjects included in the Preliminary Examination required by the Council for Registration of Students of Medicine have been passed at the same time. In some cases also the Council will not accept certificates without endorsement that all the required subjects are included. For a syllabus or for old examination papers application should be made to the Examining Bodies who can give details as to the requirements in regard to their own examinations.

A degree in Arts of any university of the United Kingdom or of the colonies or any other specially recognised university, or a certificate of having passed the final examination for a degree in Arts or Science of any university in the United Kingdom is considered a sufficient testimonial of proficiency.

Norman C. King, Acting Registrar of the General Council and of the Branch Council for England, 299, Oxford-street, London, W.—James Robertson, Registrar of the Branch Council for Scotland, 54, George-square, Edinburgh.—Richard J. E. Roe, Registrar of the Branch Council for Ireland, 35, Dawson-street, Dublin.

THE EXAMINING BODIES.

The following is a list of Examining Bodies whose examinations in general education are recognised by the General Medical Council as qualifying for registration as a medical or dental student.

I.—*Universities in the United Kingdom.*

University of Oxford.—Junior Local Examinations. Senior Local Examinations. Higher Local Examinations. Responsions. Moderations.

University of Cambridge.—Junior Local Examinations. Senior Local Examinations. Higher Local Examinations. Previous Examination. General Examination.

University of Durham.—Matriculation Examination for Science, Letters, and Music.

University of London.—Matriculation Examination. Senior School Examination.

Victoria University of Manchester.—Matriculation Examination. Senior School Certificate (under certain conditions).

University of Birmingham.—Matriculation Examination. Senior School-leaving Certificate.

University of Liverpool.—Matriculation Examination. Senior School Certificate (under certain conditions).

University of Leeds.—Matriculation Examination. Senior School Certificate (under certain conditions).

University of Sheffield.—Matriculation Examination. Senior School Certificate (under certain conditions).

University of Bristol.—Matriculation Examination.

University of Wales.—Matriculation Examination.

University of Edinburgh.—Preliminary Examination of the Joint Board of Examiners for Graduation in Arts or Science or Medicine and Surgery.

University of Aberdeen.—Preliminary Examination of the Joint Board of Examiners for Graduation in Arts or Science or Medicine and Surgery.

University of Glasgow.—Preliminary Examination of the Joint Board of Examiners for Graduation in Arts or Science or Medicine and Surgery.

University of St. Andrews.—Preliminary Examination of the Joint Board of Examiners for Graduation in Arts or Science or Medicine and Surgery. Final Examination for the diploma of L.L.A.

University of Dublin.—Junior Freshman Term Examination. Special Preliminary Examination. Junior Exhibition Examination. Examinations for the first, second, third, or fourth year in Arts.

The National University of Ireland: The Queen's University, Belfast.—Matriculation Examination.

Oxford and Cambridge Schools Examination Board.—Higher Certificate and School Examinations, Higher Certificate (certificates to include the required subjects).

II.—*Medical Licensing Bodies.*

Royal Colleges of Physicians and Surgeons in Ireland.—Preliminary Examination.

III.—*Educational Bodies other than Universities.*

College of Preceptors.—Examination for a First Class Certificate; Preliminary Examination for Medical Students.

Intermediate Education Board of Ireland.—Middle Grade Examination; Senior Grade Examination.

Educational Institute of Scotland.—Preliminary Medical Examination.

Scottish Education Department.—Leaving Certificates in Higher Grade or in Honours. Intermediate Certificate.

Central Welsh Board.—Senior Certificate Examination.

IV.—*Indian, Colonial, and Foreign Universities and Colleges.*

Every Certificate from Indian, Colonial, and Foreign Universities and Colleges must contain evidence that the Examination has been conducted by or under the authority of the Body granting it, must include all the subjects required by the General Medical Council, and must state that all the subjects of Examination have been passed in at one time; copies of the form of the required Certificate are supplied by the Registrar of the Council for the purpose. In the case of Natives of India or other Oriental countries whose

vernacular is other than English an Examination in a Classical Oriental Language may be accepted instead of an Examination in Latin. The German Abiturienten-Examen of the Gymnasia and Real-gymnasia and the examinations entitling to the French diplomas of Bachelier ès Lettres and Bachelier ès Sciences are recognised by the General Medical Council.

The remainder of the curriculum, though all under the supervision of the Council, is in detail in the hands of the various degree- and diploma-granting bodies whose representatives are members of the General Medical Council. In the next pages we give the regulations of the various examining bodies, but it must always be remembered that the examinations are under the supervision of the General Medical Council who visit the various centres in turn and closely inspect the procedure.

THE MEDICAL EXAMINING BODIES AND SCHOOLS OF THE UNITED KINGDOM.

A GUIDE TO THE FACILITIES FOR OBTAINING THE VARIOUS MEDICAL DEGREES AND OTHER QUALIFICATIONS AVAILABLE IN THE BRITISH ISLANDS.

I.—ENGLAND AND WALES.

THE UNIVERSITIES.

UNIVERSITY OF OXFORD.

THERE are two degrees in Medicine, *B.M. and D.M.*, two degrees in Surgery, *B.Ch. and M.Ch.*, and two diplomas, *Public Health* and *Ophthalmology*.

Graduates in Arts (B.A. or M.A.) are alone eligible for the degrees. The most convenient course for the B.A. degree for intending graduates in Medicine is to take Responsions, the Preliminary Science Examinations mentioned below, and the Final Honour School of Physiology. In order to obtain the degrees of B.M. and B.Ch. the following examinations must be passed:—1. Preliminary subjects: Mechanics and Physics, Chemistry, Animal Morphology, and Botany. 2. Professional. (*a*) First Examination: Subjects—Organic Chemistry, unless the candidate has obtained a first or second class in Chemistry in the Natural Science School; Human Physiology, unless he has obtained a first or second class in Animal Physiology in the Natural Science School; Human Anatomy. (*b*) Second Examination: Subjects—Medicine, Surgery, Midwifery, Pathology, Forensic Medicine with Hygiene, Materia Medica and Pharmacology. The approximate dates of the examinations are as follows:—Preliminaries—Mechanics, Physics, and Chemistry, December and June; Animal Morphology, December and March; Botany, March and June; Professional (First and Second B.M.), June and December.

The First Examination for the degrees of B.M. and B.Ch. may be passed as soon as the Preliminary Scientific Examinations have been completed. Anatomy and Physiology are to be passed together, and Organic Chemistry may be taken before or after these have been passed.

The Second Examination may be passed after the completion of the first, but Pathology, Hygiene, and Materia Medica and Pharmacology may be taken before or with the remaining subjects. Before admission to the Second Examination candidates must present certificates of attendance on a course of laboratory instruction in Practical Pathology and Bacteriology and of having acted as post-mortem clerk for three months, surgical dresser for six months, and clinical clerk for six months. Also they must produce certificates of instruction in Infectious and Mental Diseases, and of attendance on Labours, of proficiency in the practice of Vaccination and Anæsthetics, and of having attended a course of Practical Pharmacology. Also in respect of the First Examination candidates must present certificates showing that they have dissected the whole body once and have attended courses of laboratory instruction in Practical Histology and Practical Physiology.

The degree of D.M. is granted to Bachelors of Medicine of the University provided they have entered their thirty-ninth term and have composed on some medical subject a dissertation which is approved by the professors in the Faculty of Medicine and examiners for the degree of B.M. whose subject is dealt with. A book published within two years of the candidate's application for the degree may be substituted for a dissertation. The Regius Professor may direct the dissertation to be read in public. The degree of M.Ch. is granted to Bachelors of Surgery of the University who have entered their twenty-seventh term, who are members of the surgical staff of a recognised hospital, or have acted as Dresser or House Surgeon in such a hospital for six months, and who have passed the M.Ch. examination in Surgery, Surgical Anatomy, and Surgical Operations. This examination is held annually, in June, at the end of the Second B.M. Examination.

Diploma in Ophthalmology.—There is an examination once in each year in the Theory and Practice of Ophthalmology for the purpose of granting certificates of proficiency therein, styled Diplomas in Ophthalmology. The examination is under the supervision of the Board of the Faculty of Medicine, which has power to make regulations as to the subjects of the examination, the time at which the examination is held, and the conditions of admission. No candidate is admitted to the examination for the diploma who has not pursued at Oxford a course of study in Ophthalmology approved by the Board of the Faculty of Medicine, and extending over a period of at least three months. The fee for admission to the examination is £15, unless the candidate is a graduate of the University, in which case it is £10 only.

Public Health.—Information with regard to the Public Health Diploma will be found at page 638.

Travelling Fellowship, Scholarships, and Prizes.—A Radcliffe Travelling Fellowship is awarded annually after an examination held in February. It is tenable for three years and is of the annual value of £200. The stipend is paid by University College. The examination is in Physiology, Pathology, and Hygiene, and is partly "practical." Candidates must be graduates in Medicine of the University. The holder must travel abroad for the purpose of medical study. Application should be made to the Radcliffe Examiners, Radcliffe Library, University Museum. A Rolleston Memorial Prize is awarded once in two years to members of the Universities of Oxford and Cambridge of not more than ten years' standing for an original research in some Biological subject, including Physiology or Pathology. The Radcliffe Prize, founded by University College (1907), is of the value of £50 and is awarded biennially for research in some branch of medical science. The prize will be awarded in 1912. Candidates must send in their memoirs to the University Registry on or before Dec. 1st, 1912. No memoir for which any University prize has already been awarded is admitted to competition for the Radcliffe prize, and the prize will not be awarded more than once to the same candidate. The C. Theodore Williams Scholarships of the value of £50 each are awarded annually in the subjects of Anatomy and Physiology. The Scholarships in Science which are offered by several Colleges are open to those who intend to pursue Medicine. The value of these scholarships is usually £80 a year for four years.

More detailed information may be obtained from the University Calendar; from the Examination Statutes, 1902, which contain the official schedules of the several subjects of examination in both Arts and Medicine; from the Student's Handbook to the University (all of which are published by the Clarendon Press); from the Regius Professor of Medicine; and from the Professors in the several departments of medical science.

Professors—Anthropology: E. B. Tylor, M.A. Botany (Sherard): S. H. Vines, M.A. Chemistry (Waynflete): W. Odling, M.A. Comparative Anatomy (Linacre): G. C. Bourne, D.Sc. Human Anatomy: A. Thomson, M.A. Lecturer in Applied Anatomy: A. P. Dodds-Parker, B.M. Medicine (Regius): Sir W. Osler, Bart., D.M. Natural Philosophy (Sedleian): A. E. H. Love, D.Sc. Physics (Wykeham): J. S. E. Townsend, M.A. Physiology (Waynflete): F. Gotch, M.A., D.Sc. Reader: J. S. Haldane, M.A. Zoology: E. B. Poulton, M.A., D.Sc. Pathology: G. Dreyer, M.D. Lecturer: E. W. A. Walker, D.M.

In addition to the University lectures and classes the several Colleges provide their undergraduates with tuition for all examinations up to the B.A. degree.

UNIVERSITY OF OXFORD: RADCLIFFE INFIRMARY AND COUNTY HOSPITAL.—Courses of instruction are given in

connexion with the Oxford University Medical School. These include (1) a course in Practical Medicine by the Regius Professor of Medicine; (2) Clinical lectures by the Litchfield Lecturers in Medicine and Surgery; and (3) tutorial instruction and demonstrations in special Regional Anatomy (medical and surgical), methods of Medical and Surgical Diagnosis, and Surgical Manipulation. Pathological demonstrations are given in the post-mortem room at the Pathological Laboratory by the Professor of Pathology. Practical Pharmacy is taught in the Radcliffe Dispensary. Opportunities are offered to students who wish to act as surgical dressers and clinical clerks in the out-patient departments and in the wards. The Hospital contains 155 beds. Honorary Physician: Dr. E. B. Gray. Honorary Surgeon: Mr. A. Winkfield. Active Consulting Physician: Professor Sir William Osler, Bart. Acting Staff:—Honorary Physicians: Dr. W. Tyrrell Brooks, Dr. W. Collier, and Dr. E. Mallam. Honorary Assistant Physician and Medical Registrar: Dr. A. Waters. Honorary Surgeons: Mr. Horatio P. Symonds, Mr. R. H. A. Whitelocke, and Mr. A. P. Dodds-Parker. Honorary Assistant Surgeon and Surgical Registrar: Mr. E. C. Bevers. Consulting Ophthalmic Surgeon: Vacant. Honorary Consulting Pathologist: Professor Georges Dreyer. Honorary Assistant Pathologist: Dr. A. Gibson. Consulting Dental Surgeon: Mr. E. A. Bevers. Honorary Radiographer: Mr. R. H. Sankey. House Physician: Dr. C. Kemp. House Surgeon: Mr. F. C. Tibbs. Junior House Surgeon: Mr. C. A. Birts.

UNIVERSITY OF CAMBRIDGE.

The student must enter at one of the Colleges, or as a non-collegiate student, and keep nine terms (three years) by residence in the University. He must pass the Previous Examination in Classics, Mathematics, &c., which may, and should if possible, be done before he comes into residence in October, or he may obtain exemption through the Oxford and Cambridge Schools Examination Board, the Oxford or Cambridge Senior Local Examinations, the London Matriculation Examination, the Scotch Education Department, Responsions at Oxford, and the Joint Matriculation Board of the Universities of Manchester, Liverpool, Leeds, and Sheffield. He may then devote himself to medical study in the University, attending the hospital and the medical lectures, dissecting, &c. Or he may, as nearly all students now do, proceed to take a degree in Arts, either continuing mathematical and classical study and passing the ordinary examinations for B.A. or going out in one of the Honour Triposes. The Natural Sciences Tripos is taken most frequently, as some of the subjects are practically the same as those for the first and second M.B. examinations.

For the degree of *Bachelor of Medicine* (*M.B.*) five years of medical study are required. This time may be spent in Cambridge or at one of the recognised Schools of Medicine. The first three or four years are usually spent in Cambridge, the student remaining in the University till he has passed, say, the examination for the Natural Sciences Tripos and the first and second examinations for M.B. Hospital practice and many of the requisite lectures may be attended in Cambridge, and a certain number of students remain to attend lectures and hospital practice until they have passed the second part of the second examination for M.B. The laboratories for Pathology, Bacteriology, and Pharmacology are well equipped. Addenbrooke's Hospital makes provision for the necessary clinical training.

There are three examinations for M.B. The *first* includes Chemistry and other branches of Physics and Elementary Biology. These parts may be taken together or separately. The *second* is divided into two parts—viz., (1) Human Anatomy and Physiology; and (2) Pharmacology and General Pathology. The *third* is also divided into two parts: (1) Principles and Practice of Surgery (including Special Pathology and Midwifery and Diseases Peculiar to Women); and (2) Principles and Practice of Physic (including Diseases of Children, Mental Diseases, Medical Jurisprudence), Pathology (including Hygiene and Preventive Medicine), and Pharmacology (including Therapeutics and Toxicology). The examinations are partly in writing, partly oral, and partly practical, in the hospital, in the dissecting room, and in the laboratories. An Act has then to be kept in the Public Schools, by the candidate reading an original dissertation composed by himself on some subject approved by the Regius Professor of Physic.

Candidates who have passed both parts of the third M.B. examination are admitted to the registrable degree of *Bachelor of Surgery* (*B.C.*) without separate examination and without keeping an Act.

The degree of *Doctor of Medicine* (*M.D.*) may be taken three years after that of M.B. or four years after that of M.A. An Act has to be kept, consisting of an original Thesis sustained in the Public Schools with *viva voce* examination; and a short extempore essay has to be written on a topic taken from the general subject of his thesis, whether it be Physiology, Pathology, Pharmacology, the Practice of Medicine, State Medicine, or the History of Medicine.

For the degree of *Master of Surgery* (*M.C.*) the candidate must have passed all the examinations for B.C., or, if he is an M.A., have obtained some other registrable qualification in surgery. He is required either (1) to pass an examination in Principles and Practice of Surgery, Surgical Anatomy and Surgical Operations, and Pathology, and to write an extempore essay on a Surgical Subject; or (2) to submit to the Medical Board original contributions to the advancement of the Science or Art of Surgery. Before he can be admitted to the examination two years, at least, must have elapsed from the time when he completed all required for the degree of B.C. Before submitting original contributions he must have been qualified at least three years.

An abstract of the Regulations and Schedules of the range of the examinations in Chemistry, Physics, Biology, Pharmacology, and General Pathology may be obtained upon sending a stamped directed envelope to the Registrary, Cambridge.

The Professors, Readers, and Lecturers in the various subjects are as follows. Professors—Anatomy: A. Macalister, M.D. Biology (Quick): G. H. F. Nuttall, Sc.D. Botany: A. C. Seward, M.A. Chemistry: W. J. Pope. Natural Philosophy (Jacksonian): Sir James Dewar, M.A. Pathology: G. Sims Woodhead, M.A. Physic (Regius): Sir T. Clifford Allbutt, M.D. Physiology: J. N. Langley, M.A. Surgery: F. H. Marsh, M.A. Therapeutics (Downing Professor of Medicine): J. B. Bradbury, M.D. Zoology, &c.: J. Stanley Gardiner, M.A. Readers—Botany: F. F. Blackman, M.A. Chemical Physiology: F. G. Hopkins, M.A. Zoology: A. E. Shipley, M.A. Lecturers—Bacteriology: G. S. Graham-Smith, M.D., and Louis Cobbett, M.D. Botany: A. G. Tansley, M.A. Chemistry: Dr. Sell and Dr. Fenton. Organic Chemistry: S. Ruhemann, M.A. Chemistry and Physics as Applied to Hygiene: J. E. Purves, M.A. Advanced Morphology of Vertebrates: H. Gadow, M.A. Advanced Morphology of Invertebrates: A. E. Shipley, M.A. Pathology (Huddersfield): T. S. P. Strangeways, M.A. Physics: G. F. C. Searle, M.A., and C. T. R. Wilson, M.A. Pharmacology: W. E. Dixon, M.A. Advanced Physiology: W. H. Gaskell, M.D., and L. E. Shore, M.D. Physiology: H. K. Anderson, M.D. Physiological and Experimental Psychology: W. H. Rivers, M.A. Medical Jurisprudence: B. Anningson, M.D. Medicine: L. Humphry, M.D. Surgery: G. E. Wherry, M.A., F.R.C.S. Physiological Anthropology: W. L. H. Duckworth, M.D.

University Prize in Medicine.—There is only one University Prize in Medicine. The Raymond Horton Smith Prize (value £19) is awarded to that candidate for the degree of M.D. who presents the best thesis for the degree during the academical year, provided that he has taken honours in a tripos examination. Medical Studies are endowed by the numerous Natural Science scholarships at the various colleges, information about which can be obtained from the respective Deans.

Tropical Medicine and Hygiene.—Information on these subjects is given on p. 639 under the section on Public Health.

ADDENBROOKE'S HOSPITAL.—Clinical Lectures in Medicine and Surgery, in connexion with Cambridge University Medical School, are given at this hospital twice a week during the academical year; and practical instruction in Medicine and Surgery is given in the wards and out-patients' rooms by the physicians and surgeons daily during the term time and vacations. The fee for pupilship is 3 guineas a term. Physicians: Professor Sir Clifford Allbutt, Professor Bradbury, and Dr. L. Humphry. Assistant Physicians: Dr.

E. Lloyd Jones and Dr. J. Aldren Wright. Surgeons: Professor F. Howard Marsh, Mr. G. E. Wherry, Mr. F. Deighton, and Dr. Griffiths. Assistant Surgeon: Mr. Arthur Cooke.

UNIVERSITY OF LONDON.

The University of London was established by Royal Charter in 1836 as an examining and degree conferring body with several affiliated colleges but no direct teaching functions. In 1900 it was reconstituted under the Act of Parliament 1898 and became a teaching as well as an examining body. Many schools already existing became constituent colleges, including all the metropolitan medical schools. It also appoints teachers in special subjects to give lectures at the University. The question of the centralisation of preliminary scientific studies has for some years occupied the very serious attention of the University and its constituent schools, but has only partially been carried into effect at present. A considerable sum of money was offered for the erection and equipment of an institute of medical sciences as a central school of the University, but unfortunately, as we think, a division of opinion in the Faculty of Medicine forced the University to abandon the project.

The medical degrees awarded by the University are those of M.D., M.S., and M.B., B.S., the two latter being now given together as a graduating degree, whereas formerly the M.B. alone was a qualifying degree and the B.S. was taken optionally as a separate examination. The medical degrees of the University of London are granted to both internal and external students, the former being students of the constituent schools and colleges of the University.

Teaching Staff.—The teaching staff of the University is organised under two heads: 1. Appointed teachers—i.e., such as are appointed by, and are paid out of the funds of, the University. 2. Recognised teachers—i.e., those who have been appointed and are paid by the several schools of the University and other institutions at which instruction is given under the auspices of the University, and who have been recognised by the Senate as conducting work of University standard. Courses by non-recognised teachers may also be approved in schools of the University. Thus in the Faculty of Medicine there are at present nine appointed teachers, and there are 405 recognised teachers belonging to the various metropolitan medical schools. There are 235 recognised teachers in the Faculty of Science. The lecturers in the Medical Sciences and the professors in the Faculties of Medicine in University College, London, and King's College, London, will be found enumerated under their respective medical schools.

Internal and External Students.—Matriculated students of the University may be either internal or external. Internal students of the University are students who have matriculated at the University and who are pursuing a course of study approved by the University, either (*a*) under the direct control of the University or a committee appointed thereby; or (*b*) under one or more of the appointed or recognised teachers of the University. Centres for preliminary and intermediate medical studies have been established by the University at University and King's Colleges. Internal students must pursue their studies at one of the above centres, or at one of the medical schools connected with the University. These are University College Hospital, King's College Hospital, St. Bartholomew's Hospital, the London Hospital, Guy's Hospital, St. Thomas's Hospital, St. George's Hospital, the Middlesex Hospital, St. Mary's Hospital, Charing Cross Hospital, Westminster Hospital, and the London (Royal Free Hospital) School of Medicine for Women. The London School of Tropical Medicine and the Lister Institute of Preventive Medicine are also recognised as schools of the University in special departments. External students are all other matriculated students, and may pursue their studies at other universities and medical schools, presenting themselves for examination at the University of London.

The Matriculation Examination.—Students before being admitted to the University must either (1) have passed the Matriculation or the School Examination (Matriculation or Higher Standard), or (2) have been exempted therefrom under Statute 116 of the University which recognises certain other examinations in its lieu. Such exemption is granted to graduates of British and certain Colonial Universities, and under certain conditions to matriculated students of Colonial Universities and the Universities of Manchester, Liverpool, Leeds, and Sheffield, to holders of the senior local certificates of the Universities of Oxford and Cambridge, the higher certificate and the school certificate of the Oxford and Cambridge Schools Examination Board, the Scotch school-leaving certificate, the senior grade certificate of the Intermediate Examination Board for Ireland, the matriculation certificate of the Joint Board of the Northern Universities, and to students who have passed their previous examination at Cambridge. These exemptions allow of a wide choice of examinations to students who intend to take the University course. The examinations for matriculation take place three times in each year—namely, on Sept. 15th (if that day be a Monday, or if not, on the Monday next preceding the 15th), on the second Monday in January, and on the second Monday in June (or July, as may be hereafter determined). The examinations in January and June (or July), but not that in September, may be held not only at the University of London, but also, under special arrangement, in other parts of the United Kingdom or in the Colonies. (Neither Botany nor Drawing can be chosen for subjects in the Colonies.) It is noteworthy that the September examination affords an opportunity for prospective medical students who may have failed at the midsummer examination to pass the Matriculation in time to enter upon their medical course in October. Students who pass the January Matriculation are able to enter for the First Examination for Medical Degrees in the following July under certain conditions in the case of internal students. Every candidate must, on or before August 20th for the September examination, on or before Nov. 25th for the January examination, and on or before April 25th for the June (or July) examination, apply by postcard to the Principal for a form of entry, of which the first in order must be returned 14 days before the commencement of the September examination, the second on or before Dec. 1st, and the third on or before May 1st, accompanied in the same cover by a certificate showing that the candidate has completed his sixteenth year, and by his fee for the examination. A certificate from the Registrar-General in London or from the superintendent registrar of the district, or a certified copy of the baptismal register, or a declaration of the candidate's age, made before a magistrate by his parent or guardian, or by the candidate if of full age, will be accepted. As candidates cannot be admitted after the list is closed, any candidate who may not have received a form of entry within a week after applying for it should communicate immediately with the Principal, stating the exact date of his application and the place where it was posted. Every candidate must pay a fee of £2. If he withdraws his name before the last day of entry it shall be returned to him. If he fails to present himself he shall be allowed to enter for a subsequent Matriculation within eight months on payment of £1. If he retires after the commencement of the examination or fails to pass it the full fee of £2 shall be payable on every re-entry. Candidates must show a competent knowledge of each of the following five subjects, according to the details specified: 1. English—Composition, Précis-writing, salient facts in English History and Geography. A subject for an essay, to be chosen by candidates, to test power of expression, thought, and arrangement and general knowledge. 2. Elementary Mathematics—Arithmetic, Algebra (including quadratic equations and graphs of simple functions), and the subjects of Euclid (Books I. to IV). 3. Latin, or Elementary Mechanics, or Elementary Physics (Heat, Light, and Sound), or Elementary Chemistry, or Elementary Botany. 4 and 5. Two of the following subjects, neither of which has been taken under Section 3 (if Latin be not taken, one of the other subjects must be another language from the list): Latin, Greek, French, German, Ancient History, Modern History, Logic, Physical and General Geography, Geometrical and Mechanical Drawing, Mathematics (more advanced), Elementary Mechanics, Elementary Chemistry, Elementary Physics (Heat, Light, and Sound), Elementary Physics (Electricity and Magnetism), and Botany. One of the subjects may be some other language than Latin, Greek, French, and German, subject to the approval of the Matriculation Board, provided that six months' notice is given before the beginning of the Matriculation examination for which they enter and an additional fee paid. Additional subjects, of which, however, candidates must give notice two months previous to the examination,

are: Arabic, Sanskrit, Spanish, Portuguese, Italian, Hebrew, Chinese, Modern Dutch, and Zoology.

Provincial Examinations for Matriculation.—These examinations are appointed by the Senate from time to time upon the application of any city, institution, or college desiring to be named as a local centre for one or more examinations, and are carried on simultaneously with the examinations in London under the supervision of sub-examiners also appointed by the Senate. Candidates wishing to be examined at any provincial centre must give notice upon their forms of entry to the Principal of the University, who will then make all necessary arrangements. Besides the University fee, a fee usually varying from £1 to £3 is charged by the local authorities and must be paid *at the local centre* immediately before the commencement of the several examinations.

Faculty of Medicine.—The Faculty of Medicine grants the joint degrees of M.B., B.S. (*Bachelor of Medicine and Surgery*), and the higher separate degrees of M.D. (*Doctor of Medicine*) and M.S. (*Master of Surgery*).

It is noteworthy that the curriculum for the medical degrees is now five and a half years from the time of matriculation, except in the case of students who have passed the Preliminary Scientific Examination or the First Examination for Medical Degrees before July, 1910, and that the examinations formerly known as the Preliminary Scientific, the Intermediate, and the Final Examination in Medicine are now respectively entitled the First, Second, and Third Examinations for Medical Degrees. Part II. of the former Preliminary Scientific Examination has now been made Part I. of the Second Examination.

A. *Internal Students.*—In order to be admitted to the Bachelor's degrees a student must normally, after registration as an internal student, have: (1) Attended prescribed courses of study for five and a half years in one or more schools of the University. (2) Passed the following examinations, under the conditions mentioned below: (*a*) The First Examination for Medical Degrees in Inorganic Chemistry, Physics, and General Biology; (*b*) the Second Examination for Medical Degrees: Part I., Organic and Applied Chemistry; Part II., Anatomy, Physiology, and Pharmacology, including Pharmacy and Materia Medica; (*c*) the Third Examination for Medical Degrees, or M.B., B.S. Examination in Medicine, including Therapeutics and Mental Diseases, Surgery, Midwifery and Diseases of Women, Pathology, Forensic Medicine and Hygiene.

B. *External Students.*—To be admitted to the Bachelor's degrees an external student must (1) have passed the Matriculation examination or have been exempted therefrom under Statute 116 not less than five and a half years previously; (2) have passed subsequent examinations similar to those required of an internal student; and (3) have been engaged in professional studies during the five and a half years subsequently to Matriculation and four and a half years subsequently to passing the First Examination for Professional Degrees at one or more of the medical institutions or schools recognised by this University for the purpose, one year at least of the four and a half years to have been spent in one or more of the recognised institutions or schools in the United Kingdom.

The First Examination for Medical Degrees (Inorganic Chemistry, Physics, and General Biology) will take place twice in each year, commencing on the Monday following December 10th and on the second Monday in July. It must as a rule be passed by internal students not less than one academic year after matriculation and by external students not less than nine months after matriculation. Candidates, however, who have passed or been admitted under Statute 116 as exempt from matriculation in the preceding January will be admitted to the first examination for medical degrees in July as external students, or as internal students if they have attended the prescribed course of study throughout the session and obtained the consent of the authorities of their school or institution. Every candidate must apply (internal students to the academic registrar and external students to the external registrar) for a Form of Entry on or before Nov. 1st or May 24th, which must be returned, accompanied by the proper fee, not later than Nov. 8th for the December examination or June 1st for the July examination. The fee is £5 for each entry to the whole examination, provided that all the subjects are taken at one time. When less than the whole examination is taken at one time it is £2 for each subject. The examination will include two papers in each of the three subjects, three hours being allowed for each paper. Three hours each will be devoted to practical examinations in Inorganic Chemistry and Physics and six hours to a practical examination in General Biology. *Candidates must, at their first entry, present themselves in all three subjects.* Candidates failing in one subject only may, with permission, present themselves for re-examination in that subject on payment of the proper fee.

The Second Examination for Medical Degrees (Part I.): Organic Chemistry.—This examination will take place twice in each year, commencing on the Thursdays following the third Monday in March and the second Monday in July. No candidate will be admitted to this examination within six months of having passed the First Examination. Every candidate must apply on or before Feb. 8th or May 24th for a form of entry, which must be returned not later than Feb. 15th for the March examination or June 1st for the July examination. The fee is £2 for the first and every subsequent entry. The examination will consist of a paper and practical work, and may include oral questions in Organic Chemistry, which is "to be treated in an elementary manner, and with special regard to its applications in physiology, pharmacology, and pathology."

The Second Examination for Medical Degrees (Part II.) takes place twice in every year, commencing on the third Monday in March and on the first Monday in July. The subjects of the examination are Human Anatomy and Embryology, Physiology, and Pharmacology, including Pharmacy and Materia Medica. No candidate shall be admitted to the examination unless he has passed the First Examination for Medical Degrees at least 18 months previously, and has passed Part I. of the Second Examination for Medical Degrees. Internal students must have completed the courses of study prescribed for them by the University, and external students must produce certificates of having subsequently to having passed the First Examination for Medical Degrees been students during one and a half academic years at one or more of the medical institutions or schools recognised by the University and of having attended (1) a course of not less than 100 lectures and demonstrations on Human Anatomy; (2) a course of Dissections for not less than 12 months; (3) a course of not less than 60 lectures on Physiology; (4) adequate courses of Experimental Physiology, Histology, and Physiological Chemistry; (5) adequate courses of lectures and demonstrations on Pharmacology, Pharmacy, and Materia Medica; and (6) Practical Pharmacy for not less than two months. These certificates must be transmitted to the Registrar at least not later than Feb. 15th or June 1st for the March and July examinations respectively, applications for forms of entry having been made by Feb. 1st or May 17th. The fee for each entry to the whole examination is £8. For re-examination in one subject it is £4.

M.B., B.S. Examination.—The M.B., B.S. examination takes place twice in each year, commencing on the fourth Monday in October and on the first Monday in May. No candidate except those who pass the Preliminary Science or First Examination for Medical Degrees before July, 1912, will be admitted to this examination within three academic years from the date of passing in Anatomy and Physiology at the Second Examination (Part II.), nor unless he has completed that examination together with prescribed courses of study or practice summarised below. (1) Principles and Practice of Medicine; (2) Clinical Methods and Physical Diagnosis; (3) Insanity (with clinical demonstrations at a recognised Asylum); (4) Therapeutics; (5) Vaccination; (6) Principles and Practice of Surgery; (7) Operative Surgery, Surgical Anatomy, Practical Surgery, and the Administration of Anæsthetics; (8) Diseases of the Eye, Ear, and Throat; (9) Lectures and Demonstrations on Midwifery and Diseases of Women; (10) Practical Midwifery, the conduct of at least 20 Labours, and practice as a Clinical clerk in Gynæcological work; (11) Pathology and Bacteriology; (12) work of the Post-mortem room; (13) Forensic Medicine; and (14) Hygiene. He must also have attended the Medical and Surgical practice of a recognised hospital for two years and a course of instruction at a recognised Fever Hospital for two months. He must have had clinical instruction and must have held the posts of medical clinical clerk and surgical dresser for periods of six

months each. For internal students the above form the subjects of the last two and a half years of study as prescribed by the University. Forms of entry for the examination must be applied for on or before Sept. 21st or March 24th and returned with certificates of having undertaken the above-mentioned courses of study by Sept. 28th or April 1st respectively. Candidates will be examined in Medicine (including Therapeutics and Mental Diseases), Pathology, Forensic Medicine and Hygiene, Surgery, Midwifery, and Diseases of Women. The subjects may be divided into two groups—namely: (1) Medicine, Pathology, Forensic Medicine, and Hygiene; and (2) Surgery, Midwifery, and Diseases of Women. These groups may be taken either separately or together. The fee is £10 for each entry to the whole examination and £5 for examination or re-examination in either group. There will be no separate examination held for Honours, but the list of candidates who have passed will be published in two parts—namely, an Honours list and a Pass list. Bachelors of Medicine of this University who graduated in or before May, 1904, may obtain the B.S. degree by passing the Surgical part of the M.B., B.S. examination.

Doctor of Medicine.—The examination for this degree takes place twice in each year, commencing on the first Monday in December and on the first Monday in July. Candidates must have taken the degrees of M.B., B.S. not less than two years previously, but for those who have taken the M.B., B.S. degrees with honours or have done certain original work, or have had such exceptional experience in the branch in which they present themselves as may be approved by the University, this period of delay may be reduced to one year. Those who have obtained their M.B. degrees in or before May, 1904, will not be required to hold the degree of B.S. before seeking the doctorate. Candidates may present themselves for examination in one of the following branches, namely: (1) Medicine; (2) Pathology; (3) Mental Diseases; (4) Midwifery and Diseases of Women; (5) State Medicine; and (6) Tropical Medicine. In most branches an appointment at an approved hospital is necessary. Certain conditions have to be fulfilled in each case, varying according to the nature of the branch in question. Candidates who have passed or presented themselves for the M.D. examination in one branch may present themselves for examination in another branch at a subsequent examination. Any candidate for the degree of M.D. may transmit to the Registrar, not less than two months before the commencement of the examination, a thesis or published work having definite relation to the branch of Medicine in which he is a candidate, and if the thesis be approved by the examiners the candidate may be exempted from the written examination in that subject. The fee is £20, and for re-examination £10.

In Branches I. and IV. candidates (other than those who present a thesis) for the July examination must apply to the Academic or External Registrar for forms of entry on or before May 20th, which must be returned not later than June 1st, and candidates (other than those who present a thesis) for the December examination must apply for forms of entry on or before Oct. 20th, which must be returned not later than Nov. 1st. The corresponding dates for application for, and return of, forms of entry for candidates in Branches II., III., V., and VI., and candidates in other branches who present a thesis, are April 20th and May 1st for the July examination; and Sept. 20th and Oct. 1st for the December examination. Forms of entry must be returned duly filled up, accompanied by the proper fee, and by the certificates required for the branch concerned.

Master in Surgery.—The examination for the degree of Master in Surgery takes place twice in each year and commences on the first Monday in December and on the first Monday in July. Candidates must produce certificates of having taken the degrees of M.B. and B.S. not less than two years previously (with certain exemptions, as in the examination for the M.D.). They may present themselves for examination either in Branch I., Surgery, including Surgical Pathology and Anatomy, a Clinical examination, and operations on the dead body; or in Branch II., Dental Surgery, including Oral Anatomy, Physiology, Surgery, and Therapeutics, and a practical examination in Bacteriology. Candidates must have held for at least six months a Surgical (Branch I.) or a Dental (Branch II.) resident or non-resident hospital appointment approved by the University. Any candidate for the degree of M.S. may transmit to the Registrar, not later than two months before the commencement of the examination, a thesis or published work having definite relation to Surgery (Branch I.), or Dental Surgery (Branch II.), and if the thesis be approved by the examiners the candidate may be exempted from the written examination. The fee is £20, and for re-examination £10.

Full details of the prescribed curricula of study, with the syllabus for each examination and of certain exemptions which the Senate has power to grant in respect to certain examinations and the courses of study presented for them, and the names of the recognised Internal and External Schools of the University, can be obtained free on application to the Academic Registrar, University of London, South Kensington, S.W.

MEDICAL SCHOOLS OF THE UNIVERSITY OF LONDON.[1]

ST. BARTHOLOMEW'S HOSPITAL AND COLLEGE. — The clinical practice of the hospital is large. The hospital contains 750 beds, of which 680 are for patients in the hospital at Smithfield and 70 for convalescent patients at Swanley.

This hospital receives within its walls nearly 8000 in-patients annually and its out-patients and casualties amount to more than 130,000 annually.

Special departments have been organised for Diseases of Women and Children, the Eye, Ear, Larynx, and Skin, as well as for Orthopædic and Dental Surgery in which Chief Assistants and Clinical Assistants are appointed annually. There is an Electrical Department, including X Ray, &c. Surgical operations take place every day at 1.30 P.M. and Surgical Consultations are held on Thursdays at the same hour. Medical Consultations are held on Thursdays at 3.15 P.M. The physicians and surgeons deliver clinical lectures weekly during both the winter and the summer sessions. Clinical Lectures on all special subjects are also given. The visits of the physicians and surgeons are made at 1.30.

Ten house physicians and ten house surgeons are appointed annually. During their first six months of office they act as "junior" house physicians and house surgeons and receive a salary of £25 a year. During their second six months they become "senior" house physicians and house surgeons and are provided with rooms by the hospital authorities and receive £80 a year as salary. A resident midwifery assistant, an ophthalmic house surgeon, and a house surgeon for diseases of the throat, nose, and ear are appointed every six months, and are provided with rooms and receive a salary of £80 a year. Two assistant anæsthetists are appointed annually, and receive salaries of £120 and £100 respectively, with rooms. An extern midwifery assistant is appointed every three months, and receives a salary of £80 a year. The clinical clerks, the obstetric clerks, the clerks to the medical out-patients, the dressers to the surgical in-patients and to the out-patients, and the dressers in the special departments are chosen from the students. All the appointments are now free. A residential college is attached to the hospital.

New Buildings.—The new buildings comprise residential quarters for the resident staff, new casualty, medical, surgical, and special out-patient departments, new casualty wards, dispensary, and clinical lecture theatre. A new chemical laboratory has been added to the Medical School, and a laboratory devoted to instruction in Public Health. A second new Block which is devoted to Pathology, and contains the post-mortem room as well as extensive laboratories for bacteriology, clinical pathology, pathological histology, and pathological chemistry has recently been added.

The Medical School Buildings include three large lecture theatres, a large dissecting room, a spacious library (containing 13,000 volumes), a well-appointed museum of anatomy, physiology, comparative anatomy, materia medica, botany, and pathological anatomy. The pathological museum is the most complete in the kingdom. There are laboratories for chemistry, physiology, pharmacology, physics, public health, and biology, giving ample accommodation in every department.

[1] For Ancillary Metropolitan Medical Schools see p. 597.

Special Classes for the Final F.R.C.S. are held twice yearly.

Instruction in Preliminary Science is given to University of London students in chemistry, biology, and physics throughout the year.

Laboratory Instruction for the D.P.H. is provided during the winter and summer sessions, and elementary instruction in Bacteriology is also given throughout the year.

The recreation ground of 10 acres is at Winchmore Hill for the use of the members of the Students' Union, which all students are expected to join. Additional rooms for the Students' Union have recently been added, viz.: (*a*) a large reading and smoking room; (*b*) a committee and writing room; and (*c*) luncheon and dining hall; and a miniature rifle range has been provided. These are in the new block.

Staff.—Consulting Physicians: Sir William S. Church, Bart., K.C.B., Dr. Hensley, Sir Lauder Brunton, Bart., F.R.S., and Sir Dyce Duckworth, Bart. Consulting Surgeons: Mr. Willett, Sir Henry T. Butlin, Bart., Professor Marsh, and Mr. Harrison Cripps. Consulting Aural Surgeon: Mr. Cumberbatch. Physicians: Dr. Norman Moore, Dr. Samuel West, Dr. Ormerod, Dr. Herringham, and Dr. Tooth, C.M.G. Surgeons: Mr. Bruce Clarke, Sir Anthony Bowlby, C.M.G., Mr. Lockwood, Mr. D'Arcy Power, and Mr. Waring. Assistant Physicians: Dr. Garrod, Dr. Calvert, Dr. Morley Fletcher, Dr. Drysdale, and Dr. Horton-Smith Hartley, M.V.O. Assistant Surgeons: Mr. Eccles, Mr. Bailey, Mr. Rawling, Mr. Gask, and Mr. Gordon Watson. Physician Accoucheur: Sir Francis H. Champneys, Bart. Physician Accoucheur with charge of out-patients: Dr. W. S. A. Griffith. Surgeon to Martha Ward: Mr. Bruce Clarke. Assistant Physician Accoucheur: Dr. Williamson. Ophthalmic Surgeons: Mr. Jessop and Mr. Holmes Spicer. Surgeon, Throat and Nose Department: Mr. W. D. Harmer. Assistant Surgeon, Throat and Nose Department: Mr. F. A. Rose. Aural Surgeon: Mr. Ernest West. Assistant Aural Surgeon: Mr. Sydney Scott. Dental Surgeons: Mr. Paterson and Mr. Ackland. Assistant Dental Surgeons: Dr. Austen and Mr. Coleman. Medical Officer in charge of Electrical Department: Dr. Lewis Jones. Assistant Medical Officer to Electrical Department: Dr. H. Walsham. Pathologist: Dr. Andrewes. Assistant Pathologist: Dr. H. M. Gordon. Administrators of Anæsthetics: Mr. Gill and Mr. Cross. Assistant Administrators of Anæsthetics: Mr. Boyle and Mr. Trewby. Medical Registrars: Dr. Horder and Dr. Langdon Brown. Surgical Registrars: Mr. Etherington Smith and Mr. Elmslie. Casualty Physicians: Dr. Cockayne and Dr. Gow.

Lectures and Demonstrations.—Medicine: Dr. Norman Moore and Dr. S. West. Clinical Medicine: Dr. Norman Moore, Dr. S. West, Dr. J. A. Ormerod, Dr. W. P. Herringham, and Dr. H. H. Tooth. Practical Medicine: Dr. Horton-Smith Hartley and Dr. T. J. Horder. Surgery: Mr. W. Bruce Clarke and Mr. D'Arcy Power. Clinical Surgery: Mr. W. Bruce Clarke, Sir Anthony Bowlby, Mr. C. B. Lockwood, Mr. D'Arcy Power, and Mr. Waring. Practical Surgery: Mr. L. B. Rawling and Mr. G. E. Gask. Operative Surgery: Mr. W. McAdam Eccles, Mr. L. B. Rawling, and Mr. G. E. Gask. Midwifery and the Diseases of Women and Children: Sir Francis H. Champneys, Bart., and Dr. W. S. A. Griffith. Practical Midwifery: Dr. J. D. Barris. Pathology: Dr. F. W. Andrewes. Bacteriology (advanced): Dr. E. E. Klein. Chemical Pathology: Dr. A. E. Garrod and Dr. J. D. Priestley. Morbid Anatomy and Post Mortems: Dr. T. J. Horder, Dr. Langdon Brown, Mr. Etherington Smith, and Mr. Elmslie. Practical Pathology: Dr. A. E. Gow, Mr. W. G. Ball, Dr. A. E. Stansfeld, Mr. J. E. H. Roberts, and Mr. B. G. Klein. Ophthalmic Medicine and Surgery: Mr. W. H. Jessop. Diseases of the Eye: Mr. W. H. Jessop and Mr. W. Holmes Spicer. Ophthalmoscopic Demonstrations: Mr. W. Holmes Spicer. Diseases of the Ear: Mr. C. E. West and Mr. Sydney Scott. Diseases of the Larynx: Mr. W. D. Harmer and Mr. F. E. Rose. Orthopædic Surgery: Mr. W. McAdam Eccles. Diseases of the Skin: Dr. H. G. Adamson. Diseases of Children: Dr. H. Morley Fletcher. Medical Electricity and Electro-therapeutics: Dr. H. Lewis Jones and Dr. H. Walsham. Mental Diseases and Insanity: Dr. R. Jones. Dental Surgery: Mr. W. B. Paterson and Mr. R. C. Ackland. Anæsthetics: Mr. R. Gill, Mr. W. F. Cross, Mr. H. E. G. Boyle, and Mr. F. Trewby. Forensic Medicine: Dr. W. P. Herringham. Descriptive and Surgical Anatomy: Dr. C. Addison. Practical Anatomy: Dr. C. Addison, Mr. H. W. Wilson, Mr. R. F. Moore and Mr. H. Blakeway. General Anatomy and Physiology: Dr. J. S. Edkins. Practical Physiology: Dr. J. S. Edkins, Dr. W. Langdon Brown, and Dr. C. M. H. Howell. Materia Medica, Pharmacology, and Therapeutics: Dr. James Calvert. Pharmacology: Dr. F. A. Bainbridge. Biology and Comparative Anatomy: Dr. T. W. Shore. Practical Biology: Dr. T. W. Shore and Dr. W. A. Cunnington. Chemistry: Dr. W. H. Hurtley. Practical Chemistry: Dr. W. H. Hurtley and Mr. W. O. Wootton. Physics: Mr. F. Womack. Practical Physics: Mr. F. Womack and Mr. Lloyd Hopwood. Botany: Rev. G. Henslow. Public Health: Sir George Newman. Sanitary Law: Dr. Lyster. Museum Curator: Dr. F. W. Andrewes. Junior Curator: Dr. Woodwark. Dean of the School: Dr. T. W. Shore. Warden of College: Mr. R. B. Etherington Smith.

Scholarships given in aid of Medical Study.—At this school various Scholarships, prizes, &c., are given, none of those in the following list having a less value than £10. There are also other prizes and medals on a lower scale of value. For five of the Scholarships and the Exhibition—namely, (*a*), (*b*), (*c*), three Entrance Scholarships of the respective values of £75, £75, and £150; (*d*) Entrance Scholarship in Arts, £100; (*e*) Jeaffreson Exhibition, £50; and (*f*) Shuter Scholarship, £50—a full or University course at St. Bartholomew's Hospital is required. The awards of (*a*), (*b*), and (*c*) are made after examination in selections from the subjects of Chemistry, Physics, Zoology, Botany, Physiology, and Anatomy; (*d*) and (*e*) are awarded after examination in Latin, Mathematics, and Greek or French or German; (*f*) is awarded after competitive examination among Cambridge Graduates in Anatomy and Physiology. For the remaining Scholarships and prizes study at St. Bartholomew's Hospital is required. These remaining Scholarships and prizes, with the money value and the subjects of examination, are as follows:—Four Junior Scholarships: (*g*) No. 1, £30, Anatomy and Physiology; (*h*) No. 2, £20, Anatomy and Physiology; (*i*) No. 3, £25, Chemistry, Physics, and Biology; (*j*) No. 4, £15, Chemistry, Physics, and Biology; (*k*) Senior Scholarship, £50, Anatomy, Physiology, and Chemistry; (*l*) Kirkes Scholarship, £30 and medal, Clinical Medicine; (*m*) and (*n*) two Brackenbury Scholarships, £39 each, one in Medicine and one in Surgery; (*o*) Sir G. Burrow's Prize, £10, Pathology; (*p*) Skynner Prize, 13 guineas, Regional and Morbid Anatomy; (*q*) Matthews Duncan Medal and Prize, £20, Midwifery and Gynæcology; (*r*) Luther Holden Research Scholarship in Surgery, awarded by election, £105; and (*s*) Lawrence Research Scholarship and gold medal in Pathology, awarded by election, £115.

CHARING CROSS HOSPITAL.—This hospital and convalescent home contain 250 beds, a certain proportion of which are set aside for the diseases of children and those special to women. The number of patients treated during 1910 amounted to 26,146—viz., 2149 in-patients and 23,997 out-patients, of whom 10,608 were casualties. There were 76,049 out-patient attendances. The following are salaried hospital appointments. Clinical Pathologist and Bacteriologist, salary £200 per annum. Curator and Pathologist (annual), £100. Assistant Anæsthetist, £60. Medical and Surgical and Obstetrical Registrars (annual), £40 each. Resident Medical Officer (annual), £100, with board and residence. Six House Physicians, six House Surgeons, and two Resident Obstetric Officers, appointed each year on the recommendation of the committee after competitive examinations, are provided with board and residence in the hospital. Clinical clerks and dressers are appointed in all the general and special departments of the hospital. Arrangements can be made for students who have not entered for the entire curriculum to hold these posts. In the medical school demonstratorships and assistant demonstratorships in various subjects are open to students of the school and carry honoraria. Total fees, including students' club:—**For general students: Sessional payment system—Entrance fee, 10 guineas. In addition a sum of 25 guineas must be paid annually by University students; 22 guineas by Conjoint Board and other students. These fees may be paid in instalments at the beginning of the Winter and Summer Sessions. These fees may be paid in one sum on terms arranged by the Medical Committee. For Dental students: The fees for the two years' curriculum required by dental students may be paid: (*a*) in one sum of 45 guineas on entry; (*b*) in two annual instalments of 22 guineas each and entrance fee of 5 guineas. Scholarships are awarded annually to the value of £400, including two**

University Scholarships, value 30 guineas and 20 guineas respectively, Gold Medal, Huxley, Livingstone, Travers, and Pereira Prizes.

Advantage has been taken of the close proximity of King's College (University of London) to enable students to complete their primary and intermediate studies in the laboratories provided them for this purpose, in this way ensuring the widest and best possible range of teaching in these subjects.

Staff.—Consulting Physicians: Dr. Green, Dr. Bruce, and Dr. Abercrombie. Consulting Obstetric Physician: Dr. J. Watt Black. Physicians: Dr. Mott, Dr. Galloway, and Dr. Hunter. Physician with care of Out-patients: Dr. Bosanquet. Assistant Physicians: Dr. Fenton, Dr. Forsyth, and Dr. Jewesbury. Consulting Surgeons: Mr. Barwell, Mr. Bloxam, and Mr. Morgan, C.V.O. Surgeons: Mr. Boyd, Mr. Waterhouse, and Sir Frederick Wallis. Surgeon with care of Out-patients: Mr. Gibbs and Mr. Clogg. Assistant Surgeon: Mr. Daniel. Obstetric Physician: Dr. Amand Routh. Obstetric Physician with care of Out-patients: Dr. T. W. Eden. Physician for Diseases of the Skin: Dr. Galloway. Physician for Diseases of the Skin (Out-patients): Dr. MacLeod. Physician to the Electrical Department: Dr. Ironside Bruce. Surgeon for Nose, Throat, and Ear: Mr. Waggett. Ophthalmic Surgeon: Mr. Treacher Collins. Orthopædic Surgeon: Mr. Fairbank. Surgeon Dentist: Mr. J. F. Colyer. Physician for Mental Diseases: Dr. Mercier.

Lecturers: Winter Session.—Anatomy: Professor Waterston and Dr. Alexander Macphail. Bacteriology: Dr. W. W. C. Topley. Biology: Professor Arthur Dendy. Chemistry: Professor J. M. Thomson. Dental Surgery: Mr. J. F. Colyer. Medicine: Dr. James Galloway and Dr. F. W. Mott (Nervous Diseases). Ophthalmology: Mr. E. Treacher Collins. Physiology: Professor W. D. Halliburton. Practical Anæsthetics: Mr. C. Carter Braine. Practical Hygiene: Mr. Leathem and Dr. H. Forster Morley. Practical Medicine: Dr. Forsyth and Dr. Jewesbury. Diseases of Women: Dr. Amand Routh and Dr. T. W. Eden. Practical Midwifery: Dr. C. J. Lockyer and Dr. J. B. Bannister. Practical Surgery: Sir Frederick Wallis, Mr. H. S. Clogg, Mr. Peter Daniel, and Mr. Fairbank. Operative Surgery: Mr. Charles Gibbs. Psychological Medicine: Dr. Mercier. Surgery: Mr. H. F. Waterhouse and Sir Frederick Wallis. Tropical Medicine: Sir Patrick Manson, K.C.M.G.

Summer Session.—Anatomy: Professor Waterston and Dr. Alexander Macphail. Anæsthetics: Mr. C. Carter Braine. Dental Surgery: Mr. J. F. Colyer. Forensic Medicine: Dr. Brend. Materia Medica and Practical Pharmacy: Professor W. E. Dixon. Midwifery: Dr. T. W. Eden. Pathology: Dr. W. Hunter. Pharmacology and Therapeutics: Dr. Fenton. Practical Medicine: Dr. Forsyth and Dr. Jewesbury. Practical Physiology: Professor Halliburton. Public Health: Vacant by death of Dr. Bulstrode. Toxicology: Dr. H. Forster Morley. Roentgen Ray: Dr. Ironside Bruce. Dean of the Medical School: Dr. William Hunter.

Scholarships and Prizes.—At this school five Entrance Scholarships are awarded at the commencement of each Winter Session after examination in the following groups of subjects:—(1) English, including English Language and Literature, English History with alternative questions on the history of the British Empire, and Geography; (2) Latin and any one of the following three languages—Greek, French, and German; (3) Mathematics, including Arithmetic, Algebra, and Geometry: with Mechanics, including Statics and Dynamics; (4) Inorganic Chemistry and any three of the following branches of Experimental Physics—Acoustics, Heat, Magnetism, Electricity, and Optics; and (5) Animal and Vegetable Biology. A candidate may offer himself for examination in not more than three of the above groups of subjects, but Group (1) must be one of the three. The designations, money value, and conditions of the Entrance Scholarships are as follows:—(*a*) Livingstone, 60 guineas, open to all general students; (*b*) Huxley, 60 guineas, for sons of medical men; (*c*) 30 guineas, for dental students; (*d*) and (*e*) 30 and 20 guineas respectively, open to all general students. The remaining scholarships and prizes are as follows:—(*f*) Epsom Scholarship, open to Epsom Foundation Scholars who have passed the Intermediate Examination for Medical Degrees of the University of London; (*g*) and (*h*) two Universities Scholarships awarded after examination in Anatomy and Physiology, including Histology, 30 and 20 guineas respectively; open to Oxford students who have passed the first M.B. Examination, or Cambridge students who have passed the second M.B. Examination, or London students who have passed the Intermediate Examination in Medicine and have not entered at any London Medical School; (*i*) Llewellyn Scholarship, awarded annually to the student of not more than five years' standing who has been most distinguished at the Prize Examinations in Medicine, Surgery, Midwifery, Pathology, Therapeutics, Forensic Medicine, Public Health, Psychological Medicine, Ophthalmology, and Gynæcology, £25; (*j*) Dr. T. H. Green Prize for Clinical Medicine, given annually for a special subject involving clinical observation in the wards or laboratory, 5 guineas; (*k*) Dr. William Travers Prize for the student in the fifth year who is most proficient in Obstetrics and Gynæcology, £15; and (*l*) John H. Morgan Prize, £10. The Pereira Prize, £4 4*s.*, for the best reports with commentary on six cases that have been in the wards of the hospital during the preceding 12 months, for Students who have attended the clinical teaching of the Hospital for at least 12 months.

ST. GEORGE'S HOSPITAL.—This hospital has a service of 436 beds, of which 180 are allotted to surgical, 150 to medical cases, and 100 are at the Convalescent Hospital at Wimbledon. One ward is set apart for Diseases Peculiar to Women. Children's beds are placed in all the women's wards. Two wards are allotted to ophthalmic cases.

The Winter Session commences on Oct. 2nd but students can enter at any time or for any particular course. The Hospital and Medical School are situated at Hyde Park-corner and are readily accessible from all parts of London. At this school Entrance Scholarships and Endowed Prizes of a total value of £671 are awarded annually; a detailed list is placed below. As the scientific and clinical parts of the medical student's curriculum are entirely separate there is no longer any object in conducting the scientific courses upon hospital premises. The entire teaching and laboratories are therefore now devoted to purely clinical subjects, as in other universities, to the great advantage of students in their fourth and fifth years of study. Arrangements have been made with the University of London for students who enter during the first, second, or third year of the curriculum as students of St. George's to carry out the necessary courses of instruction at either University College or King's College. Students therefore have the unrivalled advantages of the lectures and practical classes of these Colleges of the University during the preliminary and intermediate portions of their studies, and then complete their course, without payment of any entrance fee, in a school entirely devoted to Clinical work. Students are permitted to enter the wards of the hospital at any hour. Dresserships to the surgeons and clinical clerkships to the physicians are open without fee to all students of the hospital. Eight house physicians and eight house surgeons are appointed annually. All house appointments are open without fee to every perpetual student of the hospital and are made strictly in accordance with the merits of the candidates. Special attention is directed to the following paid appointments, among others, which are open to students after they have held house office:—Medical Registrarship at £200 per annum; Surgical Registrarship at £200; Curatorship of the Museum at £200; Assistant Curatorship at £100; Obstetric Assistantship (Resident) at £50; the post of Resident Anæsthetist at £100; the post of Senior Anæsthetist at £50; the posts (2) of Junior Anæsthetists, each at £30. Great attention is paid by members of the staff to individual teaching. A number of special courses are given in which the requirements of university and other examinations receive careful attention. The following may be cited as examples:—(1) Elementary Bacteriology; (2) Advanced Bacteriology; (3) Clinical Pathology; (4) Systematic Pathology; (5) Histological Pathology and Morbid Anatomy; (6) Pharmacology; (7) Surgical Anatomy; (8) Advanced Anatomy and Physiology; (9) Operative Surgery; (10) Public Health; and (11) Tropical Diseases. Special classes are held by members of the staff for all examinations. The St. George's Hospital Club, with smoking- and luncheon-rooms on the hospital premises, is an amalgamation of the Hunterian Society, the *Gazette*, and the chess, lawn tennis, boxing, hockey, rifle, and golf clubs. The club contributes also to the Æsculapian, Rugby football, and cricket clubs. Students have the advantage of a library of medical and scientific books which is kept up-to-date. A register of accredited apartments and a list of medical men and others willing to receive St. George's men

as boarders may be seen on application to the Dean. Further nformation may be obtained from the Dean of the Medical School.

Staff.—Consulting Physicians: Dr. W. H. Dickinson, Dr. T. T. Whipham, Sir Isambard Owen, and Dr. W. Ewart. Consulting Surgeons: Mr. Pick, Mr. Haward, Sir W. Bennett, and Mr. Marmaduke Sheild. Consulting Ophthalmic Surgeons: Mr. Brudenell Carter and Mr. Adams Frost. Consulting Aural Surgeon: Sir William Dalby. Consulting Dental Surgeon: Mr. Winterbottom. Physicians: Dr. H. D. Rolleston, Dr. Ogle, Dr. Latham, and Dr. Collier. Obstetric Physician: Dr. W. R. Dakin. Assistant Physicians: Dr. Spriggs, Dr. Jex-Blake, and Dr. Golla. Assistant Obstetric Physician: Dr. A. F. Stabb. Physician to the Skin Department: Dr. W. S. Fox. Physician Anæsthetist: Sir Frederic Hewitt. Surgeons: Mr. C. T. Dent, Mr. G. R. Turner, Mr. F. Jaffrey, and Mr. Pendlebury. Ophthalmic Surgeon: Mr. H. B. Grimsdale. Assistant Ophthalmic Surgeon: Mr. R. R. James. Assistant Surgeons: Mr. T. Crisp English, Mr. W. F. Fedden, and Mr. I. Back. Surgeon to the Throat Department: Mr. H. S. Barwell. Aural Surgeon: Mr. W. C. Bull. Dental Surgeon: Mr. N. G. Bennett. Assistant Dental Surgeon: Mr. Morley.

Lecturers.—Baillie Lecturer in Physic: Dr. Howship Dickinson. Thomas Young Lecturer in Medicine: Sir William Osler. Clinical Medicine: the Physicians and Assistant Physicians. Clinical Surgery: the Surgeons and Assistant Surgeons. Principles and Practice of Physic: Dr. Rolleston, Dr. Ogle, Dr. Latham, and Dr. Collier. Tropical Medicine: Dr. T. S. Kerr. Principles and Practice of Surgery: Mr. Dent, Mr. Turner, Mr. Jaffrey, and Mr. Pendlebury. Midwifery and Diseases of Women and Children: Dr. Dakin. Assistant Lecturer on Midwifery and Diseases of Women and Children: Dr. Stabb. Vaccination: Mr. E. Climson Greenwood. Insanity and Clinical Instructor in Insanity: Dr. Seymour Tuke. Ophthalmic Surgery: Mr. Grimsdale. Diseases of the Skin: Dr. Fox. Aural Surgery: Mr. Bull. Diseases of the Throat and Nose: Mr. Barwell. Dental Surgery: Mr. Norman Bennett. Assistant Lecturer on Dental Surgery: Mr. Morley. Practical Medicine: Dr. Jex-Blake. Practical Surgery: Mr. English. Operative Surgery: Mr. I. Back. Surgical Anatomy: Mr. Fedden. Edward Jenner Lecturer on Public Health: Mr. C. M. Fegen. Hygiene: Dr. H. Spitta. Forensic Medicine and Toxicology: Dr. Trevor. Toxicological Chemistry: Mr. Gardner. Pathological Chemistry: Dr. Spriggs. Pathology: Dr. Trevor. Bacteriology: Dr. Slater. Assistant Lecturer on Bacteriology and Lecturer on Clinical Pathology: Dr. Harold Spitta. Materia Medica and Therapeutics: Dr. Cyril Ogle. Pharmacology: Dr. Spriggs. Anæsthetics: Sir Frederic Hewitt, M.V.O. Teacher of Anæsthetics: Dr. Blumfeld. Assistant Teachers of Anæsthetics: Dr. Powell and Dr. Horne. Advanced Anatomy: Mr. Jaffrey. Advanced Physiology and Histology: Dr. Buckmaster. Advanced Chemistry and Pharmacological Chemistry: Mr. Gardner. Teacher of Skiagraphy: Dr. Simmons. Curator of the Museum: Dr. Trevor. Assistant Curator of the Museum and Demonstrator in Pathology: Dr. F. W. Higgs. Obstetric Tutor: Dr. G. F. Darwall Smith. Curator of the Peirse-Duncombe Laboratory: Dr. Harold Spitta. Demonstrator in Materia Medica: Dr. A. Manuel. Medical Tutor: Dr. J. A. Torrens. Surgical Tutor: Mr. C. Frankau. Dean of the Medical School: Dr. E. I. Spriggs.

Scholarships and Prizes.—At this school six entrance scholarships are given, the money value and the subjects of examination being as follows: (*a*) and (*b*), two in Arts, 50 guineas each, Latin or Greek, French or German, English, Mathematics; (*c*) and (*d*), two in Science, 50 guineas each, Chemistry, Physics, Zoology, and Botany; (*e*) and (*f*), two University Entrance Scholarships, 70 guineas and £50 respectively, Anatomy and Physiology. The others are as follows: (*g*) William Brown Exhibition, tenable for two years and open to perpetual pupils having registrable qualifications, £100 per annum, Practice of Medicine, Midwifery, and Surgery; (*h*) William Brown Exhibition, tenable for three years and open to perpetual pupils qualified not more than three years previously, £40 per annum, Essay and Original Work; (*i*) Allingham Scholarship in Surgery for students qualified not more than three years, £50, Competitive Essay; (*j*) and (*k*), two Brackenbury Prizes, one in Medicine and one in Surgery, £30 each, open to students of not more than five years' standing; (*l*) Treasurer's Prize for Proficiency in Clinical Examination of Cases and a written Examination in Medicine, Surgery, and Midwifery, £10 10*s.*; (*m*) H. C. Johnson Memorial Prize, £15, Practical Anatomy; (*n*) Pollock Prize, £17, Physiology, Physiological Chemistry, and Histology; (*o*) Clarke Prize, £5; (*p*) Thompson Medal, £7, Clinical Reports; (*q*) Brodie Prize, interest on £220, Clinical Reports; (*r*) Webb Prize, open to perpetual pupils, £30, Bacteriology.

GUY'S HOSPITAL.—This hospital, founded by Thomas Guy in 1721 for the reception of 400 patients, and enlarged through the aid of a large bequest from the late William Hunt, contains at the present time 618 beds.

House physicians, house surgeons, out-patient officers and assistant house surgeons, obstetric residents, ophthalmic house surgeons, clinical assistants, clerks to anæsthetists, surgeons' and assistant surgeons' dressers, surgical and medical clinical clerks, post-mortem clerks, extern obstetric attendants, and dressers and clerks in the special departments are appointed from among the students upon the recommendation of the medical council according to merit. The house physicians, of whom there are four, hold office for six months each. The out-patient officers, who hold office for three months, attend in the out-patient or casualty department during the week and see all the cases not seen by the assistant physician of the day. The house physicians have the care of the patients in the medical wards and attend to all emergencies arising in the absence of the physicians. They are provided with board and lodging in the college free of expense. The house surgeons, of whom there are four, hold office for six months each and are provided with board and lodging in the college free of expense. The Surgical Casualty Department is in charge of two assistant house surgeons and there are four out-patient officers appointed each three months. The surgeons' dressers are selected from those students who have completed their third winter session and have been most diligent in the junior appointments. They hold office for three or six months. Six are attached to each surgeon and during their weeks of special duty they are provided with board and lodging in the hospital free of expense. The college stands upon a site fronting the east gate of the hospital and is connected with it by a subway. The building serves as a Residential College for Students and at the same time provides accommodation for the Students' Club.

Medical and Surgical Staff.—Consulting Physicians: Sir Samuel Wilks, Bart., Dr. F. W. Pavy, Dr. P. H. Pye-Smith, Sir James F. Goodhart, Bart., and Dr. F. Taylor. Consulting Surgeons: Mr. Thomas Bryant, Sir H. G. Howse, Mr. W. H. A. Jacobson, Mr. R. C. Lucas, and Mr. Golding-Bird. Consulting Obstetric Physician: Dr. A. L. Galabin. Consulting Physician for Mental Diseases: Dr. G. H. Savage. Consulting Aural Surgeon: Mr. W. Laidlaw Purves. Consulting Anæsthetist: Mr. Tom Bird. Consulting Ophthalmic Surgeons: Mr. C. Higgens and Mr. W. A. Brailey. Consulting Dental Surgeons: Mr. Newland-Pedley and Mr. W. A. Maggs. Physicians and Assistant Physicians: Dr. W. Hale White, Dr. G. Newton Pitt, Sir Cooper Perry, Dr. L. E. Shaw, Dr. J. Fawcett, Dr. A. P. Beddard, Dr. H. S. French, Dr. A. F. Hertz, and Dr. H. C. Cameron. Surgeons and Assistant Surgeons: Mr. Charters J. Symonds, Mr. W. Arbuthnot Lane, Mr. L. A. Dunn, Sir Alfred Fripp, C.B., K.C.V.O., Mr. F. J. Steward, Mr. Fagge, Mr. R. P. Rowlands, Mr. Philip Turner, and Mr. E. C. Hughes. Obstetric Physicians: Mr. J. H. Targett and Mr. G. Bellingham Smith. Ophthalmic Surgeons: Mr. H. L. Eason and Mr. A. W. Ormond. Physician in Charge of Skin Department: Sir Cooper Perry. Physician in Charge of Nervous Diseases: Dr. Hertz. Physician in Charge of Children, Dr. Cameron. Physician for Mental Diseases: Dr. M. Craig. Surgeon in Charge of Throat Department: Mr. F. J. Steward. Surgeon in Charge of Aural Department: Mr. W. M. Mollison. Dental Surgeons: Mr. R. Wynne Rouw, Mr. H. L. Pillin, Mr. M. F. Hopson, and Mr. J. B. Parfitt. Anæsthetists: Mr. G. Rowell, Dr. H. F. Lancaster, Mr. C. J. Ogle, Dr. F. E. Shipway, Mr. H. M. Page, Mr. R. Davies-Colley, and Mr. T. B. Layton. Medical Registrars and Tutors: Dr. C. H. Rippmann and Mr. G. H. Hunt. Obstetric Assistant and Tutor: Mr. H. Chapple. Surgical Registrars and Tutors: Mr. V. Townrow and Mr. L. Bromley. Actino-Therapeutic Department: Dr. C. E. Iredell. Radiographers: Mr. E. W. H. Shenton,

Dr. A. E. Jordan, and Dr. C. J. Morton. Bacteriologist to the Hospital: Dr. J. W. H. Eyre. Surgeon in charge of Genito-Urinary Department: Mr. A. R. Thompson. Resident Surgical Officer: Mr. W. H. Trethowan. Hon. Librarian, Wills Library: Dr. H. S. French. Lying-in Charity: Mr. Targett and Mr. Bellingham Smith. Dean of the Medical School: Dr. H. L. Eason. Sub-Dean: Dr. H. C. Cameron. Warden of the College: Mr. W. M. Mollison, M.C.

Lecturers and Demonstrators.—Clinical Medicine: the Physicians and Assistant Physicians. Clinical Surgery: the Surgeons and Assistant Surgeons. Medicine: the Physicians. Practical Medicine: Dr. C. H. Rippmann and Dr. G. H. Hunt. Surgery: Mr. Symonds, Mr. Lane, Mr. Dunn, and Sir Alfred Fripp. Operative Surgery: Mr. R P. Rowlands and Mr. P. Turner. Practical Surgery: Mr. Townrow and Mr. Bromley. Midwifery and Diseases of Women: Mr. Targett and Mr. Bellingham Smith. Practical Obstetrics: Mr. Chapple. Mental Diseases: Dr. Craig. Ophthalmic Surgery: Mr. Eason. Dental Surgery: Mr. Wynne Rouw. Aural Surgery: Mr. Mollison. Diseases of the Skin: Sir Cooper Perry. Diseases of the Throat: Mr. Steward. Anæsthetics: Mr. Rowell. Hygiene and Public Health: Dr. R. King Brown. Pathology: Dr. A. E. Boycott. Gordon Lecturer on Experimental Pathology: Dr. Boycott. Morbid Anatomy: Dr. Fawcett, Dr. French, and Dr. Hertz. Morbid Histology and Bacteriology: Dr. Eyre and Dr. Boycott. Medical and Surgical Pathology Classes: Dr. Fawcett and Mr. Rowlands. Bacteriology: Dr. Eyre. Practical Bacteriology: Dr. Eyre. Forensic Medicine: Mr. Ryffel. Anatomy: Mr. Steward and Mr. Fagge. Practical Anatomy: Mr. Layton, Mr. Davies-Colley, and Mr. Saner. Physiology: Dr. Pembrey. Practical Physiology: Dr. Pembrey, Mr. J. H. Ryffel, B.C., and Mr. E. L. Kennaway, M.B., B.Ch. Materia Medica and Therapeutics: Dr. A. P. Beddard. Practical Pharmacy: the Hospital Pharmacist. Chemistry: Dr. Wade. Practical Chemistry: Dr. Wade, Mr. Ball, and Mr. Merriman. Experimental Physics: Dr. Fison and Mr. Merriman. Biology: Mr. Assheton, Mr. Reed, and Mr. Saner. Psychology: Dr. Craig.

Scholarships and Prizes.—For the first two scholarships in the list here given a course of study at Guy's Hospital is required; for all the others a perpetual course is required. There are five entrance scholarships, the money value, the conditions of eligibility, and the subjects of examination being as follows:—(*a*) and (*b*), two scholarships, one of £100 for students under 20 years of age and one of £50 for those under 25 years, Latin, English, Greek or French or German, Arithmetic, Euclid, and Algebra; (*c*) and (*d*). two scholarships for students under 25 years, £150 and £60 respectively; Chemistry, Biology, and Physics; (*e*) scholarship open to students under 25 years who have completed the curriculum for, or passed, the graduation examinations in Anatomy and Physiology in any university of the British Empire and have not entered as students in any Metropolitan Medical School, £50; (*f*) Hilton prize for senior students, £5, Dissections; (*g*), (*h*), and (*i*), three Junior General Proficiency Prizes, £20, £15, and £10 respectively, Anatomy, Histology, &c.; (*j*) Michael Harris Prize for second-year students, £10, Human Anatomy; (*k*) Sands Cox Scholarship for second-year students tenable for three years, £15 per annum, Physiology, Histology, &c.; (*l*) Wooldridge Memorial Prize for second-year students, £10, Physiology, Histology, &c.; (*m*) and (*n*), two Treasurer's Gold Medals, one for Clinical Medicine and one for Clinical Surgery open to senior students; (*o*) Golding-Bird Prize for senior students, £20 and Medal, Bacteriology; (*p*) Beaney Prize, £34, Pathology; (*q*) Gull Studentship tenable for three years awarded for research without competitive examination, £150 per annum, Pathology; (*r*) Beaney Scholarship tenable for three years awarded for research without competitive examination, £31 10*s*., Therapeutics; (*s*) Arthur Durham Travelling Studentship tenable for three years, £100; (*t*) Greville Research Scholarship, £200, Cancer Investigation; and (*u*) Oldham Prize in Ophthalmology, £30.

KING'S COLLEGE AND HOSPITAL.—On Sept. 1st, 1909, the Faculty of Medicine at King's College was divided into two parts. The first is concerned with Preliminary and Intermediate subjects and instruction on these is given in the College laboratories. This department is now designated Faculty of Science (Medical Division). The second deals with the Advanced or Final subjects of the curriculum, instruction on which is given at the hospital, the committee of management of which is now the governing body of King's College Hospital Medical School.

In the Faculty of Science (Medical Division) the following are the:—

Lecturers on Preliminary and Intermediate Subjects.—Anatomy: Dr. P. Thompson (Professor), Dr. C. J. Jenkins (Lecturer), and Mr. J. E. S. Frazer (Demonstrator). Physiology: Dr. W. D. Halliburton (Professor), Dr. H. W. Lyle (Lecturer), Dr. O Rosenheim (Lecturer on Chemical Physiology), and Dr. C. S. Myers (Lecturer on Experimental Psychology). Zoology: Dr. A. Dendy (Professor). Botany: Dr. W. B. Bottomley (Professor) and Mr. E. J. Schwartz (Demonstrator). Chemistry: Dr. J. M. Thomson (Professor), Mr. H. Jackson (Assistant Professor), and Mr. P. H. Kirkaldy (Lecturer). Physics: Dr. C. G. Barkla. Materia Medica and Pharmacology: Dr. W. E. Dixon (Professor).

Fees.—For London University Course: for Preliminary Scientific (Part I.), 25 guineas; for Preliminary Scientific (Part II.) and Intermediate M.B., 55 guineas, or two instalments of 30 guineas each. For Conjoint Board Course: for First examination, 20 guineas; for Second examination, 55 guineas, or two instalments of 30 guineas each. For prospectus and further information application should be made to Dr. P. Thompson, Dean of the department.

KING'S COLLEGE HOSPITAL MEDICAL SCHOOL.—The advanced or final subjects in the curriculum are dealt with at the Medical School attached to King's College Hospital. The hospital contains 224 beds. 3000 in-patients, 16,000 new out-patient cases, 40,600 casualties, and about 350 midwifery cases are attended yearly. The hospital contains special departments for diseases of women and children, and of the eye, ear, throat and nose, skin and teeth. There are special operation theatres for diseases of women, for eye, and for throat, nose, and ear cases. There is a clinical pathologist and a laboratory in the hospital where histological, bacteriological, hæmatological, and chemical investigations are carried out. In connexion with this is a vaccine department for the treatment of patients suffering from tuberculosis and other infective diseases. The appointments open to students are those of senior clinical assistant to the special departments; senior medical, surgical, and obstetric registrar; and Sambrooke medical and surgical registrars, all of whom receive salaries, as do the medical and surgical tutors. There are 14 resident medical and surgical officers appointed yearly and the usual six senior surgical dressers, medical and obstetric clinical clerks, surgical dressers, and clerks and dressers in all the special departments for in- and out-patients, and post-mortem clerks.

Hospital Staff.—Consulting Physicians: Dr. Alfred B. Duffin, Dr. I. Burney Yeo, and Sir David Ferrier. Consulting Surgeon: Lord Lister. Physicians: Dr. Nestor Tirard, Dr. Norman Dalton, Dr. Raymond Crawfurd, and Dr. Aldren Turner. Surgeons: Sir W. Watson Cheyne, Bart., Mr. A. B. Barrow, Mr. A. Carless, Mr. F. F. Burghard, Mr. G. L. Cheatle, and Dr. T. P. Legg. Assistant Physicians: Dr. Tunnicliffe Dr. J. C. Briscoe, and Dr. H. W. Wiltshire. Obstetric Physician: Dr. John Phillips. Assistant Obstetric Physician: Dr. Hugh Playfair. Physician for the Diseases of Children: Dr. George F. Still. Diseases of the Throat: Dr. StClair Thomson. Dental Surgeon: Mr. C. E. Wallis. Ophthalmic Surgeons: Mr. L. V. Cargill and Mr. H. Willoughby Lyle. Aural Surgeons: Mr. Arthur H. Cheatle and Dr. G. J. Jenkins. Physician for Diseases of the Skin: Dr. A. Whitfield. Pathological Registrar: Dr. Norman Dalton. Physician in charge of Electrical Department: Dr. W. Aldren Turner. Medical Officer in charge of X Ray Department: Mr. A. D. Reid. Anæsthetist and Instructor in Anæsthetics: Dr. J. F. W. Silk. Anæsthetist: Dr. G. B. Flux. Clinical Pathologist: Dr. Emery. Senior Medical Registrar and Tutor: Dr. H. W. Wiltshire. Senior Surgical Registrar and Tutor: Dr. T. Percy Legg. Obstetric Registrar and Tutor: Dr. E. L. Holland. Sambrooke Registrars: Mr. Arthur D. Griffith and Mr. H. E. Treadgold.

Lecturers on Final Subjects.—Medicine (Principles and Practice of): Dr. Nestor Tirard (Professor). Neuro-Pathology: Dr. W. A. Turner (Lecturer). Psychological Medicine: Dr. Steen (Professor). Surgery (Principles and Practice of): Mr. A. Carless (Professor). Surgery (Operative): Mr. F. F. Burghard (Teacher). Surgical Pathology: Mr. G. L. Cheatle (Teacher). Obstetric Medicine and Diseases of

Women and Children: Dr. John Phillips (Professor). Practical Obstetrics: Dr. Hugh Playfair (Lecturer). Diseases of Children: Dr. G. F. Still (Professor). Pathology: Dr. N. Dalton (Professor). Forensic Medicine: Dr. W. R. Smith (Professor). Hygiene: Dr. W. J. R. Simpson (Professor). State Medicine: Dr. Hewlett (Professor) and Mr. D. Somerville (Demonstrator). Bacteriology: Dr. Hewlett (Professor) and Dr. F. E. Taylor. Ophthalmic Surgery: Mr. L. V. Cargill. Aural Surgery: Mr. A. H. Cheatle (Lecturer). Dermatology: Dr. A. Whitfield (Professor). Anæsthetics: Dr. J. F. W. Silk. Dental Surgery: Mr. A. S. Underwood (Professor). Diseases of the Skin: Dr. A. Whitfield (Professor).

Fees.—The composition fee for Hospital work and Final subjects of the curriculum is 75 guineas in one sum, or 77 guineas if paid in two instalments, on entrance and on commencement of second year of study respectively. For information and prospectus application should be made to the Dean of the Hospital, or to Mr. Clifton Kelway, the Secretary of the Medical School, Portugal-street, W.C. For information regarding fees, curriculum, &c., in Public Health and Bacteriology application should be made to Professor Hewlett.

Athletics.—The King's College Hospital Clubs and Societies Union was formed in 1908 and consists of the Medical and Musical Societies, the Hospital Common Room, and the various athletic and sports clubs. Students' subscription is included in the fees mentioned above.

Scholarships and Prizes.—For the first two scholarships in the list here shown a perpetual course at King's College is required. The money value and subjects of examination are as follows:—(*a*) and (*b*) Two Warneford Scholarships, tenable for four years, £25 each per annum, Divinity, English History, Latin, Greek, French, German, and Mathematics; (*c*) Sambrooke Exhibition, £100, Mathematics, Physics, Inorganic Chemistry, Botany, and Zoology; (*d*) Rabbeth Scholarship, £20, Preliminary Scientific Subjects; (*e*) and (*f*) Two Science Exhibitions, open to students under 19 years of age and tenable for two years, £30 and £20 per annum respectively, Mathematics, Mechanics, Physics, &c.; (*g*) Medical Entrance Scholarship, £50, Anatomy and Physiology, open to students who (1) propose to take a degree at any British University and have passed the examination there in Biology, Chemistry, and Physics, and who (2) will become perpetual students at King's College from date of entering upon Scholarship; (*h*), (*i*), (*j*) and (*k*), Two Medical Entrance Exhibitions in Arts and two in Science, £50 each, tenable for five years, successful candidates to study at King's College and King's College Hospital; (*l*), (*m*), and (*n*), Three Medical Scholarships, £40 for fourth-year students, £20 for third-year students, and £20 for second-year students; (*o*) and (*p*), Two Sambrooke Registrarships, open to matriculated students who have filled certain appointments in hospitals, £50 each; (*q*) Daniel Scholarship, open to six-months' laboratory students, and tenable for two years, £20 per annum, Chemistry; (*r*) Carter Prize, £15, Botany; (*s*) Tanner Prize, £10, Obstetrics and Diseases of Women and Children; (*t*) Todd Prize, £4 4*s*. and medal, Clinical Medicine.

LONDON HOSPITAL.—The hospital has 922 beds in constant use and no beds are closed. It is the only general hospital for East London—i.e., for a million and a half people. In-patients last year, 15,257; out-patients, 222,822; accidents, 12,508; major operations, 5060. Owing to the enormous number of patients more appointments are open to students than at any other hospital. Resident accoucheurs, receiving-room officers, house physicians, house surgeons, emergency officers, pathological assistants, out-patient clinical assistants, senior dressers to out-patients, &c.: 137 of these qualified appointments are made annually and more than 150 dressers, clinical clerks, &c., appointed every three months. All are free to students of the College. Holders of resident appointments have free board. Special classes are held for the University of London, the Fellowship of the Royal College of Surgeons, and other higher examinations. Special entries for medical and surgical practice can be made. Lectures and classes are held throughout the year to suit the requirements of candidates desirous of obtaining the diploma in Public Health. The Lecturer on Public Health has his offices in the College, enabling the candidates to attend daily to work under his supervision. These courses are recognised both by the Universities of Oxford, Cambridge, London, &c., and by the Examining Board in England. A reduction is made from the fees to the sons of members of the profession. A Students' Hostel has recently been opened on the hospital ground. The Clubs Union Athletic Ground is within easy reach of the hospital. The Metropolitan and other railways have stations close to the hospital and the college.

Staff.—Consulting Physician: Dr. Hughlings Jackson. Consulting Surgeons: Sir Jonathan Hutchinson, Mr. Couper, Mr. McCarthy, Sir Frederick Treves, Bart., Mr. Tay, Mr. Mansell Moullin, and Mr. Hurry Fenwick. Consulting Obstetric Physician: Dr. Herman. Consulting Dental Surgeon: Mr. Barrett. Consulting Aural Surgeon: Mr. Mark Hovell. Consulting Anæsthetist: Sir Frederic Hewitt. Physicians: Dr. Francis Warner, Dr. Percy Kidd, Dr. Frederick J. Smith, Dr. W. J. Hadley, Sir Bertrand Dawson, K.C.V.O., Dr. Henry Head, Dr. Robert Hutchison, and Dr. Lewis Smith. Assistant Physicians: Dr. Wall, Dr. Grünbaum, and Dr. Thompson. Surgeons: Sir Frederic Eve, Mr. J. Hutchinson, Mr. T. H. Openshaw, Mr. H. P. Dean, Mr. P. Furnivall, Mr. Rigby, and Mr. Sherren. Assistant Surgeons: Mr. Lett, Mr. Russell-Howard, Mr. R. Warren, Mr. Frank Kidd, and Mr. R. Milne. Obstetric Physicians: Dr. Lewers and Dr. Andrews. Physician to the Skin and Phototherapy Departments: Dr. Sequeira. Ophthalmic Surgeons: Mr. A. B. Roxburgh and Mr. W. T. Lister. Surgeon to the Throat Department: Dr. Lambert Lack. Aural Surgeon: Mr. Hunter Tod. Surgeon in charge of the Orthopædic Department: Mr. Openshaw. Medical Officer in charge of the Radiographic Department: Dr. Gilbert Scott. Medical Officer in charge of the Physico-Therapeutical and Tyrnauer Baths Departments: Dr. R. S. Woods. Analyst to the Hospital: Mr. Hugh Candy. Bacteriologist to the Hospital: Dr. W. Bulloch. Assistant Bacteriologist: Mr. P. Fildes. Pathological Institute: Dr. H. M. Turnbull, Director; Dr. G. B. Bartlett, Assistant Director. Clinical Pathologists: Dr. P. N. Panton; Assistant, Dr. H. L. Tidy. Dental Surgeons: Mr. H. Chapman, Mr. F. M. Farmer, Mr. G. Northcroft, Mr. G. P. Pollitt, Mr. E. C. Sprawson, and Mr. J. Sim Wallace. Anæsthetists: Dr. Probyn-Williams, Mr. Clapham, and Mr. Daly. Assistant Anæsthetists: Dr. Austin Cooper and Mr. Bligh Wall.

Lecturers.—Medicine: Dr. Hadley. Clinical Medicine the Physicians and Assistant Physicians. Cardiac Research: Dr. J. Mackenzie. Surgery: Mr. J. Hutchinson. Clinical Surgery: the Surgeons and Assistant Surgeons. Anatomy: Dr. Wright, Mr. R. Warren, Mr. R. Milne, Mr. A. J. Walton, and Mr. W. S. Perrin. Physiology and Histology: Dr. Leonard Hill, Dr. Martin Flack, Dr. Miller, and Mr. R. A. Rowlands. Chemistry: Mr. Hugh Candy and Mr. Twort. Physics: Dr. A. H. Fison and Mr. Griffith. Biology: Mr. G. P. Mudge and Mr. R. A. Buddicom. Pathology—General and Surgical: Dr. W. Bulloch. Special: Dr. H. M. Turnbull. Clinical: Dr. P. N. Panton. Midwifery and Diseases of Women: Dr. H. R. Andrews. Clinical Obstetrics: the Obstetric Physicians. Practical Obstetrics: Dr. R. D. Maxwell. Forensic Medicine—(1) Public Health: Dr. J. C. Thresh; and (2) Medical Jurisprudence and Toxicology: Dr. F. J. Smith. Public Health and Sanitary Science: Dr. W. Bulloch, Dr. J. C. Thresh, and Mr. Candy. Mental Diseases: Dr. J. Kennedy Will. Materia Medica, General Therapeutics, Pharmacology, and Practical Pharmacy: Dr. Francis Warner, Dr. Grünbaum, and Mr. F. A. Hocking. Ophthalmic Surgery: Mr. A. B. Roxburgh. Diseases of the Throat: Dr. Lambert Lack. Aural Surgery: Mr. Hunter Tod. Orthopædic Surgery: Mr. Openshaw. Foods and Dietetics: Dr. R. Hutchison. Operative Surgery: Mr. H. P. Dean. Demonstrators of Morbid Anatomy: Dr. F. J. Smith, Dr. W. J. H. Hadley, Dr. Grünbaum, Dr. Theodore Thompson, and Dr. C. H. Miller. Bacteriology: Dr. W. Bulloch and Dr. P. Fildes. Pathological Histology: Dr. W. Bulloch. Inoculation Department: Dr. J. T. Western and Dr. T. H. C. Benians. Anæsthetics: Dr. R. J. Probyn-Williams, Mr. Clapham, and Mr. Daly. Elementary Clinical Medicine: Dr. Grünbaum and Dr. Thompson. Medical Tutor: Dr. Thompson. Elemental Clinical Surgery: Mr. Howard and Mr. Warren. Surgical Tutor: Mr. Lett. Obstetric Tutor: Dr. R. D. Maxwell.

Sir Jonathan Hutchinson and Sir Frederick Treves, Bart., Emeritus Professors of Surgery, Mr. Hurry Fenwick, Emeritus Professor of Urology, and Sir Frederic Hewitt, Emeritus Lecturer on Anæsthetics, will give courses of

lectures during the year. The Schorstein Memorial Lectures in Clinical Medicine will be given on Oct. 3rd and Oct. 4th, at 4 P.M. by Dr. James Mackenzie, Lecturer on Cardiac Research to the Hospital. Dean: William Wright, M.B., D.Sc., F.R.C.S.

Scholarships and Prizes.—At this school the successful candidate for the first items in the list here shown must enter as a full student. The money value and subjects of examination are as follows:—(*a*) Price Scholarship £120; (*b*) and (*c*) two Entrance Scholarships, £60 and £35 respectively, subjects of Preliminary Scientific M.B. Examination at the University of London; (*d*) Epsom College Scholarship, free education, subjects of Preliminary Scientific Examination as above; (*e*) Price Scholarship, open to students of Oxford and Cambridge Universities, £60, Human Anatomy and Physiology; (*f*) and (*g*) two Buxton Scholarships, £30 and £20 respectively, subjects of Preliminary Examination in Arts; (*h*), (*i*), and (*j*) three Scholarships for Clinical Work, £20 each, Medicine, Surgery, and Obstetrics; (*k*) Sutton Prize, £20, Pathology; (*l*) Duckworth Nelson Prize, biennial, £10, Pathology, Practical Medicine, and Surgery; (*m*) Letheby Prizes (3), £30, Chemistry; (*n*) and (*o*) two Scholarships £25 in Anatomy and Physiology, £20 in Anatomy and Biology; (*p*), (*q*), (*r*), (*s*), (*t*), (*u*) seven Dressers' Prizes, amounting to £30, zeal, efficiency, and knowledge of Elementary and Minor Surgery; (*v*) Hutchinson Prize, triennial, £40, Clinical Surgery; (*w*) and (*x*) two Practical Anatomy Prizes, £6 and £4 respectively; (*y*) Andrew Clark Prize, biennial, £26, Clinical Medicine and Pathology; (*z*) James Anderson Prizes, £9, Clinical Medicine; (*a a*) Douro Hoare Prize, £5, Physiology; and (*b b*) Wynne Baxter Prize, £5 5*s*., Forensic Medicine.

Medical Research Funds.—Research Fund of £20,000 and the Eliza Ann Alston Endowment Fund for Medical Research provide valuable scholarships for men wishing to undertake research or desirous of preparing Theses for University degrees.

ST. MARY'S HOSPITAL.—301 beds, 31 of which are situated in the Clarence Wing and are devoted to cases requiring treatment by therapeutic inoculation. The number of in-patients treated during 1910 was 4318. The number of out-patients was 27,144 with 27,402 casualty cases, a total of 54,546. The situation of the hospital and Medical School in the centre of the residential districts of Paddington, Bayswater, and North Kensington renders it exceptionally convenient for students' rooms, a register of which is kept by the authorities for the use of students.

Laboratories, &c.—The Medical School provides for the entire curriculum. Special laboratories are in use for Biology, Chemistry, and Physics, a series of lecture theatres and laboratories for anatomy and physiology, and a spacious and well-lighted dissecting-room. The Pathological Department is under the direction of Sir Almroth Wright, F.R.S., and a block of consulting-rooms and laboratories in the New Wing of the Hospital has been equipped for the department of Therapeutic Inoculation to meet the increased amount of work in that department. During the past year 214 in-patients have received treatment in the department. A special laboratory is provided for the study of chemical pathology.

Appointments.—All clinical appointments in the hospital are free to students of the Medical School and the resident medical officers are chosen by competitive examination. Six house physicians, six house surgeons, four obstetric officers, and two Resident Medical Officers for the Inoculation Wards are appointed in each year and receive board and lodging in the hospital. Two resident anæsthetists are appointed in each year and receive a salary at the rate of £100 per annum, with board and lodging. Two casualty house surgeons are appointed in each year upon the same conditions. Several assistants in the department of Therapeutic Inoculation are appointed annually at salaries of £100 per annum and upwards, the total sum available for salaries of assistants in this department being £1600 per annum. In addition to the above, the senior appointments, medical and surgical registrar, casualty physician, demonstrator of anatomy, physiology, and biology are made annually.

Clubs, &c.—The amalgamated clubs include all the various athletic clubs, as well as the rifle club, medical society, &c There is a students' club on the Hospital premises, the membership of which is included in the amalgamated clubs. The athletic clubs' ground is situated at Park Royal, Acton, and is easy of access from the Medical School. It consists of Rugby and Association football grounds, tennis courts, and a large cricket pitch, and has a large and well-equipped pavilion.

Special Tuition.—In addition to systematic courses of lectures and demonstrations special tuition is provided for the Intermediate and Final Examinations of the Universities of Oxford, Cambridge, and London, and for the Primary and Final F.R.C.S.

Preliminary Scientific Course.—Special classes, including lectures and laboratory work, are held throughout the year under recognised teachers of the University of London.

The composition fee for full students is £140 if paid in one sum, or £145 if paid in four instalments. University students who have completed their examinations in Anatomy and Physiology are admitted on payment of a composition fee of 60 guineas (£63) paid in one sum or by payment of two annual instalments of 35 guineas (£36 15*s*.) and 30 guineas (£31 10*s*.) respectively. University students who have not completed their examination in Anatomy and Physiology pay an annual fee of 25 guineas (£26 5*s*.) until they have passed these examinations, and then pay the composition fee. Separate courses of lectures, laboratory work, or hospital practice may be taken. The School Calendar and full information can be obtained from the Secretary, St. Mary's Hospital Medical School, Paddington, W.

Staff.—Consulting Physician: Dr. Lees. Consulting Surgeons: Mr. A. T. Norton, Mr. Edmund Owen, Mr. Herbert Page, Mr. A. J. Pepper, Mr. G. P. Field (Aural), Sir G. Anderson Critchett, Bart. (Ophthalmic), Sir Malcolm Morris (Skin), Mr. Morton Smale (Dental), and Dr. Scanes Spicer (Throat). Consulting Anæsthetist: Mr. Henry Davis. Physicians: Dr. Sidney Phillips, Dr. A. P. Luff, and Dr. Wilfred Harris. Surgeons: Mr. J. Ernest Lane, and Mr. Warren Low. Physicians in charge of Out-Patients: Sir John Broadbent, Bart., Dr. W. H. Willcox, and Dr. R. H. Miller. Surgeons in charge of Out-Patients: Mr. W. H. Clayton-Greene, Mr. Maynard Smith, and Mr. Fitzwilliams. Obstetric Surgeon: Dr. Montagu Handfield-Jones. Obstetric Surgeon in charge of Out-Patients: Dr. W. J. Gow. Physician in charge of Children's Department: Dr. Sidney Phillips. Ophthalmic Surgeon: Leslie Paton. Assistant Ophthalmic Surgeon: Mr. G. Coats. Physician to the Skin Department: Dr. Graham Little. Dental Surgeon: Mr. W. H. Dolamore. Surgeons to the Ear, Nose, and Throat Department: Dr. G. William Hill and Mr. C. I. Graham (assistant). Administrators of Anæsthetics: Dr. Blumfeld, Mr. Collum, and Mr. Henry Chaldecott. Director in Medical Charge of Inoculation Department: Sir Almroth Wright. Dean: Sir John Broadbent.

Lecturers.—Clinical Medicine: Dr. Sidney Phillips. Clinical Surgery: Mr. Ernest Lane. Medicine: Dr. A. P. Luff, Dr. Harris, and Sir John Broadbent. Surgery: Mr. V. Warren Low. Practical and Operative Surgery: Mr. Maynard Smith and Mr. Fitzwilliams. Pathology: Sir A. E. Wright and Dr. Spilsbury. Bacteriology: Sir A. E. Wright and Dr. Freeman (assistant lecturer). Pathological Chemistry: Dr. W. H. Willcox and Mr. J. Webster (demonstrator). Midwifery and Gynæcology: Dr. M. Handfield-Jones. Materia Medica and Therapeutics: Dr. R. H. Miller. Forensic Medicine: Dr. Willcox. Neurology: Dr. Harris. Descriptive and Surgical Anatomy: Mr. J. Ernest Frayer. Demonstrator: Mr. D. W. Daniels. Physiology and Histology: Dr. H. E. Roax and Dr. Ellison (demonstrator). Biology: Dr. W. G. Ridewood. Demonstrator: Mr. A. S. Horne. Chemistry: Dr. G. Senter and Mr. R. W. Davies (demonstrator). Physics: Mr. W. H. White. Hygiene and Public Health: Dr. W. H. Willcox. Mental Diseases: Dr. R. H. Cole. Diseases of the Eye: Mr. Leslie Paton. Diseases of the Ear, Nose, and Throat: Dr. G. William Hill and Mr. Graham. Diseases of the Skin: Dr. Graham Little. Dental Surgery: Mr. Dolamore. Medical Tutor: Dr. Willcox. Surgical Tutor: Mr. Clayton-Greene. Obstetric Tutor: Dr. T. G. Stevens. Medical Registrar: Mr. C. M. Wilson. Surgical Registrar: Mr. V. Z. Cope. Department for Nervous Diseases: Dr. Wilfred Harris. Practical Pharmacy: Mr. E. A. Andrews. School Secretary: Mr. B. E. Matthews.

Scholarships and Prizes.[1]—The money value and subjects of

[1] The number and value of Entrance Scholarships will be altered in September, 1912.

examination of these are as follows: (*a*), (*b*), (*c*), and (*d*), four Natural Science Scholarships awarded by competition in September, 1911, £145, £50, £50, and £25 respectively; (*e*) and (*f*), two University Scholarships open to students from any British University, £52 10*s*. each, Natural Science; (*g*) Epsom College Scholarship awarded by nomination, representing free tuition; (*h*) Gold Medal, £20, an Essay on Some Special Point in Clinical Medicine; (*i*) Dermatology Prize, awarded twice in each year, £5 5*s*.; (*j*) Meadows' Prize, awarded in alternate years, £8, Obstetrics; (*k*) nine Winter Session Prizes, £2 2*s*. each, subjects of the medical curriculum; and (*l*) nine Summer Session Prizes, £2 2*s*. each, subjects of the medical curriculum.

MIDDLESEX HOSPITAL.—The hospital contains 355 beds, which includes a special wing for patients suffering from cancer, consisting of five wards, containing 47 beds; here cancer patients are received and attended for a period limited only by the duration of their disease. The number of patients treated last year were: Out-patients, 54,240; in-patients, 5434. Cancer: Out-patients, 93; in-patients, 153.

The Hospital and Medical School are fully equipped for the theoretical and practical teaching of all the subjects included in the examinations in Medicine and Surgery in the United Kingdom and for the diploma in Public Health; and ample laboratory and class-room accommodation is provided for the teaching of the various subjects of the curriculum and for original research in Medicine, Pathology, and Bacteriology. A Maternity Ward in which students receive systematic instruction in Obstetric Medicine has recently been added to the hospital.

Special Classes are held to prepare students for the Second M.B. (Lond.) Examinations and for the Primary and Final Examinations for the diploma of F.R.C.S. Eng.

Attached to the Cancer Wing of the hospital is a special research laboratory and in connexion with this there are the Emden Cancer Research Scholarship, the Richard Hollins Research Scholarship, the Salters' Company Cancer Research Scholarship, and a Cancer Research Scholarship.

Hospital Appointments.—All hospital appointments are allotted to students without any extra fee. The following 18 resident appointments—six house physicians, six house surgeons, two obstetric house physicians, two casualty medical officers, and two casualty surgical officers—are annually filled from the pupils of the hospital, each appointment extending over six months.

A Residential College to accommodate a limited number of students adjoins the hospital. Breakfast, luncheon, and dinner are supplied in the College Hall at moderate charges.

The Amalgamated Students' Club includes the following: the Medical Society, the Common Room Society, the cricket club, the football clubs, the athletic clubs, the rowing club, the musical society, the chess club, the lawn tennis club, and the hockey club. The athletic ground, which is eight acres in extent, is situated within easy access at Park Royal. There is a gymnasium within the precincts of the Medical School.

Fees.—The Composition Fee for the entire curriculum is 135 guineas, or 145 guineas if paid in three instalments. The fee for London University students is 145 guineas; for those who have passed the First Examination for Medical Degrees 120 guineas. The fee for the Dental Curriculum is 54 guineas, or 60 guineas if paid in two instalments. Students who have completed the study of Anatomy and Physiology and passed First Examination for Medical Degrees are received on special terms.

Lecturers.—Winter Session: Anatomy: Dr. Cameron. Demonstrator: Dr. Gladstone. Embryology: Dr. Gladstone. Biology and Physiology: Mr. Goodall. Demonstrator: Mr. Earle. Chemistry: Dr. Kellas. Emeritus Lecturer in Medicine: Sir R. D. Powell, Bart., M.D. Medicine: Dr. Pasteur and Dr. Wynter. Practical Medicine: Dr. Voelcker. Emeritus Lecturer in Surgery: Sir Henry Morris, Bart. Surgery: Sir Alfred Pearce Gould, K.C.V.O., Mr. Bland-Sutton, and Mr. Murray. Practical Surgery: Mr. Kellock. Operative Surgery: Mr. Kellock. Practical Midwifery: Dr. Bonney. Pathology: Dr. Voelcker. Forensic Medicine and Toxicology: Dr. Wethered. Clinical Lectures in Medicine: The Physicians. Clinical Lectures in Surgery: The Surgeons. Clinical Lectures on Diseases of the Ear, Throat, and Nose: Mr. S. Hastings. Lectures in Ophthalmology: Mr. Lang. Lectures in Dental Surgery: Mr. Nowell. Public Health and Bacteriology: Mr. Foulerton. Summer Session: Pharmacology and Therapeutics: Dr. R. A. Young. Midwifery: Dr. Comyns Berkeley. Pathological Histology: Dr. Voelcker. Practical Toxicology: Dr. Kellas. Mental Diseases: Dr. Bond. Lectures in Dermatology: Dr. Pringle. Anatomy, Chemistry, and Physiology: as in Winter Session. Tutors—Medicine: Dr. Campbell Thomson; Surgery: Mr. Handley; Obstetrics: Dr. Taylor.

Staff.—Consulting Physicians: Dr. W. Cayley, Dr. Sidney Coupland, and Sir Richard Douglas Powell, Bart. Physicians: Sir James Kingston Fowler, K.C.V.O., Dr. W. Pasteur, and Dr. W. E. Wynter. Physicians to Out-patients: Dr. A. F. Voelcker, Dr. F. J. Wethered, Dr. H. Campbell Thomson (Dean of the Medical School), and Dr. R. A. Young. Consulting Physician to the Skin Department: Dr. R. Liveing. Physician to the Skin Department: Dr. J. J. Pringle. Consulting Obstetric Physician: Dr. W. Duncan. Obstetric Physician: Dr. Comyns Berkeley. Assistant Obstetric Physician: Dr. Victor Bonney. Consulting Surgeons: Sir Henry Morris, Bart., and Mr. Andrew Clark. Surgeons: Sir Alfred Pearce Gould, K.C.V.O., Mr. Bland-Sutton, and Mr. Murray. Surgeon to Out-patients: Mr. Kellock. Assistant Surgeons: Mr. W. S. Handley and Mr. Gordon Taylor. Ophthalmic Surgeon: Mr. W. Lang. Assistant Ophthalmic Surgeon: Mr. Arnold Lawson. Consulting Aural Surgeon: Mr. Stephen Paget. Aural Surgeon: Mr. Somerville Hastings. Consulting Dental Surgeon: Mr. W. Hern. Dental Surgeon: Mr. Nowell. Assistant Dental Surgeon: Mr. H. W. Turner. Curator of the Museum and Pathologist: Dr. Lakin. Registrars: Dr. MacCormac, Mr. Rowntree, Dr. F. E. Taylor, and Dr. E. Musgrave Woodman. Resident Medical Officer: Mr. A. E. Johnson. Anæsthetists: Mr. T. G. A. Burns, Mr. H. P. Noble, and Mr. H. Charles. Assistant Anæsthetist: Mr. R. E. Apperly.

Scholarships and Prizes.—Holders of the Entrance Scholarships are required to become general students of the school. The money value and subjects of examination are as follows: (*a*), (*b*), and (*c*), three Entrance Scholarships, £100, £50, and £25 respectively; (*d*) Entrance Scholarship for Students from the Universities of Oxford or Cambridge, £50, Anatomy and Physiology, including Histology; (*e*) Freer Lucas Scholarship for Students of Epsom College, on nomination of Headmaster, £126; (*f*) and (*g*), two Broderip Scholarships for Senior Students, £60 and £40 respectively, Clinical subjects; (*h*) Freeman Scholarship, £30, Obstetrics and Gynæcology; (*i*) Hetley Clinical Prize for Fifth-Year Students, £25; (*j*) John Murray Gold Medal and Scholarship, awarded every third year, £25, Theoretical and Practical Medicine; (*k*) Lyell Medal and Scholarship, £55 5*s*., Surgical Anatomy and Practical Surgery; (*l*) Leopold Hudson Prize, £11 11*s*., Surgical Pathology and Bacteriology; (*m*) second year's Exhibition, £10 10*s*., Anatomy and Physiology; (*n*) "Emden" Cancer Research Scholarship tenable for three years, £100; (*o*) Richard Hollins Research Scholarship, £105; (*p*) Salters' Company Cancer Research Scholarship, £100; and (*q*) Cancer Research Scholarship, £60.

ST. THOMAS'S HOSPITAL.—This hospital received its present charter from King Edward VI., but as a monastic institution was in existence prior to the year 1207. The building occupies a unique position by the river, opposite the Houses of Parliament, and contains 604 beds. The in-patients last year numbered 7316, whilst the number of attendances as out-patients, including the casualty and light departments, was 240,277. There are departments for the treatment of women, children, the eye, ear, nose and throat, skin, and teeth. Departments for light treatment, X rays, and physical exercises are also special features. Exceptional facilities are offered in the hospital laboratories for the study of general pathology, clinical pathology, and of treatment by serums and vaccines. Surgical operations take place in the main theatres every day except Saturdays at 2 P.M. Clinical teaching in the wards, out-patients' and special departments is available every day of the week. Clinical lectures are delivered every Wednesday during the sessions. All appointments in the hospital are open to students without extra fee. Casualty officers and resident anæsthetists, house physicians, house surgeons, obstetric house physicians, ophthalmic house surgeons, and out-patient officers are appointed and hold office for six months. They are provided with rooms and commons in the hospital free of expense. Clinical assistants to all the special departments are appointed every three months; they

are non-resident. A resident assistant physician and a resident assistant surgeon, at a salary of £100 each, are appointed biennially; also four hospital registrars (medical, surgical, obstetric, and ophthalmic), the two former receive a salary of £100 and the two latter £50. An assistant in the clinical laboratory, at a salary of £137 10*s*. per annum, and an assistant pathologist, at a salary of £137 10*s*. are from time to time appointed. Appointments open to students before qualification: Clinical clerks and dressers for in- and out-patients are selected from students who have completed their third year's work. The accident dressers are provided with board and lodging during their periods of special duty. Every student acts as clerk in the post-mortem room and in one of the pathological laboratories, takes his turn on maternity duty under proper supervision in the maternity ward, containing 20 beds, which affords students full facilities for maternity training (this obviates any necessity for seeking instruction elsewhere, and fully prepares the student for the extern maternity practice of the hospital district), and is practically instructed in the administration of anæsthetics by one of the hospital anæsthetists. On completion of his term as clerk or dresser he is expected to fill appointments in one or more of the special departments. In their earlier years of study students are selected as assistants to the lecturers in the preliminary and intermediate subjects. The Medical School is fully equipped for the teaching of all subjects of the curriculum. A fine museum and large library are at the disposal of the students. There are three lecture theatres, an unusually large and well-ventilated dissecting-room, and special laboratories for biology, chemistry, physics, physiology, and pathology. The post-mortem room, where demonstrations are given every day, is ventilated by the electric fan and provided with cold storage. The Students' Club comprises a spacious restaurant and magnificent smoking and reading room. There is no occasion for students to leave the hospital buildings during working hours. The athletic ground of the Amalgamated Clubs at Chiswick is over nine acres in extent and is easily accessible from Waterloo Station. The curriculum is arranged to meet the requirements of all the Examining Bodies. Special classes are held for the examinations at the University of London and for the First and Final Fellowship Examinations of the Royal College of Surgeons of England. Tutorial classes in all subjects precede the various examinations. There is a special course for the Diploma in Public Health. The hospital is easily accessible from all parts. It is close to the Waterloo and Westminster Bridge Stations (L. & S.W., Bakerloo, and District Railways). Electric trams which pass the doors connect it with all parts of South London. A register of lodgings and a list of medical men and others who are willing to receive boarders is kept by the secretary, Mr. G. Q. Roberts, who will give any further information required.

Fees.—The annual composition fee is 30 guineas, covering all tutorial classes—in addition to a fee on entrance. Post-graduate study is afforded to qualified practitioners by a joint ticket which admits to the practice of 14 hospitals (general and special) on terms which may be ascertained from the secretary.

Staff.—Consulting Physicians: Dr. Harley and Dr. Sharkey. Consulting Surgeons: Mr. S. Jones and Mr. B. Pitts. Consulting Obstetrical Physician: Dr. Gervis. Consulting Ophthalmic Surgeons: Mr. Liebreich and Mr. Nettleship. Consulting Anæsthetist: Mr. W. Tyrrell. Consulting Dentist: Mr. C. E. Truman. Physicians: Dr. Acland, Dr. Hawkins, Dr. Mackenzie, Dr. Turney, and Dr. Perkins. Surgeons: Mr. G. H. Makins, C.B., Mr. Battle, Mr. Ballance, M.V.O., and Mr. Robinson. Physicians to Out-patients: Dr. Dr. Box, Dr. Russell, Dr. Buzzard, and Dr. Cassidy. Surgeons to Out-patients: Mr. Cuthbert S. Wallace, Mr. E. M. Corner, Mr. Percy W. G. Sargent, and Mr. C. A. R. Nitch. Obstetric Physician: Dr. Tate. Obstetric Physician to Out-patients: Dr. Fairbairn and Dr. Hedley. Ophthalmic Surgeons: Mr. Lawford and Mr. Fisher. Physician for Diseases of Children: Dr. Box. Surgeon for Diseases of Children: Mr. C. A. R. Nitch. Surgeon for Diseases of the Throat: Mr. W. G. Howarth. Physician for Diseases of the Skin: Dr. E. Stainer. Surgeon for Diseases of the Ear: Mr. Marriage. Dental Surgeon: Mr. R. McKay. Resident Assistant Physician: Dr. De Wesselow. Resident Assistant Surgeon: Mr. C. M. Page. Anæsthetists: Dr. H. Low, Dr. Bevan, Dr. Mennell, Dr. Hedley, and Dr. Howitt. Pharmaceutist: Mr. J. A. Jennings. Curator of Museum: Mr. S. G. Shattock. Director of Laboratories: Mr. L. S. Dudgeon. Superintendent of X Ray Department: Dr. Greg. Physical Exercise Department: Mr. R. Timberg.

Lecturers and Demonstrators.—Anatomy: Mr. F. G. Parsons and Dr. Wood-Jones. Chemistry: Dr. Le Sueur. Physiology: Dr. E. Mellanby and Dr. A. Mavrogordato. Biology: Mr. Cutting. Pathology and Bacteriology: Mr. Shattock and Mr. Dudgeon. Surgery: Mr. Battle and Mr. Robinson. Medicine: Dr. Sharkey and Dr. Mackenzie. Practical and Operative Surgery: Mr. Robinson, Mr. Wallace, and Mr. Corner. Comparative Anatomy: Mr. Parsons. Applied Anatomy: Dr. Box. Anæsthetics: Dr. Low. Physics: Mr. Brinkworth. Clinical Medicine: The Physicians. Clinical Surgery: The Surgeons. Midwifery and Diseases of Women: Dr. Tate and Dr. Fairbairn. Diseases of the Eye: Mr. Lawford and Mr. Fisher. Pharmacology and Therapeutics: Professor Dixon. Throat Disease: Mr. W. G. Howarth. Obstetrical Demonstrators: Dr. Fairbairn and Dr. Hedley. Practical Medicine: Dr. Perkins, Dr. Box, Dr. Russell, and Dr. Cassidy. Surgical Classes: Mr. Wallace, Mr. Corner, Mr. Sargent, Mr. Fisher, and Mr. Shattock. Forensic Medicine and Toxicology: Dr. E. Smith and Dr. Haas. Mental Diseases: Dr. R. Percy Smith. Public Health: Professor Simpson, C.M.G. Tropical Medicine: Dr. Sandwith. Instruction in Vaccination by Dr. Cope. Dean of the School: Dr. E. Stainer. Sub-Dean: Dr. C. R. Box. Secretary: Mr. G. Q. Roberts, from whom any further information may be obtained.

Scholarships and Prizes.—At this school there are five Entrance Scholarships—namely, two in Arts, equivalent to the tuition fees for the first medical examination; two in Natural Science of the value of £150 and £60 respectively, to be taken out in tuition fees; and the University Scholarship of £50 in Anatomy, Physiology, and Chemistry. The money value and subjects of examination of the remainder are as follows:—(*a*) and (*b*), two College Prizes, one for second-year students and one for third-year students, £10 and £5 respectively; (*c*) William Tite Scholarship for second-year students, £25; (*d*) and (*e*), Musgrove Scholarship or (alternately) Peacock Scholarship each for third-year students and tenable for two years, £35 each; (*f*) three College Prizes for fifth-year students of £10 each and three of £5 each; (*g*) Cheselden Medal, Surgery and Anatomy; (*h*) Mead Medal, Medicine, Pathology, and Hygiene; (*i*) Toller Prize, Medicine, Pathology, and Hygiene; (*j*) Bristowe Medal, Pathology and Morbid Anatomy; (*k*) Solly Medal and Prize, biennially, Surgical Reports; (*l*) Medal for the most distinguished fifth-year student; (*m*) Wainwright Prize, Medicine, Pathology, and Hygiene; (*n*) Hadden Prize, Pathology; (*o*) Beaney Scholarship, £50 biennially, Surgery and Surgical Pathology; (*p*) Sutton Sams Prize, biennially, reports of cases in Obstetric Medicine; (*q*) Grainger Testimonial Prize, £15, Anatomy and Physiology; (*r*) Salters' Company Research Fellowship, tenable for three years, £100 annually, Pharmacology; and (*s*) Louis Jenner Research Scholarship, tenable for two years, £60 annually, Pathology.

UNIVERSITY COLLEGE, LONDON.—University College has been constituted a University centre for the teaching of medical sciences. The College Faculty of Medical Sciences comprises the Departments of Physics, Chemistry, Botany, and Zoology (the Preliminary Medical Sciences); also the Departments of Anatomy, Physiology, and Pharmacology (the Intermediate Medical Sciences), and the Departments of Hygiene and Public Health and of Pathological Chemistry (Post-graduate Study).

Faculty of Medical Sciences.—Composition fees.—For the courses required by the University of London. 1. For the First Medical (Preliminary Scientific) Course, 26 guineas, entitling to one attendance and to the privileges of the Union Society (including the use of the gymnasium and the athletic ground at Perivale) for one session. 2. For the Second Medical (Intermediate) Course, 58 guineas if paid in one sum; 63 guineas if paid in two instalments of 32 guineas and 31 guineas respectively. This fee entitles to attendance on Anatomy and Physiology during three years and to one attendance on Organic and Applied Chemistry, Pharmacology, and Materia Medica, and to the privileges of the Union Society (including the use of the gymnasium and the athletic ground at Perivale) for two sessions.

For the medical education required by the Examining

Board in England and the Society of Apothecaries. First examination, Parts I., II., III., 21 guineas, entitling to one attendance and to the privileges of the Union Society (including the use of the gymnasium and the athletic ground at Perivale) for one session. First examination, Part IV., and second examination, 58 guineas if paid in one sum, and 63 guineas if paid in two instalments of 32 guineas and 31 guineas respectively. This fee entitles to attendance during three years and to the privileges of the Union Society (including the use of the gymnasium and the athletic ground at Perivale) for two sessions.

Professors and Lecturers.—1. First Medical (Preliminary Scientific) Course.—Chemistry:—Professor: Sir William Ramsay, K.C.B., F.R.S.; assistant professors: Samuel Smiles, D.Sc., N. T. M. Wilsmore, D.Sc., and R. W. Gray, Ph.D.; teachers of chemistry to medical students: R. H. Aders-Plimmer, D.Sc., and W. B. Tuck, D.Sc.; demonstrator: H. J. Page. Physics:—Professor: F. T. Trouton, F.R.S.; assistant professor: A. W. Porter, B.Sc.; assistants: N. Eumorfopoulos, B.Sc., A. O. Rankine, D.Sc., and D. O. Wood, B.Sc. Botany:—Professor: F. W. Oliver, M.A., D.Sc., F.R.S.; assistant professor: T. G. Hill, A.R.C.S. Zoology:—Professor: J. P. Hill, D.Sc.; assistants: W. N. F. Woodland, D.Sc., and C. H. O'Donoghue, B.Sc. 2. Second Medical (Intermediate) Course.—Anatomy:—Professor: G. D. Thane, LL.D.; assistant and curator of the museum: D. E. Derry, M.B., Ch.B.; demonstrators: H. T. Mant, M.S., F.R.C.S., and E. K. Martin, M.B., B.S., F.R.C.S.; assistant demonstrators: L. S. B. Tasker and G. B. King. Physiology:—Professor: E. H. Starling, M.D., F.R.S.; assistant professors: W. M. Bayliss, D.Sc., F.R.S., G. A. Buckmaster, M.D., and R. H. Aders-Plimmer, D.Sc. Pharmacology:—Professor: A. R. Cushny, M.D., F.R.S. Organic Chemistry:—Professor: J. N. Collie, F.R.S.; assistant professor: Samuel Smiles, D.Sc.

Scholarships and Prizes.—At University College the various exhibitions, prizes, medals, &c., which are given have a relation to medical study. The first three items on the present list require a complete intermediate course at University College. The money value and subjects of examination are as follows:—(*a*) The Bucknill Scholarship, 135 guineas; (*b*) and (*c*) two Entrance Exhibitions, 55 guineas each, Chemistry, Physics, Botany, and Zoology; (*d*) Cluff Memorial Prize, £15 biennially, Anatomy, Physiology, and Chemistry; (*e*) Schäfer Prize in Physiology, £18 triennially; (*f*) Sharpey Physiological Scholarship, £105, Biological Sciences; (*g*) Morris Bursary for sons of deceased professional men, by nomination, tenable for two years, £16 a year; and (*h*) five Gold and five Silver Medals awarded annually in various departments.

UNIVERSITY COLLEGE HOSPITAL MEDICAL SCHOOL.—Dean: Raymond Johnson, B.S., F.R.C.S. Vice-Dean: G. F. Blacker, M.D., F.R.C.P., F.R.C.S. Secretary: L. R. Thomas. Fees for Preliminary and Intermediate Course: See under University College. For the Final M.B., B.S. (London) Course, 80 guineas if paid in one sum, 82 guineas if paid in two instalments, as follows—first year, 50 guineas; second year, 32 guineas. This fee entitles to attendance on Lectures and Hospital Practice during three years and to one attendance on Practical Pathology and Practical Surgery. Vaccination and attendance at a Fever Hospital are not included. Students who obtain a medical qualification within three years of the time of commencing this course are not required to pay an additional fee for further attendance. This course of instruction is also suitable for the corresponding examinations at the Universities of Oxford, Cambridge, and Durham, and for the medical education required by the Examining Board in England and the Society of Apothecaries.

There are over 300 beds in the hospital.

Special Departments, Clinical or Laboratory Facilities.—Those who are desirous of carrying out original research in Pathology, including Morbid Anatomy, Bacteriology, Experimental Pathology, and Chemical Pathology are admitted to work in the laboratories of the school by the Director of Pathological Studies and Research. A special course of instruction is given for preparation for the examinations for Diplomas in Public Health of the various universities and examining bodies; also special courses of Lectures and Demonstrations in Anæsthetics, Diseases of the Eye, Ear, Nose, and Throat, Skin, and Diseases of the Teeth, in Electrical and Radioscopic Diagnosis and Treatment, and in Clinical and Tropical Pathology. These courses are designed for senior students and graduates.

Appointments tenable by Students.—Clerkships and dresserships to the physicians, surgeons, anæsthetist, and pathologist are allotted amongst the students of the hospital. Maternity students are appointed each month and reside in the Students' House connected with the Medical School and Hospital. Eight house physicians and house surgeons, four senior and four junior obstetric assistants are selected annually by examination from among the senior students who have a medical qualification. The house physicians and house surgeons reside free in the hospital for six months, and the senior obstetric assistants for three months. In addition to these posts there are certain special appointments which are vacant from time to time and are filled by senior students of the hospital: 1. The Resident Medical Officer. This officer is appointed for a period of two years and is chosen from amongst the more senior recent residents of the hospital. 2. The Surgical Registrar is also chosen from among the more senior recent residents of the hospital. 3. The Obstetric Registrar. 4. A Casualty Medical Officer and a Casualty Surgical Officer are appointed, each for a period of six months. 5. Deputy Anæsthetists. During the absence of one or another of the Anæsthetists in the summer months a senior qualified student is appointed as a substitute and is granted a special certificate.

Museum of Pathological Anatomy.—The Museum, a spacious and well-lighted room, is open for study from 9 A.M. to 5 P.M. The collection is divided into three sections—medical, surgical, obstetrical and gynæcological. The surgical section is a particularly complete one and contains examples of every variety of surgical disease and injury. Diseases of the skin are well illustrated by a number of wax models which are conveniently displayed in glass cases. The obstetrical and gynæcological section is very complete. Microscopic sections of most of the specimens in the Museum have been prepared and are available for the use of students on application to the Curator. The Museum contains 1100 admirable paintings by Sir Robert Carswell and Sir Charles Bell and a collection of old surgical instruments formerly belonging to Robert Liston.

The Anatomical Museum of the University of London, University College, is open to all students of University College Hospital and Medical School on the recommendation of the School Committee.

The Medical Library is open daily for the purposes of study to every student of the Medical School from 9 A.M. to 5 P.M., Saturdays 9 A.M. to 1 P.M. It contains about 12,500 works on medical subjects, including all the current text-books and works of reference required for study or research.

The Medical Society of University College Hospital Medical School exists for the dual purpose (1) of promoting the study of Medical and Surgical Science, and (2) of promoting social intercourse among its members. All Students of the Medical School are eligible for membership. Meetings are held once a fortnight for the purpose of discussing subjects connected with the study of medicine and the allied sciences and for the exhibition of cases of pathological interest. One room in the Medical School is specially reserved as a Reading Room and is provided with current medical works and periodicals. The society also possesses an osteological and a pathological collection for the use of its members. In its social aspect the society includes various athletic clubs and has the management of three rooms on the ground floor of the Medical School, which are supplied with newspapers, magazines, writing materials, chess- and draught-boards, &c., solely for the use of its members. The society also superintends the commodious gymnasium of the Medical School. The Athletic Ground, which is used in conjunction with the Union Society of the University of London University College, is situated near the Great Western Railway station at Perivale and is within easy reach of the Hospital and School, about 35 minutes by train from Gower-street station. The following clubs are connected with the society: Cricket Club, Rugby Football Club, Association Football Club, Hockey Club, and Lawn-Tennis Club. The society also has the use of the College racquets and fives courts for its members. The affairs of the society are conducted by a committee elected annually by the members.

Residence of Students.—A register of boarding residences is kept in the office of the Medical School for the convenience of students; these residences are not under the control of the school authorities. The Students' House in University-street contains large and comfortable rooms. The

Maternity Students occupy them on payment of a moderate charge.

Private Instruction.—Gentlemen who desire assistance in their studies should consult the Dean, Professors, or Lecturers.

Hospital Staff.—Consulting Physicians: Sir William R. Gowers, Dr. H. C. Bastian, Sir John Williams, Bart., Dr. F. T. Roberts, and Sir Thomas Barlow, Bart. Physicians: Sir John Rose Bradford, Dr. Sidney Martin, Dr. J. Risien Russell, Dr. H. Batty Shaw, and Dr. F. J. Poynton. Assistant Physicians: Dr. C. Bolton and Dr. T. R. Elliott. Obstetric Physicians: Dr. H. R. Spencer and Dr. G. F. Blacker. Physician to Skin Department: Dr. A. M. H. Gray. Consulting Surgeons: Sir John Tweedy (Ophthalmic) and Sir Victor Horsley. Surgeons: Mr. A. E. Barker, Mr. R. J. Godlee, Mr. Bilton Pollard, and Mr. Raymond Johnson. Assistant Surgeons: Mr. Wilfred Trotter and Mr. H. Morriston Davies. Ophthalmic Surgeons: Mr. Percy Flemming and Mr. J. H. Parsons. Professor and Lecturer on Public Health: Dr. Henry R. Kenwood. Dental Surgeons: Mr. Sidney Spokes and Mr. H. J. Relph. Anæsthetists: Dr. Dudley Buxton and Dr. H. J. Scharlieb. Assistant Anæsthetist: Dr. A. Beresford Kingsford. Surgical Registrar: Mr. G. E. O. Williams. Resident Medical Officer: Dr. E. M. Cowell, B.S., F.R.C.S. Pathologist: Mr. T. W. P. Lawrence. Officer in Charge of Electro-Radiographic Department: Mr. R. H. Cooper. Pharmacist: Mr. R. R. Bennett.

Teaching Staff.—Medicine—The Principles and Practice of Medicine: Dr. Sidney Martin. Clinical Medicine: Sir John Rose Bradford, Dr Sidney Martin, Dr. J. Risien Russell, Dr. H. Batty Shaw, Dr. F. J. Poynton, Dr. C. Bolton, and Dr. T. R. Elliott. Therapeutics: Dr. H. Batty Shaw. Surgery—The Principles and Practice of Surgery: Mr. Arthur E. J. Barker. Clinical Surgery: Mr. Arthur E. J. Barker, Mr. Rickman J. Godlee, Mr. Bilton Pollard, Mr. Raymond Johnson, Mr. Wilfred Trotter, and Mr. H. Morriston Davies. Practical Surgery: Mr. Raymond Johnson and Mr. H. Morriston Davies. Surgical Anatomy: Mr. H. T. Mant. Midwifery and Gynæcology—Dr. H. R. Spencer. Clinical Midwifery and Gynæcology: Dr. H. R. Spencer and Dr. G. F. Blacker. Diseases of Childhood: Dr. F. J. Poynton, Mr. Raymond Johnson, Mr. Percy Flemming, and Mr. Herbert Tilley. Pathology and Morbid Anatomy—General Pathology: Dr. Charles Bolton. Practical Pathology: Dr. F. H. Thiele, Mr. T. W. P. Lawrence, Mr. D. Embleton, and Mr. S. H. Warren. Laboratory and Special Instruction: Dr. Charles Bolton. Chemical Pathology and Clinical Pathology: Dr. F. H. Thiele. Museum of Pathological Anatomy and Post-mortem Examination: Mr. T. W. P. Lawrence. Forensic Medicine: Dr. F. J. Poynton. Diseases of the Eye—Ophthalmic Medicine and Surgery: Mr. Percy Flemming. Clinical Ophthalmology: Mr. Percy Flemming and Mr. J. Herbert Parsons. Diseases of the Ear and Throat: Mr. Herbert Tilley. Diseases of the Skin: Dr. A. M. H. Gray. Psychiatry: Mr. Bernard Hart. Dental Surgery: Mr. Sidney Spokes and Mr. H. J. Relph. Instruction in the Use of Anæsthetics: Dr. Dudley W. Buxton. Electro-radiographic Department: Mr. R. Higham Cooper. Practical Pharmacy: Mr. R. R. Bennett.

Scholarships and Prizes.—At this School the first two Scholarships (*a*) and (*b*) require a complete course at University College and University College Hospital Medical School; the second two (*c*) and (*d*) require a final course at the Medical School. The money value and subjects of examination are as follows:—(*a*) Entrance Scholarship, Bucknill, 135 guineas, Chemistry, Physics, Botany, and Zoology; (*b*) Epsom Free Medical Scholarship, subjects of Preliminary Scientific Examination and nomination by Epsom College; (*c*) and (*d*) two Entrance Exhibitions, 80 guineas each, Anatomy and Physiology; (*e*) Graham Scholarship in Pathology £200 per annum for two years, awarded by the Senate of the University of London; (*f*) Atkinson Morley Scholarship, tenable for three years, £45 per annum, Surgery; (*g*) Atchison Scholarship, tenable for two years, £55 per annum; (*h*) Filliter Exhibition, £30, Pathology; (*i*) Erichsen Prize, £10 10*s*., Practical Surgery; (*j*) two Senior and two Junior Fellowes Clinical Medals for Clinical Medicine; (*k*) two Liston Gold Medals for Clinical Surgery; (*l*) Alexander Bruce Gold Medal for Pathology and Surgery; and (*m*) Tuke Silver and Bronze Medals for Pathology.

WESTMINSTER HOSPITAL.—The hospital contains 215 beds and affords relief to upwards of 2000 in-patients and 30,000 out-patients annually. There are separate departments for Diseases of the Eye, Ear, Skin, Teeth, and Throat, for Orthopædic practice, for Diseases of Women, for Diseases of Children, for Radiography, and for the Light Treatment. The Anatomical, Pathological, and Materia Medica Museums are open to all students of the school.

A medical and a surgical registrar, each with a salary of £50, are appointed annually. Two house physicians, three house surgeons, and a resident obstetric assistant are appointed for six months after examination, and are provided with rooms and commons; also one assistant house physician and one assistant house surgeon with commons only. Clinical assistants to the assistant physicians and assistant surgeons, and to the officers in charge of special departments, are appointed from among qualified students of the hospital.

By a scheme for the concentration of the teaching of the preliminary and intermediate subjects of the curriculum, which has the support of the London University, an arrangement has been made by the Westminster School for the teaching of these subjects at King's College. Students, however, join the Westminster Medical School as formerly and may compete for Entrance Scholarships as heretofore.

There is laboratory accommodation for practical work in Chemistry, Physics, Biology, Anatomy, Physiology, Histology, Pathology, and Bacteriology, and a new Clinical Laboratory has recently been erected. Facilities for research are afforded in all the laboratories.

For out-door recreation the following clubs exist: the Athletic Sports Club, the Cricket, Lawn Tennis, and Swimming Clubs, and the Rugby and Association Football Clubs. For in-door recreation there are the Students' Club, the Chess Club, and the Guthrie Society, the last-named being a debating club. These clubs and societies together constitute the Clubs Union, for membership of which students are not required to pay, the expense being covered by the entrance fee to the school.

Staff.—Consulting Medical Staff: Sir Bryan Donkin and Sir William H. Allchin. Consulting Surgical Staff: Mr. Richard Davy, Mr. G. Cowell, and Mr. N. C. Macnamara. Medical In-patient Staff: Dr. de Havilland Hall, Dr. W. Murrell, and Dr. R. G. Hebb. Obstetric Physician: Dr. G. H. Drummond Robinson. Surgical In-patient Staff: Mr. C. Stonham, Mr. W. G. Spencer, and Mr. A. H. Tubby. Medical Out-patient Staff: Dr. A. M. Gossage, Dr. Purves Stewart, Dr. Eric Macnamara, and Dr. Carmalt-Jones. Physician for Diseases of the Skin: Dr. T. Colcott Fox. Assistant Obstetric Physician: Dr. S. Dodd. Surgical Out-patient Staff: Mr. W. Turner, Mr. Arthur Evans, Mr. Rock Carling, and Mr. J. M. G. Swainson. Surgeon in Charge of the Throat Department: Mr. P. R. W. De Santi. Ophthalmic Surgeon: Mr. G. Hartridge. Surgeon in charge of the Orthopædic Department: Mr. A. H. Tubby. Surgeon in charge of the Ear Department: Mr. P. R. W. De Santi. Dental Surgeons: Mr. C. W. Glassington and Mr. E. Gardner. Administrators of Anæsthetics: Dr. N. W. Bourns and Dr. V. B. Orr. Assistant Anæsthetist: Dr. Cecil Hughes. Physician Pathologist: Dr. R. G. Hebb. Assistant Pathologist and Curator of Museum: Dr. J. A. Braxton Hicks. Medical Registrar: Dr. de Souza. Surgical Registrar: Mr. R. Farrant. Pharmacist: Mr. A. E. Tanner. Secretary: Mr. S. M. Quennell.

Lecturers.—Clinical Medicine: Sir William Allchin, Dr. Hall, Dr. Murrell, and Dr. Hebb. Clinical Surgery: Mr. Stonham, Mr. Spencer, and Mr. Tubby. Clinical Gynæcology: Dr. Drummond Robinson. Medicine: Dr. Murrell, Dr. Hebb, Dr. Gossage, Dr. Purves Stewart, Dr. Macnamara, Dr. Duncan, and Dr. Carmalt-Jones. Diseases of the Skin: Dr. Colcott Fox. Insanity: Dr. Stoddart. Surgery: Mr. Spencer. Ophthalmic Surgery: Mr. Hartridge. Surgery of the Throat and Nose: Mr. De Santi. Orthopædic Surgery: Mr. Tubby. Aural Surgery: Mr. De Santi. Dental Surgery: Mr. Glassington. Anæsthetics: Dr. Bourns. Operative Surgery: Mr. Turner. Surgical Anatomy: Mr. Arthur Evans. Practical Surgery: Mr. Rock Carling (Dean of the school) and Mr. Swainson. Surgical Pathology: Mr. Turner. Midwifery and Diseases of Women: Dr. Drummond Robinson. General Pathology and Morbid Anatomy: Dr. Hebb. Post-mortem Demonstrations: Dr. Hebb. Materia Medica, Therapeutics, and Pharmacology: Dr. Dixon. Demonstrator of Practical Pharmacy: Mr. A. E. Tanner. Forensic Medicine: Dr. Bernstein. Toxicology: Dr. H. Wilson Hake. Public

Health: Dr. S. Monckton Copeman. Bacteriology: Dr. Bernstein. Anatomy: Dr. Waterston. Demonstrators of Practical Anatomy: Mr. Ritson and Mr. Hickey. Physiology: Dr. Halliburton. Practical Physiology and Histology: Dr. Halliburton, Dr. Lyle, and Dr. Rosenheim. Biology: Dr. Bottomley and Dr. Dendy. Chemistry and Practical Chemistry: Dr. Thomson, Mr. Jackson, and Mr. Kirkaldy. Physics: Dr. Barkla, Dr. Allen, Mr. Nicol, and Dr. W. Wilson. Secretary and Librarian: Mr. W. Fryer.

Scholarships and Prizes.—The following Entrance Scholarships are offered for competition:—Winter Session: (*a*) Arts Scholarship, the "Guthrie," £60. (*b*) Science Scholarships: Natural Science Scholarship, £60; Chemistry and Physics Scholarship, £30; and Two Scholarships in Anatomy and Physiology, £50 each. (*c*) Epsom Scholarship: Free Medical education to a Foundation Scholar of Epsom College, or a Scholarship of 60 guineas to a pupil who has passed the First Examination of the University of London for Medical Degrees in July of the current year. The entrance fee is payable by the Epsom Scholar. The presentation entitles him to remission of five consecutive annual payments. Summer Session: The Governors' Scholarship, for Chemistry and Physics, £40; and Two Scholarships in Anatomy and Physiology, £50 each. During the period of study the following prizes may be competed for: Sturges Prize in Clinical Medicine, about £6, Notes of Cases; Clinical Surgery Prize, £5, Notes of Cases; Chadwick Prize, £21 in books or instruments, Medicine and Surgery, including Pathology and Applied Anatomy and Physiology; Frederic Bird Medal and Prize, open to Fourth-year Students, £14 in medal and books or instruments—Midwifery, Diseases of Women, Medicine, and Pathology; Abrahams Prize in Clinical Pathology, 5 guineas, a Paper and Tests in Practical Work; Alfred Hughes Memorial Prize, open to Second year Students, about £5 in books or instruments—Anatomy; Carter Gold Medal and Prize for Botany, open to Students of not more than three years' attendance, gold medal and books of the joint value of £15; Jelf Medal awarded to Third-year Students; Second-year Scholarship, £20, Elementary Anatomy, Physiology, Histology, and Organic Chemistry; Daniell Scholarship, tenable for two years, £20, Chemistry; Rabbeth Scholarship, open to First-year Students, £20, Class Examinations in the Preliminary Scientific Course; and the Sambrooke King's College Scholarship in Science, value £25.

LONDON (ROYAL FREE HOSPITAL) SCHOOL OF MEDICINE FOR WOMEN, 8, Hunter-street, Brunswick-square, W.C.—The fee for the medical course for the degrees of the University of London and for the diplomas of the Royal Colleges of England, after the completion of the First Medical Examination Course, is £135 in one sum, or £145 in four instalments. The fee for the First Medical classes is £25. The fee for the course for the University of Durham, the Society of Apothecaries, and the Conjoint Colleges of Scotland, including Elementary Science, is £140 in one sum, or £150 in four instalments.

The hospital contains 165 beds, of which 78 are reserved for surgical, 64 for medical, 13 for gynæcological, six for ophthalmic, and four for isolation cases. The number of in-patients treated during the past year was 2225. There is also a department for attending women in their confinements at their own homes. Students can also attend the in-patient and out-patient practice of the New Hospital for Women.

Special classes for the First Medical Examination of the University of London are held and special courses of instruction in Anatomy, Physiology, and Practical Pharmacology are provided for students preparing for the Second Medical Examination of the University of London.

Students after qualification can hold at the Royal Free Hospital the posts of house physician, house surgeon, obstetric assistants, clinical assistants, anæsthetists and assistant anæsthetist, medical and surgical registrars, medical electrician, and museum curator; and at the Medical School the posts of demonstrators in the departments of Anatomy, Physiology, Chemistry, and museum curator. They can also hold posts at the New Hospital for Women, which is officered entirely by medical women.

The School buildings have been entirely rebuilt in recent years and there are spacious, well-equipped laboratories, which afford every facility for efficiency of teaching and practical work in all departments.

There are residential chambers at 8, Hunter-street, with accommodation for 17 students, and the Secretary can be consulted on the subject of other residences for students. There is a Tennis Club with a gravel court at the School, and also hockey, boating, and other clubs.

Staff.—Consulting Physician: Dr. S. West. Physicians: Dr. Harrington Sainsbury, Dr. J. W. Carr, and Dr. A. G. Phear. Assistant Physicians: Dr. W. P. S. Branson and Dr. Langmead. Consulting Surgeons: Mr. W. Rose and Mr. A. B. Barrow. Surgeons: Mr. J. Berry, Mr. E. W. Roughton, and Mr. W. H. Evans. Assistant Surgeons: Mr. T. Percy Legg and Mr. Cunning. Consulting Neurologist: Dr. Farquhar Buzzard. Consulting Physician for Diseases of Women: Mrs. Scharlieb, M.S., M.D. Physician for Diseases of Women: Mrs. Vaughan-Sawyer, M.S., M.D. Assistant Physician for Diseases of Women: Mrs. Willey, M.S., M.D. Ophthalmic Surgeon: Mr. H. Work Dodd. Surgeon for Diseases of Throat, Nose, and Ear: Mr. E. W. Roughton. Surgeon for Diseases of Skin: Mr. W. H. Evans. Dental Surgeon: Mrs. Handley-Read, L.R.C.P. & S., L.D.S. Senior Resident Medical Officer: Mr. A. C. Sturdy. Registrars: Miss Haslam, M.D. Brux., L.S.A., and Miss Bolton, M.D., B.S. Anæsthetists: Mrs. Berry, M.D., B.S., and Miss Turnbull, M.D., B.S. Secretary: Mr. Reginald Garratt.

Lecturers.—At the School: Anatomy and Practical Anatomy: Mr. Parsons. Physiology and Practical Physiology: Miss Cullis, D.Sc. Chemistry: Miss C. de B. Evans, D.Sc. Practical Chemistry: Miss Widdows, B.Sc. Physics: Miss E. Stoney, M.A. Biology: Mr. Mudge, A.R.C.S. Pharmacology: Dr. R. H. P. Crawfurd. Practice of Medicine: Miss Cock, M.D., and Dr. J. W. Carr. Midwifery: Mrs. Scharlieb, M.S. Gynæcology: Mrs. Vaughan-Sawyer, M.D. Forensic Medicine: Dr. Hawthorne. Toxicology: Dr. Wilson Hake. Practice of Surgery: Mr. Roughton. Operative Surgery: Mr. Roughton. Ophthalmic Surgery: Mr. Percy Flemming. Pathology: Dr. W. d'Este Emery. Mental Pathology: Dr. Stoddart. Tropical Diseases: Sir Patrick Manson. Operative Midwifery: Miss McCall, M.D., Mrs. Vaughan-Sawyer, M.D., and Mrs. Willey, M.D., M.S. Demonstrators of Anatomy, Miss A. Seaton-Smith, M.D., B.S., and Miss M. A. Blair, M.D., B.S.; of Physiology, Mrs. Tribe B.Sc.; of Chemistry, Miss Laycock, B.Sc.; of Practical Pharmacology, Miss Buchanan, M.P.S. At the Royal Free Hospital: Clinical Medicine: Dr. Sainsbury and Dr. Carr. Clinical Surgery: Mr. Berry and Mr. Roughton. Clinical Obstetrics: Mrs. Willey, M.D., M.S. Pathology: Dr. Langmead. Bacteriology: Miss Chambers, M.D., B.S. Surgical Tutors: Mr. W. Evans, Mr. Legg, and Mr. Cunning. Medical Tutors: Dr. A. G. Phear and Dr. Branson. Demonstrator of Auscultation: Dr. Phear. Demonstrator of Practical Clinical Pathology: Miss Chambers, M.D., B.S. Practical Pathology: Miss G. Gazdar, M.B., B.S.

Dean of the School, Miss Cock, M.D.; Vice-Dean, Miss Aldrich-Blake, M.D., M.S.; Honorary Secretary, Dr. May Thorne; Secretary and Warden, Miss L. M. Brooks.

Scholarships and Prizes.—At this School candidates for the second item (*b*) on the following list must be (1) not more than 20 years of age on June 1st in the year of the examination; (2) resident in the Metropolitan Police district; (3) Matriculated Students of the University of London; and (4) in need of an Exhibition for the prosecution of their medical studies. The third item (*c*) is given as the result of an examination held by the University of London in June to a student who has passed the First or Second Medical Examinations of that University held in the previous July or the July following the examination. Candidates are expected to read for the M.B., B.S. degree of the University of London. The money value and subjects of examination are as follows: (*a*) Entrance Scholarship, £30, English, Latin, Arithmetic, Euclid, and Algebra; (*b*) St. Dunstan's Medical Exhibition, tenable for three years, extendible to five years, £60, English, Latin, Arithmetic, Euclid, and Algebra; (*c*) Bostock Scholarship, tenable for two or four years, and next to be awarded in June, 1915, £60; (*d*) Mabel Webb Research Scholarship, tenable for one year and renewable, £30, Physiology, Chemistry, or Pathology; (*e*) Fanny Butler Scholarship, tenable for four years; Candidates must be willing to work in connexion with the Church of England Zenana Missionary Society; next award in September, 1914, £14 10*s.*; (*f*) John Byron Bursary, tenable from two to four years, for students already in the School requiring assistance for the prosecution of their medical studies, application to the Secretary by March 31st; next

award in March, 1912, £20; (*g*) Helen Prideaux Scholarship, awarded every second year to a student who has become qualified during the two years immediately preceding the award, and to be spent in assisting the holder to further study, £40, Medicine, Surgery, Obstetric Medicine, and Pathology. Three Evans Prizes of £3 3*s*., £2 2*s*., and £1 1*s*. are given in alternate years on the results of the class examination in Midwifery, and a Durham Prize, value £5, is given in alternate years on the results of the class examination in Gynæcology, and a prize of £5 is awarded in alternate years on the results of the class examination in Midwifery and Gynæcology respectively. The Evans Prize for Operative Midwifery, value £5 5*s*., is awarded yearly. Prizes of £10 each are awarded yearly in Anatomy and Physiology. There is also a small fund from which assistance can occasionally be given to students and to graduates who specially require pecuniary help. Prizes and Certificates of Honour are awarded in each class at the end of the session.

UNIVERSITY OF DURHAM.

One Diploma, one Licence, and six degrees are conferred —viz., the Diploma in Public Health, the Licence in Dental Surgery, and the degrees of Bachelor of Medicine, Bachelor of Surgery, Master of Surgery, Doctor of Medicine, Bachelor of Hygiene, and Doctor of Hygiene. These degrees, Diploma, and Licence are open both to Men and Women.

For the degree of *Bachelor of Medicine* there are four professional examinations. The subjects of the First Examination are—Elementary Anatomy and Elementary Biology, Chemistry, and Physics. The subjects of the Second Examination are—Anatomy and Physiology. The subjects for the Third Examination are—Materia Medica and Pharmacy, Pathology, Medical Jurisprudence, Public Health, and Pathology and Elementary Bacteriology. The subjects of the Fourth Examination are—Medicine, Clinical Medicine and Psychological Medicine, Surgery and Clinical Surgery, Midwifery and Diseases of Women and Children.

It is required that at least one of the five years of professional education shall be spent in attendance at the University College of Medicine, Newcastle-upon-Tyne. Candidates who have passed the First and Second Examinations of the University will be exempt from First and Second Examinations of the Conjoint Board.

For the degree of *Bachelor of Surgery* every candidate must have passed the examination for the degree of Bachelor of Medicine of the University of Durham and must have attended one course of lectures on Operative Surgery and one course on Regional Anatomy. Candidates will be required to perform operations on the dead body and to give proof of practical knowledge of the use of surgical instruments and appliances.

For the degree of *Master of Surgery* candidates must not be less than 24 years of age and must satisfy the University as to their knowledge of Greek or German. In case they shall not have passed in one of these subjects at the Matriculation Examination for the M.B. degree they must present themselves at Newcastle-upon-Tyne for examination in it at one of the ordinary examinations held for this purpose before they can proceed to the higher degree of M.S. They must also have obtained the degree of Bachelor of Surgery of the University of Durham and must have been engaged for at least two years subsequently to the date of acquirement of the degree of Bachelor of Surgery, in attendance on the practice of a recognised hospital, or in the naval or military services, or in medical or surgical practice. The subjects of examination are:—Principles and Practice of Surgery, Surgical Pathology, Surgical Anatomy, Surgical Operations, Clinical Surgery.

For the degree of *Doctor of Medicine* candidates must be not less than 24 years of age and must satisfy the University as to their knowledge of Greek or German. In case they shall not have passed in one of these subjects at the Matriculation Examination for the M.B. degree they must present themselves at Newcastle-upon-Tyne for examination in it at one of the ordinary examinations held for this purpose before they can proceed to the higher degree of M.D. They must also have obtained the degree of Bachelor of Medicine of the University of Durham and must have been engaged for at least two years subsequently to the date of acquirement of the degree of Bachelor of Medicine in attendance on the practice of a recognised hospital, or in the military or naval services, or in medical and surgical practice. Each candidate must present an essay prepared entirely by himself, which must be typewritten, based on original research or observation, on some medical subject selected by himself, and approved of by the Professor of Medicine and must pass an examination thereon, and must be prepared to answer questions on the other subjects of his curriculum so far as they are related to the subject of the essay.

Doctor of Medicine (without residence).—The University of Durham has instituted a special examination whereby the degree of Doctor of Medicine may be obtained without residence. Candidates shall not be under 40 years of age and shall have been in active practice for 15 years as registered medical practitioners. They shall produce certificates of moral character from three registered members of the medical profession, and if they have not passed an examination in Arts previously to the Professional Examination in virtue of which they have been placed on the Register, they shall be required to pass in Classics and Mathematics. Candidates who have passed an examination in Arts previously to being placed on the Register are required to pass an examination in Latin. They will be examined in the Principles and Practice of Medicine, including Psychological Medicine, Hygiene, and Therapeutics, the Principles and Practice of Surgery, Midwifery, and Diseases of Women and Children, Pathology (Medical and Surgical), Anatomy (Medical and Surgical), Medical Jurisprudence, and Toxicology. The fee will be 50 guineas, of which 20 guineas will be retained if the candidate fails to satisfy the examiners.

Candidates for any of the above degrees, diploma or licence, must give at least 28 days' notice to Professor Howden, Secretary, College of Medicine, Newcastle-upon-Tyne. In the case of the M.D. (essay) examination candidates must send in their essays six weeks before the date of the examination.

Professors—Medicine: Sir G. H. Philipson, M.D., D.C.L. Surgery: J. Rutherford Morison, F.R.C.S. Physiology: F. A. Bainbridge, M.D. Anatomy: R. Howden, M.B. Midwifery: R. P. R. Lyle. M.D. Comparative Pathology: H. J. Hutchens, M R.C.S.

Scholarships and Prizes.—In connexion with this University the following scholarships and prizes are awarded:—(*a*), (*b*), (*c*), and (*d*), Four Scholarships of £25 a year each, tenable for four years; the examination will be the September Matriculation Examination. Candidates must take English, Latin, Arithmetic, Euclid, Algebra, Geography, English History, with Greek or German, or both. (See College Calendar for special books.) Open to candidates desirous of being admitted as Medical Students. The successful candidates must take out their entire curriculum at the University of Durham College of Medicine, Newcastle-upon-Tyne. (*e*) Pears Scholarship of £50 a year, tenable for three years; Matriculation Examination. —At the College of Medicine are: (*f*) Dickinson Scholarship, interest on £400 and gold medal; examination in Medicine, Surgery, Midwifery, and Pathology. Open to full students of the College of Medicine who have passed the third M.B. Examination. (*g*) Tulloch Scholarship, interest on £400; examination in Anatomy, Physiology, and Chemistry. No student is eligible who commenced his medical curriculum more than two academical years before the date of examination. (*h*) Charlton Memorial Scholarship, interest on £700; examination in Medicine. Open to full students of the College entered for the class on the Principles and Practice of Medicine. (*i*) Gibb Scholarship, interest on £500; awarded annually as a Scholarship in Pathology to full student who passes the best examination in that subject. No student is eligible after completion of his curriculum. (*j*) Luke Armstrong Memorial Scholarship, interest on £680: original essay on some subject in Comparative Pathology. (If no essay of sufficient merit be presented the scholarship may be awarded to the candidate who, in passing the first part of the Examination for the B.Hy. Degree, obtains the highest number of marks in Comparative Pathology during the year.) Open to all Graduates in Medicine or Hygiene and candidates for these degrees who have spent six months at the University and whose age does not exceed 30 years. (*k*) Stephen Scott Scholarship, interest on £1000; original essay on any Surgical subject. Open to any graduate in Medicine or Surgery of the University or any student of the College

of Medicine. Student's age must not exceed 30 years. (*l*) Heath Scholarship, interest on £4000. For 1912: Original Essay on Inflammations of Bone—excluding Tuberculous and Syphilitic. All Graduates in Medicine or Surgery of the University are eligible. (*m*) Gibson Prize, interest on £225; examination in subject of Midwifery and Diseases of Women and Children. Open to students who have attended one course of lectures on Midwifery and Diseases of Women and Children. (*n*) Turnbull Prize and Medal; examination in Surface Anatomy. Open to students at end of their second winter session.—At the Royal Infirmary is (*o*) Goyder Memorial Scholarship, interest on £325; awarded annually to student who most distinguishes himself in Clinical Medicine and Clinical Surgery at the Royal Infirmary.

Hygiene.—The regulations with regard to the degrees in Sanitary Science will be found under the section on Public Health.

Clinical Instruction.—THE COLLEGE OF MEDICINE, Newcastle-upon-Tyne.—A new wing has been added to accommodate the departments of physiology and bacteriology. It also contains a students' gymnasium and a set of Students' Union rooms. The new Royal Victoria Infirmary, containing upwards of 400 beds, was opened by His late Majesty King Edward VII. in 1906. In the new infirmary adequate accommodation is provided for the study of the various special subjects, in addition to the ordinary clinical work. The following Scholarships and Prizes are awarded annually:—Four University of Durham Scholarships, value £25, tenable for four years, for proficiency in Arts, awarded to full students in their first year. The Pears Scholarship, value £50 a year, tenable for three years (when vacant). The Dickinson Scholarship, value interest of £400, and a Gold Medal, for Medicine, Surgery, Midwifery, and Pathology. The Tulloch Scholarship, value the interest of £400, for Anatomy, Physiology, and Chemistry. The Charlton Scholarship, value the interest of £700, for Medicine. The Gibb Scholarship, value the interest of £500, for Pathology. The Goyder Memorial Scholarship (at the Infirmary), value the interest of £325, for Clinical Medicine and Clinical Surgery. The Luke Armstrong Memorial Scholarship, value the interest of £680, for Comparative Pathology. The Stephen Scott Scholarship in Surgery, value the interest of £1000. Heath Scholarship: The late Dr. George Yeoman Heath, President of the University of Durham College of Medicine, bequeathed the sum of £4000 to found a Scholarship in Surgery, the interest to be awarded every second year; the next award will be in 1912. The Gibson Prize, interest on £225, in the department of Midwifery and Diseases of Women and Children. The Turnbull Prize and Medal for Surface Anatomy. At the end of each session Prizes of Books are awarded in each of the regular classes. Assistant Demonstrators of Anatomy, Prosectors, and Assistant Demonstrators of Physiology and Pathology are elected yearly. Pathological Assistants, Assistants to the Dental Surgeon, Assistants in the Eye Department, Throat and Ear Department, and Skin Department, Clinical Clerks, and Dressers are appointed every three months.

NEWCASTLE-UPON-TYNE ROYAL VICTORIA INFIRMARY.—This Infirmary was founded in 1751 but has been recently rebuilt, the new hospital being opened in 1906. The number of beds is 430. The number of in-patients annually is 8000 and of out-patients 100,000. The medical students of the University of Durham attend the practice of this hospital. Clinical Lectures are delivered by the Physicians and Surgeons weekly and ward demonstrations are given daily. Tutorial classes are held by the Assistant Physicians and Assistant Surgeons weekly, and demonstrations are given in the several out-patient departments daily. Pathological demonstrations are given by the Pathologist daily or as opportunity occurs, and in the new buildings nothing has been spared in perfecting scientific equipment. In addition to medical and surgical in-patient and out-patient departments the following special departments are fully equipped for teaching students: Ophthalmic, Throat and Ear, Skin, Orthopædic, Gynæcological, Electrical, and Bacteriological. The hospital building contains the following laboratories: 1. Special Pathological Laboratory, attached to the post-mortem rooms. 2. Bacteriological Laboratory, in which all clinical bacteriological investigations are carried out—opsonic indices estimated with a view to treatment by vaccines and serums, &c. 3. There is in addition a Clinical Laboratory attached to each ward and to the out-patient department. There are five operating theatres in use in the hospital, three large theatres, a smaller one for emergencies, and an out-patient theatre. The surgical practice is especially good; more than 8000 surgical operations were performed in the last 12 months. Every facility is given to students to take out the full or any part of the hospital curriculum, and clerkships or assistantships in any of the several special departments are open to undergraduates or graduates for periods of from one to three months. There are 12 resident medical and surgical officers, three of whom are paid, and preference for these appointments is given to students who have fulfilled their curriculum in the hospital. The sessions open on April 19th and Oct. 2nd of each year. Applications for detailed information should be made to the Dean, Dr. W. E. Hume, at the hospital. The following is the staff of the hospital:—Physicians: Dr. David Drummond, Sir Thomas Oliver, Dr. T. Beattie, and Dr. W. E. Hume. Assistant Physicians: Dr. Horsley Drummond, Dr. Alfred Parkin, Dr. George Hall, and Dr. T. M. Allison. Surgeons: Mr. J. Rutherford Morison, Mr. A. M. Martin, Mr. H. B. Angus, and Mr. J. V. W. Rutherford. Assistant Surgeons: Mr. W. G. Richardson, Mr. J. W. Leech, Mr. John Clay, and Mr. G. G. Turner. Ophthalmic Surgeon: Mr. J. D. Wardale. Assistant Surgeon: Mr. T. Gowans. Throat and Ear Department: Surgeon: Mr. S. S. Whillis. Assistant Surgeon: Mr. W. F. Wilson. Gynæcological Department: Dr. R P. R. Lyle. Skin Department: Physician: Dr. Robert A. Bolam; Assistant Physician: Dr. D. W. Patterson. Orthopædic Department: Mr. A. M. Martin. Electrical Department: Dr. W. D. Arnison. Pathologist: Dr. Stuart McDonald. Assistant Pathologist: Mr. W. T. Sewell. Bacteriologist: Dr. H. J. Slade. Pathological and Analytical Chemist: Mr. P. P. Bedson, D.Sc. Anæsthetists: Dr. F. G. Armstrong, Dr. W. J. Phillips, Dr. H. H. Markham, and Dr. W. Seymour. Medical Registrars: Miss H. Gurney and Dr. T. C. Hunter. Surgical Registrars: Mr. J. W. Heslop, Mr. J. C. Stewart, Mr. R. J. Willan, Mr. Hamilton Drummond, and Mr. F. C. Pybus.

There are other institutions at which the student of medicine of the University of Durham can receive clinical instruction. Practical Midwifery can be studied at the Newcastle Lying-in Hospital. Instruction is given in Psychological Medicine at the Northumberland County Asylum, Morpeth. A special course of instruction is given in the City Hospital for Infectious Diseases by the Superintendent, the City Officer of Health, Dr. H. E. Armstrong.

NORTHUMBERLAND, DURHAM, AND NEWCASTLE INFIRMARY FOR DISEASES OF THE EYE, St. Mary's-place, Newcastle-on-Tyne.—Consulting Surgeon: Dr. F. Page. Staff Surgeons: Mr. A. S. Percival and Mr. H. P. Bennett. Assistant Surgeons: Dr. Stanley Robson. Honorary Anæsthetists: Dr. O. W. Ogden and Dr. T. H. Livingstone. House Surgeon: Dr. A. R. Gunn. **Matron**: Miss C. Crump. Secretary: Mr. Richard Smith, 61, Westgate-road, Newcastle-on-Tyne. Out-patients for 1910, 7859; in-patients, 314.

UNIVERSITY OF BIRMINGHAM.

The University of Birmingham grants the degrees of M.B., Ch.B., M.D., Ch.M., and also a degree and a diploma in Public Health. The course for the Bachelors' degrees extends over five years from the date of registration with the General Medical Council. As a rule the first four of these years must be spent in the University, but the Senate has power of recognising attendance at another University as part of the attendance qualifying for these degrees and of recognising examinations passed at such other Universities as exempting from the examinations in Chemistry, Physics, and Elementary Biology. In the case of such students at least three years must be spent in attendance upon classes at the University. The fifth year may be spent at any other school or schools of medicine recognised by the University. The students of the Medical Faculty can be members of the University Club, the University Athletic Club, and the University Officers' Training Corps, while they possess a guild—the Guild of Undergraduates—which is designed to be a recognised medium of communication between the teachers and the taught. The University Medical Society and the Dental Students' Society also offer opportunities of coöperation for mutual benefit.

Degrees of Bachelor of Medicine and Bachelor of Surgery.—The student must have passed either the Matriculation Examination of the University or one of the following

examinations. For the present the University will recognise any one of the following examinations, in lieu of its own Matriculation, in the case of medical students, provided always that such examination shall have included the subjects of English, Latin, Mathematics, and any one of the following: Greek, French, German, or any other modern foreign language, together with Chemistry or Experimental Mechanics, or some other branch of Experimental Physics, and that all the subjects have been passed at one examination: (*a*) the previous examination of the University of Cambridge; (*b*) Responsions of the University of Oxford; (*c*) the Preliminary or Matriculation Examination of a recognised University; (*d*) the (Higher) Certificate of the Oxford and Cambridge Examinations Board; (*e*) the Oxford or Cambridge Senior Local Examination. A Matriculation Examination will commence on Sept. 11th, 1911. First Examination.—Chemistry and Physics and Elementary Biology. Second Examination.—Anatomy and Physiology. Third Examination.—Pathology and Bacteriology, Materia Medica and Practical Pharmacy. Fourth Examination (at the end of the fourth year).—Forensic Medicine, Toxicology, Public Health, and Therapeutics. Two years' hospital work must have been accomplished. Final Examination.—Medicine, Surgery, Midwifery, Diseases of Women, Mental Diseases, and Ophthalmology. Attendance at a general hospital for a year after the passing of the fourth examination will be required, also attendance at a fever hospital and lunatic asylum. Vaccination instruction must be taken out and courses of Ophthalmology, Medical and Surgical Anatomy, and Operative Surgery.

Degrees of Doctor of Medicine and Master of Surgery.—At the end of one year from the date of having passed the final M.B., Ch.B. examination the candidate will be eligible to present himself for the higher degrees of either Doctor of Medicine or Master of Surgery or both.

Candidates for either of these degrees will be required to comply with the following regulations. Every candidate for the degree of M.D. shall present a thesis embodying observations in some subject embraced in one of the departments of the medical curriculum enumerated below, and in addition he will be required to pass a general examination in Principles and Practice of Medicine. It will be in the power of the Board of Examiners to exempt a candidate whose thesis is of exceptional merit from any part of these examinations.

A thesis may be presented in any of the following departments of study: (*a*) Anatomy, including Comparative Anatomy, (*b*) Physiology, (*c*) Human or Comparative Pathology, (*d*) Bacteriology, (*e*) Pharmacology, (*f*) Therapeutics, (*g*) Medicine, (*h*) Mental Diseases, (*i*) Preventive Medicine or Public Health, (*j*) Toxicology, (*k*) Legal Medicine, (*l*) Midwifery.

Candidates for the degree of Ch.M. are required to comply with the following regulations:—At the end of one year from the date of having passed the final M.B., Ch.B. Examination candidates will be eligible to present themselves for the higher degree of Master of Surgery. Candidates for this degree will be required to comply with the following regulations: 1. Every candidate shall present a thesis, embodying observations in some subject embraced in one of the departments of the medical curriculum enumerated below; in addition the candidates will be required to pass a general examination in Principles and Practice of Surgery and to perform operations on the cadaver. 2. It will be in the power of the board of examiners to exempt a candidate whose thesis is of exceptional merit from any part of these examinations. 3. The candidate may be examined in that department of the medical curriculum from which the subject of his thesis is chosen and the examiners may require to see the notes of original observations on which the thesis is based, (*a*) Surgery, (*b*) Pathology, (*c*) Bacteriology, (*d*) Gynæcology, (*e*) Ophthalmology.

Degree in Public Health.—For the regulations for this degree and for the diploma in the same subject see p. 641.

Fees.—Matriculation, £2; First Examination, £2; Second Examination, £2; Third Examination, £2; Fourth Examination, £2; Final Examination, £8; M.D. or Ch.M., £10.

Professors—Physics: J. H. Poynting, Sc.D., F.R.S. Chemistry: P. H. Frankland, Ph.D., F.R.S. Elementary Biology: F. W. Gamble, D.Sc., F.R.S. Medicine: R. Saundby, M.D., and A. H. Carter, M.D. Surgery: G. Barling, F.R.C.S., and Jordan Lloyd, F.R.C.S. Anatomy: Peter Thompson, M.D. Physiology: E. W. Wace Carlier, M.D. Therapeutics: Sir R. M. Simon, M.D. Forensic Medicine: J. T. J. Morrison, F.R.C.S. Hygiene and Public Health: A. Bostock Hill, M.D. Midwifery: E. Malins, M.D. Diseases of Women: Thomas Wilson, Ch.M., M.D., F.R.C.S. Pathology: R. F. C. Leith, F.R.C.P. Edin. Lunacy and Mental Disease: (Vacant.) Ophthalmology: Priestley Smith, F.R.C.S.

At the University of Birmingham the following Scholarships are awarded:—(*a*) Myers Travelling Studentship of £150, tenable for one year, awarded by vote of committee to M.B., Ch.B. Birm., B.Sc. candidates, tenable at one of certain German universities; (*b*) Ingleby Scholarship of £10, tenable for one year, awarded to the candidate at Final Examination obtaining highest "first-class" marks in the subjects of Midwifery and Disease of Women; (*c*) Sydenham Scholarship of £42, tenable for three years, award of Council to orphan sons of medical practitioners; (*d*) Sands Cox Scholarship of £42, tenable for three years, awarded to the candidate, not being more than 19 years of age, taking the highest marks at the July Matriculation; (*e*) Dental Scholarship of £37 10*s*., Open Competitive Examination in subjects learned during apprenticeship; (*f*), (*g*), (*h*), and (*i*) Four Queen's Scholarships of £10 10*s*. each, awarded to candidates taking highest "first-class" marks at Second, Third, Fourth, and Final M.B. Examinations; (*j*) George Henry Marshall Scholarship of £10, awarded annually, for the encouragement of Research Work in Ophthalmology; and (*k*) Russell Memorial Prize, a prize of books, value about £2, awarded annually to the student who, not being of more than six years' standing as a student of the School of Medicine of the University, shall pass the best examination in the subject of Nervous Diseases.

Clinical Instruction.—The medical students of the University receive their clinical instruction by attending the amalgamated practice of the General Hospital and the Queen's Hospital, details of which follow.

The clinical instruction of the Birmingham medical students is carried on under the direction of the University Clinical Board. The hospitals present an excellent field for clinical work, possessing more than 500 beds, treating annually 8000 in-patients and 100,000 out-patients. The students spend part of their curriculum in each hospital, and thus have every opportunity of acquiring a varied, full, and practical knowledge of their professional work. The curriculum is adapted in the first place to meet the needs of the students of the University of Birmingham, but it is also well adapted to the requirements of students preparing for the examinations of all other universities and licensing bodies. At the General Hospital there are open to the students the following appointments: A resident medical officer, elected annually (£100); a resident surgical officer, elected annually and eligible for re-election for three years (£100); a resident pathologist, elected for six months (£50); three surgical casualty officers, elected annually and eligible for re-election (£50); three house physicians and four house surgeons hold office for six months, receiving board, residence, and salaries at the rate of £50 a year; one house surgeon to the gynæcological, ophthalmic, and aural departments is elected every six months, receiving board, residence, and a salary of £50 a year; two assistant house surgeons are elected every three months, receiving board, residence, and salaries at the rate of £40 a year; a resident medical officer at the Jaffray Hospital, who is elected annually but is eligible for re-election, and who receives £150 a year; and a resident medical assistant at this hospital, who is not necessarily qualified, is provided with board and residence, and holds office for three months. At the Queen's Hospital there are open to the student the following appointments: Three house physicians, three house surgeons, and one obstetric and ophthalmic house surgeon, who hold office for six months and have salaries at the rate of £50 a year. Thirty-eight other appointments of varying value are at the City Workhouse and Workhouse Infirmary, at the Birmingham General and Branch Dispensaries, at the Birmingham Lunatic Asylums, at the City Fever Hospitals, at the Children's Hospital, at the Birmingham and Midland Eye Hospital, at the Orthopædic and Spinal Hospital, at the Maternity Hospital, and at the Ear and Throat Hospital.

THE BIRMINGHAM GENERAL HOSPITAL.—The General Hospital contains 342 beds, and of these 327 are in daily use, upwards of 5500 in-patients passing through the wards yearly. There are special wards for children, for gynæcological, septic and infectious cases, and special beds are reserved for eye, ear, and skin cases. Some

62,500 out-patients are treated there annually. The post-mortem department is in a separate building. It consists of a mortuary with a small viewing room, a post-mortem room proper, and laboratories for bacteriology and morbid histology. In addition there are separate rooms in the main building, adjoining the various medical and surgical wards, for clinical pathology and these are under the direction of special officers. There are four operating theatres, all designed and fitted on the most modern lines. In connexion with the hospital is the Jaffray Suburban Hospital of 56 beds at Gravelly Hill. The arrangements for clinical teaching at this hospital are very thorough. In addition to the clinical teaching given in the wards and out-patient department by the honorary staff medical and surgical tutorial classes are held for senior and junior students, while clinical instruction is given in all the special departments by the gentlemen in charge of them.

Staff of General Hospital.—Consulting Physician: Lord Ilkeston. Consulting Obstetric Officer: Dr. Edward Malins. Physicians: Dr. Robert Saundby, Sir Robert M. Simon, Dr. T. Stacey Wilson, and Dr. T. Sydney Short. Surgeons: Sir Thomas F. Chavasse, Mr. Gilbert Barling, Mr. William F. Haslam, and Mr. George Heaton. Obstetric Physician: Dr. Thomas Wilson. Ophthalmic Surgeon: Dr. D. C. Lloyd-Owen. Aural Surgeon and Laryngologist: Dr. F. W. Foxcroft. Physician in Charge of Skin Department: Dr. A. Douglas Heath. Assistant Physicians: Dr. James W. Russell and Dr. A. Stanley Barnes. Dr. William H. Wynn and Dr. J. E. H. Sawyer. Assistant Surgeons: Mr. Albert Lucas, Mr. Leonard P. Gamgee, Mr. Frank Barnes, and Mr. Seymour Barling. Assistant Obstetric Officer: Mr. H. B. Whitehouse. Visiting Pathologist: Dr. J. C. Sholto Douglas. Anæsthetists: Dr. Sydney Haynes, Dr. W. J. McCardie, and Mr. R. H. R. Whitaker. Surgical Photographers and Radiographers: Mr. J. Hall-Edwards and Mr. F. Emrys-Jones. Dental Surgeon: Mr. A. T. Hilder.

THE QUEEN'S HOSPITAL.—Similar arrangements for clinical teaching are made here, and the material also is excellent. Ward and tutorial classes are regularly conducted by the staff, there are daily clinics in the out-patient department, while teaching duties are definitely assigned to the house physicians and house surgeons. There are also special departments for gynæcology and ophthalmology.

Staff of Queen's Hospital.—Consulting Physicians: Sir James Sawyer, Dr. C. W. Suckling, and Dr. A. H. Carter. Consulting Surgeons: Mr. Frank Marsh and Mr. Bennett May. Consulting Ophthalmic Surgeon: Mr. Priestley Smith. Physicians: Dr. O. J. Kauffmann, Dr. J. Douglas Stanley, and Dr. J. G. Emanuel. Surgeons: Mr. Jordan Lloyd, Mr. J. T. J. Morrison, and Mr. C. A. Leedham-Green. Ophthalmic Surgeon: Mr. Wilfrid Allport. Obstetric Officer: Dr. C. E. Purslow. Physician for Out-patients: Dr. L. G. J. Mackey. Surgeons for Out-patients: Mr. W. Billington, Mr. A. W. Nuthall, and Mr. B. J. Ward. Pathologist: Dr. L. G. Parsons. Radiographer: Mr. F. Emrys-Jones.

BIRMINGHAM AND MIDLAND EYE HOSPITAL, Church-street, Birmingham.—Honorary Consulting Physician: Dr. R. Saundby. Honorary Consulting Surgeon: Mr. D. C. Lloyd-Owen. Surgeons: Mr. H. Eales, Mr. E. W. Wood-White, and Mr. J. Jameson Evans. Dental Surgeon: W. Madin, B.D.S. Anæsthetist: Dr. S. W. Haynes. Radiographers: Mr. Hall-Edwards and Mr. Emrys-Jones. This hospital possesses 110 beds, and there is an average daily attendance of out-patients of 250. This institution is recognised by Universities and the Royal College of Surgeons, England, and Royal College of Physicians, London, as an ophthalmic hospital at which clinical instruction in ophthalmology may be received. Students attending for a period of three months will be granted certificates which will qualify for the University and Conjoint Board examinations.

UNIVERSITY OF LIVERPOOL.

The student must pass either (1) the University Matriculation Examination, or (2) the Final Examination for Graduation in Arts of any university in Great Britain and Ireland, or (3) the Matriculation Examination of the University of London, or (4) the Higher Certificate Examination of Oxford and Cambridge Joint Board, or (5) the Senior Local Examination of Oxford or Cambridge, or (6) some other examination of equal standard accepted by the Joint Matriculation Board. The course of professional study, subsequent to passing the Matriculation Examination and having been registered as a medical student, extends over five years. The degrees in the Faculty of Medicine are Bachelor of Medicine and Bachelor of Surgery (M.B. and Ch.B.), Doctor of Medicine (M.D.), and Master of Surgery (Ch.M.).

Degrees of Bachelor of Medicine and Bachelor of Surgery.—Candidates for the degrees of Bachelor of Medicine and of Surgery must have attained the age of 21 years on the day of graduation. At least two of the five years of medical study must have been passed in the University, and one year at least must have been passed in the University subsequently to the date of passing the First Examination. The other three years may be passed at any college or medical school recognised for this purpose by the University. Candidates must pass three examinations entitled respectively: the First Examination, the Second Examination, and the Final Examination. The fee is £5 for each examination. The subjects of the First Examination are: (1) Chemistry, Inorganic and Organic; (2) Biology (Zoology and Botany); and (3) Physics. The examination is divided into two parts—namely, (1) Chemistry and Physics, and (2) Biology; and candidates may present themselves in these parts separately. The subjects of the Second Examination are (*a*) Anatomy and Physiology (including Physiological Chemistry and Histology), and (*b*) Materia Medica, Pharmacy, and Pharmacology. Candidates may present themselves in *a* or *b* separately. The subjects for the Final Examination are: (1) General Pathology and Morbid Anatomy; (2) Therapeutics; (3) Forensic Medicine and Toxicology, and Public Health; (4) Obstetrics and Diseases of Women; (5) Surgery, Systematic, Clinical, and Practical; and (6) Medicine, Systematic and Clinical, including Mental Diseases and Diseases of Children. The Final Examination is divided into three parts, the first consisting of subject (1), the second of subjects (2) and (3), the third of subjects (4), (5), and (6). Candidates may present themselves in these parts separately. Candidates for the third part must have completed the fifth year of medical study.

Degrees of Doctor of Medicine and Master of Surgery.—No candidate will be admitted to the degrees of Doctor of Medicine or Master of Surgery unless he has previously received the Degrees of Bachelor of Medicine and Bachelor of Surgery, and at least one year has elapsed since he passed the examinations for those degrees. Candidates for the degree of Doctor of Medicine are required to present a dissertation embodying the results of personal observations or original research, either in some department of medicine or of some science directly relative to medicine: provided always that original work published in scientific journals or separately shall be admissible in lieu of, or in addition to, a dissertation specially written for the degree. No candidate shall be admitted to the degree unless his application after report from the Faculty of Medicine shall have been accepted by the Senate. Candidates may be required to undergo examination in any subject connected with the dissertation. The subjects of examination for the degree of Master of Surgery are: (1) Surgical Anatomy, (2) Surgery, (3) Operative Surgery, (4) Clinical Surgery, (5) Ophthalmology, and (6) Pathology and Bacteriology.

Diploma in Ophthalmic Surgery.—A Diploma in Ophthalmic Surgery has been instituted for candidates who possess a qualification or Diploma in Medicine which entitles to registration in the United Kingdom. The examination for the Diploma will be held twice a year, at the end of the summer and autumn terms. Candidates before presenting themselves for examination, and subject to having obtained a registrable qualification or diploma, must have attended: (*a*) a three months' course of study in the anatomy, physiology, and pathology of the eye in the University; and (*b*) a course of instruction extending over not less than three terms in an ophthalmic clinic recognised by the University. The subjects of examination are: (1) The anatomy and histology of the visual organs and centres; (2) the physiology of vision; (3) physiological optics; (4) bacteriology in relation to diseases of the eye; (5) the morbid anatomy of diseases of the eye; (6) the diagnosis and treatment of diseases of the eye; (7) the estimation and correction of errors of refraction. The fee for the examination is £5 5*s*., and for each subsequent examination £3 3*s*.

Professors—Inorganic Chemistry: E. C. C. Baly, F.R.S. Physical Chemistry: F. G. Donnan, Ph.D., F.R.S. Physiology: C. S. Sherrington, M.D., F.R.S. Physics: L. R.

Wilberforce, M.A. Natural History: W. A. Herdman, D.Sc., F.R.S. Botany: R. J. H. Gibson, M.A. Anatomy: A. Melville Paterson, M.D. Medicine: T. Robinson Glynn, M.D. Surgery: Rushton Parker, F.R.C.S. Pathology: Vacant. Midwifery and Gynæcology: H. Briggs, M.D. Therapeutics: J. H. Abram, M.D. Hygiene: E. W. Hope, D.Sc. Forensic Medicine: R. J. M. Buchanan, M.D. Tropical Medicine: Major Ronald Ross, C.B., F.R.S. Bio-Chemistry: B. Moore, D.Sc. Entomology: R. Newstead, M.Sc., A.L.S.

At this University the following Scholarships and Fellowships are awarded:—(*a*) and (*b*), Robert Gee Entrance Scholarships, two annually, of £25 each, tenable for two years, Joint Matriculation Board Examination held in July, open to First M.B. Course Students; (*c*) Lyon Jones Scholarship, No. 1, of £21 per annum, tenable for two years, Competitive Examination among Junior Students in First M.B. Subjects, Perpetual Course at the University; (*d*) Lyon Jones Scholarship, No. 2, of £21, Competitive Examination among Senior Students in Anatomy, Physiology, Pharmacology, and Materia Medica; (*e*) Derby Exhibition of £15, Competitive Examination among Fourth- or Fifth-year Students in Clinical Subjects, and Clinical School Exhibition of £15 annually for Fourth- or Fifth-year students; (*f*) University Scholarship of £25 for one year, awarded on results of Second Examination for the degrees; (*g*) Holt Fellowships, Physiology and Pathology, of £100 each, for one year; this and the following six Fellowships are awarded by vote of Faculty to Student after graduation, for Teaching and Original Research; (*h*) Gee Fellowship, Anatomy, of £100, for one year, for Teaching and Research; (*i*) Alexander Fellowship, Pathology, of £100, for one year, for Research in Pathology, as are also the following four Fellowships; (*j*) Johnston Colonial Fellowship, Pathology, Bacteriology, and Bio-Chemistry, of £100, for one year; (*k*) John W. Garrett International Fellowship, Physiology, Pathology, and Bio-Chemistry, of £100, for one year; (*l*) Thelwall Thomas Fellowship, Surgical Pathology, of £100, for one year; (*m*) Ethel Boyce Fellowship in Gynæcological Pathology, of £100, for one year; the last two are awarded by vote of Faculty to graduate, and are for Research.

Medical School Buildings.—Spacious and well-equipped class-rooms and laboratories have been erected for the practical study of all the important scientific subjects which form the basis of medicine. Medical research has also been endowed with several new laboratories in which students can pursue research work after graduation. All the laboratories and class-rooms are situated close together, communicating with one another, and are made up of four large blocks of buildings which form one side of the College quadrangle. The most recent additions are the Johnston Laboratories for Experimental Medicine, Bio-Chemistry, and Tropical Medicine, and the new building for Anatomy, Surgery, Toxicology, Ophthalmology, and Dental subjects. The departments of Physiology and Pathology are accommodated in the large block provided by the generosity of the late Rev. S. A. Thompson Yates in 1898. The Anatomical department is situated in a separate block and has a complete suite of rooms, including a large and well-stocked museum and a well-lighted dissecting room on the upper floor measuring 70 by 40 feet.

Fellowships and Scholarships.—Fellowships, scholarships, and prizes of over £1000 are awarded annually. A Holt Fellowship in Pathology and Surgery of the value of £100 for one year is awarded annually by the Medical Faculty to a senior student possessing a medical qualification. The successful candidate is required to devote a year to tutorial work and investigation in the Pathological department. A Holt Fellowship in Physiology, awarded under similar conditions of the value of £100 for one year. A Robert Gee Fellowship in Anatomy, awarded under similar conditions, also of the value of £100 for one year. An Alexander Fellowship for Research in Pathology of the annual value of £100, renewable. A Johnston Colonial Fellowship in Pathology, Bacteriology, and Bio-Chemistry (£100 a year, renewable). A John W. Garrett International Fellowship in Physiology, Pathology, and Bio-Chemistry (£100 a year, renewable). An Ethel Boyce Fellowship in Gynæcological Pathology (£100 a year, renewable). A Thelwall Thomas Fellowship (£100 a year, renewable) in Surgical Pathology. Two Lyon Jones Scholarships of the value of £21 each for two years are awarded annually—a Junior Scholarship, open at the end of the first year of study to Liverpool University students, on the subjects of the First M.B. Examinations, and a Senior Scholarship, open to all students in the school on the subjects of Anatomy, Physiology, Pharmacology, and Materia Medica. A University Scholarship of £25 awarded on the results of the second examination for the degree. The Derby Exhibition of £15 for one year is awarded in Clinical Medicine and Surgery in alternate years. Students may compete in their fourth and fifth years. A Clinical School Exhibition of £15 for one year awarded under similar conditions. The Torr Gold Medal in Anatomy, the George Holt medal in Physiology, the Kanthack Medal in Pathology, the Robert Gee Book Prize, of the value of £5, for Children's Diseases. Two Robert Gee Entrance Scholarships of the value each of £25 per annum for two years are offered annually for competition. The holder is required to take out the Course for the University Degrees in Medicine. Communications should be addressed to the Dean, Mr. K. W. Monsarrat, The University, Liverpool.

Clinical Instruction.—The Clinical School of the University now consists of four general hospitals—the Royal Infirmary, the David Lewis Northern Hospital, the Royal Southern Hospital, and the Stanley Hospital; and of five special hospitals—the Eye and Ear Infirmary, the Hospital for Women, the Infirmary for Children, St. Paul's Eye Hospital, and St. George's Hospital for Skin Diseases. These hospitals contain in all a total of 1050 beds. The organisation of these hospitals to form one teaching institution provides the medical student and the medical practitioner with a field for clinical education and study which is unrivalled in extent in the United Kingdom. All the hospitals are within easy access from the University; those which are situated at any distance are readily reached by the tramway service of the city. The period of hospital practice extends over the last three years of medical study. During the first two years of this period no student will be permitted to change his attendance from one general hospital to another except at the commencement of an academic term. It is a regulation of the school that not more than five of the six terms of these two years shall be spent at any single general hospital. During the final year of hospital practice a student is permitted to attend the practice of all the general hospitals without restriction. The regulations demand only that his attendance shall be regular and to the satisfaction of the Hospitals' Board. There are a large number of appointments to house physicianships and surgeonships both at the general and special hospitals which are open to qualified students of the school. These appointments (20) in most cases carry salaries ranging from £60 to £100 per annum. Applications for further information regarding the Medical Curriculum should be addressed to the Dean of the Faculty of Medicine.

School of Veterinary Medicine.—A school of Veterinary Medicine in connexion with the University was opened in October, 1904; full courses of instruction for the Veterinary Curriculum will be provided and students will be prepared for the M.R.C.V.S. A diploma in Veterinary Hygiene is now granted by the University.

Public Health Department.—This is located in a separate building known as Ashton Hall, in which full courses of instruction are given to D.P.H. students for the D.P.H. of the University and the diplomas of other Examining Boards (see p. 641).

Special Diplomas.—The University has instituted diplomas in Anatomy, Bacteriology, Bio-chemistry, and Parasitology. A special course of study of three terms' duration is required in the subject chosen for the diploma and allied subjects.

School of Pharmacy.—Complete courses of instruction are provided adapted to the requirements of candidates preparing for either the Minor or Major Examinations of the Pharmaceutical Society of Great Britain.

Prospectuses and further information may be had on application to the Dean of the Faculty of Medicine, University of Liverpool.

Royal Infirmary Staff.—Consulting Physicians: Dr. A. T. H. Waters, Dr. T. R. Glynn, Dr. R. Caton, and Sir James Barr. Physicians: Dr. T. R. Bradshaw, Dr. J. H. Abram, and Dr. R. J. M. Buchanan. Assistant Physicians: Dr. John Hay and Dr. O. T. Williams. Consulting Surgeon: Mr. R. Parker. Surgeons: Mr. F. T. Paul, Mr. R. A. Bickersteth, and Mr. W. T. Thomas. Assistant Surgeons:

Mr. T. C. Littler-Jones, Mr. R. E. Kelly, and Mr. F. A. G. Jeans. Gynæcological Surgeon: Mr. T. B. Grimsdale. Assistant Gynæcological Surgeon: Mr. W. B. Bell. Ophthalmic Surgeon: Mr. T. H. Bickerton. Surgeon to the Throat Department: Mr. J. M. Hunt. Physician to the Skin Department: Dr. L. Roberts. Dental Surgeon: Mr. E. J. M. Phillips. Pathologist: Dr. E. Glynn. Anæsthetists: Mr. W. Fingland, Mr. F. W. Bailey, Mr. H. Armstrong, and Mr. A. J. O'Leary.

David Lewis Northern Hospital Staff.—Physicians: Dr. T. Bushby and Dr. W. B. Warrington. Consulting Surgeons: Mr. W. M. Campbell and Mr. C. Puzey. Surgeons: Mr. D. Harrisson, Mr. R. W. Murray, and Mr. K. W. Monsarrat. Ophthalmic Surgeon: Mr. A. N. Walker. Surgeon to the Orthopædic Department: Mr. W. H. Broad. Dental Surgeon: Mr. W. Matthews. Pathologists: Dr. H. L. Murray, Dr. J. Owen, and Dr. R. Stenhouse Williams. Anæsthetists: Mr. R. Stevenson and Dr. H. J. Knox. Medical Tutor: Dr. P. Hick. Surgical Tutor: Mr. R. O. Knowles.

Royal Southern Hospital Staff.—Consulting Physicians: Dr W. Williams and Dr. William Carter. Consulting Surgeons: Mr. Robert Hamilton and Dr. William Alexander. Honorary Physicians: Dr. C. J. Macalister, Dr. J. L. Roberts, and Professor Sir Ronald Ross. Honorary Surgeons: Mr. R. Jones, Mr. G. P. Newbolt, and Mr. Douglas Crawford. Honorary Assistant Surgeon: Mr. S. R. W. Armour. Honorary Medical Officer for Tropical Diseases: Professor Sir Ronald Ross. Honorary Dermatologist: Dr. F. H. Barendt. Honorary Ophthalmic Surgeon: Mr. R. J. Hamilton. Honorary Aural Surgeon: Mr. G. C. Lee. Honorary Laryngologist: Dr. W. Permewan. Honorary Pathologist in Tropical Medicine: Dr. J. W. W. Stephens. Radiologist: Dr. D. Morgan. Honorary Dental Surgeon: Mr. J Royston. Anæsthetists: Dr. F. M. Gardner-Medwin, Dr. S. A. Smith, Dr. T. E. Jones, and Dr. W. J. Bennett Jones.

Stanley Hospital Staff.—Consulting Physician: Dr. R. I. Richardson. Consulting Surgeons: Mr. J. Bark and Mr. K. A. Grossmann. Physicians: Dr. A. G. Gullan and Dr. J. Owen. Surgeons: Mr. F. C. Larkin and Mr. A. J. Evans. Gynæcology: Miss F. Ivens, M.B., M.S. Ophthalmic Physician: Dr. J. Grimshaw. Laryngologist: Mr. J. E. McDougall. Dentist: Mr. J. Woodford Williams.

School of Tropical Medicine.—The school is affiliated with the University of Liverpool and the Royal Southern Hospital of Liverpool. Three courses of instruction are given every year. Two of these last for three full months and are called respectively the Lent Course, from Jan. 6th to April 5th; and the Autumn Course, from Sept. 15th to Dec. 13th. The Third Course, called the Short Course, lasts one month, from June 1st to the 30th. The full course consists (1) of a systematic series of lectures on Tropical Medicine and Sanitation delivered by the Professor of Tropical Medicine at the University; (2) of additional lectures on Special African and other Diseases, delivered at the University; (3) of systematic lectures and demonstrations on Tropical Pathology and Parasitology by the Walter Myers Lecturer at the University; (4) of similar instruction on Medical Entomology by the Lecturer on Economic Entomology at the University; (5) of Practical Work on the Bacteriology of Typhoid, Dysentery, Cholera, Plague, and Malta Fever by the Assistant Lecturer on Tropical Bacteriology; and (6) of clinical lectures and demonstrations delivered at the Royal Southern Hospital by the Physician in charge of the Tropical Ward, the Professor, and the Walter Myers Lecturer. The instruction given occupies six hours a day for five days a week during the course. Teaching under headings 3, 4, and 5 above is delivered in the laboratory of the school at the University, which contains accommodation for 30 students, with all necessary appurtenances, including a well-equipped museum, a class library, and access to the general departmental library. Teaching under heading 6 is given in the tropical ward and the attached clinical laboratories of the Royal Southern Hospital on two or three afternoons a week. At the end of each course an examination is held by the University for its diploma of Tropical Medicine (D.T.M.), which is open only to those who have been through the course of instruction of the school. The examination lasts three days and consists (1) of papers on Tropical Medicine, Tropical Pathology, and Tropical Sanitation and Entomology respectively; (2) of a clinical examination; and (3) of an oral examination. The results are declared as soon as possible afterwards. Those who do not wish to undertake the examination are given a certificate of attendance if their attendance has been satisfactory. The Short Course consists entirely of Practical and Clinical Laboratory Work, given at the laboratory at the University and at the Royal Southern Hospital. The fee for the full course of instruction is 13 guineas, with an extra charge of 10*s.* 6*d.* for the use of a microscope if required. The fee for the examination is 5 guineas. Applications should be made to the Dean of the Medical Faculty, University of Liverpool, from whom prospectuses may be obtained. Two University Fellowships of £100 a year each are open to students of the school, amongst others. Accommodation for research work is to be had both at the University Laboratory of the school and at its Research Laboratories at Runcorn (16 miles distant from Liverpool). Since it was instituted nine years ago the school has employed 25 different investigators paid out of its funds and has despatched to the tropics 21 scientific expeditions, many of the workers having been taken from among its students. The work done by them has been published in 21 special memoirs with many plates and figures, besides text-books and numerous articles in the scientific press. Since 1906 the memoirs have been succeeded by the "Annals of Tropical Medicine and Parasitology," published by the Committee and open to outside contributors (apply to the Secretary, B 10, Exchange-buildings, Liverpool). The Mary Kingsley Medal is awarded by the school for distinguished work in connexion with Tropical Medicine, and has been given to Sir David Bruce, Professor Koch, Dr. Laveran, Sir Patrick Manson, and others.

THE VICTORIA UNIVERSITY OF MANCHESTER.

Four degrees in Medicine and Surgery are conferred by the University—viz., Bachelor of Medicine and Bachelor of Surgery (M.B. and Ch.B.), Doctor of Medicine (M.D.), and Master of Surgery (Ch.M.).

All candidates for degrees in Medicine and Surgery are required to pass an examination called the Matriculation Examination (Faculty of Medicine), or to have passed such other examination as may be recognised by the University for this purpose.[1]

Degrees of Bachelor of Medicine and Bachelor of Surgery.—Before admission to the degree of M.B. or Ch.B. candidates are required to present certificates that they will have attained the age of 21 years on the day of graduation and that they have pursued the courses of study required by the University Regulations during a period of not less than five years subsequently to the date of their registration by the General Medical Council, two of such years having been passed in the University and one year at least having been passed in the University subsequently to the date of passing the First M.B. Examination. All candidates for the degrees of Bachelor of Medicine and Bachelor of Surgery are required to satisfy the examiners in the several subjects of the following examinations: the First Examination, the Second Examination, the Third Examination, and the Final Examination.

The First Examination.—The subjects of examination are as follows:—(1) Inorganic Chemistry and Physics; (2) Biology; and (3) Elementary Organic Chemistry and Bio-Chemistry. Candidates must have attended during at least one year courses both of lectures and of laboratory work in each of the above-named subjects. The Examination is divided into three parts: Part 1, Inorganic Chemistry and Physics; Part 2, Biology; Part 3, Elementary Organic Chemistry and Bio-Chemistry; and the candidates may pass in these parts separately under certain conditions.

The Second Examination.—The subjects of examination are as follows:—(1) Anatomy; (2) Physiology, including Physiological Chemistry and Histology. Candidates may pass in (1) and (2) separately under certain conditions.

The Third Examination.—(1) Pathology; (2) Pharmacology and Therapeutics; (3) Hygiene. These subjects may be taken separately under certain conditions.

The Final Examination.—The subjects of examination are as follows:—(1) Medicine, Systematic and Clinical (including Mental Diseases and Diseases of Children); (2) Surgery, Systematic, Clinical, and Practical; (3) Obstetrics and

[1] 1. The Board will grant exemption from the Matriculation Examination to graduates of any university of the United Kingdom, provided Latin has formed part of one of the degree examinations. 2. For particulars of the conditions under which holders of Certificates from the Universities of Oxford, Cambridge, and London are entitled to exemption, the Calendar of the Joint Matriculation Board should be consulted. The fee for registering external Certificates when exemption is granted is £1.

Gynæcology (including Clinical and Practical); (4) Forensic Medicine (including Toxicology). These subjects may be taken separately under certain conditions.

Candidates for the Final Examination must have completed the fifth year of medical study.

Degree of Doctor of Medicine.—Candidates are not eligible for the degree of Doctor of Medicine unless they have previously received the degrees of Bachelor of Medicine and Bachelor of Surgery and at least one year has elapsed since they passed the examination for those degrees. Candidates may elect either (1) to present an original dissertation; or (2) to undergo an examination. The dissertation must embody the results of personal observation or original research, either in some department of medicine or of some science directly relative to medicine. The examination, which will be partly written, partly practical, is in the Principles and Practice of Medicine, in Pathology, and in some other subject to be selected by the candidate.

Degree of Master of Surgery.—Candidates are not eligible for the degree of Master of Surgery unless they have previously received the degrees of Bachelor of Medicine and Bachelor of Surgery and at least one year has elapsed since they passed the examination for those degrees. The subjects of examination are as follows: (1) Surgical Anatomy; (2) Surgery; (3) Operative Surgery; (4) Clinical Surgery; (5) Ophthalmology; and (6) Pathology and Bacteriology.

Professors—Physics: E. Rutherford, D.Sc., F.R.S. Chemistry: H. B. Dixon, M.A., F.R.S. Organic Chemistry: W. H. Perkin, D.Sc., F.R.S. Zoology: S. J. Hickson, D.Sc., F.R.S. Botany: F. E. Weiss, D.Sc. Cryptogamic Botany: W. H. Lang, M.B., B.Sc., F.R.S. Physiology: W. Stirling, D.Sc. Anatomy: Grafton Elliot Smith, M.A., M.D., F.R.S. Materia Medica: R. B. Wild, M.D. Public Health and Bacteriology: A. S. Delépine, M.B., C.M., M.Sc. Pathology: J. Lorrain Smith, M.D. Clinical Medicine: Judson S. Bury, M.D., B.Sc., F.R.C.P. Systematic Medicine: George R. Murray, M.A., M.D. Systematic Surgery: J. W. Smith, M.B., C.M., F.R.C.S. Clinical Surgery: William Thorburn, B.Sc., M.D., B.S., F.R.C.S. Obstetrics and Gynæcology: Sir W. J. Sinclair, M.D. Forensic Medicine: J. Dixon Mann, M.D.

Communications should be addressed to the Registrar, The University, Manchester.

Scholarships, Fellowships, and Prizes.—At this University there are 22 Foundation Scholarships, 12 Exhibitions, five being for subjects connected with medical study, a Surgical Prize, a Fellowship, Research Fellowships in Public Health, and Honorary Research Fellowships. 13 Scholarships are Entrance Scholarships, three are Medical, and there are one each for Surgery, Biology, Physiology, and Diseases of Children, and one General Medical and Surgical. Three of the Exhibitions are for Physiology, one for Anatomy, and one for French and German. The Surgical Prize, named "The Dumville," is awarded for the subjects of Systematic, Practical, and Operative Surgery, Surgical Anatomy, and Surgical Pathology, £15. The Leech Fellowship (£100) is for the encouragement of study and research, and is open to persons who have graduated M.B., Ch.B. in the University. The Honorary Research Fellowships, tenable for two years, conferring the right of free use of the laboratories, are awarded generally in October on application, with evidence of capacity for independent investigation.

The following entrance scholarships are offered for award to persons of either sex proposing to enter a medical course of study at the University:—Seaton—One of £40, tenable for two years. Subjects: Greek and Latin Translation at sight, and Prose Composition. Credit given for knowledge of Mathematics (Geometry and Algebra); Elements of English Language, Literature, and History; French and German. Rogers.—One of £40, tenable for two years. Subjects as in Seaton. Dalton.—Two of £40, tenable for two years. Subjects: Geometry (Euclid I.—IV., and VI., or the subjects thereof); Algebra (as far as the Binomial Theorem, inclusive), Plane Trigonometry (to Solution of Triangles); Elementary Analytical Geometry; Conic Sections. Credit given for knowledge of Classics, Elements of English Language, Literature, and History; French and German. Cartwright.—£35 per annum, tenable for three years. Subjects as in Dalton. Dreschfeld Memorial—£30, tenable for one year. Subjects: those of July Matriculation Examination. Hulme.—£35, tenable for three years. Subjects: English Language (Grammatical Structure and Outlines of its History); English Literature (an essay on some subject of English literature); and Modern History (Outlines of English History and Geography); with at least two of the following: Latin (Translation at sight, Grammar, and Easy Composition); Greek (ditto); French (ditto); German (ditto). Credit given for knowledge of Mathematics (Geometry and Algebra). Dora Muir.—£25 per annum, tenable for three years (open to women only). Candidates may select such of the subjects as they desire from amongst those set for the other Entrance Scholarships. James Gaskill.—£35, tenable for two years. Subjects: Mathematics, Geometry (the substance of Euclid I.—IV. and VI.), Algebra (as far as the Binomial Theorem, inclusive), Plane Trigonometry (to Solution of Triangles), Elementary Mechanics, Chemistry. Credit given for knowledge of Classics, Elements of English Language, Literature, and History, and French and German. Manchester Grammar School.—£25 per annum, tenable for three years. The examinations for all these scholarships are held in the month of May. Kay-Shuttleworth (Sir James Phillips).—£30 per annum, tenable for three years. Subjects: Mathematics, Elementary Mechanics, Chemistry. Entrance Scholarships in Medicine.—One or more Scholarships in each year will be offered for proficiency in Arts or Science. The Scholarships are of the value of £100 each, which will be set off against fees as follows: £60 against the University class fees and £40 against the Infirmary fees.

The Platt Biological Scholarship of £50 for one year is awarded to the candidate who shows the most promise of ability for prosecuting original research in Zoology and Botany, and the holder is to devote his time to research in Zoology or Botany. The Robert Platt Physiological Scholarship of £50 for two years, with the subjects of Physiology and Comparative Anatomy, is open to candidates whether or not previously students of the University. There are two Dauntesey Medical Scholarships of £35 each for one year, with the subjects of Zoology, Botany, and Chemistry. These Scholarships are open to all students preparing for a medical course who shall not have attended lectures or laboratory courses on Human Anatomy or Physiology, or a purely medical or surgical course in the University or in any other medical school in the United Kingdom. Candidates must not be more than 25 years of age on Oct. 1st of the year of competition. Scholars must immediately on election enter for a full course of medical studies. The subjects of the Turner Scholarship of £20, for students who have completed a full course of medical study in the University, are: Medicine, Pathology (written and practical), Obstetrics, Practical Surgery, Ophthalmology, Forensic Medicine, and Public Health. The John Henry Agnew Scholarship of £30, awarded on the results of an examination, partly written and partly clinical, on Diseases of Children, Medical and Surgical, is open for competition annually to all students in the medical department who have pursued a regular course of medical study in the University extending over a period of not less than four years or more than six years and have attended the course of lectures on Diseases of Children. The Ashby Memorial Scholarship, value £100, is open to duly qualified medical men and women who intend to pursue research in diseases of children.

The Professor Tom Jones Memorial Surgical Scholarship of £100 for one year is awarded on the result of evidence submitted by the candidate who must have either graduated in the University or have obtained the Diploma of the Conjoint Colleges. The Graduate Scholarship in Medicine of the value of £25 to £50 for one year is awarded on the results of the Final Examination for M.B., Ch.B. The Theodores Exhibition of £15 for one year has the subjects of French and German, and the successful candidate is required to enter for a regular University course. There are two Robert Platt Exhibitions of £15 each for first and second-year students in physiology, and the Sydney Renshaw Exhibition of £15 is for second-year students in physiology. The Professor Tom Jones Exhibition in Anatomy, value £25, is for first-year students in anatomy. The Dumville Surgical Prize of £15 is awarded after examination in Systematic, Practical and Operative Surgery, Surgical Anatomy, and Surgical Pathology. A gold medal is awarded for distinction on obtaining the degree of M.D.

The Medical School.—This medical school is located in a large building, which forms a part of the University. It is provided with large dissecting-rooms, physiological laboratories, private laboratories, and work-rooms, besides lecture-rooms, a museum, and a library. In order to give the

fullest possible opportunities for teaching and investigation in the departments of Anatomy, Physiology, Pathology, and Materia Medica, a large extension of the school buildings was made in 1895. The greater part of the new buildings is devoted to the departments of physiology, pathology, toxicology, anatomy, and public health. The physiological department occupies more than half of the new buildings, and includes a large lecture theatre, accommodating 350 students, with preparation and diagram rooms adjacent to it, and a research laboratory fitted with the necessary apparatus for the use of advanced students, research scholars, or practitioners of medicine undertaking the investigation of some special subject. In the new pathological laboratories ample provision is made for the teaching of pathology and bacteriology and for the prosecution of original research. In the toxicological department there is a large laboratory, capable of accommodating 50 students, lighted from both sides and also from the roof, completely equipped with all that is necessary for the practical teaching of toxicology; also a small laboratory for private research, containing the apparatus and fittings necessary for investigations in toxicological chemistry. In the public health department suitable laboratory accommodation is provided for the study of sanitary chemistry, physics, and practical bacteriology in the departments of chemistry and physics and in that of pathology. A large room is provided in the new buildings for a museum of apparatus, models, plans, and other sanitary appliances for the practical instruction of the students, together with a special library of works on State medicine, hygiene, vital statistics, and sanitary engineering. In addition, a large lecture theatre for general purposes, accommodating 250 students, has been provided, and the existing accommodation for students is supplemented by the provision of a larger common room.

Clinical Studies.—The clinical and practical departments of medical study are taught partly in the Medical School and partly in the Royal Infirmary, as well as in a fever hospital, a lunatic asylum, and a convalescent home. Medical and Surgical Clinical Classes are conducted in the Infirmary, which in the new buildings together with the associated hospitals at Cheadle will contain 1158 beds, and separate instruction is afforded in the elements of Medical and Surgical Physical Diagnosis, in Obstetric Medicine, Ophthalmic Surgery, and Pathological Anatomy by the different members of the staff of the Medical School and Infirmary.

Public Health.—The regulations with regard to the Degrees in Sanitary Science will be found under the special section on p. 641.

Clinical Instruction.—THE MANCHESTER ROYAL INFIRMARY.—The New Royal Infirmary has been built on the pavilion system, near the University, between the recently enlarged Eye Hospital and the new St. Mary's Hospital for Women and Children, and has accommodation for 592 beds. Of these, 52 are allotted to the Special and Emergency Departments; the 540 remaining beds are allocated as follows: 240 for medical practice and 300 for surgical practice (180 for men and 120 for women and children). The medical side consists of five units, each unit having a testing room for the scientific investigation of morbid products and a class-room. The surgical beds are also arranged in five units, each unit having its own operation theatre, with anæsthetising, recovery, sterilising, testing, and apparatus rooms, and its own class-room attached. Of these units four on each side are already occupied. The fine educational block provides very handsomely for the wants and comforts of the students, there being separate suites of rooms for the men and the women, and also a large common reading room, a lecture theatre, and a museum. The present annual average number of in-patients is 8000, of out- and home-patients 33,000, and the list of casualties in the accident room has averaged 16,000 per annum. About 6000 operations are performed annually in the operation theatres. Associated with the Infirmary are: (1) the Convalescent Hospital at Cheadle, containing 136 beds; (2) the Royal Lunatic Hospital at Cheadle, accommodating with its branches 430 patients; and (3) the Central Branch in Piccadilly for casualty and out-patient work. The Associated Hospitals thus contain 1158 beds and are under the same management. Women students are admitted to the practice of the Infirmary on the same terms as men.

Fees.—Medical Practice: Three months, 5 guineas; six months, 8 guineas; 12 months. 12 guineas; full period required by the Examining Boards, 25 guineas.

In addition to the list of scholarships given under the general heading, "The Victoria University of Manchester," two Entrance Scholarships in Medicine of the value of £100 each are offered annually by the Council of the Manchester University and the Medical Board of the Manchester Royal Infirmary for proficiency in Arts and Science subjects respectively. The Bradley Memorial Scholarship in Clinical Surgery, value £20, is offered annually in the Summer Session. Gentlemen are eligible who are in their fifth or sixth year of study, have completed their dresserships, and have spent two years in clinical work at the Manchester Royal Infirmary. One Medical and one Surgical Clinical Prize of the value of 6 guineas are offered annually. (The other scholarships and prizes are in the College Syllabus.) Annual appointments may be held by those who have attended the practice of the infirmary: a Surgical Registrar (£75); a Pathological Registrar (£100); a Medical Registrar (£75); a Surgical Tutor (£30); a Director and Assistant Directors of the Clinical Laboratory (£200, £75, and £40); an Assistant Medical Officer (£105); Three Assistant Surgical Officers (£35 each); Five Anæsthetists (£50); a Medical Officer for home patients (£150); and a Medical Officer for Radiography and Electricity Department (£100). The following resident appointments are also made annually: Resident Medical Officer (£150); Resident Surgical Officer (£150); Resident Medical Officer at the Convalescent Hospital at Cheadle (£150); two Medical Officers at the Central Branch, £100 each. An Assistant Medical Officer at the Convalescent Hospital is appointed every six months at a salary of £80 per annum. The following unpaid appointments are open to those who have attended the practice of the Infirmary:—House Surgeons: Two Senior and Two Junior House Surgeons are appointed every three months for a term of six months. House Physicians: Ten House Physicians are appointed during each year for a term of six months. Also every six months officers are appointed to the Accident Room, and the Gynæcological, Ear and Throat Departments. The House Surgeons and House Physicians and Resident Assistant at Cheadle must possess registrable qualifications. Consulting Physician: Dr. Graham Steell. Physicians: Dr. Judson S. Bury, Dr. A. T. Wilkinson, Dr. E. S. Reynolds, Dr. G. R. Murray, and Dr. R. T. Williamson. Assistant Physicians: Dr. E. M. Brockbank, Dr. E. N. Cunliffe, and Dr. F. Craven Moore. Pathologist: Dr. J. Lorrain Smith. Consulting Surgeons: Mr. Walter Whitehead, Mr. F. A. Southam, and Mr. G. A. Wright. Surgeons: Mr. W. Thorburn, Mr. J. W. Smith, Mr. A. H. Burgess, and Mr. J. H. Ray. Assistant Surgeons: Mr. E. D. Telford, Mr. C. Roberts, Mr. P. R. Wrigley, and Mr. H. H. Rayner. Anæsthetist: Mr. Alexander Wilson. Consulting Obstetric Physician: Dr. Lloyd Roberts. Gynæcological Surgeon: Dr. A. Donald. Assistant Gynæcological Surgeon: Dr. W. E. Fothergill. Ophthalmic Surgeon: Dr. A. Hill Griffith. Aural Surgeon: Dr. William Milligan. Dental Surgeon: Mr. W. A. Hooton. Resident Medical Officer: Dr. D. E. Core. Resident Surgical Officer: Mr. W. H. Hey. Pathological Registrar: Dr. W. B. Anderton Medical Registrar: Dr. F. E. Tylecote. Surgical Registrar: Mr. R. Ollerenshaw. Director of the Clinical Laboratory: Dr. G. E. Loveday. Assistant Directors of the Clinical Laboratory: Dr. A. Ramsbottom and Dr. C. E. Lea. Anæsthetists: Dr. S R. Wilson, Mr. Edward Moir, Dr. E. Falkner Hill, Dr. T. Coogan, and Dr. G. Jefferson. Assistant Medical Officer: Dr. A. Ramsbottom. Assistant Surgical Officers: Mr. W. R. Douglas and Mr. Howard Buck. Surgical Tutor: Mr. W. R. Douglas. Medical Officer for Home Patients: Dr. George Ashton. Medical Officer for Radiography and Electricity Department: Mr. A. E. Barclay. Resident Superintendent of the Royal Lunatic Hospital at Cheadle: Mr. W. Scowcroft. Medical Officers, Central Branch: Mr. C. H. Hibbert and Mr. J. W. Bride. General Superintendent and Secretary: Mr. Walter G. Carnt.

MANCHESTER CHILDREN'S HOSPITAL, Pendlebury and Gartside-street, Manchester.—The hospital contains 168 beds and 26 in the Convalescent Home, St. Anne's-on-Sea. The medical staff visit the hospital daily at 10 A.M. Clinical instruction is given by the medical staff at the Hospital and Dispensary. Out-patients are seen daily at 9 A.M. at the new Out-patient Department, Gartside-street, Manchester. Physicians: Dr. Hutton, Dr. Heywood, and Dr. Lapage. Surgeons: Mr. J. Howson Ray, Mr. C. Roberts, and Mr. H. H. Rayner. Honorary Consulting Surgeon: Mr. G. A. Wright. Honorary Consulting Pathologist: Professor R. Lorrain Smith. Honorary Surgeon for Throat,

Nose, and Ear Diseases: Mr. F. H. Westmacott. Pathologist: Dr. W. Mair. Honorary Dental Surgeon: Mr. Barron J. Rodway. Resident Medical Officers: Mr. G. G. Wray and Dr. Rupert Briercliffe. Medical Officer at the Dispensary: Dr. Hugh Ashby. Assistant Medical Officers: Dr. Maude Marsden and Dr. Batty. During 1910 there were 2702 in-patients, and 34,135 new out-patients were under treatment at the Dispensary, and there were 105,534 attendances made by out-patients. Secretary: Mr. H. J. Eason.

THE MANCHESTER NORTHERN HOSPITAL FOR WOMEN AND CHILDREN, Park-place, Cheetham Hill-road, Manchester.—The hospital contains 70 beds. Out-patients are seen daily from 8.30 to 10 A.M. Honorary Consulting Physicians: Dr. W. N. Maccall and Dr. T. C. Railton. Honorary Consulting Surgeons: Mr. Frederick A. Southam. Honorary Physician for Women: Dr. T. Arthur Helme. Honorary Surgeon for Women: Mr. Arnold W. W. Lea. Honorary Physician: Dr. J. J. Cox. Honorary Physicians for Children: Dr. C. H. Melland and Dr. A. A. Mumford. Honorary Assistant Surgeon for Women: Mr. Harold Clifford. Honorary Surgeon for Children: Mr. R. Ollerenshaw. Honorary Assistant Physician for Children: Dr. A. C. Sturrock. Honorary Ophthalmic Surgeon: Dr. H. H. McNabb. Anæsthetists: Mr. G. A. Barrow, Dr. T. W. Chaff, and Dr. C. H. Lee. Pathologist: Dr. H. R. Clarke. Assistant Medical Officers: Dr. Whitworth and Mr. R. W. Walsh. Honorary Dentist: Mr. W. A. Hooton. House Surgeon: Dr. David H. Paul.

UNIVERSITY OF LEEDS.

Candidates presenting themselves for Matriculation in the Faculty of Medicine must pass an examination in English (Language or Literature) and English History, Mathematics and Latin, and in two of eight optional subjects. Exemption from the matriculation examination is granted to graduates of any university of the United Kingdom provided Latin has formed part of one of the degree examinations.

Four degrees in Medicine and Surgery are conferred—viz.: Bachelor of Medicine and Bachelor of Surgery (M.B. and Ch.B.), Doctor of Medicine (M.D.), Master of Surgery (Ch.M.), also Degrees and Diplomas in Dental Surgery and a Diploma in Public Health.

Degrees of Bachelor of Medicine and Bachelor of Surgery.—Candidates for the degrees of Bachelor of Medicine and of Surgery are required to present certificates showing that they will have attained the age of 21 years on the day of graduation, and that they have attended courses of instruction approved by the University extending over not less than five years, two of such years, at least, having been passed in the University subsequently to the date of passing the First Examination. Candidates must also satisfy the examiners in the several subjects of the following examinations entitled respectively: the Matriculation Examination, or such other examination as may have been recognised by the Joint Matriculation Board in its stead; the First Examination; the Second Examination; and the Final Examination.

The First Examination.—The First Examination consists of: Part I., Physics and Chemistry; Part II., Biology. Candidates will be allowed to pass the two parts separately.

The Second Examination.—The Second Examination consists of: Part I., Anatomy and Physiology; Part II., Materia Medica and Pharmacy. Candidates will be allowed to pass the two parts separately.

The Final Examination.—The Final Examination consists of: Part I., Pathology and Bacteriology. Part II., Forensic Medicine and Public Health. Part III., Medicine: Systematic and Clinical, including Mental Diseases and Diseases of Children; Surgery: Systematic, Clinical and Practical; Obstetrics and Gynæcology: Systematic, Clinical, and Practical; Pharmacology and Therapeutics. Candidates will be allowed to pass Parts II. and III. separately or together, and they may present themselves for examination in Part I. at the end of the tenth term.

Degree of Doctor of Medicine.—Candidates are not eligible for the degree of Doctor of Medicine unless they have previously received the degrees of Bachelor of Medicine and Bachelor of Surgery and at least one year has elapsed since they passed the examination for those degrees. Candidates for the degree of Doctor of Medicine are required to present a dissertation and, if the dissertation be accepted, to pass an examination. The dissertation, of which the subject must previously have received the approval of the Board of the Faculty of Medicine, must embody the results of personal observations or original research, either in some department of medicine or of some science directly related to medicine; provided always that original work published in scientific journals or in the Proceedings of learned societies, or separately, shall be admissible in lieu of, or in addition to, a dissertation specially written for the degree. Candidates will be required to write a short extempore essay on some topic connected with medicine and to answer questions on the history of medicine. They will also be examined orally on the dissertation or other work submitted. Any candidate may be exempted from a part or the whole of the examination if the Board of the Faculty so decide. No candidate will be admitted to the degree unless his application, after report from the Board of the Faculty of Medicine, shall have been accepted by the Senate.

Degree of Master of Surgery.—Candidates are not eligible for the degree of Master of Surgery unless they have previously received the degrees of Bachelor of Medicine and Bachelor of Surgery and at least one year has elapsed since they passed the examination for those degrees. Every candidate is also required to furnish certificates of attendance in accordance with the regulations of the University. The subjects of examination are as follows: Surgical Anatomy, Surgery, Operative Surgery, Clinical Surgery, Ophthalmology, Pathology, and Bacteriology.

Diploma in Public Health.—The regulations for this diploma will be found on p. 641.

Professors—Physics: W. Bragg, M.A., F.R.S. Chemistry: A. Smithells, B.Sc., F.R.S. Organic Chemistry: J. B. Cohen, B.Sc. Zoology: W. Garstang, M.A. Botany: J. H. Priestley. Anatomy: J. K. Jamieson, M.B. Physiology and Histology: De Burgh Birch, M.D. Pathology: A. S. Grünbaum, M.D. Clinical Medicine: A. G. Barrs, M.D. Medicine: T. W. Griffith, M.D. Surgery: R. L. Knaggs, F.R.C.S. Clinical Surgery: B. G. A. Moynihan, F.R.C.S. Obstetrics: J. B. Hellier, M.D. Public Health: J. S. Cameron, M.D. Therapeutics: H. J. Campbell, M.D. Forensic Medicine: F. W. Eurich, M.D.

At the University of Leeds (School of Medicine) there are two Scholarships and six Prizes. The Entrance Scholarship, value £73 2*s.* 6*d.*, is awarded on the results of the Joint Matriculation Board Examination held in July after a complete course of lectures and practical classes at the Leeds School. The Infirmary Scholarship, value £42, is awarded on the results of the First M.B. Examination of the University of Leeds after a complete course of hospital practice and clinical lectures at Leeds Infirmary. The Hardwick Prize of £10 is awarded after competitive examination in Clinical Medicine among Clinical Clerk Students of two years' standing. The McGill Prize of £10 is awarded after competitive examination among advanced surgical students in Clinical Surgery. The Thorp Scholarship of about £25 is awarded annually to a student or graduate who undertakes research in some subject in Public Health or Forensic Medicine.

Clinical Instruction.—THE LEEDS GENERAL INFIRMARY, in connexion with this medical faculty, has accommodation for 524 in-patients, including 88 beds at branch hospitals in the country. During the last year 7935 in-patients and 51,243 out-patients were treated. Clinical teaching takes place daily in the wards, and Clinical lectures are given in Medicine and Surgery by the Physicians and Surgeons. There are Medical, Surgical, Ophthalmic, Aural, Electro-therapeutic, and Radiographic Departments, in each of which special instruction is imparted to students. A Gynæcological and Extern Obstetric Department, in which there were 509 confinements, together with Laryngeal and Skin Clinics, are in operation. Several valuable prizes are given at the end of each session. The following appointments at the Infirmary are annually open to students (for some of them, however, a registered legal qualification is required): Non-resident: clinical pathologist, £300; assistant clinical pathologist, £150; senior anæsthetist, £50; 7 anæsthetists, £25. Resident: medical officer, £150; surgical officer, £150; casualty officer, £125; ophthalmic, £100; ophthalmic house surgeon, £50. These appointments are made annually and holders are eligible for re-election. Resident medical officer to the Ida Hospital, for six months; honorarium £30. Obstetric officer, for six months; 6 house physicians, for six months; 4 house surgeons, for 12 months; 24 physicians' clerks, for six months; 24 surgeons' dressers, for six months; 16 ophthalmic and aural surgeons' dressers, for three

months; 12 gynæcological ward clerks, for three months; 16 gynæcological out-patient clerks, for three months; 24 maternity clerks, for one month; 24 assistant physicians' clerks, for three months; 8 dermatological clerks, for three months; 8 laryngological clerks, for three months; 24 assistant surgeons' dressers, for three months; 8 assistant ophthalmic surgeons' dressers, for three months; 24 dressers in the casualty-room, for three months; 24 post-mortem room clerks, for three months; 8 laboratory assistants, for three months. There are appointments open to students in other medical institutions in the town and also in the West Riding (Lunatic) Asylum.

The Public Dispensary, the Hospital for Women and Children, the Fever Hospital, the Maternity Home, and the West Riding Lunatic Asylum are other medical institutions which are made use of by the Leeds students. The buildings of the Medical School are placed close to the Infirmary and contain complete accommodation for the training of medical students upon the most approved modern methods. A very fine dissecting-room, extensive laboratories for Physiology and Pathology, with the most recent improvements in fittings and apparatus, ample lecture-room accommodation, a large Library, and separate Museums for Pathology and Anatomy are some of the most striking features of the buildings. Provision for the convenience of students, in the shape of a common room, a refectory, &c., are made. The classes in Systematic and Practical Chemistry, Physics, Botany, and Zoology are held in the Science and Arts Department of the University, in College-road. Two Entrance Scholarships are offered: one, of the value of £73 2*s.* 6*d.*, covering admission to all requisite lectures; and the other, of the value of 40 guineas, covering the cost of admission to the medical and surgical practice of the infirmary.

Staff of Leeds General Infirmary.—Consulting Physicians: Sir Thomas Clifford Allbutt, K.C.B., Dr. John E. Eddison, and Dr. Charles M. Chadwick. Consulting Surgeons: Mr. Thomas Pridgin Teale, Mr. A. W. Mayo Robson, and Mr. Edward Ward. Consulting Eye and Ear Surgeon: Mr John Albert Nunneley. Consulting Obstetric Physician: Dr. James Braithwaite. Consulting Dental Surgeon: Mr. T. S. Carter. Physicians: Dr. Thomas Churton, Dr. Alfred George Barrs, and Dr. T. Wardrop Griffith. Surgeons: Mr. Harry Littlewood, Mr. R. Lawford Knaggs, Mr. B. G. A. Moynihan, and Mr. Walter Thompson. Surgeons to the Eye and Ear Department: Mr. H. Secker Walker and Mr. A. L. Whitehead. Obstetric Physician: Dr. J. B. Hellier. Physician with Charge of Out-patients: Dr. E. F. Trevelyan. Assistant Physician: Dr. W. H. Maxwell Telling. Assistant Surgeons: Mr. J. Faulkner Dobson, Mr. H. Collinson, Mr. L. R. Braithwaite, and Mr. A. Coupland. Surgeon to Out-patients in the Eye and Ear Department: Mr. G. Constable Hayes. Pathologist: Dr. Albert S. Grünbaum. Dental Surgeon: Mr. J. B. Hordern. Medical Officer in Charge of the Electro-Therapeutic Department: Mr. L. A Rowden. Clinical Pathologist: Mr. M. J. Stewart. Assistant Clinical Pathologist: Miss C. Eglington. Medical Tutor: Dr. George W. Watson. Surgical Tutor: Mr. Alfred Gough. Anæsthetists: Dr. Douglas Seaton, Mr. J. Nicholson, Dr. T. P. Rowling, Dr. G. E. St. Clair Stockwell, Dr. Frank Dobson, Dr. F. Whalley, Dr. Macvean, and Dr. F. Marshall Greaves.

UNIVERSITY OF SHEFFIELD.

Candidates for a medical degree shall have matriculated in the University or have passed such other examination as may be recognised for this purpose by the University and sanctioned by the Joint Matriculation Board. The subjects required by the General Medical Council must be included in the Matriculation Examination or its recognised substitute.

The Degrees in the Faculty of Medicine are Bachelor of Medicine and Bachelor of Surgery (M.B., Ch.B.), Doctor of Medicine (M.D.), and Master of Surgery (Ch.M.).

Degrees of Bachelor of Medicine and Bachelor of Surgery.—A candidate for the degrees of M.B., Ch.B., shall produce certificates that he will have attained the age of 21 years on the day of graduation; that he has pursued the courses of study required by the University regulations during a period of not less than five years subsequently to the date of his registration as a medical student by the General Medical Council, three of such years at least having been passed in the University, one at least being subsequent to the passing of the First Examination.

The First Examination.—The subjects of examination are chemistry, physics, and biology. The examination is divided into two parts: Part I., A (chemistry and physics) and B (biology); and Part II.: Organic Chemistry. Candidates may pass in each part separately. The Intermediate B.Sc. Examination in these subjects will, on payment of the required additional fee, be accepted instead of Part I. of this examination. Candidates must, after matriculation and registration as a medical student, have attended courses of instruction (lectures and laboratory work) in chemistry, physics, and biology for one year each, and special organic chemistry for one term.

The Second Examination.—The subjects of examination are anatomy, physiology, materia medica, and pharmacy. The examination is divided into two parts, A (anatomy and physiology) and B (materia medica and pharmacy), and candidates may pass in either part separately. Candidates must have completed the third winter session of professional study, must have passed the first examination, and must have attended (1) lectures on anatomy and dissections during two winter sessions and one summer session; (2) lectures on physiology during two winter sessions, practical physiology during two winter sessions, and histology during one summer session; and (3) materia medica and pharmacy for three months.

The Third or Final Examination.—The subjects of examination are divided into two parts—namely, A (forensic medicine and toxicology, public health, and pathology and morbid anatomy) and B (medicine, including pharmacology and therapeutics, mental diseases, and diseases of children, surgery, obstetrics, and gynæcology). Candidates may present themselves for examination in both parts on the same occasion or separately, but Part A may not be passed before the completion of the fourth year of study. Candidates for the whole examination or for Part B must have completed the fifth year of study.

Degree of Doctor of Medicine.—Candidates for the degree of Doctor of Medicine must have passed the examination for the degrees of M.B., Ch. B. at least one year previously, must present a thesis embodying observations in some subject approved by the professor of medicine, and must pass an examination in the Principles and Practice of Medicine.

Degree of Master of Surgery.—Candidates for the degree of Ch.M. must have passed the examination for the degrees of M.B., Ch.B. at least one year previously and must, since taking the degrees of M.B., Ch.B., have held for not less than six months a surgical appointment in a public hospital or other public institution, affording full opportunity for the study of Practical Surgery.

The subjects of examination are Systematic, Clinical, and Operative Surgery, Surgical Anatomy, Surgical Pathology and Bacteriology.

Professors—Physics: W. M. Hicks, Sc.D., F.R.S. Chemistry: W. Palmer Wynne, D.Sc., F.R.S. Biology: Alfred Denny. M.Sc., F.L.S. Anatomy: C. J. Patten, M.A., M.D., Sc.D. Physiology: J. S. Macdonald, B.A., L.R.C.S., L.R.C.P. Medicine: D. Burgess, M.A., M.B., F.R.C.P. Materia Medica, &c.: (vacant). Surgery: Sinclair White, M.D., M.Ch., F.R.C.S. Pathology: J. M. Beattie. M.A., M.D. Midwifery: (vacant). Public Health: Ralph P. Williams, M.D., B.S., D.P.H.

Scholarships, &c.—There are 10 scholarships and a Town Trust Fellowship. The Entrance Scholarship, value £122, is awarded after examination, but the candidate must read for a Degree in Medicine. There are two Special (1911) Scholarships, which are awarded on the results of the Joint Board Matriculation Examination, and the candidates must read for a Degree in Medicine of the University of Sheffield. They are of the values of 150 guineas and 50 guineas respectively. There are four Town Trust Scholarships, obtainable by a special examination open to boys or girls, who must have been educated in Sheffield, which are of the value of £50 each per annum. The Kaye Scholarship in Anatomy and Physiology, of £22 10*s.* for one year, is awarded after special examination of students who have completed the second Winter Session. The candidates must be natives of Sheffield. The Mechanics' Institute Scholarship of £50 per annum for one year (renewable for a second) is a post-graduate Scholarship. The Frederick Clifford Scholarship of £50 per annum for two years is available for graduates of the University residing within 40 miles. The Senate considers each application for these two latter, as also that of the Town Trust Fellowship, value £75 per annum for one year, open to graduates of the University. Full particulars as to

curriculum, scholarships, &c., may be had on application to the Registrar or to the Dean of the Medical Faculty.

Public Health.—The regulations with regard to the degrees in Sanitary Science will be found on p. 642.

The Medical School.—The new buildings of the University opened in 1905 are situated at the west end of the city, adjoining Weston Park, and the Medical department occupies the entire north wing of the University quadrangle. The various athletic and other students' societies are under the management of a Students' Representative Council, elected annually. There are large and comfortable common rooms both for men and women students. A refectory is open daily at the University where students may obtain refreshments, lunch, dinner, &c., at extremely moderate prices. The University journal *Floreamus*, edited by a committee of staff and students, is published each term. The University Hostel, Ashgate-road, is recognised by the Senate as a residence for women students, full particulars of which may be obtained of the tutor for women students. Other societies of interest to the medical student are the Biological, Chemical, and Clinical and Pathological Societies.

Clinical Instruction.—The University is within easy reach of the various hospitals with which it is connected for clinical purposes. These are as follows: The Royal Infirmary, containing 320 beds, with an annual average number of over 3800 in-patients, over 11,500 out-patients, and over 23,000 casualties; the Royal Hospital, with 191 beds, and an annual number of 3000 in-patients, over 18,000 out-patients, and over 18,000 casualties; and the Jessop Hospital for Diseases of Women, with 80 beds, over 1000 in-patients, and over 3000 out-patients; also a Maternity department, with over 350 in-patients per annum and over 500 out-patient cases attended. Special courses on Fevers are held at the City Fever Hospitals (547 beds) and on Mental Diseases at the South Yorkshire Asylum (1610 beds). For purposes of clinical practice the practices of the Royal Infirmary and Royal Hospital are amalgamated, giving a total of 511 beds for the treatment of medical, surgical, and special cases. There are special departments for the treatment of Diseases of the Eye at each institution, with wards assigned to them. In addition to these the Royal Infirmary has special departments for the treatment of Diseases of the Skin and Ear, with beds assigned to them, whilst at the Royal Hospital there are special out-patient departments for Diseases of the Throat, Ear, Skin, Orthopædics, and Mental Diseases. During the last year over 6000 patients passed through the wards of the two institutions, while those attending as out-patients numbered over 45,000. The medical and surgical staffs attend daily and give clinical instruction in the wards and out-patient rooms at stated times. Clinical lectures in Medicine and Surgery are given weekly at stated times. Instruction in the practical administration of anæsthetics is given at either institution by the Anæsthetists. The laboratories and lecture rooms connected with the subjects of the first and second examinations—namely, chemistry, physics, biology, anatomy, and physiology—which are in the University buildings are, both as regards structural arrangements and scientific equipment, on the most modern and complete lines. No expense has been spared in the matter of apparatus for teaching or research work and the facilities for practical study in these subjects are second to none. The department of Pathology and Bacteriology in the University is replete with every requirement for the most advanced work in these subjects. There is a large Pathological Museum in the department open daily to students. The post-mortem rooms of the Royal Infirmary and Royal Hospital are under the charge of the Professor of Pathology and afford ample material for demonstrations. In connexion with the University there is a complete dental department, fully recognised by the various examining bodies, at the Sheffield Royal Hospital.

Students who have passed their examination in anatomy and physiology can hold the usual dresserships and clerkships, the appointments being for a period of three months except in the case of casualty dresserships, which last two months. All students beginning hospital practice in Sheffield will be required to hold the post of casualty dresser before being eligible for any other of the above appointments. In addition to the laboratories above mentioned the Medical department of the University contains lecture rooms for the various subjects of the curriculum, a complete materia medica museum, and the large library and reading-room of the Medico-Chirurgical Society which is open daily to students for purposes of study.

Fees.—Composition fee of £80, payable in three instalments—viz., £24 at commencement of first year of study, £28 at commencement of second year of study, and £28 at commencement of third year of study. A composition fee of £80 entitles the student to attendance on all the courses of lectures and practical classes except pharmacy, vaccination, and instruction in anæsthetics required for a degree course in the University or for the ordinary qualifications in medicine and surgery of the Examining Boards. The composition fee does not include medical and surgical hospital practice, clinical lectures, practical instruction in mental diseases, diseases of women, and infectious diseases, the fee for the full period of both medical and surgical hospital practice required by the Examining Boards being £42 if paid in one sum at commencement of hospital practice; or £43 1*s.* if paid in two sums of 21 guineas and 20 guineas, one on beginning hospital practice, the other twelve months later.

Staff of the Royal Infirmary, Sheffield.—Physicians: Dr. W. Dyson, Dr. W. S. Porter, Dr. W. Tusting Cocking, and Dr. A. E. Barnes. Surgeons: Dr. Sinclair White, Mr. Arthur Connell, and Mr. Archibald Cuff. Medical Officer to the Skin Department: Dr. Rupert Hallam. Pathologist: Professor J. M. Beattie. Medical Officer to the Ear and Throat Department: Mr. W. S. Kerr. Ophthalmic Surgeon: Mr. G. H. Pooley. Medical Registrars: Dr. A. E. Barnes and Dr. A. G. Yates. Medical Officer in Charge of Electrical Department: Dr. Rupert Hallam. Anæsthetists: Mr. H. T. Wightman, Mr. J. Wilfred Stokes, and Dr. W. D. Mart. Clinical Pathologist: Dr. W. W King. Honorary Secretary to the Medical Staff: Mr. W. S. Kerr.

Staff of the Sheffield Royal Hospital.—Physicians: Dr. Duncan Burgess and Dr. Arthur Hall. Surgeons: Mr. Harry Lockwood and Mr. Graham Simpson. Assistant Surgeons: Mr. Garrick Wilson and Mr. F. A Hadley. Assistant Physicians: Dr. A. E. Naish and Dr. Herbert Henry. Ophthalmic Surgeon: Dr. Stanley Riseley. Assistant Ophthalmic Surgeon: Mr. Herbert Emmerson. Aural Surgeon: Dr. George Wilkinson. Physician for Mental Diseases: Mr. Gilbert E. Mould. Medical Officer to the Electrical Department: Dr. W. Harwood Nutt. Physician for Skin Diseases: Dr. E. F. Skinner. Anæsthetists: Mr. Herbert Hallam, Mr. Norton Milner, and Dr. C. Graham Murray. Pathologist: Dr. J. M. Beattie. Honorary Secretary to the Medical and Surgical Staff: Dr. Stanley Riseley. Dental Surgeons: Mr. F. G. Mordaunt, Mr. Frank Harrison, Mr. D. Dathl Davies, Mr. H. J. Morris, and Mr. C. C Drabble. Assistant Dental Surgeons: Mr. P. S. Stokes, Mr. W. J. Law, Mr. H. J. Stoner, Mr. R. Cecil Webster, and Mr. J. H. Skerritt. Honorary Secretary to the Dental Staff: Mr. W. J. Law.

There are other institutions at which the students of the University of Sheffield can receive clinical instruction. These are the City Fever Hospitals (Medical Superintendent, Dr. Egerton H. Williams), the South Yorkshire Asylum (Medical Superintendent, Dr. W. S. Kay), and the Jessop Hospital for Women, Gell-street, Sheffield. The hospital contains 56 beds for gynæcological cases and 24 for obstetric cases. A staff of midwives connected with the hospital attend lying-in women at their own homes, and, in case of need, are assisted by the members of the medical staff. A 12 weeks' course of instruction (theoretical and practical) is also provided for resident pupil midwives, the institution being approved by the Central Midwives Board as a training centre. Medical Officers: Mr. Richard Favell, Mr. Percival E. Barber, and Mr. Miles H. Phillips. Assistant Medical Officer: Mr. D. Gray Newton. Honorary Secretary to the Staff: Mr. Percival E. Barber.

UNIVERSITY OF BRISTOL.

In the Faculty of Medicine there are the following degrees:—Bachelor of Medicine and Bachelor of Surgery (M.B. and Ch.B.), Doctor of Medicine (M.D.), Master of Surgery (Ch.M.), Bachelor of Dental Surgery (B.D.S.), and Master of Dental Surgery (M.D.S.). There are also the following diplomas: Diploma in Public Health (D.P.H.), Diploma in Dental Surgery (L.D.S.), and Diploma in Veterinary State Medicine.

All candidates for degrees in Medicine, Surgery, and Dentistry are required to pass an examination called the Matriculation Examination, which must include Latin, or to pass such examination as may be regarded as equivalent by

the Senate. All courses, degrees, and diplomas are open to men and women alike.

Conjoined Degrees of Bachelor of Medicine and Bachelor of Surgery.—Candidates shall be not less than 21 years of age and shall have pursued the courses prescribed by University Regulations during not less than five and a half years, of which three shall have been passed in the University, and two of these three subsequent to pass in the second examination. All candidates for the degrees of M.B., Ch.B., are required to satisfy the examiners in the several subjects of three examinations: the First Examination, the Second Examination, and the Final Examination.

The First Examination.—The subjects of examination are: Chemistry (Inorganic), Physics, and Biology, the courses pursued being those for the time being approved for the intermediate part of the B.Sc. curriculum. This part of the curriculum shall extend over one year.

The Second Examination.—The subjects of examination are: Organic Chemistry and Elementary Anatomy (Part I.) and Advanced Anatomy and Physiology (Part II.). Parts I. and II. may be passed separately or together.

The Final Examination.—The subjects of examination are: Materia Medica and Pharmacy, Pharmacology and Therapeutics. General Pathology, Morbid Anatomy, and Bacteriology (Part I.); Special Pathology, Forensic Medicine, Toxicology, and Public Health, Obstetrics (including Diseases of Women), Surgery (Systematic, Clinical, Practical, and Operative), Medicine (Systematic, Clinical, and Practical, including Mental Diseases) (Part II.). Candidates may pass I. and II. together, or separately.

Degree of Doctor of Medicine.—Candidates shall be Bachelors of the University of not less than two years' standing as such and may elect either (1) to pass an examination in General Medicine, or (2) to pass an examination in State Medicine, or (3) to present a Dissertation. The candidate who elects to pass the examination in State Medicine must hold a diploma in Public Health of some University or College, and the candidate who elects to present a Dissertation may be examined in the subject thereof.

Degree of Master of Surgery.—Candidates shall be Bachelors of not less than two years as such, during which period they shall have attended the Surgical Practice of an institution approved for the purpose. They shall pass an examination in Surgical Anatomy, Pathology, and Bacteriology, and Operative, Clinical, and General Surgery, and present to the University a Dissertation on some subject of Surgery.

Professors—Chemistry: Francis Francis, D.Sc., Ph.D. Anatomy: Edward Fawcett, M.D., C.M. Physiology: A. F. Stanley Kent, M.A. Pathology: I. Walker Hall, M.D., C.M. Obstetrics: W. C. Swayne, M.D., B.S. Surgery: C. A. Morton, F.R.C.S., and James Swain, M.D., F.R.C.S. Medicine: F. H. Edgeworth, M.D., B.C., D.Sc., and J. Michell Clarke, M.D., F.R.C.P.

Clinical Instruction.—The allied hospitals (Bristol Royal Infirmary and Bristol General Hospital) have between them 470 beds and extensive out-patient departments, special clinics for Diseases of Women and Children and those of the Eye, Throat, and Ear, in addition to arrangements for Dental work and large outdoor Maternity Departments.

At each of these institutions there are well-arranged pathological museums, post-mortem rooms, and laboratories for Morbid Anatomy. There are also laboratories for work in Clinical Pathology, Bacteriology, and Cytology, in which special instruction is given in these subjects. Departments are provided and well-equipped for X ray work, both for diagnosis and treatment, the various forms of Electrical treatment, including High Frequency Currents, Electric Baths, Finsen Light treatment, and Massage.

The students of the school have also the advantage of attending the practice of the Royal Hospital for Sick Children and Women, containing 140 beds, and that of the Bristol Eye Hospital, with 40 beds. The total number of beds available for clinical instruction is therefore upwards of 600. Excellent facilities are thus afforded to students for obtaining a wide and thorough acquaintance with all branches of Medical and Surgical work. Each student has the opportunity of personally studying a large number of cases and acquiring practical skill in diagnosis and treatment. All classes are open to women.

Appointments (Undergraduates).—Clinical Clerkships, Dresserships, also Ophthalmic, Obstetric, and Pathological Clerkships are tenable at the Bristol Royal Infirmary and the Bristol General Hospital. In these institutions the Dressers reside in rotation free of charge.

Appointments (Post-Graduate) at the Bristol Royal Infirmary.—Two House Surgeons £100 each per annum, two House Physicians £100, Resident Obstetric and Ophthalmic House Surgeon £75, Throat, Nose, and Ear House Surgeon £75, Casualty Officer £50, Dental House Surgeon £100. All these appointments are made for 12 months, except that of Casualty Officer, which is for six months. From the resident officers a Senior Resident Officer is appointed at an additional salary of £30.

At the Bristol General Hospital.—Senior House Surgeon £150 per annum, Casualty House Surgeon £100 per annum if another resident appointment has been previously held. Two House Physicians £80, House Surgeon £80, Dental House Surgeon £200 per annum. All these appointments are for six months, except that of Dental House Surgeon, which is for two years.

Staff of the Bristol Royal Infirmary.—Honorary and Consulting Physicians: Dr. R. Shingleton Smith, Dr. H. Waldo, and Dr. J. E. Shaw. Honorary and Consulting Surgeons: Mr. E. C. Board, Mr. W. H. Harsant, Mr. A. W. Prichard, and Mr. G. Munro Smith. Honorary and Consulting Ophthalmic Surgeon: Mr. F. Richardson Cross. Honorary Physicians: Dr. A. B. Prowse, Dr. F. H. Edgeworth, Dr. J. A. Nixon (Dean), and Dr. J. R. Charles. Honorary Surgeons: Mr. J. Paul Bush, Mr. H. F. Mole, Dr. J. Swain, and Mr. T. Carwardine. Honorary Ophthalmic Surgeon: Dr. Ogilvy. Honorary Obstetric Physician: Dr. Walter Swayne. Honorary Dental Surgeon: Mr. W. R. Ackland. Honorary Physician to the Nose and Throat Department: Dr. P. Watson Williams. Honorary Assistant Dental Surgeon: Mr. F. C. Nichols. Honorary Assistant Physician: Dr. J. M. Fortescue-Brickdale. Honorary Assistant Surgeons: Mr. E. H. E. Stack and Mr. C. F. Walters. Pathologist: Dr. I. Walker Hall. Honorary Demonstrator of Morbid Anatomy: Dr. J. J. S. Lucas. Honorary Anæsthetist: Mr. A. L. Flemming. Honorary Assistant Anæsthetists: Mr. S. V. Stock and Mr. Leonard Moore. Honorary Skiagraphist: Mr. James Taylor.

Staff of the Bristol General Hospital.—Honorary and Consulting Physicians: Dr. A. J. Harrison and Dr. J. Barclay Baron. Honorary and Consulting Surgeons: Dr. George F. Atchley, Mr. Nelson C. Dobson, Mr. F. Poole Lansdown, and Mr. Chas. F. Pickering. Physicians: Dr. J. Michell Clarke, Dr. George Parker, and Dr. J. O. Symes. Surgeons: Mr. C. A. Morton, Dr. R. G. Poole Lansdown, Dr. J. Lacy Firth, and Dr. H. Greville Kyle. Physician Accoucheur: Dr. W. H. C. Newnham. Physician to Department for Diseases of the Skin: Dr. W. Kenneth Wills. Surgeon to the Throat and Nose: Dr. J. Lacy Firth. Ophthalmic Surgeon: Mr. Cyril H. Walker. Assistant Physicians: Dr. Newman Neild and Dr. Carey F. Coombs. Assistant Surgeon: Mr. E. W. H. Groves. Assistant Physician Accoucheur: Mr. D. C. Rayner. Anæsthetists: Dr. J. Freeman and Dr. Hedley Hill. Dental Surgeon: Mr. E. A. G. Dowling. Assistant Dental Surgeon: Mr. H. J. Wyatt. Pathologist: Mr. G. Scott Williamson. Curator of Museum: Mr. G. Scott Williamson. Skiagraphist: Mr. J. Ellington Jones.

Scholarships and Prizes.—At the Bristol Royal Infirmary there are five prizes, which are restricted to perpetual students who have done the necessary qualifying work at the Infirmary. They are the Suple Medical Prize and the Suple Surgical Prize, each consisting of a gold medal of the value of 5 guineas and 7 guineas in money. The one is awarded after competitive examination in Medicine of students of the fourth and fifth years and the other after competitive examination in Surgery of students of the third and fourth years. The Henry Clark Prize, value 11 guineas, is awarded for the class work of third-year students. The Crosby Leonard Prize, value 7 guineas, is awarded after examination in Clinical Surgery, and the Augustin Prichard Prize, value 6 guineas, is awarded after examination in Surgical Anatomy.

At the Bristol General Hospital there are two scholarships and a prize, which are restricted to perpetual students who have done the necessary qualifying work at the Hospital. The Sanders Scholarship, value £22 10*s.*, is awarded after competitive examination in Medicine, Surgery, and Midwifery of fourth-year students. The Clarke Scholarship of £15 is awarded after competitive examination in surgery among students of the fourth year. The Marshall Prize,

value £12, is awarded to the best surgical dresser of the fourth year.

The Tibbits Surgical Prize of £9 9*s*. is awarded for proficiency in Practical Surgery. The Martyn Memorial Pathological Prizes of £10 each, of which there are two annually, are awarded after competitive examination in Pathology and Morbid Anatomy. A gold medal and a silver medal are given by the committees of the two institutions to the most distinguished students of the fifth year. These prizes and medals can be competed for by perpetual students of the Faculty of Medicine, University of Bristol.

Fees.—For the complete curriculum for the degrees of M.B., Ch.B., 140 guineas, or 150 guineas if paid in two instalments.

For the complete curriculum for the degree of B.D.S., including the Mechanical Laboratory work, 190 guineas; if without the Laboratory work, 115 guineas. This fee may also be paid by instalments.

For the complete curriculum for the L.D.S., including the Mechanical Laboratory, 168 guineas; if without Laboratory, 93 guineas. This fee may also be paid by instalments.

For the complete curriculum for the D.P.H., 25 guineas.

The fees for Hospital work may be paid separately. For a Medical curriculum they amount to 60 guineas; for the B.D S., 30 guineas; and for the L.D.S., 20 guineas.

Medical Practitioners and others not requiring certificates of attendance may attend the Medical and Surgical Practice of the Hospitals at the following fees:—For one month, 2 guineas; two months, 3 guineas; three months, 4 guineas; six months, 7 guineas.

Further information as to curricula and fees can be obtained from the Dean or the Registrar of the University.

UNIVERSITY OF WALES.

This University has now the privilege of granting degrees in Medicine and Diplomas in Public Health. At the three constituent Colleges of Aberystwyth, Bangor, and Cardiff there are Professors of Chemistry, Botany, Zoology, and Physics, so that the students of the University can obtain proper instruction in the ancillary subjects. The foundation of a Medical Faculty has been laid at University College, Cardiff, where there is a recognised school of medicine.

University College, Cardiff: School of Medicine.—All classes are open to both men and women students who may spend three or four out of their five years of medical study at Cardiff. The courses of instruction given at Cardiff are recognised as qualifying for the examinations of the Universities, Royal Colleges, and other licensing bodies of Great Britain and Ireland, and they are specially adapted to meet the needs of those University students studying for Cambridge and London degrees. Students who are preparing for these examinations may compound for their courses by paying a fee of £63, while a composition fee of £41 10*s*. includes all the necessary courses for the first and second examinations for the Diploma of the Conjoint Board. In all cases the composition fees may be paid by instalments. Hospital instruction is given at the Cardiff Infirmary. The attention of students about to matriculate is drawn to the numerous entrance scholarships and exhibitions, varying in value from £10 to £35 per annum, offered for competition at University College, Cardiff, in April next, most of which may be held by medical students. Full particulars of the examination for these may be obtained by application to the Registrar. In the department of Public Health established in 1899 instruction is given qualifying for the D.P.H. examinations. The Council of the College has appointed a Professor of Pathology and Bacteriology. Further information may be obtained from the Dean of the Faculty of Medicine.

Lecturers.—Physics: Professor A. L. Selby. Chemistry: Professor C. M. Thompson. Zoology: Professor W. N. Parker. Botany: Professor A. H. Trow. Anatomy: Professor David Hepburn. Physiology: Professor J. B. Haycraft. Materia Medica and Therapeutics: Dr. W. Mitchell Stevens. Pathology and Bacteriology: Professor Emrys-Roberts. Hygienic Chemistry: Mr J. H. Sugden. Public Health and Hygiene: Dr. E. Walford and one Lecturer to be appointed. Midwifery (for Midwives): Dr. E. J. Maclean.

Clinical Instruction.—Students can attend the practice of the Cardiff Infirmary, which contains 196 beds.

CARDIFF INFIRMARY.—Founded 1837. 196 beds In-patients, 2483; out-patients, 21,917. Consulting Physicians: Dr. W. T. Edwards, Dr. William Taylor, and Dr. C. T. Vachell. Consulting Surgeon: Mr. T. Wallace. Consulting Dental Surgeon: Mr. John C. Oliver. Physicians: Dr. H. R. Vachell and Dr. A. E. Taylor. Surgeons: Mr. P. Rhys Griffiths, Mr. William Sheen, and Mr. J. Lynn Thomas. Assistant Physicians: Dr. W. Mitchell Stevens, Dr. Cyril Lewis, and Dr. Alfred Howell. Assistant Surgeons: Mr. H. G. Cook, Mr. Cornelius A. Griffiths, and Mr. William Martin. Ophthalmic Surgeons: Mr. F. P. S. Cresswell and Mr. R. Russell Thomas. Assistant Ophthalmic Surgeon: Mr. D. Leighton Davies. Gynæcologists: Dr. Ewen J. Maclean and Mr. E. Tenison Collins. Ear, Throat, and Nose Surgeon: Mr. D. R. Paterson. Pathologists: Dr. H. A. Schölberg and Professor Emrys-Roberts. Sanitary Adviser: Dr. E. Walford. Anæsthetists: Mr. Frederick W. S. Davies and Mr. Alexander Brownlee. Dental Surgeons: Mr. W. Kittow and Mr. Thomas Quinlan. Electrical Department: Dr. Owen L. Rhys. Resident Medical Officer: Dr. C. W. Shepherd.

SWANSEA GENERAL AND EYE HOSPITAL AND SWANSEA HOSPITAL CONVALESCENT HOME.—Hospital established 1817, Home 1903. Hospital 141, Convalescent Home built for 20 beds and one cot. Consulting Physicians: Dr. D. A. Davies, Dr. John A. Rawlings, Dr. F. Knight, and Dr. J. S. H. Roberts. Consulting Surgeons: Mr. J. Thomas and Mr. H. A. Latimer. Physicians: Dr. E. Le C. Lancaster and Dr. D. E. Evans. Surgeons: Mr. W. F. Brook and Mr. R. C. Elsworth. Obstetric Physician: Mr. R. N. Jones. Ophthalmic Surgeon: Dr. Frank G. Thomas. Assistant Ophthalmic Surgeon: Mr. H. E. Quick. Surgeon to the Throat, Nose, and Ear Department: Dr. A. F. Blagdon-Richards. Assistant Physicians: Dr. A. W. Cameron and Dr. C. L. Isaac. Assistant Surgeon: Mr. E. Reid. Vaccine Therapist: Dr. A. Clarke Begg. Medical Officers for Outdoor Patients: Mr. E. Reid, Dr. A. W. Cameron, and Dr. C. L. Isaac. Surgeon-Dentist: Mr. H. J. Thomas. Electro-Therapeutic Officer: Mr. D. R. Edwards. Anæsthetists: Dr. W. L. Griffiths, Mr. Alban Evans, and Dr. A. Clarke Begg. Resident Medical Officers—House Surgeons: Mr. Peter Chalmers and Mr. E. V. Williams. Secretary-Superintendent: W. D. Hughes. In-patients, 1932; out-patients, 9284. Convalescent Home patients, 306.

ENGLISH MEDICAL CORPORATIONS GRANTING DIPLOMAS.

EXAMINING BOARD IN ENGLAND BY THE ROYAL COLLEGE OF PHYSICIANS OF LONDON AND THE ROYAL COLLEGE OF SURGEONS OF ENGLAND.

Under this heading we give the regulations for the examinations enforced by the Conjoint Examining Board of the Royal Colleges of Physicians of London and Surgeons of England and of the Society of Apothecaries upon students desiring their respective diplomas of qualification. We do not give any list of schools recognised by these bodies as eligible to prepare students for their examinations beyond mentioning that all the schools which we have already described (under the heading of the Universities to which they are attached) are recognised as suitable places of instruction by the corporations granting medical diplomas. The courses of study at the principal colonial medical schools are also recognised as qualifying for the examinations of these corporations.

Any candidate who desires to obtain both the Licence of the Royal College of Physicians of London and the diploma of Member of the Royal College of Surgeons of England is required to complete five years of professional study at recognised Medical Schools and Hospitals and to comply with the following regulations and to pass the examinations hereinafter set forth. Six months of the curriculum may be spent in an Institution recognised by the Board for instruction in Chemistry, Physics, Practical Chemistry, and Biology.

Professional Examinations.—There are three Examinations, called herein the First Examination, the Second Examination, and the Third or Final Examination, each being partly written, partly oral, and partly practical. These examinations will be held in the months of January, April, July, and October, unless otherwise appointed. Every candidate intending to present himself for examination is required to give notice in writing to Mr. F. G. Hallett, secretary of the Examining Board, Examination Hall, Victoria Embankment,

W.C., 14 clear days before the day on which the examination commences, transmitting at the same time the required certificates.

The subjects of the *First Examination* are—Chemistry, Physics, Elementary Biology, and Practical Pharmacy. A candidate may take this examination in three parts at different times (Chemistry and Physics must be taken together until the required standard is reached in both or in one of these subjects, but a candidate will not be allowed to pass in one without obtaining at the same time at least half the number of marks required to pass in the other). A candidate will be admitted to examination in Chemistry and Physics, in Practical Pharmacy, and Elementary Biology on producing evidence of having passed the required Preliminary Examination and of having received instruction in these subjects at a recognised institution, but he may take Pharmacy at any time during the curriculum. Certificates must be produced of 180 hours' instruction and laboratory work in chemistry; 120 hours' instruction and laboratory work in physics; and 120 hours' instruction and laboratory work in biology. These courses need not be completed within one year, nor need they run concurrently, and they may be commenced or attended before the candidate passes the required preliminary examination in general education. Synopses of the subjects of examination may be obtained on application. A candidate rejected in one part or more of the First Examination will not be admitted to re-examination until after the lapse of a period of not less than three months from the date of rejection, and he will be re-examined in the subject or subjects in which he has been rejected. If referred in Chemistry, Physics, or Biology he must produce evidence of further instruction at a recognised Institution. Any candidate who shall produce satisfactory evidence of having passed an examination for a degree in Medicine on any of the subjects of this examination conducted at a university in the United Kingdom, in India, or in a British colony will be exempt from examination in those subjects in which he has passed.

The fees for admission to the *First Examination* are as follows: For the whole examination, £10 10*s.*; for re-examination after rejection in Parts I. and II., £3 3*s.*; and for re-examination in each of the other parts, £2 2*s.*

The subjects of the *Second Examination* are Anatomy and Physiology. Candidates will be required to pass in both subjects at one and the same time. Candidates will be admissible to the Second Examination on production of the required certificates of professional study. The study of Anatomy and Physiology before passing in two of first three parts of the First Professional Examination is not recognised.

A candidate referred on the *Second Examination* will be required, before being admitted to re-examination, to produce a certificate that he has pursued, to the satisfaction of his teachers, in a recognised place of study, his Anatomical and Physiological studies during a period of not less than three months subsequently to the date of his reference.

The fees for admission to the *Second Examination* are: £10 10*s.* for the whole examination and £6 6*s.* for re-examination after rejection.

The subjects of the *Third* or *Final Examination* are: Part I. Medicine, including Medical Anatomy, Pathology, Practical Pharmacy, Therapeutics, Forensic Medicine, and Public Health. Candidates who have passed in Practical Pharmacy at the First Examination will not be re-examined in that subject at the Third Examination. Part II. Surgery, including Pathology, Surgical Anatomy, and the use of Surgical Appliances. Part III. Midwifery and Diseases Peculiar to Women. Candidates may present themselves for Parts I., II., and III. of the examination separately or together at the expiration of not less than two years (24 months) from the date of passing the Second Examination, on production of the certificates of study required for the respective parts, provided that the examination is not completed before the expiration of five years from the date of passing the Preliminary Examination—viz., Part I., Medicine, of having attended Lectures on Medicine, Pathology including Bacteriology, Pharmacology, and Therapeutics, Forensic Medicine, and Public Health; Practical Instruction in Medicine; Medical Hospital Practice during two winter and two summer sessions; Demonstrations in the Post-mortem Room during 12 months; Clinical Lectures on Medicine during nine months; of having discharged the duties of Medical Clinical Clerk; Instruction in the Administration of Anæsthetics; Practice of a Fever Hospital and Clinical Demonstrations at a recognised Lunatic Asylum. Part II., Surgery, of having attended Lectures on Surgery and Pathology including Bacteriology; Practical Instruction in Surgery; of having performed operations upon the Dead Subject; Surgical Hospital Practice during two winter and two summer sessions; Demonstrations in the Post-mortem Room during 12 months; Clinical Lectures on Surgery during nine months; of having discharged the duties of Surgical Dresser; Instruction in the Administration of Anæsthetics; and Clinical Instruction in Ophthalmology. Part III., Midwifery, of having attended all the above courses as well as Lectures on Midwifery; Practical Instruction in Midwifery; Clinical or other Lectures, with Practical Instruction in Diseases Peculiar to Women; of having discharged the duties of Clinical Clerk in the Gynæcological Wards or Out-patient Department; and of having conducted 20 Labours.

The fees for admission to the *Third* or *Final Examination* are as follows: For the whole examination, £21. Part I. For re-examination in Medicine, including Medical Anatomy, Pathology, Therapeutics, Forensic Medicine, and Public Health, £5 5*s.*; for re-examination in Practical Pharmacy (if taken at this examination), £2 2*s.* Part II. For re-examination in Surgery, including Pathology, Surgical Anatomy, and the use of Surgical Appliances, £5 5*s.* Part III. For re-examination in Midwifery and Diseases Peculiar to Women, £3 3*s.*

A candidate referred on the *Third* or *Final Examination* will not be admitted to re-examination until after the lapse of a period of not less than three months from the date of rejection and will be required, before being admitted to re-examination, to produce a certificate, in regard to Medicine and Surgery, of having attended the Medical and Surgical Practice, or the Medical or Surgical Practice, as the case may be, during the period of his reference; and in regard to Midwifery and Diseases Peculiar to Women a certificate of having received, subsequently to the date of his reference, not less than three months' instruction in that subject by a recognised teacher.

Students of recognised universities in England, Scotland, and Ireland, who have passed examinations for a degree in Medicine at their universities in the subjects of the First and Second Examinations of the Examining Board, may enter for the Final Examination at the expiration of two years from the date of passing in Anatomy and Physiology, on production of the required certificates.

Graduates in Medicine of certain recognised Indian, Colonial, and Foreign universities may present themselves for the Final examination under special conditions which can be ascertained on application to the Secretary.

ROYAL COLLEGE OF PHYSICIANS OF LONDON: THE MEMBERSHIP AND FELLOWSHIP.

In addition to the diplomas granted by the English Conjoint Board, the Royal College of Physicians of London and the Royal College of Surgeons of England grant honour diplomas, which no longer give the right to practise professionally if held separately. The Royal College of Physicians of London has two such diplomas, the *Fellowship* which is a purely honorary distinction and the *Membership* which is obtained by examination.

Membership.—Every candidate for the Membership of the College must furnish proof of having attained the age of 25 years. Candidates must not be engaged in trade, dispense medicine, make any engagement with a chemist, or any other person for the supply of medicine, or practise medicine or surgery in partnership, by deed or otherwise. Any candidate being already registered or having passed a qualifying examination in accordance with the Medical Act of 1886, who has obtained the degree of Doctor or Bachelor of Medicine at a University in the United Kingdom, in India, or a British colony, or who has obtained a foreign qualification entitling him or her to practise medicine or surgery in the country where such qualification has been conferred, wherein the courses of study and the examinations to be undergone previously to graduation have been adjudged by the Censors' Board to be satisfactory, will (if the Censors think fit) be admitted to the Pass Examination. The nature and extent of this examination will, in the case of each

candidate, be determined by the Censors' Board. All other candidates must produce proof of having passed the examinations required for the Licence of the College. The examination is directed partly to pathology and partly to the practice of medicine and may be modified in circumstances to be ascertained by application to the Registrar. For example, candidates under 40 years of age are examined in an ancient or modern language, a test from which their seniors are exempt. The fee for admission as a Member of the College is 40 guineas, except when the candidate for Membership is a Licentiate of the College, in which case the fee already paid for the Licence shall be deducted from the 40 guineas. The fee for the examination is £6 6*s*.

Fellowship.—The *Fellows* are selected annually from the ranks of the *Members*.

ROYAL COLLEGE OF SURGEONS OF ENGLAND: THE FELLOWSHIP.

The Royal College of Surgeons of England confers its diploma of Fellow upon a few distinguished persons in an honorary capacity. Two Members of long standing may also be elected to the Fellowship annually. But the bulk of the Fellows obtain the diploma as the result of examination.

Fellowship.—The examination for the Fellowship is divided into two parts—viz., the First Examination and the Second Examination. The subjects of the First Examination are Anatomy and Physiology and the questions on these subjects may require an elementary acquaintance with Comparative Anatomy and Physiology. The examination is partly written and partly *vivâ voce*. The subjects of the Second Examination are Surgery, including Surgical Anatomy and Pathology. The examination is partly written and partly *vivâ voce* and includes the examination of patients and the performance of operations on the dead body. The examinations are held during the months of May and November of each year.

The fees for examination are :—First Examination, each admission, 5 guineas. Second Examination, each admission, 12 guineas. Of such examination fees 17 guineas will be reckoned as part of the fee payable upon admission to the Fellowship. The fee to be paid upon admission to the Fellowship is 30 guineas, except when the candidate is a Member of the College, in which case the fee is 20 guineas.

A Member of the College is admissible to the First Examination at any time after receiving his Diploma of Membership. A candidate who is not a member of the College is admissible to the first Professional Examination for the Fellowship on the production of evidence of having passed the First and Second Examinations of the Examining Board in England by the Royal College of Physicians of London and the Royal College of Surgeons of England (or, if a member of a University recognised by the College for the purpose, of having passed the Examinations in his University equivalent to the First and Second Examinations of the Board) and on the production of certificates of attendance upon certain courses of study described in the Regulations.

A Member of the College is admissible to the Second Examination at any time after having passed the First Examination, on producing satisfactory evidence of having been engaged not less than six years in the study (or study and practice) of the profession.

A candidate who is not a Member of the College must possess the registrable surgical and medical degrees of universities recognised by the Council and must have been engaged in the study (or study and practice) of the profession for not less than four years subsequent to the date of obtaining the recognised qualification, one year of which shall have been spent in attendance on the Surgical Practice of a recognised hospital. The diploma of Fellow is not conferred upon successful candidates until they have attained the age of 25 years.

The Regulations may be obtained on application to the Secretary of the Examining Board, Examination Hall, Victoria Embankment, London, W.C.

SOCIETY OF APOTHECARIES OF LONDON.

There are two examinations—Primary and Final. The Final examination is divided into Section I. and Section II. The Primary examination is held quarterly. Final examinations are held monthly. No examinations are held in the month of September.

The Primary examination consists of two parts. Part I. Elementary Biology; Chemistry, Chemical Physics, including the Elementary Mechanics of Solids and Fluids, Heat, Light, and Electricity; Practical Chemistry; and Materia Medica and Pharmacy. A synopsis indicating the range of the subjects in the examination will be sent with the regulations on application. Evidence of instruction in these subjects must be produced prior to examination. Part II. includes Anatomy, Physiology, and Histology. This examination cannot be passed before the completion of twelve months' Practical Anatomy with Demonstrations, and these subjects cannot be taken separately except in the event of the candidate having previously passed in one. Evidence must be produced of the candidate's course of study. A schedule for the Primary examination, to be obtained of the Secretary, must be signed by the Dean of the Medical School or other authority. Section I. of the Final examination consists of three parts. Part I. includes the Principles and Practice of Surgery, Surgical Pathology, and Surgical Anatomy, Operative Manipulation, Instruments, and Appliances. Part II. includes the Principles and Practice of Medicine, Pharmacology, Pathology, and Morbid Histology; Forensic Medicine, Hygiene, Theory and Practice of Vaccination; and Mental Diseases. Part III. includes Midwifery, Gynæcology, and Diseases of New-born Children and the Use of Obstetric Instruments and Appliances. Section I. of the Final examination cannot be passed before the expiration of 45 months after registration as a medical student, during which time not less than three winter sessions and two summer sessions must have been passed at one or more of the medical schools connected with a general hospital recognised by the Society. Section II. of the Final examination consists of two Parts. Part I. Clinical Surgery; Part II. Clinical Medicine and Medical Anatomy. Section II. cannot be passed before the end of the fifth year.

The course of study for the *Primary examination* is as follows:—Elementary Biology, not less than three months; Chemistry and Chemical Physics, six months; Practical Chemistry, three months; Pharmacy and Dispensing, three months; Anatomy, six months; Practical Anatomy with Demonstrations, 12 months; Physiology, six months; Histology with Demonstrations, three months. The study of these subjects must be pursued at a Medical School recognised by the Society. Instruction in Pharmacy and Dispensing must be given by a registered medical practitioner or by a member of the Pharmaceutical Society by examination or in a public hospital, infirmary, or dispensary.

The course of study for the *Final examination, Section I.*, includes attendance on the Surgical and Medical Practice (with Post-mortem Examinations) at a hospital connected with a medical school for a period of one winter and one summer session; lectures on the Principles and Practice of Surgery, six months; Practical Surgery, three months; Clinical Surgical Lectures, nine months; Dressership, six months; Performance of Surgical Operations on the Dead Body; lectures on Principles and Practice of Medicine, six months; Pathology, three months; Clinical Medical Lectures, nine months; Clinical Clerkship, six months; Forensic Medicine, Hygiene, and Insanity, three months; Midwifery and Gynæcology, three months; Clinical Instruction in the same, three months; a course of Practical Midwifery; attendance on 20 Midwifery cases. The course of medical study must extend over the above-mentioned period of 45 months and the offices of dresser or clinical clerk must be held at a hospital, or other institution recognised by the Society.

The course of study for the *Final examination, Section II.*, includes either attendance on the Practice of Medicine and Surgery at a hospital or other institution recognised by the Society for a further period of 12 months, or six months as above and six months as a pupil of a registered practitioner holding a public medical or surgical appointment, or attendance at two special hospitals for six months (three months at each hospital), and for six months at a general hospital, all such hospitals to be recognised by the Society. Evidence shall also be given of practical instruction in Infectious Diseases and in Mental Diseases (at a lunatic asylum or in the wards of an institution containing a special ward set apart for the treatment of mental diseases), and in any two of the following subjects: Ophthalmic Surgery, Laryngology with Rhinology and Otology, Dermatology, and Diseases of Children. No candidate is eligible for the Final

examination who has not completed the curriculum prescribed by the Society, in evidence of which a schedule, to be obtained of the Secretary, must be produced, signed by the Dean of the Medical School or other authority. Prior to Section II. of the Final examination the candidate must produce certificates: (1) of being 21 years of age; (2) of moral character; (3) of the course of medical study; (4) of proficiency in vaccination signed by a teacher authorised by the Local Government Board; and (5) of instruction in the administration of anæsthetics. Candidates intending to present themselves for examination are required to give 14 days' notice. A form for this purpose will be sent on application.

Licentiates are eligible for the Membership of the Society of Apothecaries. Particulars may be obtained on application to the clerk

The fee for the Licence is 20 guineas. The examination offices are open from 10 A.M. to 4 P.M.; on Saturdays from 10 A.M. to 1 P.M. All letters should be addressed to the Secretary, Court of Examiners, Society of Apothecaries of London, Blackfriars, E.C.

METROPOLITAN ANCILLARY SCHOOLS AND HOSPITALS AFFORDING FACILITIES FOR CLINICAL OBSERVATION.

THE institutions which follow provide to the medical student and medical graduate facilities for different forms of instruction and clinical observation. In each case further information can be obtained from the secretary of the hospital.

THE SEAMEN'S HOSPITAL SOCIETY possesses two hospitals—the *Dreadnought* Hospital at Greenwich, 250 beds, and the Branch Hospital in the Royal Victoria and Albert Docks, E., 50 beds. It has also two Dispensaries—one in the East India Dock-road and the other at Gravesend—from which the patients are transferred to the hospitals. The London School of Clinical Medicine is attached to the *Dreadnought* Hospital and the medical staff is as follows:—Physicians: Sir Dyce Duckworth, Bart., Dr. F. Taylor, Sir J. Rose Bradford, Dr. Guthrie Rankin, and Dr. S. Russell Wells. Surgeons: Sir William Bennett, K.C.V.O., Mr. W. Turner, and Mr. L. H. McGavin. Ophthalmic Surgeon: Mr. L. V. Cargill. Surgeon for Diseases of the Skin: Sir Malcolm Morris, K.C.V.O. Surgeon for Diseases of the Throat, Nose, and Ear: Mr. Richard Lake. Physician in charge of the Electrical Department: Dr. A. Howard Pirie. Assistant Physicians: Dr. Fredk. Langmead, Dr. G. M. Holmes, and Dr. Charles Singer. Assistant Surgeons: Mr. E. Rock Carling, Mr. C. C. Choyce, Mr. H. Curtis, and Mr. A. J. Walton. Assistant Physician for Diseases of the Skin: Dr. Wilfrid Fox. Assistant Ophthalmic Surgeon: Dr. R. Bickerton. Assistant Surgeon for Diseases of the Throat, Nose, and Ear: Mr. G. N. Biggs. Director of Pathology: Professor R. Tanner Hewlett. Anæsthetists: Dr. M. Horne, Dr. C. Hughes, and Dr. R. E. Delbruck. Dean: Mr. C. C. Choyce. Medical Superintendent: Dr. R. D. O'Leary. The London School of Tropical Medicine is attached to the Albert Dock Hospital of the Society and the medical staff is as follows:—Physicians: Sir Patrick Manson, K.C.M.G., and Dr. Andrew Duncan. Surgeon: Mr. J. Cantlie. Assistant Physicians: Dr. F. M. Sandwith and Dr. C. W. Daniels. Ophthalmic Surgeon: Mr. L. V. Cargill. Dental Surgeon: Mr. K. W. Goadby. Director: Mr. H. B. Newham. Medical Officer East India Dock-road Dispensary: Mr. W. H. F. Oxley. Surgeon Gravesend Dispensary: Mr. C. E. Robbs. Secretary: Mr. P. J. Michelli, C.M.G.

WEST LONDON HOSPITAL, Hammersmith-road, W.—This hospital has 160 beds, all of which are constantly in use. About 2600 in-patients and 44,000 out-patients, whose attendances number 151,000, are treated annually. Attached to the hospital is the West London Post-Graduate College. The practice of the hospital is reserved exclusively for qualified men, no junior students being admitted. Instruction is given in the medical and surgical out-patient rooms and demonstrations are given in the wards daily. Post-graduate lectures and demonstrations are given daily except Saturdays; notice of the commencement of each course is advertised in the medical journals. Special Classes are held in Diseases of the Throat and Nose, Skin, and Eye, and in Gynæcology, Medical Electricity, Operative Surgery, Bacteriology, Anæsthetics, Intestinal Surgery, Surface Anatomy, Blood and Urine, Clinical Microscopy, Tropical Medicine, Cystoscopy, Venereal Diseases, and Operative Ophthalmology. The accommodation for post-graduates consists of a large lecture room, together with reading, writing, and class rooms, &c. The hospital has a fully equipped pathological laboratory at which instruction is given in elementary bacteriology, a class being held every month. The fees for hospital practice, including lectures, are £6 6*s*. for three months or £15 15*s*. for one year. The certificate of the hospital is accepted by the Admiralty, War Office, Colonial Office, and India Office in cases of study leave. Further information can be obtained on application to the Dean, Mr. L. A. Bidwell, at the hospital. Physicians: Dr. Seymour Taylor, Dr. A. P. Beddard, and Dr. E. A. Saunders. Physician for Diseases of Women: Dr. Drummond Robinson. Assistant Physician for Diseases of Women: Dr. H. J. F. Simson. Surgeons: Mr. F. Swinford Edwards, Mr. L. A. Bidwell, and Mr. A. Baldwin. Surgeon for Diseases of the Eye: Mr. H. P. Dunn. Assistant Surgeon for Diseases of the Eye: Mr. Bishop Harman. Assistant Physicians: Dr. H. Pritchard, Dr. Grainger Stewart, and Dr. J. M. Bernstein. Assistant Surgeons: Mr. Donald Armour, Mr. John Pardoe, and Mr. Etherington Smith. Surgeon-Dentist: Mr. H. Lloyd Williams. Physician in charge of Throat and Nose and Aural Department: Dr. H. J. Davis. Physician in charge of Children's Department: Dr. E. A. Saunders. Surgeon in charge of Orthopædic Department: Mr. A. Baldwin. Pathologist: Dr. Bernstein. Dermatologist: Dr. P. S. Abraham. Administrators of Anæsthetics: Messrs. Rickard W. Lloyd, E. W. Lewis, G. P. Shuter, and Dr. H. M. Page. Assistant Anæsthetists: Dr. Austin Cooper, Dr. J. D. Mortimer, and Dr. W. E. Robinson. Electrician: Mr. E. D. MacDougal. X Ray Department: Dr. R. Morton. Medical Registrar: Dr. A. C. D. Firth. Surgical Registrar: Mr. O. Addison. Secretary of the Hospital: Mr. A. Betteridge.

GREAT NORTHERN CENTRAL HOSPITAL, Holloway-road, N.—This hospital is recognised by the Examining Board in England of the Royal Colleges of Physicians and Surgeons as a place of study during the fifth year of the medical curriculum. Besides the Honorary Staff there are two resident House Physicians, three resident House Surgeons, five Anæsthetists, Pathologist, and Resident Medical Officer. The hospital contains 182 beds which are now fully occupied. There is also a ward for children under five years of age. The large rectangular and circular wards, each of which contains 24 beds, the observation wards, the two operation theatres, general and special out-patient and pathological departments, are specially designed with a view of offering the greatest facilities for clinical work. An electrical department is also provided. The Pathological Department has been extended and a Director of Chinical Pathology appointed. The Reckitt Convalescent Home at Clacton-on-Sea belongs to the hospital. It contains 26 beds. Medical practitioners are cordially invited to see the general and special practice of the hospital. Demonstrations are given daily in the wards and out-patient departments and during the coming winter session there will be a weekly clinical lecture. Clinical assistants (qualified), clinical clerks, and pathological clerks are appointed in the general and special departments and may receive certificates at the end of their terms of office. Further particulars from the Secretary of the Medical Committee at the Hospital. Consulting Physicians: Sir S. Wilks, Bart., Sir R. W. Burnet, and Dr. E. C. Beale. Physicians: Dr. A. Morison, Dr. T. J. Horder, Dr. Symes Thompson, Dr. Hinds Howell, Dr. F. W. Price, and Dr. H. Tidy. Obstetric Physicians: Dr. G. F. Blacker and Dr. Cuthbert Lockyer. Physician for Skin: Dr. A. Whitfield. Consulting Surgeon: Mr. P. T. B. Beale. Surgeons: Mr. G. B. M. White, Mr. E. C. Stabb, Mr. V. W. Low, Mr. Arthur Edmunds, and Mr. C. C. Choyce. Ophthalmic Surgeons: Mr. A. S. Morton and Mr. A. H. Payan Dawnay. Throat and Ear Surgeons: Mr. J. Gay French and Mr. H. T. Mant. Dental Surgeon: Mr. C. Peyton Baly. Medical Officer in Charge of Electrical Department: Dr. Robert Knox. Director of Clinical Pathology: Dr. Ernest H. Shaw.

PRINCE OF WALES'S GENERAL HOSPITAL, Tottenham, N.—This general hospital is in the midst of a densely populated neighbourhood of more than half a million inhabitants. It contains medical, surgical, gynæcological, and children's wards, having in all 125 beds. There are special departments for gynæcological cases, diseases of the eye, ear, throat, and nose, skin diseases, medical electricity and

radiography, and dentistry. Operations are performed every afternoon of the week (except Saturday) at 2.30 P.M. Clinical instruction, laboratory classes, and lectures are given daily in the wards and out-patient departments, laboratories, and lecture hall in connexion with the North-East London Post-Graduate College attached. There are four Resident Medical Officers, and Clinical Assistants are appointed under certain conditions. Further particulars in regard to the hospital may be obtained from Mr. H. W. Carson, Secretary to the Medical Committee, 26, Welbeck-street, W.; or from Dr. A. J. Whiting, Dean of the North-East London Post-Graduate College, 142, Harley-street, W. Consulting Physicians: Sir James Reid, Bart., and Dr. Percy Kidd. Consulting Surgeons: Mr. Hooper May and Mr. Walter Edmunds. Physicians: Dr. R. Murray Leslie, Dr. G. P. Chappel, and Dr. A. J. Whiting. Assistant Physicians: Dr. A. G. Auld and Dr. T. R. Whipham. Surgeons: Mr. H. W. Carson and Mr. J. Howell Evans. Assistant Surgeon: Mr. E. Gillespie. Gynæcologist: Dr. A. E. Giles. Surgeon to Ear, Nose, and Throat Department: Mr. H. D. Gillies. Ophthalmic Surgeon: Mr. R. P. Brooks. Physician for Skin Diseases: Dr. G. Norman Meachen. Anæsthetists: Dr. C. F. Hadfield, Mr. J. F. Trewby, and Dr. Dunkley. Pathologist: Dr. Hunter Duncan. Bacteriologist: Dr. G. Macdonald. Secretary: Mr. F. W. Drewett.

LONDON TEMPERANCE HOSPITAL, Hampstead-road, N.W. (Established 1873).—Physicians: Dr. Fenwick, Dr. Parkinson, and Dr. Addinsell. Assistant Physician: Dr. Kevin Byrne. Surgeon: Sir William J. Collins. Assistant Surgeon: Mr. H. J. Paterson. Assistant Ophthalmic Surgeon: Mr. J. Stroud Hosford. Dental Surgeon: Mr. A. Alexander. The hospital contains 100 beds. The in-patients in 1910 were 1289, and the out-patients and casualties numbered 26,396 new cases. The medical and surgical practice of the hospital is open to students and practitioners. Operations: Mondays and Thursdays, 3.30 P.M.

HAMPSTEAD GENERAL AND NORTH-WEST LONDON HOSPITAL.—The Hampstead General Hospital (Haverstock Hill) and the North-West London Hospital (Kentish Town-road) are now amalgamated. The Hampstead General Hospital (114 beds) accommodates the in-patients from the districts hitherto served by both hospitals. The out-patients, with the exception of Hampstead casualty and emergency cases, attend exclusively at the North-West London Hospital, where there is a Resident Medical Officer as well as resident nurses. Consulting Physician: Sir Samuel Wilks, Bart. Physicians to In-patients: Dr. G. A. Sutherland and Sir John F. H. Broadbent, Bart. Surgeons to In-patients: Mr. J. Jackson Clarke and Mr. W. H. Clayton-Greene. Physicians to Out-patients: Dr. C. O. Hawthorne, Dr. A. Manuel, and Dr. Oliver K. Williamson. Surgeons to Out-patients: Mr. J. W. Thomson Walker, Mr. G. E. Waugh and Mr. H. Tyrrell Gray. Physician for Diseases of the Skin: Dr. S. E. Dore. Gynæcologist: Dr. F. E. Taylor. Ophthalmic Surgeon to In-patients: Sir William J. Collins. Ophthalmic Surgeon to Out-patients: Mr. Malcolm L. Hepburn. Throat and Ear: Mr. H. S. Barwell. Dental Surgeon: Mr. C. H. J. Acret. Anæsthetists: Dr. G. A. H. Barton and Mr. Hedley C. Visick. Pathologist: Dr. J. A. Torrens. Medical Officer, Roentgen Ray Department: Mr. S. Gilbert Scott. Further particulars from the secretary at the hospital (Haverstock Hill, N.W.).

NEW HOSPITAL FOR WOMEN, 144, Euston-road, N.W.—Physicians for In-patients: Miss Walker, M.D., and Miss Macdonald, M.B. Surgeons for In-patients: Miss Aldrich-Blake, M.D., M.S., and Miss Chadburn, M.D., B.S. Physicians and Surgeons for Out-patients: Miss Anderson, M.D., B.S., Miss Woodcock, M.D., B.S., Miss Bolton, M.D., B.S., and Miss Hamilton, M.D. Children's Department: Mrs. Flemming, M.D. Ophthalmic Surgeon: Miss Sheppard, M.B. Senior Assistants for Out-patients: Miss Fraser, M.B., Miss Stoney, M.D., Miss N. Payne, M.D., and Miss Davies-Colley, M.D., B.S. Obstetrician: Miss Turnbull, M.D. Anæsthetists: Miss Browne, L.S.A., Miss Turnbull, M.D., and Miss Payne, M.D. A considerable number of the students hold posts in the New Hospital under the visiting staff, and in return for much valued clinical teaching they do the work assigned to students in the wards of a general hospital. Secretary: Miss M. M. Bagster.

FRENCH HOSPITAL AND DISPENSARY, Shaftesbury-avenue, W.C.—This hospital, which was founded in 1867 to afford medical treatment for poor foreigners who speak the French language, has 73 beds. Physicians: Dr. G. Ogilvie and Dr. L. Williams. Physicians to the Out-patients: Dr. L. Vintras, Dr. H. Dardenne, and Dr. Alex. Manuel. Surgeons: Mr. E. Owen, Mr. H. de Méric, and Mr. W. H. Clayton-Greene. Obstetric Physician: Dr. S. Sunderland. Ophthalmic Surgeons: Mr. C. Higgens and Mr. G. W. Thompson. Dental Surgeon: Mr. M. Thomson. Honorary Anæsthetist: Mr. Walter Tyrrell. Anæsthetist: Dr. Percy Bott.

The French Convalescent Home and Retreat for Aged French People (at Brighton) contains 61 beds. Secretary: G. Pondepeyre.

GERMAN HOSPITAL, Dalston, N.E.—This hospital was founded in 1845 with the object of supplying medical aid to poor people speaking the German language and for cases of emergency and of accident. It has 130 beds, including a sanatorium with six beds and a convalescent home at Hitchin with 25 beds. Consulting Physician: Sir H. Weber. Consulting Surgeon: Mr. R. W. Parker. Physicians: Dr. F. P. Weber, Dr. K. Fürth, and Dr. D. O'C. Finigan. Surgeons: Mr. E. Michels, Mr. J. P. zum Busch, and Mr. G. J. Jenkins. Ophthalmic Surgeons: Mr. R. Gruber and Mr. C. Markus. Anæsthetist: Mr. C. Louis Leipoldt. Radiographer: Mr. N. S. Finzi. Dental Surgeon: Mr. W. West. Resident Medical Officers: Mr. G. Dorner, Mr. G. Leopold, Mr. H. Mendelsohn, and Mr. S. Mitterstiller.

ITALIAN HOSPITAL.—This institution was established in 1884 for the maintenance and medical treatment of Italian and Italian-speaking people, irrespective of their religious and political opinions, who may be suffering from sickness or bodily infirmity, but the sick poor of any nationality are also admitted for treatment. The institution also provides surgical and medical relief to Italians and others not being inmates of the hospital. It has 50 beds. Honorary Consulting Physician: Sir Dyce Duckworth. Honorary Consulting Surgeon: Sir Frederick Treves. Physicians: Cav. Uff. Dr. F. Melandri, and Cav. Dr. Vincent Dickinson. Assistant Physicians: Dr. Edwin L. Ash and Dr. G. Tallarico. Surgeon: Mr. George Lenthal Cheatle, C.B. Assistant Surgeon: Mr. T. P. Legg. Throat and Ear Department: Cav. J. Donelan. Ophthalmic Surgeon: Mr. Stanford Morton. Consulting Dental Surgeon: Cav. J. FitzGerald. Assistant Dental Surgeon: Mr. E. Whishaw Wallis. Anæsthetists: Dr. Hugh Richard Phillips and Mr. G. H. Longton.

NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC (Albany Memorial), Queen-square, Bloomsbury.—The hospital, with the Finchley branch, contains 200 beds and cots. The physicians attend every Monday, Tuesday, Wednesday, and Friday at 2 P.M. In- and out-patient practice and electrical-room treatment at that hour. Consulting Physicians: Dr. Hughlings Jackson, Dr. Buzzard, Dr. Bastian, Sir D. Ferrier, and Sir William Gowers. Physicians: Dr. Ormerod, Dr. Tooth, Dr. James Taylor, and Dr. J. S. Risien Russell. Physicians for Out-patients: Dr. Aldren Turner, Dr. Batten, Dr. J. S. Collier, and Dr. F. Buzzard. Assistant Physicians: Dr. Grainger Stewart and Dr. Gordon Holmes. Surgeons: Sir Victor Horsley, Mr. Donald J. Armour, and Mr. Percy W. G. Sargent. Ophthalmic Surgeon: Mr. Leslie Paton. Laryngologist and Otologist: Mr. Sydney Scott. Gynæcologist: Dr. Walter Tate. Anæsthetists: Dr. Llewelyn Powell and Dr. Z. Mennell. Clinical clerks are appointed under the in-patient physicians. Lectures are given on Tuesdays and Fridays at 3.30. The hospital is a school of the University of London and has been recognised by the Conjoint Board for England as a place where part of the fifth year may be devoted to clinical work. All communications concerning clinical appointments, lectures, hospital practice, and fees should be addressed to the Secretary at the hospital.

BETHLEM ROYAL HOSPITAL.—This hospital is open for the admission of two Resident House Physicians who have recently obtained their diplomas to practise Medicine and Surgery. They are permitted to reside in the hospital for a term generally not exceeding six months, commencing Jan. 1st and July 1st, and are provided with apartments, complete board, attendance, washing and a salary at the rate of £100 per annum. They are under the direction of the Resident Physician and are elected by the Committee from candidates whose testimonials appear to be most satisfactory. The students of certain specified London Medical Schools receive Clinical Instruction in the wards of the hospital and qualified practitioners and other students may attend for a period of three months on payment

of a fee. Lectures are also given in connexion with the London School of Clinical Medicine and the London Polyclinic. Resident Physician: Dr. W. H. B. Stoddart. Senior Assistant Physician: Dr. J. G. Phillips. Junior Assistant Physician: Dr. Ralph Brown.

HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, Brompton (333 beds).—The hospital contains 333 beds in the two buildings. The Sanatorium at Frimley contains 100 beds and 50 beds for paying patients. Six House Physicians reside in the hospital for a term of six months; their duties include attendance in the out-patient department. Pupils are admitted to the practice of the hospital: terms, £1 1*s*. for one month; three months, £2 2*s*.; perpetual, £5 5*s*. Lectures and Clinical Demonstrations are given throughout the year by members of the medical staff. The next course will commence on October 11th. Courses of instruction are given in the laboratories for one month (£5 5*s*.). Clinical Assistants are appointed to the Assistant Physicians in the out-patient department and Clinical Clerks to the Physicians in the wards. The hospital has been recognised by the Conjoint Board for England as a place where six months of the fifth year may be spent in clinical work. The medical practice of the hospital is also recognised by the University of London, the Apothecaries' Society, and the Army and Navy and Indian Medical Boards. Consulting Physicians: Sir Richard Douglas Powell, Dr. F. T. Roberts, Dr. C. T. Williams, Dr. J. M. Bruce, Dr. T. H. Green, Dr. T. D. Acland, Sir J. K. Fowler, and Dr. P. Kidd. Physicians: Dr. R. Maguire, Dr. H. W. G. Mackenzie, Dr. S. H. Habershon, Dr. F. J. Wethered, Dr. P. Horton-Smith Hartley, and Dr. J. J. Perkins. Assistant Physicians: Dr. H. Batty Shaw, Dr. W. C. Bosanquet, Dr. R. A. Young, Dr. C. Wall, Dr. W. J. Fenton, and Dr. A. J. Jex-Blake. Consulting Surgeons: Lord Lister and Mr. R. J. Godlee. Surgeon: Mr. S. Boyd. Dental Surgeon: Mr. A. E. Ironside. Surgeon to Throat and Ear Department: Dr. Dundas Grant. Superintendent of Laboratories: Dr. A. C. Inman; X-ray Department: Dr. S. Melville. Resident Medical Officer: (vacant).

CITY OF LONDON HOSPITAL FOR DISEASES OF THE CHEST, Victoria Park, E.—During the past year 1096 in-patients have been treated in the wards, and the large number of 42,931 cases since the opening of the wards in 1855. The number of out-patients treated during 1910 was 12,379 and 773,454 since the commencement of the institution in 1848. Information as to medical instruction can be obtained on application to the Secretary of the Clinical Sub-committee at the hospital. Consulting Physicians: Dr. J. C. Thorowgood, Dr. Eustace Smith, Dr. Vincent D. Harris, Sir William S. Church, Bart., Dr. E. Clifford Beale, Dr. Harrington Sainsbury, Dr. G. A. Heron, and Sir Hugh Beevor, Bart. Consulting Surgeon: Lord Lister. Physicians: Dr. T. Glover Lyon, Dr. W. J. Hadley, Dr. E. H. Colbeck, Dr. Arnold Chaplin, Dr. Hugh Walsham, and Dr. O. K. Williamson. Surgeon: Mr. G. Lenthal Cheatle. Physicians to Out-patients: Dr. Clive Riviere, Dr. T. Lewis, Dr. Eric Pritchard, Dr. A. H. Miller, Dr. Haldin Davis, and Dr. Sydney Owen. Laryngologist: Mr. W. G. Howarth. Surgeon Dentist: Mr. Evelyn C. Sprawson. Secretary: Mr. George Watts. Secretary of the Medical Committee: Dr. Haldin Davis.

ROYAL HOSPITAL FOR DISEASES OF THE CHEST, City-road. (80 beds.)—This hospital provides accommodation for 80 in-patients. Expenditure for 1910 £6919; income £6300. The attendance of out-patients averages 26,000 annually. Consulting Physicians: Dr. Horace Dobell, Dr. P. J. Hensley, and Professor D. W. Finlay. Physicians: Dr. W. H. White, Dr. A. Davies, Dr. J. Calvert, Dr. M. Leslie, Dr. J. H. Drysdale, and Dr. A. G. Phear. Assistant Physicians: Dr. H. E. Symes-Thompson, Dr. Kenneth Kellie, and Dr. Barty King. Consulting Surgeons: Sir Jonathan Hutchinson, Mr. Pearce Gould, and Mr. W. Turner. Surgeon: Mr. Arthur Evans. Anæsthetist: Dr. G. H. Longton. Clinical Pathologist: Dr. Percy B. Ridge. Dental Surgeon: Mr. G. Thomson. Radiographer: Dr. A. C. Jordan. Resident Medical Officer: Dr. H. O. West. House Physician: Dr. R. C. Brewster. Secretary: Mr. A. T. Mays.

THE MOUNT VERNON HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, HAMPSTEAD AND NORTHWOOD, CENTRAL OUT-PATIENT DEPARTMENT, Fitzroy-square, W.—The Hospitals contain 230 beds. Number of in-patients, 1410; out-patients, 2684. Resident Medical Staff. Lectures and Clinical Demonstrations are given by the Visiting Medical Staff at the Hospital at Hampstead and the Out-patient department. The next course begins in October, at the out-patient department. Clinical assistants are appointed to physicians in the wards, and in the out-patient department. Consulting Physicians: Sir Hermann Weber and Sir T. Clifford Allbutt, K.C.B. Consulting Surgeon: Sir W. Watson Cheyne, Bart. Physicians: Dr. J. Edward Squire, C.B., Dr. F. W. Tunnicliffe, Dr. George Johnston, Dr. T. N. Kelynack, Dr. T. D. Lister, Dr. A. Latham, Dr. F. W. Price, Dr. A. J. Whiting, and Dr. James Mackenzie. Pathologist: Dr. F. W. Price. Surgeon: Mr. James Berry. Laryngologist: Mr. Seccombe Hett. Anæsthetist: Dr. Herbert Scharlieb, C.M.G. Dental Surgeon: Mr. Leonard Balls. Secretary: W. J. Morton. Offices: 7, Fitzroy-square, W.

QUEEN CHARLOTTE'S LYING-IN HOSPITAL AND MIDWIFERY TRAINING SCHOOL, Marylebone-road, N.W.—This hospital receives about 1800 patients annually, besides having a large out-patient department. Medical pupils are received at all times of the year. Pupils have unusual opportunities of seeing obstetric complications and operative midwifery, on account of the very large number of primiparous cases—nearly one-half of the total admissions. Clinical instruction is given on the more important cases which present themselves. Certificates of attendance at this hospital are recognised by all the Universities, Colleges, and licensing bodies. Pupil midwives and monthly nurses are received and specially trained. Fees: Medical Students, £8 8*s*. for four weeks; Qualified Medical Practitioners, £8 8*s*. for four weeks. Pupil Midwives (including board and lodging), £35 for five months (trained nurses £25 for four months); Pupil Nurses (including board and lodging), £24 for sixteen weeks (trained nurses £18 for 12 weeks). The new Residential College provides accommodation for 12 men at a time, students and qualified practitioners, and is opposite the hospital, with which it is in telephonic communication. Terms for residence and full board, 30*s*. per week. For further particulars application should be made to Mr. Arthur Watts, Secretary, at the hospital. Students join preferably on the first Monday in each month. Arrangements have been made whereby 14 Medical Students can now be admitted per month (168 per annum) to the practice of the hospital in order to receive preliminary instruction in Practical Midwifery in accordance with the recommendations of the General Medical Council. This instruction will include: (1) Practical instruction in the methods of examination of pregnant women; (2) delivery of women in labour under the direct supervision of a Medical Officer of the hospital; (3) practical instruction in the treatment of the mother and child during the puerperium, including clinics held four times weekly by the Visiting Medical Staff; and (4) instruction in the Clinical Laboratory of the hospital. The fee for hospital practice will be £5 5*s*. per calendar month. Students will be accommodated at the Residential College adjoining the hospital. Terms for residence and full board, 30*s*. per week. Consulting Physicians: Dr. George B. Brodie and Dr. W. S. A. Griffith. Consulting Surgeon: Mr. Alfred Willett. Physicians to In-patients: Dr. W. J. Gow, Dr. T. W. Eden, Dr. A. F. Stabb, and Dr. C. Hubert Roberts. Physicians to Out-patients: Dr. Thomas G. Stevens and Dr. R. D. Maxwell.

THE HOSPITAL FOR WOMEN, Soho-square, W.[1]—In connexion with the out-patient department there has been for some years a well-organised Clinical Department. Gentlemen are appointed to act as clinical assistants to the gynæcologists to out-patients. The appointments are open to qualified medical men and women. They are entitled to receive notice of all operations performed within the hospital, and every facility is afforded them by the gynæcologists in the out-patient department of obtaining experience in diagnosis and treatment and the practical use of instruments. Fee for one month £2 2*s*.; for each subsequent month the same. The hospital contains 67 beds. In the out-patient department there were over 4000 new cases during the past year, the total number of out-patient attendances being 14,500. This large number affords exceptional opportunities for examining and studying most of the varieties of the diseases of women. Applications should be made to the Dean. Consulting Physicians: Dr. C. H. Carter, Dr. E. Holland, and

[1] No returns.

Dr. Richard T. Smith. Consulting Surgeon: Mr. H. A. Reeves. Consulting Surgeon Dentist: Mr. Canton. Gynæcologists: Dr. J. A. Mansell-Moullin, Dr. Bedford Fenwick, Dr. James Oliver, Dr. J. H. Dauber, Dr. T. G. Stevens, and Dr. H. J. F. Simson. Surgeon: Mr. D. Drew. Assistant Surgeon: Mr. L. H. McGavin. Surgeon Dentist: Mr. W. J. May. Anæsthetists: Mr. C. J. Ogle and Dr. M. Horne. Registrar: Dr. W. A. Milligan.

EAST LONDON HOSPITAL FOR CHILDREN AND DISPENSARY FOR WOMEN, Glamis-road, Shadwell, E.—The hospital maintains 124 cots, and on an average 245 out-patients are seen daily. Clinical instruction is given by the physicians and surgeons to the hospital, which is recognised by the Conjoint Board for England as a school of medical teaching for students in the fifth year of the curriculum. All particulars may be obtained on application to the Secretary. Two clinical clerkships for qualified or unqualified students are open every three months, subject to reappointment if desired. Clinical assistants (qualified men only) are from time to time appointed in the out-patient department. Any additional information may be obtained on applying to Mr. W. M. Wilcox, the Secretary, at the hospital. Physicians: Dr. Eustace Smith, Dr. J. A. Coutts, Dr. Morley Fletcher, Dr. E. Graham Little, Dr. A. M. Gossage, and Dr. Clive Riviere. Surgeons: Mr. W. Trotter and Mr. R. Warren. Assistant Physicians: Dr. O. K. Williamson and Dr. T. Fisher. Assistant Surgeons: Mr. J. E. Adams and Mr. S. Hastings. Ophthalmic Surgeon: Mr. F. Juler. Dental Surgeon: Mr. E. S. Pierrepont. Medical Officer for the Electrical Department: Dr. E. H. Browne Carthew. Medical Officer for the Casualty Department: Dr. E. Matthews. Resident Medical Officer: Dr. H. K. Waller. House Physician: Mr. G. Walker. House Surgeon: Mr. A. G. Hamilton. Secretary: Mr. W. M. Wilcox.

THE HOSPITAL FOR SICK CHILDREN, Great Ormond-street, W.C., contains 240 beds, divided into 103 medical, 115 surgical, and 22 for special and infectious cases, besides 30 beds at the convalescent branch, Highgate. The hospital having been recognised by the Conjoint Board for England as a place where, under the new curriculum, six months of the fifth year may be spent in clinical work, the practice is arranged to meet this need and is open to students who have completed four years of medical study and also to qualified medical men. The medical staff are recognised by the University of London as teachers in Diseases of Children. Appointments are made every three months to six medical clerkships, which are open to students of the hospital. Lectures or demonstrations are given once every week during both winter and summer sessions, which qualified practitioners are invited to attend free of charge. There is a museum in connexion with the hospital. The sessions are of ten weeks' duration, and begin in October, January, and March. Fees for hospital practice, one month, £2 2*s.*; three months, 5 guineas; perpetual ticket, 10 guineas. Clinical Clerks, 1 guinea for three months. Consulting Physicians: Dr. W. H. Dickinson, Sir Thomas Barlow, Bart., Dr. D. B. Lees, and Dr. F. G. Penrose. Physicians: Dr. A. E. Garrod, Dr. A. F. Voelcker, Dr. W. S. Colman, and Dr. F. E. Batten. Physicians to Out-patients: Dr. G. F. Still, Dr. F. J. Poynton, Dr. Robert Hutchison, Dr. H. Thursfield, and Dr. T. Thompson. Consulting Surgeons: Mr. Howard Marsh, Mr. Edmund Owen, Mr. John H. Morgan, C.V.O., and Mr. Bernard Pitts. Surgeons: Mr. W. Arbuthnot Lane, Mr. Thomas H. Kellock, Mr. H. Stansfield Collier, and Mr. Edred M. Corner. Surgeons to Out-patients: Mr. G. E. Waugh, Mr. H. A. T. Fairbank, and Mr. O. L. Addison. Ophthalmic Surgeon: Mr. W. H. McMullen. Aural Surgeon: Mr. G. E. Waugh. Dental Surgeon: Mr. W. Warwick James. Radiographer: Dr. Ironside Bruce. Local Medical Officer for Cromwell House: Dr. A. M. Henderson. Medical Registrar: Mr. R. S. Frew. Clinical Pathologist and Bacteriologist: Dr. Graham Forbes. Anæsthetists: Mr. Graham Scott, Dr. H. S. Sington, Mr. C. J. Loosely, and Mr. H. B. Wilson. Resident Medical Superintendent: Mr. L. E. Barrington Ward. Secretary: Mr. Stewart Johnson.

EVELINA HOSPITAL FOR SICK CHILDREN, Southwark-bridge-road, S.E.—This hospital contains 76 cots and a very extensive Out-patient Department. About ten clinical assistants, to work with the Honorary Medical Staff for Out-patients, are appointed quarterly for a period of three months; there is no salary attached to these posts; but, on the other hand, no fees are charged. Consulting Physicians: Sir J. F. Goodhart, Bart., Dr. Frederick Taylor, and Dr. Nestor Tirard. Physicians: Dr. J. Charlton Briscoe, Dr. T. R. Whipham, and Dr. D. Forsyth. Physicians in charge of Out-patients: Dr. H. C. Mann and Dr. Otto May. Physician in charge of Skin Department: Dr. S. Ernest Dore. Consulting Surgeons: Sir H. G. Howse, Mr. R. Clement Lucas, Mr. G. H. Makins, C.B., Sir F. S. Eve, Mr. F. C. Abbott, Mr. A. H. Tubby, and Mr. C. H. Fagge. Consulting Dental Surgeon: Mr. R. D. Pedley. Surgeons: Mr. H. S. Clogg and Mr. W. M. Mollison. Surgeons in charge of Out-patients: Mr. C. A. R. Nitch and Mr. P. Maynard Heath. Dental Surgeon: Mr. G. G. Packe. Ophthalmic Surgeon: Mr. R. E. Bickerton. Aural Surgeon: Mr. G. N. Biggs. Anæsthetist: Mr. F. D. S. Jackson. Radiographer: Mr. R. H. Cooper. House Physicians: Mr. J. J. S. Rowe and Mr. H. Steinbach. House Surgeon: Mr. R. M. R. Thursfield. Secretary: H. C. Staniland Smith.

VICTORIA HOSPITAL FOR CHILDREN, Chelsea, S.W.—The hospital contains 104 beds and has a large out-patient department (over 1200 weekly); the home at Broadstairs has 50 beds. Consulting Physicians: Sir Francis Laking, Sir Wm. Henry Allchin, and Dr. Ridge Jones. Consulting Surgeons: Mr. Cowell, Mr. Pickering Pick, and Mr. D'Arcy Power. Physicians: Dr. Walter Carr, Dr. Humphry D. Rolleston, Dr. Edmund Ivens Spriggs, Dr. Charles Miller, Dr. Reginald Jewesbury, and Dr. A. C. D. Firth. Physician to Skin Department: Dr. J. M. H. MacLeod. Surgeons: Mr. H. F. Waterhouse, Mr. Joseph Cunning, and Mr. Fedde Fedden. Surgeons to the Out-patients: Mr. S. Maynard Smith, Mr. Ralph Thompson, and Mr. Harold W. Wilson. Ophthalmic Surgeon: Mr. C. Devereux Marshall. Dental Surgeon: Mr. Francis R. Smyth. Anæsthetists: Dr. Randolph Grosvenor, Dr. W. B. Grandage, and Dr. F. Stanley Hewett. Electro-Therapeutic and Radiographic Department: Mr. E. S. Worrall. Resident Medical Officer: Mr. J. B. de W. Molony. House Surgeon: Mr. M. K. Nelson. House Physician: Mr. M. N. Woods. Secretary: Mr. H. G. Evered. Out-patients are seen as under:—Diseases of the Eye: Wednesday, 2 P.M. Diseases of the Skin: Wednesday, 1.30 P.M. Whooping-cough Cases: Friday, 2.30 P.M. Medical and Surgical Cases: Mornings at 9.30. Dental Cases: Thursday, 1.30 P.M. Accidents and urgent cases are admitted at any time.

THE QUEEN'S HOSPITAL FOR CHILDREN (*late North-Eastern Hospital for Children*), Hackney-road, Bethnal Green, N.E. (Telephone 305 Dalston.) For the sick children of the poor under 12 years of age. Established 1867. 134 beds in London and 30 at the seaside branch, "Little Folks" Home, Bexhill.—During the past year 1970 in-patients and 32,975 out-patients (representing 84,317 attendances and including 17,175 casualty cases) were relieved, 741 of the in-patients being under two years of age. Consulting Physicians: Dr. W. Cayley, Dr. W. Pasteur, Dr. W. A. Wills, and Dr. James Taylor. Consulting Surgeons: Sir Jonathan Hutchinson, Mr. Waren Tay, Mr. R. J. Godlee, Mr. Bilton Pollard, and Mr. H. Percy Dean. Physicians: Dr. J. Porter Parkinson, Dr. Sheffield Neave, and Dr. R. A. Chisolm. Assistant Physicians: Dr. Eric Pritchard, Dr. Eric Bellingham-Smith, Dr. Sidney Owen, and Dr. Alexander Gow. Surgeons: Mr. Douglas Drew and Mr. P. Lockhart Mummery. Assistant Surgeons: Mr. Stephen Fenwick and Mr. Blundell Bankart. Ophthalmic Surgeon: Mr. Sydney Stephenson (Thursday, 2.30 P.M.). Physician in charge of Skin Department: Dr. J. L. Bunch. (Wednesday, 1.30 P.M.). Surgeon in charge of the Ear, Nose, and Throat Department: Mr. W. G. Howarth (Monday, 10 A.M., and Thursday, 9 A.M.). Dental Surgeon: Mr. S. F. Rose (Tuesday, 9.30 A.M., and Friday, 2.30 P.M.). Medical Radiographer: Dr. William Hampson. Pathologist and Registrar: Dr. A. W. G. Woodforde. Resident Medical Officer: Dr. L. B. Perry. Four other resident medical men (appointed half-yearly)—viz., two House Physicians and two House Surgeons. Matron: Miss Bushby. Secretary: Mr. T. Glenton-Kerr. The surgeons attend on Wednesdays at 2 P.M. and Fridays and Saturdays at 9.30 A.M.; the physicians daily at 2 P.M., except Saturday, 9.30 A.M., and Wednesday, 9.30 A.M., as well as 2 P.M. Applications for permission to attend the practice of the hospital should be addressed to the secretary.

ROYAL LONDON OPHTHALMIC HOSPITAL (Moorfields, 1804–1899), City-road, E.C. 138 beds.—This hospital, known as Moorfields Eye Hospital, was moved in 1899 to

larger buildings in City-road. In 1910 there were 2128 in-patients, the new out-patients were 50,484, and the attendances were 118,963. Operations are performed daily from 10 A.M. to 1 P.M. and four surgeons attend on each day. Students are admitted to the practice of the hospital. Fee for six months, £3 3*s.*; perpetual, £5 5*s.* Courses of instruction on the following subjects are given at the hospital periodically: (1) examination of the eye; (2) the use of the ophthalmoscope; (3) errors of refraction; (4) external diseases of the eye; (5) surgical anatomy of the eye; (6) motor anomalies; (7) pathology of the eye; (8) practical pathology; (9) bacteriology; (10) operative surgery; (11) X ray work; and (12) clinical lectures. A composition fee of £10 10*s.* will entitle students of the hospital to a perpetual ticket and will admit them once to all the above lectures and demonstrations except the classes on practical pathology, bacteriology, operative surgery, and X ray work. Students of the hospital are eligible for the offices of house surgeon or clinical and junior assistants. Junior assistants are appointed every three months. Any further information will be furnished by Mr. Robert J. Bland, Secretary. Consulting Surgeons: Sir Jonathan Hutchinson, Mr. J. Couper, Mr. E. Nettleship, Sir John Tweedy, Mr. W. Tay, and Mr. A. S. Morton. Consulting Medical Officer to the X Ray Department: Mr. J. M. Davidson. Physician: Dr. J. Taylor. Surgeons: Mr. W. Lang, Mr. J. B. Lawford, Mr. E. T. Collins, Mr. W. T. H. Spicer, Mr. P. Flemming, Mr. J. H. Fisher, Mr. A. Lawson, Mr. C. D. Marshall, Mr. J. H. Parsons, and Mr. C. Worth. Assistant Surgeons: Mr. G. Coats and Mr. M. L. Hepburn. Medical Officer to the X Ray Department: Mr. E. W. H. Shenton. Curator and Librarian: Mr. A. C. Hudson. Bacteriologist: Mr. S. H. Browning. Four Refraction Assistants; 3 Resident House Surgeons; 26 Chief Clinical Assistants; 20 Clinical Assistants; and 15 Junior Assistants.

ROYAL WESTMINSTER OPHTHALMIC HOSPITAL, King William-street, West Strand.—The hospital contains 40 free beds. Patients, who number over 14,000 annually, are seen at 1 P.M., and operations performed daily at about 2 P.M. The following are the days of attendance of the surgeons: Mr. Grimsdale and Mr. Brewerton, Mondays and Thursdays; Mr. Roll and Mr. McMullen, Tuesdays and Fridays; and Mr. Dodd and Mr. Cruise, Wednesdays and Saturdays. The practice of the hospital is open to practitioners and students. Fees for six months, £3 3*s.*; perpetual, £5 5*s.* Students of the hospital are eligible for the posts of house surgeon, assistant house surgeon, pathologist, and clinical assistants. Special demonstrations and lectures will be given during the session, commencing early in October; for details see weekly journals. Clinical Assistants (who must be duly qualified) to the Surgical Staff are appointed twice a year for periods of six months. Secretary: Mr. John Hy. Johnson.

ROYAL EYE HOSPITAL, St. George's-circus, Southwark, S.E.—There are 40 beds and 2 cots. There were 75,470 attendances in the Out-patient Department last year and the new patients numbered 24,184. Operations are performed, and out-patients are seen daily at 9 A.M. and 2 P.M. The following are the days of attendance:—Afternoons: Sir William J. Collins, Wednesdays; Mr. L. V. Cargill, Tuesdays; Mr. J. Stroud Hosford, Mondays and Fridays; Mr. E. Brooksbank James, Mondays and Thursdays; and Mr. E. A. Dorrell, Saturdays. Mornings: Dr. H. Willoughby Lyle, Tuesdays and Fridays; Mr. A. D. Griffith, Mondays, Thursdays, and Saturdays; and Mr. E. A. Dorrell, Wednesdays. Courses of clinical and practical instruction in Ophthalmology will be given, commencing October, January, and May. In addition special lectures and clinical demonstrations will be given by the hospital staff on dates to be announced. Fee for the course, including three months' hospital practice, £3 3*s.* Tutorial classes for the various examinations arranged as far as possible to suit candidates. Clinical assistantships are open to fully qualified practitioners who have received a course of instruction at the hospital. Further particulars may be obtained from the Dean, J. Stroud Hosford, F.R.C.S.

CENTRAL LONDON OPHTHALMIC HOSPITAL, Gray's Inn-road, W.C.—This hospital has 26 beds and possesses facilities for clinical teaching daily. Last year there were 417 in- and 13,587 out-patients (entailing 31,242 attendances). Classes of instruction in the various branches of Ophthalmology will be held during the winter session, commencing in October. The out-patient work begins at 1 o'clock and operations are performed daily between 1 and 4. Consulting Physician: Sir Dyce Duckworth, Bart. Consulting Surgeon: Mr. T. Brittin Archer. Surgeons: Mr. Ernest Clarke, Mr. A. P. L. Wells, and Mr. Stephen Mayou. Assistant Surgeons: Mr. A. C. Hudson, Mr. J. F. Cunningham, and Mr. A. Levy. Physician: Dr. Charles O. Hawthorne. Pathologist: Mr. Stephen Mayou. House Surgeon: Mr. A. A. Campbell. Dentist: Mr. E. P. May. Secretary: Mr. H. R. S. Druce.

CENTRAL LONDON THROAT AND EAR HOSPITAL, Gray's Inn-road.—In addition to the new In-patient Department and operation theatre the hospital has a very extensive out-patient department, which is open to all medical practitioners and students for the purpose of clinical demonstration and instruction during the hours of the surgeons' visits. During the past year 11,404 out-patients (involving 53,665 attendances) and 727 in-patients were treated. The fee for three months' attendance, 5 guineas; for six months, 8 guineas. The post-graduate teaching consists of successive series of practical demonstrations by the members of the staff delivered twice weekly during the winter and summer sessions. They are so arranged that practitioners joining at any part of the course are enabled to complete the group of subjects. A special Operative Surgery class is held at intervals. The fee for each course is 2 guineas, with daily attendance at the out-patient department during the period of the course. Details of subjects, &c., will be afforded by the Dean. Considerable attention is given to scientific work, particularly with regard to Bacteriology of the ear and respiratory passages. Operation days: in-patients, Monday, Tuesday, Wednesday, Thursday, and Friday, at 2 P.M.; out-patients, daily at 9 A.M. Consulting Physicians: Dr. Arthur Orwin and Dr. Purves Stewart. Consulting Surgeon: Sir Watson Cheyne, Bart. Consulting Ophthalmic Surgeon: Mr. Stanford Morton. Surgeons: Dr. Dundas Grant, Dr. Percy Jakins, Mr. Chichele Nourse, Dr. Abercrombie, Mr. Stuart-Low, and Dr. Andrew Wylie. Assistant Surgeons: Dr. Atkinson, Dr. McKenzie, and Mr. Gay French. Pathologist: Dr. Wyatt Wingrave. Dental Surgeon: Mr. Whishaw Wallis. Assistant Dental Surgeon: Mr. Henning James. Anæsthetists: Mr. W. Hotten George and Dr. Beresford Kingsford. Assistant Anæsthetists: Dr. Mortimer and Dr. Crampton In addition the following appointments are open to qualified members of the profession:—Six Registrars, tenable for twelve months; and sixteen Clinical Assistants, tenable for three or six months. Dean: Dr. Wyatt Wingrave. Secretary: Mr. Richard Kershaw.

LONDON THROAT HOSPITAL, 204, Great Portland-street, W.—Clinical Demonstrations on the Diseases of the Throat, Nose, and Ear are given daily at 2 P.M. and on Tuesday and Friday evenings at 6 P.M. Operations are performed daily at 9.30 A.M. Individual instruction is given in the examination of cases to students attending the hospital. Fees: one month's attendance, £1 1*s.*; three months, £2 2*s.*; perpetual, £5 5*s.* Detailed information may be obtained from the Hon. Secretary of the Medical Committee. Surgeons: Mr. Claud Woakes, Dr. G. Cathcart, Dr. W. H. Kelson, and Mr. Atwood Thorne. Assistant Surgeons: Mr. Sommerville Hastings, Dr. Irwin Moore, and Mr. Francis Muecke.

THE METROPOLITAN EAR, NOSE, AND THROAT HOSPITAL.—The hospital was founded in 1838 and is situated in Grafton-street, Tottenham-court-road. The out-patient department is opened daily at 2.30 P.M. to all medical practitioners and senior students for acquiring clinical instruction and technical knowledge. Operations upon in-patients are performed on Tuesdays, Wednesdays, Thursdays, and Fridays at 10 A.M. Fee for one month's attendance at the hospital £1 1*s.*, and for three months £2 2*s.* During the forthcoming session practical demonstrations will be given by members of the staff on the diagnosis and treatment of diseases of the ear and respiratory passages. Each course may commence at any time. Consulting Surgeons: Mr. G. Saunders and Mr. J. Pickett. Surgeons: Mr. H. Pegler, Mr. F. Spicer, Mr. W. J. Horne, Mr. J. C. Potter, and Mr. B. Jones. Assistant Surgeons: Mr. A. L. Murison and Mr. E. W. Bain. Anæsthetists: Mr. C. Looseley, Mr. D. J. Munro, Mr. J. D. Mortimer, and Mr. R. Pollard. Dentist: Mr. J. A. Bowes.

ROYAL EAR HOSPITAL, Dean-street, Soho. (Founded 1816.)—Courses of instruction of a practical character in Diseases of the Ear and Nose are given by the members of the staff throughout the year. Clinical assistants are also appointed. Students may join at any time. For information address the Honorary Secretary of the Medical Board, Royal Ear Hospital, Dean-street, Soho. Surgeons: Mr. M. Yearsley, Mr. Richard Lake, Mr. R. S. Cocke, Mr. E. A.

Peters, and Mr. H. A. Kisch. Anæsthetists: Dr. Harold Siugton, Mr. Lawson, Dr. Maclean, and Dr. H. B. Wilson. Ophthalmic Surgeon: Mr. H. W. Lyle. Dental Surgeon: Mr. F. W. Barrett.

ST. PETER'S HOSPITAL FOR STONE AND OTHER URINARY DISEASES, Henrietta-street, Covent Garden. Established 1860. New Hospital opened 1882.—Honorary Surgeons: Mr. F. Swinford Edwards and Mr. P. J. Freyer. Assistant Surgeons: Mr. John Pardoe, Mr. J. W. Thomson Walker, and Mr. J. Swift Jolly. The hospital contains 30 beds for men and 2 beds for women and children. Consultations are held and operations are performed each Wednesday and Friday at 2 P.M. Medical practitioners and students are invited to the clinical instructions which are given in the wards and out-patient department daily, and to the operations in the theatre on Wednesdays and Fridays at 2 P.M. Average beds occupied daily, 29; average out-patients seen daily, 125.

ST. JOHN'S HOSPITAL FOR DISEASES OF THE SKIN, 49, Leicester-square, W.C. Rebuilt 1905.—The in-patient department, 40 beds, is at 262, Uxbridge-road, W. The out-patient practice is open to the medical profession at the following times: Every day, from 2 to 4 P.M., and every evening (except Saturday) 6 to 8. At the afternoon clinics specially selected Clinical Demonstrations, also demonstrations on the different diseases presenting themselves in the out-patient department, will be given. The X ray department is in operation every afternoon except Saturday. The Chesterfield Lectures by Dr. Morgan Dockrell are given on Thursdays at 6 P.M., October to March, commencing on Oct. 5th, in the lecture room at 49, Leicester-square. At the end of the course the Chesterfield silver medal may be competed for by those who have attended three-fourths of the lectures. Physicians: Dr. Morgan Dockrell, Dr. W. Griffith, Dr. J. L. Bunch, and Dr. Knowsley Sibley. Surgeon: Mr. M. K. Hargreaves. Electro-Therapeutist: Dr. W. Hampson. There is a well-equipped laboratory where special courses in Pathology and Bacteriology of the Skin may be arranged for.

LONDON LOCK HOSPITAL AND RESCUE HOME.—This institution consists of a hospital for females in the Harrow-road and a hospital for males in Dean-street, Soho. At the latter branch an out-patient department is attached and both sexes receive treatment. In the female branch there are 145 beds and 312 patients were admitted in 1910. In the male branch there are 16 beds which during 1910 accommodated 168 patients. 32,251 out-patients were treated. Patients are seen at Dean-street on Mondays from 1 to 2 P.M. and from 6 to 8 P.M.; on Tuesdays and Wednesdays from 6 to 8 P.M.; on Fridays from 2 to 3 P.M. (female patients); and on Saturdays from 2 to 4 P.M. Consulting Surgeons: Mr. Buxton Shillitoe and Mr. J. A. Bloxam. Consulting Ophthalmic Surgeon: Mr. Henry Edward Juler. Physician: Dr. Sidney Phillips. Surgeons: Mr. J. Ernest Lane, Mr. Arthur Shillitoe, and Mr. Charles Gibbs. Surgeons to Out-patients: Mr. Charles Gibbs, Mr. Arthur Shillitoe, Mr. Charles Ryall, Mr. Herbert J. Paterson, and Mr. J. E. R. McDonagh. Pathologist: Mr. H. W. Bayly. Dental Surgeon: Mr. Spencer-Pierrepont. House Surgeon at the Female Hospital: Mr. Washington E. Wilks. House Surgeon at the Male Hospital and Out-patients' Department: Mr. A. Forster.

ENGLISH PROVINCIAL ANCILLARY SCHOOLS AND HOSPITALS.

Under this heading we include all the hospitals which are recognised by the English Royal Colleges for a part of the required attendance on medical and surgical practice, for medical clerkships, and surgical dresserships. The list includes nearly every hospital of a general character in the country having more than 150 beds, though occasionally a large hospital is omitted because equally good opportunities are afforded to students at other institutions in its neighbourhood, while a small hospital may be included because no such facilities for study are present elsewhere. The list is arranged alphabetically as to the town where the hospital is located.

BATH ROYAL UNITED HOSPITAL, Bath.—This hospital contains 130 beds. Consulting Physician: Dr. A. E. W. Fox. Consulting Surgeons: Mr. R. J. H. Scott, Mr. F. K. Green, and Mr. T. D. Ransford. Physicians: Dr. G. A. Bannatyne, Dr. T. W. Smith, and Dr. E. J. Cave. Assistant Physicans: Dr. G. E. Bowker, Dr. L. H. Walsh, and Dr. R. Waterhouse. Surgeons: Mr. H. G. Terry, Mr. F. Lace, and Mr. F. Fraser. Assistant Surgeons: Mr. W. S. Melsome, Mr. E. L. Fuller, and Mr. W. G. Mumford. Physician to Electrical Department: Dr. P. King. Pathologist and Curator of Museum: Dr. R. Waterhouse. Anæsthetist: Mr. A. de V. Blathwayt. Assistant Anæsthetist: Dr. F. G. Thomson. Dental Surgeon: Mr. W. J. Royal. Assistant Dental Surgeon: Mr. S. Carter. Secretary: Mr. J. M. Sheppard. House Surgeon: Dr. A. J. Bruce-Leckie. House Physician: Dr. V. Wiley.

BEDFORD COUNTY HOSPITAL, Bedford.—This hospital has 100 beds. Consulting Physician: Dr. G. P. Goldsmith. Consulting Surgeons: Mr. E. C. Sharpin and Mr. R. H. Kinsey. Physicians: Dr. R. Coombs and Dr. W. Phillips. Surgeons: Mr. W. Gifford Nash and Mr. Henry Skelding. Ophthalmic Surgeon: Dr. H. Goldsmith. Assistant Physicians: Dr. A. C. Perram and Dr. G. T. Birks. Assistant Surgeons: Dr. S. J. Ross and Mr. Walter Sharpin. Dental Surgeon: Mr. F. W. Williams. Secretary: Mr. W. F. Morley.

BRADFORD ROYAL INFIRMARY, Bradford.—This hospital contains 210 beds. Consulting Physicians: Dr. Reginald G. Alexander, Dr. Herbert C. Major, and Dr. David Goyder. Physicians: Dr. Henry J. Campbell, Mr. Thomas Wilmot, Dr. Richard Honeyburne, and Dr. F. W. Eurich. Consulting Surgeons: Mr. Philip E. Miall and Mr. Harry Meade. Surgeons: Mr. Charles F. M. Althorp, Dr. Thomas J. Wood, Mr. John B. Hall, and Mr. James Phillips. Gynæcologist: Dr. A. C. F. Rabagliati. Laryngologist: Dr. Andrew Little. Electrical Department: Mr. William Mitchell. Assistant Surgeons: Mr. Francis W. Goyder and Mr. Peter McEwan. Assistant Physicians: Dr. John B. Dunlop and Dr. William Wrangham. Dental Surgeon: Mr. Arthur A. Matthews.

THE ROYAL SUSSEX COUNTY HOSPITAL, Brighton (195 beds).—This hospital affords ample facilities for students, possessing a large out-patient department, a library, and a well-appointed clinical research and bacteriological department. The hospital does not take resident pupils, but out-pupils may attend the practice of the hospital for any period not exceeding two years on payment in advance of such a fee, not exceeding 20 guineas, as the Committee of Management shall direct. Consulting Physicians: Dr. Rutter, Dr. Hollis, and Dr. Branfoot. Physicians: Dr. J. F. G. Dill, Dr. Hobhouse, and Dr. Maynard. Assistant Physicians: Dr. W. Broadbent, Dr. Hall, and Dr. Bailey. Consulting Surgeons: Mr. H. P. Blaker, Mr. W. Furner, and Mr. T. J. Verrall. Surgeons: Mr. R. F. Jowers, Mr. F. J. Paley, and Mr. A. H. Buck. Assistant Surgeons: Mr. T. H. Ionides, Mr. W. A. Bowring, and Mr. H. W. Fletcher. Honorary Medical Clinical Assistant: Dr. C. H. Benham. Honorary Surgical Clinical Assistant: Mr. A. G. Bate. Ophthalmic Surgeon: Mr. W. W. Griffin. Dermatologist: Dr. A. W. Williams. Dental Surgeon: Mr. W. R. Wood. Assistant Dental Surgeon: Mr. T. S. Worboys.

KENT AND CANTERBURY GENERAL HOSPITAL, Canterbury.—The hospital contains 104 beds. Pupils of the staff are admitted to the practice of the hospital and have the use of the library of the East Kent and Canterbury Medical Society for £7 7s. Operation day, Thursday, 11 A.M. Physicians: Dr. Harold Wacher and Dr. M. T. Williams. Consulting Surgeons: Mr. James Reid and Mr. Frank Wacher. Surgeons: Mr. J. Greasley, Mr. Sidney Wacher, Mr. Z. Prentice, and Dr. T. Whitehead Reid. Dentist: Mr. R. S. N. Faro. Secretary: Mr. Arthur J. Lancaster.

DERBYSHIRE ROYAL INFIRMARY, Derby.—This hospital contains 259 beds. Consulting Physicians: Dr. Charles A. Greaves, Dr. Winfred Benthall, and Dr. G. Rice. Physicians: Dr. Edmund Vaudrey, Dr. Maurice Parry-Jones, and Dr. Hugh Barber. Consulting Surgeons: Mr. John A. Sharp, Mr. Charles H. Hough, and Mr. John L. Wright. Surgeons: Dr. Richard H. Luce, Mr. John A. Southern, Mr. Francis L. A. Greaves, and Mr. John E. Kilvert. Ophthalmic Surgeon: Mr. Edwin Collier Green. Gynæcologist: Mr. Henry T. Hicks. Anæsthetists: Mr. W. St. A. St. John, Dr. J. D. C. Allen, and Dr. J. W. King. Pathologist: Dr. Hugh Barber. Dental Surgeons: Mr. Charles J. Allin and Mr. J. Montague Murphy.

ROYAL DEVON AND EXETER HOSPITAL, Exeter.—Medical and Surgical Staff: Consulting Physician: Dr. Drake. Physicians: Dr. H. Davy and Dr. William Gordon. Surgeons: Mr. J. D. Harris, Mr. E. J Domville, Mr. Charles E. Bell, and Mr. A. C. Roper. Assistant Physician and Pathologist: Mr. Reginald V. Solly. Surgical Registrar and Assistant Pathologist: Mr. Robert Worthington. Surgeon Dentist: Mr. J. M. Ackland. Anæsthetists: Mr. Henry

Andrew and Mr. J. Shirley Steele-Perkins. The hospital contains 200 beds (including special children's wards) and has a good library, museum, dissecting room, and post-mortem room. Attendance on the practice of this hospital qualifies for all the examining boards. Arrangements can be made by which students can attend Midwifery on application to the House Surgeon. There is also a Private Nursing Staff attached to the hospital. For particulars as to fees, &c., apply to the Matron. A new wing was added in 1897. Arrangements may be made by which gentlemen in practice desiring to increase their qualifications may have the use of the museum and library and other facilities and by which students may attend midwifery. A new Operating Theatre was opened in 1906 (the gift of Mrs. Nosworthy of Newlands, Dawlish, Devon). An Electrical Treatment Department (the gift of Mrs. M. A. Sanders) was opened in 1907 by Lady Duckworth-King.

WEST OF ENGLAND EYE INFIRMARY, Exeter.—Physician: Dr. William Gordon. Surgical Staff: Mr. A. C. Roper and Mr. Ransom Pickard. Assistant Surgeon: Mr. G. P. Hawker. Secretary: Mr. Sidney E. Whitton. The infirmary contains 64 beds. Students of the Exeter Hospital can attend the practice of the Eye Infirmary. Patients for the year ending Michaelmas, 1910, 3147.

THE GLOUCESTERSHIRE ROYAL INFIRMARY AND EYE INSTITUTION, Gloucester.—This hospital, which was granted the title of "Royal" on the occasion of King Edward VII.'s visit to Gloucester in the year 1909, has 140 beds. Consulting Surgeons: Mr. J. P. Wilton, Mr. T. S. Ellis, Mr. R. M. Cole, and Mr. H. E. Waddy. Physicians: Dr. O. W. Clark and Dr. W. W. Grosvenor. Assistant Physician: Dr. D. E. Finlay. Surgeons: Mr. E. D. Bower, Mr. W. Washbourn, and Mr. G. W. Ancrum. Ophthalmic Surgeon: Mr. E. D. Bower. Assistant Surgeon: Mr. C. V. Knight. Secretary: Mr. H. P. Pike. In-patients, 1506; out-patients, 9130.

NORTH STAFFORDSHIRE INFIRMARY AND EYE HOSPITAL, Hartshill, Stoke-on-Trent.—The New Infirmary, opened in 1869, is built on the pavilion plan, has accommodation for over 200 patients, including Children's wards, and a special department for the treatment of Diseases of the Eye, so that there are excellent facilities for acquiring a practical knowledge of the profession. An appeal has just been issued, and great efforts are being made to raise the sum of £35,000, with the object of carrying out certain alterations and additions to the buildings—notably a new Out-patient Department, new wards to the Children's Pavilion, and other improvements. Of this sum £31,000 have already been promised. The new laundry has been in use for some eight or nine months, and the foundation-stones of the new out-patient department were laid on July 7th last. Physicians: Dr. S. King Alcock, Dr. H. Nicholls, and Dr. J. Russell. Surgeons: Dr. G. Stokes Hatton, Dr. Wheelton Hind, and Mr. Reginald Alcock. Assistant Physicians: Dr. W. E. L. Horner, Dr. G. H. Sowry, and Dr. E. C. Myott. Assistant Surgeons: Dr. W. C. Allardice, Dr. Harold Hartley, and Mr. Eric E. Young. Ophthalmic Surgeon: Mr. Herbert H. Folker. Assistant Ophthalmic Surgeon: Mr. R. H. Dickson. Medical Officers in Charge of the Electrical Department: Dr. G. H. List and Dr. A. H. John. Dental Surgeon: Mr. R. J. Hall. Secretary and House Governor: Dr. T. Basil Rhodes.

HULL ROYAL INFIRMARY, Hull.—This hospital contains 249 beds. Consulting Physician: Dr. Edward O. Daley. Consulting Surgeons: Sir John Sherburn, Mr. Thomas M. Evans, and Mr. Robert H. B. Nicholson. Consulting Ophthalmic Surgeon: Dr. W. C. Rockliffe. Physicians: Dr. Frank Nicholson, Dr. Frank C. Eve, and Dr. Edward Turton. Surgeons: Mr. Edmund H. Howlett, Mr. Alfred G. Francis, Mr. Henry W. Pigeon, and Mr. Edward Harrison. Ophthalmic Surgeon: Mr. A. Legge Roe. Assistant Ophthalmic Surgeon: Dr. Duncan A. Mackay. Assistant Surgeons: Mr. Harold Upcott, Mr. Edward M. Hainworth, Mr. Robert Grieve, and Mr. Guy B. Nicholson. Dental Surgeon: Mr. John C. Storey. Assistant Dental Surgeon: Mr. Arthur W. Turton. Anæsthetists: Mr. Harry L. Evans and Dr. A. T. Sissons.

LEICESTER INFIRMARY, Leicester.—Instruction in the infirmary for first-year students is duly recognised by the various examining bodies. At the General Infirmary there are 230 beds, and at the Children's Hospital in connexion 42; total 272. A new wing containing 100 beds was recently opened by H.R.H. the Duchess of Argyll, and a new Nurses' Home containing separate accommodation for 100 nurses has also been opened. A reconstruction scheme has been carried out, and £100,000 spent on bringing the accommodation of the institution to a modern standard of efficiency. This scheme has included the provision of two modern operating theatres, as well as a self-contained out-patients' department. There are eight resident medical officers—viz., two house surgeons, one house physician, two assistant house surgeons, one assistant house physician, and two dressers. All receive salaries. The dressers are given an honorarium of £10 10*s*. on completion of six months' satisfactory service. Consulting Surgeon: Mr. George C. Franklin. Physicians: Dr. Frank M. Pope, Dr. Reginald Pratt, and Dr. Astley V. Clarke. Surgeons: Mr. Charles J. Bond, Mr. Claude Douglas, Mr. Henry J. Blakesley, and Mr. Cecil E. Marriott. Ophthalmic Surgeon: Mr. Nicholas C. Ridley. Aural Surgeon: Dr. Frederick W. Bennett. Physicians to Out-patients: Dr. Robert Sevestre and Dr. T. Villiers Crosby. Surgeons to Out-patients: Mr. John S. Sloane and Mr. F. Bolton Carter. House Governor and Secretary: Mr. Harry Johnson.

NORTHAMPTON GENERAL HOSPITAL, Northampton—Two new wings were opened in 1904 and the old buildings entirely renovated and re-arranged. The number of beds is 166. Non-resident pupils are received and have every opportunity of acquiring a practical knowledge of their profession. The fee is £10 10*s*. Pupils can be received at any time. Physicians: Dr. Frank Buszard and Dr. Peverell S. Hichens. Surgeons: Mr. George H. Percival and Dr. R. A. Milligan. Ophthalmic Surgeon: Mr. E. Harries Jones. Assistant Physician: Dr. W. M. Robson. Assistant Surgeon: Mr. N. Blake Odgers. Dental Surgeon: Mr. E. Rogers Bull.

NORFOLK AND NORWICH HOSPITAL, Norwich.—This hospital has 230 beds. Non-resident pupils admitted. Fees: For three months, £3 3*s*.; for six months, £5 5*s*.; as permanent pupil, £8 8*s*. Consulting Physician: Sir P. Eade. Consulting Surgeons: Dr. Beverley and Mr. H. S. Robinson. Physicians: Dr. Barton, Dr. Burton-Fanning, and Dr. Long. Surgeons: Mr. S. H. Burton, Mr. D. D. Day, and Mr. H. A. Ballance. Assistant Physician: Dr. A. J. Cleveland. Assistant Surgeons: Mr. E. W. Everett, Mr. A. J. Blaxland, and Mr. D. K. Coutts. Dental Surgeon: Mr. H. F. White. Electro-Therapeutist: Dr. A. J. Cleveland. Secretary: Mr. F. G. Hazell.

NOTTINGHAM GENERAL HOSPITAL.—This hospital contains 246 beds. Consulting Physician: Dr. Henry Handford. Physicians: Dr. Charles H. Cattle, Dr. Frank H. Jacob, and Dr. William T. Rowe. Assistant Physicians: Dr. James C. Buckley and Dr. Samuel Ernest Gill. Consulting Surgeons: Mr. Rupert C. Chicken and Mr. Joseph Thompson. Surgeons: Dr. H. Owen Taylor, Mr. Alexander R. Anderson, Mr. Robert G. Hogarth, and Mr. W. Morley Willis. Assistant Surgeons: Mr. Charles H. Allen and Mr. Alexander Robert Tweedie. Dental Surgeon: Mr. John Battersby.

SOUTH DEVON AND EAST CORNWALL HOSPITAL, Plymouth.—This hospital contains 158 beds. Consulting Physician: Dr. R. H. Clay. Physicians: Dr. E. L. Fox and Dr. A. B. Soltau. Consulting Surgeons: Mr. P. Swain and Mr. R. H. Lucy. Surgeons: Mr. W. L. Woollcombe, Mr. H. W. Webber, and Mr. G. F. Aldous. Assistant Surgeons: Mr. C. E. R. Rendle, Mr. W. Crosbie Hamilton, and Mr. G. C. F. Robinson. Pathologist: Dr. W. L. Pethybridge. Physician in charge of X Ray and Finsen Light Department: Dr. W. Cheyne Wilson. Anæsthetists: Mr. C. H. Whiteford and Mr. E. G. Smith. Registrar and Out-patient Anæsthetist: Mr. G. S. Earl. Emergency Anæsthetist: Mr. W. L. Hodge. Dental Surgeon: Mr. G. R. Brittan.

THE ROYAL HOSPITAL, Portsmouth (founded 1847).—The number of beds is 146. Honorary Physicians: Dr. John Phillips and Dr. W. P. McEldowney. Surgeons: Mr. C. P. Childe, Mr. T. A. M. Forde, and Mr. A. B. Wright. Honorary Anæsthetist: Dr. W. J. Essery. Honorary Assistant Physicians: Dr. J. T. Leon, Dr. E. J. Davis Taylor, and Dr. H. Farncombe. Honorary Assistant Surgeons: Mr. L. Cole Baker, Mr. C. A. Scott Ridout, and Mr. H. Burrows. The hospital is a preparatory School of Medicine and Surgery; the attendance of pupils at this hospital is recognised by the Examining Boards. Particulars of the Secretary at the hospital.

ROYAL BERKSHIRE HOSPITAL, Reading.—This hospital contains 168 beds. Consulting Surgeon: Mr. James H.

Walters. Physicians: Dr. Charles W. Marriott and Dr. Francis H. Hawkins. Assistant Physicians: Dr. William T. Freeman and Dr. George S. Abram. Surgeons: Mr. William J. Maurice and Dr. J. A. P. Price. Assistant Surgeons: Dr. Lansdown M. Guilding and Mr. William J. Foster. Aural Surgeon: Mr. Arthur Roberts. Ophthalmic Surgeon: Mr. Richard P. Brooks. Consulting Dental Surgeon: Mr. Allan L. Goadby.

SALISBURY GENERAL INFIRMARY, Salisbury.—This hospital contains 120 beds. Consulting Physician: Dr. G. G. Morrice. Physicians: Dr. W. W. Ord and Mr. J. E Gordon. Surgeons: Mr. L. S. Luckham, Dr. C. G. B. Kempe, and Dr. E. T. Fison. Surgeon Dentist: (vacant). Secretary: Mr. S. B. Smith. In-patients, 86, weekly average; out-patients, 1111; attendances on casuals, 3230; dental cases, 566. Assistant Secretary: Mr. G. F. Henbest.

SALOP INFIRMARY, Shrewsbury.—This hospital has 130 beds. Consulting Physicians: Dr. E. Burd, Mr. R. W. O. Withers, Dr. E. Lycett Burd, and Dr. E. Cureton. Physicians: Dr. H. W. Gardner, Dr. R. H. Urwick, and Dr. C. V. Bulstrode. Consulting Surgeon: Mr. W. Eddowes. Surgeons: Mr. A. Jackson, Mr. H. H. B. MacLeod, and Mr. L. J. Godson. Ophthalmic Surgeon: Mr. C. G. Russ Wood. Pathologist: Dr. Paul Mathews. Radiographer: Mr. W. F. Buckle. Dental Surgeon: Mr. W. E. Harding. Secretary: Mr. Joseph Jenks. In-patients, 1242; out-patients, 2771; out-patients' attendances for the year, 26,039.

ROYAL SOUTH HANTS AND SOUTHAMPTON HOSPITAL, Southampton.—This hospital contains 130 beds. Physicians: Dr. J L. Thomas and Dr. N. E. Aldridge. Assistant Physicians: Dr. H. P. Ward, Dr. J. H. P. Fraser, and Dr. B. N. Tebbs. Surgeons Extraordinary: Mr. W. Sims and Mr. A. B. Wade. Surgeons: Mr. H. W. Shettle, Mr. J. R. Keele, and Mr. W. P. Purvis. Assistant Surgeon: Mr. G. H. Cowen. Throat and Ear Surgeon: Mr. W. P. Purvis. Dental Surgeon: Mr. A. Saunders. Electro-Therapeutic Department: Dr. N. E. Aldridge. Secretary: Mr. T. A. Fisher-Hall. In-patients, 2194; out-patients, 10,603.

STAFFORDSHIRE GENERAL INFIRMARY, Stafford.—This hospital has 77 beds. Honorary Consulting Physician: Dr. G. Reid. Physicians: Dr. C. Reid and Dr. L. Gray. Surgeons: Mr. F. M. Blumer and Mr. F. H. Marson. Assistant Honorary Surgeon: Mr. F. N. Cookson. Ophthalmic Surgeon: Mr. A. B. Cridland. Surgeon Dentist: Mr. W. H. Ridge. Secretary: Mr. R. Battle. In-patients, 988; out-patients, 4469.

ROYAL HANTS COUNTY HOSPITAL, Winchester.—This hospital has 108 beds. Honorary Consulting Physicians: Dr. W. M. Harman and Dr. H. E. Wingfield. Physicians: Dr. G. F. A. England. Dr. A. E. Bodington, and Dr. G. A. Tullis. Surgeons: Mr. C. Wace. Mr. H. J. Godwin, and Mr. F. J. Child. Honorary Ophthalmic Surgeon: Mr. J. F. Bullar. Honorary Dental Surgeon: Mr. L. M. Balding. Secretary: Mr. A. D. White.

WOLVERHAMPTON AND STAFFORDSHIRE GENERAL HOSPITAL, Wolverhampton.—There are 200 beds. Special departments for Children, Gynæcology, Ear, Throat, and Nose Diseases, Electro-therapeutic and X ray departments. There is an excellent library. The resident officers are a resident surgical officer, a resident medical officer, and two house surgeons. Pupils are allowed to witness the whole of the practice of the hospital and to be present at operations and have every opportunity of acquiring a practical knowledge of their profession. Fees: £3 3*s*. a quarter, £10 10*s*. the first year, and £5 5*s*. subsequent years. A course of Practical Pharmacy is given by the dispenser. Fee £3 3*s*. for three months. Applications should be made to the Secretary of the Medical Committee.

Staff.—Consulting Physician: Dr. W. Millington. Consulting Surgeon: Mr. W. H. T. Winter. Physicians: Dr. H. Malet and Dr. J. A. Codd. Surgeons: Mr. E. Deanesly, Mr. A. H. Hunt, and Mr. W. F. Cholmeley. Assistant Physicians: Dr. A. H. Carter, Dr. E. H. Coleman, and Dr. T. H. Galbraith. Assistant Surgeons: Mr. H. Dent and Mr. C. A. Stidston. Anæsthetists: Dr. E. W. Strange and Mr. David Mann.

WORCESTER GENERAL INFIRMARY, Worcester.—This hospital has 132 beds. Consulting Physician: Dr. E. H. W. Swete. Physicians: Dr. G. W. Crowe, Dr. M. Read, and Dr. H. A. Watson. Consulting Surgeons: Mr. G. E. Hyde and Mr. T. Bates. Surgeons: Mr. T. P. Gostling, Mr. C. Pollard, and Mr. T. Bates, jun. Secretary: Mr. W. Stallard. In-patients, 1262; out-patients, 6581.

YORK COUNTY HOSPITAL, York.—This hospital contains 150 beds. Consulting Physician: Dr. Richard Petch. Physicians: Dr. Richard Turner. Dr. William A. Evelyn, and Dr. J. S. Gayner. Consulting Surgeon: Mr. Frederick Shann. Surgeons: Mr. William H. Jalland, Mr. G. Wilfred Gostling, Dr. Noel L. Hood, and Mr. Gerald S. Hughes. Consulting Ophthalmic Surgeon: Dr. Tempest Anderson. Ophthalmic Surgeon: Dr. Peter Macdonald. Electro-therapeutic Department: Dr. Hinton E. Bateman. Anæsthetist: Mr. Robert Fell. Consulting Dental Surgeon: Mr. Walter Glaisby. Dental Surgeons: Mr. Leonard A. Glaisby and Mr. H. W. Mace.

II.—SCOTLAND.

THE UNIVERSITIES.

UNIVERSITY OF EDINBURGH.

Four Degrees in Medicine and Surgery are conferred by the University of Edinburgh—viz., Bachelor of Medicine (M.B.), Bachelor of Surgery (Ch.B.), Doctor of Medicine (M.D.), and Master of Surgery (Ch.M.). The degree of Bachelor of Surgery cannot be conferred on any person who does not at the same time obtain the degree of Bachelor of Medicine, and similarly the degree of Bachelor of Medicine is not conferred on any person who does not at the same time obtain the degree of Bachelor of Surgery.

A diploma in Tropical Medicine and Hygiene (D.T.M. and H.) is granted to graduates in Medicine and Surgery of the University of not less than six months' standing. The course of study includes (1) Practical Bacteriology; (2) Diseases of Tropical Climates; (3) Tropical Hygiene; (4) a Practical Course in Medical Entomology and Protozoology and Venomous Animals; and (5) a Course of Clinical Instruction in Tropical Diseases. Any two of these courses may be taken under Extra-academical Teachers and exemption from the latter course may be granted to those graduates who have been engaged for a period of at least 12 months in the treatment of Tropical Diseases in any tropical or subtropical country. The examinations for the diploma, which will embrace all the foregoing subjects, are held in December and July of each year.

Before commencing his medical studies each student must pass a preliminary examination in (1) English, (2) Latin, (3) Elementary Mathematics, and (4) Greek or French or German: provided always that, in the case of a candidate whose native language is not English, an examination in the native language of the candidate may be substituted for one in either French or German, and an examination in any other classical language for one in Latin or Greek.

No one is admitted to the degrees of *Bachelor of Medicine* and *Bachelor of Surgery* who has not been engaged in Medical and Surgical study for five years. No course of lectures will be allowed to qualify unless the lecturer certifies that it has embraced at least 100 lectures, or 50 lectures, as may be required by the regulations, and that the student has also duly performed the work of the class.

Candidates for the degrees of M.B. and Ch.B. must have attended for at least three academic years the medical and surgical practice either of the Royal Infirmary, Edinburgh, or of a general hospital elsewhere which accommodates not fewer than 80 patients and possesses a distinct staff of physicians and surgeons. They must have attended Clinical Surgery during a course or courses extending over not less than nine months. These courses may be conducted by the professor of clinical surgery, or by professors or lecturers appointed for the purpose by the University Court, or by the ordinary surgeons of the Royal Infirmary, Edinburgh, or of a general hospital defined and recognised as hereinbefore provided, and shall consist of regular instruction at the bedside, along with clinical lectures. A similar course of clinical medicine during a course or courses extending over not less than nine months is required. The candidate must have attended a course of instruction in Mental Diseases given by the University Lecturer, or by a recognised Teacher, consisting of not less than six Class-room meetings for lectures and demonstrations and ten meetings in the Wards of a recognised Asylum for the insane. The candidate must have attended a course of

25 meetings on Practical Pharmacy in a university or recognised school of medicine, or have dispensed drugs for a period of three months in a hospital or dispensary, or in an establishment recognised by the Pharmaceutical Society. The candidate must have attended for at least six months, by apprenticeship or otherwise, the out-practice of a hospital, or the practice of a dispensary, or of a physician or surgeon, or of a member of the London or Dublin Society of Apothecaries. He must have acted as clerk in the medical wards and dresser in the surgical wards of a public hospital for a period of six months in each case; and must also have availed himself, to such an extent as may be required by the Senatus, with the approval of the University Court, of opportunities of studying at a hospital or dispensary, Post-mortem Examinations, Fevers, Diseases of the Eye, Operative Surgery, Practical Anæsthetics, Diseases of Children, Diseases of the Larynx, Ear, and Nose, and Diseases of the Skin, or such other special departments as may from time to time be determined. The candidate must have attended, under the superintendence of a registered medical practitioner, 25 cases of labour, or such additional number as the Senatus, with the sanction of the University Court, may from time to time determine; or have attended for three months the practice of a lying-in hospital, or of the maternity department of a general hospital or other public charitable institution and have conducted personally 12 or such an additional number of cases of labour as the Senatus, with the approval of the University Court, may from time to time determine. The candidate must have been properly instructed in Vaccination at a public vaccination station, by a public vaccinator, authorised by the proper Government authority to grant certificates of proficiency in vaccination.

With respect to the places and institutions at which the studies of the candidate may be prosecuted the following regulations have effect:—Two of the five years of medical study must be spent in the University of Edinburgh. The remaining three years may be spent in any University of the United Kingdom, or in any Indian, Colonial, or Foreign university recognised for the purpose by the University Court, or in such medical schools or under such teachers as may be recognised for the purpose by the University Court. Of the subjects of study, 16 in number—viz., Anatomy, Practical Anatomy, Chemistry, Practical Chemistry, Materia Medica, Physiology, Practical Physiology, Practice of Medicine, Surgery, Midwifery and Diseases of Women, Pathology, Practical Pathology, Physics, Botany, Zoology, Medical Jurisprudence, and Public Health—not less than eight must be taken in the University of Edinburgh, which corresponds to the two years above referred to.

Women are admitted to graduation in medicine under practically the same conditions as men, excepting that, until provision is made in the University for instruction of women in all subjects of the medical curriculum, the regulations as to places of study contained in the foregoing paragraph do not apply to them. Women who study in Edinburgh receive their instruction from recognised Extra-Academical Teachers, who are Lecturers in the School of Medicine for Women, Surgeons' Hall.

Each candidate is examined, both in writing and orally, and clinically where the nature of the subject admits:—First, in Chemistry, Zoology, Botany, and Physics; second, in Anatomy and Physiology; third, in Materia Medica and Therapeutics and Pathology; and fourth, in Surgery, Medicine, Midwifery, Forensic Medicine, and Public Health, and clinically in Medicine, Surgery, and Gynæcology in a hospital. The examinations are conducted, as far as possible, by demonstrations of objects placed before the candidates. Candidates who profess themselves ready to submit to an examination in the first division of these subjects may be admitted to examination therein at the first period of examination after they have completed their attendance on the necessary classes. Candidates who have passed their examination in the first division of these subjects may be admitted to examination in the second division at the end of their third winter session. Candidates who have passed their examinations in the subjects comprised in the first and second divisions may be admitted to examination in the third division at the end of the fourth winter session. Candidates who have passed their examinations in the subjects comprised in the first, second, and third divisions may be admitted to examination in the fourth or final division when they have completed the fifth year of study.

Under a new medical ordinance it is provided that candidates may pass all or any of the subjects of the first division—viz., Botany, Zoology, Physics, or Chemistry—at a university in the United Kingdom or at any other university approved by the Senate for this purpose, when such subjects qualify for a degree in arts or science. In the second division the examination in Physiology may be taken at any time and in Anatomy at any time after the first half session of the third winter session. In the third division the examination in Pathology may be taken at any time after the end of the third summer session in the case of students who begin the medical curriculum in October and at the end of the fourth summer session in the case of students who begin their medical curriculum in May. In Materia Medica the examination may be taken at any time after the end of the fourth winter session. Candidates may be admitted to examination in Practical Pharmacy and in the physical, chemical, and botanical characters of medicinal substances at any examination held after they have completed the qualifying course of study, but not later than the examination in Materia Medica. In the fourth division a student, after taking the prescribed courses of study, may be examined in Forensic Medicine and Public Health at any time, in Midwifery, Practice of Medicine, and Surgery at any time after the end of the fifth winter session, and in Clinical Medicine (including the subject of Diseases Peculiar to Women) and Clinical Surgery at the end of the fifth year of study. This new ordinance applies to students who entered the University at or after the beginning of the winter session 1907, but students who entered before that date have the option of finishing their course under the existing regulations or of taking advantage of the new ordinance.

The fee to be paid for the degrees of Bachelor of Medicine and Bachelor of Surgery is £23 2*s.*, and the proportion of this sum to be paid by a candidate at each division of the examination shall be as follows—viz.: For the First Division of the Examination (Botany, Zoology, Physics, and Chemistry), £6 6*s.*; for the Second Division (Anatomy, and Physiology), £5 5*s.*; for the Third Division (Pathology and Materia Medica and Therapeutics), £4 4*s.*; and for the Final Division (Surgery and Clinical Surgery, Medicine and Clinical Medicine, Midwifery, Clinical Gynæcology, and Forensic Medicine and Public Health), £7 7*s.*

Bachelors of Medicine and *Bachelors of Surgery* may proceed to the degrees of *Doctor of Medicine* and *Master of Surgery* after they have spent one year in the medical or surgical wards respectively of a hospital, or the Military or Naval Medical Services, or in scientific work bearing directly on their profession, or two years in practice. In each case an examination must be passed and a thesis submitted for approval of the Faculty. The fee to be paid for the degree of M.D. is £10 10*s.*, and the fee to be paid for the degree of Ch.M. is £10 10*s.*

Diploma in Psychiatry.—Courses of instruction have also been instituted for a Diploma in Psychiatry, open to all legally qualified Medical Practitioners who conform with the Regulations. There shall be two examinations for the Diploma, the first comprising the subjects of Anatomy of the Nervous System; Physiology, Histology, and Chemistry of the Nervous System; Pathology of the Brain and Nervous System; and Practical Bacteriology in its relation to Mental Diseases; and the second examination comprising the subjects of Psychology with Experimental Psychology, Clinical Neurology, and Psychiatry (systematic and clinical). The fee for each examination shall be £5 5*s.*

Professors—Chemistry: James Walker, D.Sc., F.R.S. Zoology: J. Cossar Ewart, M.D. Botany: I. Bayley Balfour, M.D. Physiology: E. A. Schäfer, F.R.S. Anatomy: Arthur Robinson, M.D. Pathology: William Smith Greenfield, M.D. Materia Medica: Sir Thomas R. Fraser, M.D., F.R.S. Forensic Medicine: Harvey Littlejohn, M.B., F.R.C.S.E. Public Health: C. Hunter Stewart, M.B., D.Sc. Midwifery: Sir John Halliday Croom, M.D. Surgery: Alexis Thomson, M.D., F.R.C.S.E. Medicine: John Wyllie, M.D. Clinical Surgery: F. M. Caird, M.B., F.R.C.S. Clinical Medicine: Sir Thomas R. Fraser, W. S. Greenfield, M.D., and J. Wyllie, M.D.

Scholarships and Prizes.—In the University of Edinburgh many bursaries, scholarships, prizes, &c., are given, some of which, by the nature of the subject or by the conditions attached, are restricted to Medical Students, while others are open to Students in two or more Faculties, of which Medicine may be one. In the following list the money

value, the subjects of examination, or other system of selection, and any special conditions that may be imposed, are placed in that order. As "continued study" is a condition in a considerable proportion of the cases it has not been thought necessary to repeat these words.

For Students entering on or in their First Year.—Sibbald Bursaries for entrants, one or two annually, tenable for three years, each £30 per annum, Preliminary Subjects; Heriot Bursaries for entrants, seven for men and one for women annually, tenable for three years, each £30 per annum, Preliminary Subjects; Thomson Bursary, £25 per annum, tenable for four years, Distinction in Medical Preliminary Examination; Grierson Bursary No. 1, £20, Distinction in Medical Preliminary Examination; Crichton Bursaries, six annually, tenable for four years, each £50 per annum, Distinction in Medical Preliminary Examination with extra subjects, birth in Scotland; Mackie Bursary No. 1, tenable for two years, £30 per annum, vote of Faculty, need of pecuniary aid; Junior J. A. Carlyle Bursary, £28, Class Examinations in Anatomy and Chemistry; Coldstream Memorial Scholarship for intending Medical Missionaries, tenable for five years, £25 per annum; three Vans Dunlop Scholarships, Nos. 1, 2 and 3, each tenable for three years, £100 per annum, one for first place in Medical Preliminary Examination, one for Chemistry and Physics, one for Botany and Zoology; Thomson Scholarship, tenable for four years, £40 per annum, Botany, Zoology, and Mechanics.

For Students entering on or in their Second Year.—Mackie Bursary No 2, tenable for two years, £30 per annum, vote of Faculty, need of pecuniary aid; Grierson Bursary No. 2, £20, Chemistry, Botany, Zoology, and Physics; Senior J. A. Carlyle Bursary, £28, Class Examinations in Anatomy and Physiology; Sibbald Scholarship, tenable for three years, £40 per annum, Chemistry, Botany, Zoology, and Physics; Neil Arnott Prize, £37 10*s.*, Distinction in Natural Philosophy in the M.A. Examination.

For Students entering on or in their Third Year.—Grierson Bursary No. 3, £20, Anatomy and Physiology. Vans Dunlop Scholarships Nos. 4 and 5, tenable for three years, £100 per annum, one in Physiology and one in Anatomy.

For Students entering on their Fourth or Fifth Year or for Graduates.—Syme Surgical Fellowship, tenable for two years, £100 per annum, Thesis by M.B. of not more than three years' standing; Goodsir Memorial Fellowship, tenable for two years, £100 per annum, Thesis by M.B., &c., of not more than three years' standing; Leckie Mactier Fellowship, tenable for three years, £80 per annum, competition among M.B.'s of not more than three years' standing; Freeland Barbour Fellowship, £100, highest marks in Anatomy, Physiology, and Pathology in Professional Examinations, with one year's research in Midwifery as a condition; Allan Fellowship, about £55, Clinical Medicine and Clinical Surgery; three Vans Dunlop Scholarships, Nos. 6, 7, and 8, tenable for three years, £100 per annum, one in Pathology and Surgery, one in Materia Medica and Medicine, and one in Forensic Medicine, Public Health, and Midwifery; Murchison Memorial Scholarship, interest on £1000 Clinical Medicine; Stark Scholarship, £112, Clinical Medicine, with Research in Clinical Medicine as a condition; Buchanan Scholarship, £40, Midwifery and Gynæcology, with work in gynæcological ward as a condition; James Scott Scholarship, £32 10*s.*, Midwifery, with work in maternity hospital as a condition; Ettles Scholarship for the most distinguished M.B., Ch.B of the year. £31; Crichton Research Scholarships in Anatomy, Physiology, Materia Medica, and Pathology, tenable for one, two, or three years, £100 each per annum, competition among graduates; Mouat Scholarship, £55 and medal, Class and Degree Examinations in Practice of Physic; two Grierson Bursaries, Nos. 4 and 5, £10 each, one in Materia Medica and one in Pathology; McCosh Graduate's Bursary and McCosh Medical Bursary for Research, income of £5500, Distinction in Professional Subjects and Knowledge of Foreign Languages, with the condition of Study or Research in Medical Schools of Europe; Gunning Victoria Jubilee Prizes, four awarded annually, each £50, Thesis or Original Research in Anatomy, Physiology, Zoology, Botany, Chemistry, Materia Medica, Surgery, Practice of Physic, Pathology, Obstetrics, Medical Jurisprudence, and Public Health respectively; Theses Gold Medals for the best Theses for the M.D. degree; Conan Doyle Prize for the most distinguished Graduate of the year from South Africa, £32; Wightman Prize, £12, Clinical Reports on Medical Cases; Beaney Prize, £32 10*s.*, highest marks in Anatomy, Surgery, and Clinical Surgery, in M.B. and Ch.B. Examinations; Annandale Gold Medal awarded to the best candidate in Clinical Surgery for the degrees of M.B., Ch.B.; Ellis Prize, £28, Essay on Animal or Vegetable Physiology; Cameron Prize, for the most valuable addition to Practical Therapeutics during the preceding five years, annual proceeds of £2000; Milner Fothergill Gold Medal, about £20, Essay on Pharmacological or Therapeutic subject; Mackay Smith Scholarship for Students in Chemistry, tenable for two years, £25 per annum; Houldsworth Scholarship for Students or Graduates, £40, Materia Medica, with the condition of Research in Pharmacology; Mackenzie Bursaries, two annually, £20, Practical Anatomy; Pattison Prize, about £11 7*s.* 6*d.*, Clinical Reports of Surgical Cases; Dobbie Smith Gold Medal for a Botanical Essay; Anderson Henry Prize for a Botanical Essay, proceeds of £300 accumulated for three years; Dorothy Gilfillan Memorial Prize for the most distinguished Woman Graduate of the year, about £10.

SCHOOL OF MEDICINE OF THE ROYAL COLLEGES, Edinburgh.—The number of students varies much in the classes and subjects. It is within the limit to say that about 1000 students avail themselves each session of the opportunity of attending the school. The lectures qualify for the University of Edinburgh and other Universities, the Royal Colleges of Physicians and Surgeons of London, Edinburgh, and Dublin, the Faculty of Physicians and Surgeons of Glasgow, and other Medical and Surgical and Public Boards. A post-graduate vacation course commences on August 31st.

The anatomy rooms and laboratories will open on Tuesday, Oct. 3rd, and the lectures will commence on Oct. 10th.

In accordance with the statutes of the University of Edinburgh one-half of the qualifying classes required for graduation may be attended in this school, including the classes of Clinical Medicine and Clinical Surgery. The regulations require that the fee for any class taken for graduation in Edinburgh shall be the same as that for the corresponding class in the University. The whole education required for graduation at the University of London may be taken in this school.

The appointment of Resident Physician to the wards in the Royal Infirmary under the care of the Ordinary Physicians is open to those members of their clinical class who have held the office of clerk in their wards for at least six months. Six Residentships are appointed for a period of six months each. Resident Surgeons are also appointed by the Ordinary Surgeons to the Hospital. In all respects the students are taught under regulations similar to those at the University of Edinburgh and the other Universities of Scotland, and they receive similar certificates at the close of each session. Moreover, the University and College authorities in Edinburgh and the Governing Board of the school call upon each recognised lecturer to supply them at the close of each session with a statement giving the number of students attending the class, the number of lectures or prelections delivered during the session, the class examinations held, and the general mode of conducting the class. The courses on special non-qualifying subjects have for the last quarter of a century formed a marked feature of the school. Indeed, such medical subjects could be studied in Edinburgh only in this school until lately, when the University of Edinburgh appointed from the school lecturers on Diseases of the Eye, Insanity, and Diseases of Children to take charge of classes intra-murally. A list of the classes and lecturers will be found below. Special courses of instruction for dental students and for women are also included in the curriculum of this school. The classes of the school are conducted in several separate buildings, such as at Surgeons' Hall, Nicolson-square, and the New School, Bristo-street.

Lecturers and Fees.—Winter Session: Anatomy, Practical Anatomy, and Demonstrations, Dr. Ryland Whitaker (£3 5*s.* and £4 4*s.*); Chemistry (Practical, &c.), Mr. Gemmell and Dr. T. W. Drinkwater*; Physiology (Institutes of Medicine), Dr. Alex. Goodall (£3 5*s.*); General Pathology, &c., Dr. Shennan and Dr. James Miller (£3 5*s.*); Biology, Mr. Malcolm Laurie (£3 5*s.*); Zoology, Mr. Malcolm Laurie; Physics, Dr. Dawson Turner (£3 3*s.*); Meteorology, Dr. Dawson Turner (£2 2*s.*); Bacteriology, Dr. Taylor Grant, Dr. Theodore Shennan, and Dr. James Miller: Practice of Physic, Dr. Byrom Bramwell, Dr. R. A. Fleming, Dr. Lovell Gulland, Dr. W. Russell, Dr. Harry Rainy, and Dr. E. Bramwell

(£3 5s.); Surgery, Mr. Scot Skirving, Mr. Dowden, Mr. Chiene, Mr. H. Wade, Mr. J. W. Struthers, Mr. W. J. Stuart, and Mr. L. Beesly (£3 5s.); Materia Medica, &c., Dr. Craig and Dr. F. D. Boyd† (£3 5s.); Midwifery, &c., Dr. Hart, Dr. Ballantyne, Dr. Haig Ferguson, Dr. Fordyce, Dr. Lamond Lackie, Dr. Elsie Inglis, Dr. McGibbon, Dr. Barbour Simpson, Dr. Davidson, and Dr. Watson (£3 5s.); Medical Jurisprudence, &c., Dr. Aitchison Robertson and Dr. Macmillan (£3 5s.); Public Health, Dr. Aitchison Robertson, Dr. W. Robertson, and Dr. Macmillan; Hospital Practice (Edinburgh Royal Infirmary): Physicians, Dr. Bramwell, Dr. Gibson, Dr. Philip, and Dr. Brewis for Gynæcology; Surgeons, Mr. Cotterill, Mr. Cathcart, Mr. Hodsdon, Mr. Wallace, and Mr. Miles (perpetual ticket, £12); Clinical Medicine, Dr. Byrom Bramwell, Dr. Gibson, and Dr. Philip; Dr. Brewis for Gynæcology (£3 5s.); Clinical Surgery, Mr. Cotterill, Mr. Cathcart, Mr. Hodsdon, Mr. Wallace, and Mr. Miles (£3 5s.); Diseases of the Chest, Dr. Philip† and Dr. Lovell Gulland (£2 2s.); Vaccination, Dr. Buist† and Dr. W. G. A. Robertson (£1 1s.); Diseases of Ear, Nose, and Throat, Dr. J. Malcolm Farquharson and Dr. J. S. Fraser (£2 2s.); Diseases of the Eye, Dr. Sym† and Dr. J. V. Paterson (£2 2s.); Ophthalmoscopy, Dr. A. H. H. Sinclair (£2 2s.); Gynæcology, Dr. Haig Ferguson and Dr. Elsie M. Inglis (Systematic), Dr. Brewis and Dr. J. Haig Ferguson (Clinical), and Dr. J. W. Ballantyne (Advanced) (£2 2s.); Neurology, Dr. J. J. Graham Brown (£2 2s.); Clinical Methods, Dr. W. Russell (£2 5s.); Medical Electricity, Dr. Dawson Turner (£2 12s. 6d.); Tropical Diseases, Major D. G. Marshall, I.M.S. (£2 2s.). Summer Session: Practical Anatomy and Demonstrations, Dr. Ryland Whitaker (£2 2s.); Practical Physiology, Dr. Goodall (£3 3s.); Biology, Mr. M. Laurie‡ and Dr. Newbigin (£3 3s.); Practical Chemistry and Analytical Chemistry, Mr. Gemmell and Dr. Drinkwater §; Practical Bacteriology, Dr. Shennan, Dr. Taylor Grant, and Dr. James Miller; Materia Medica, Dr. Craig and Dr. F. D. Boyd; Diseases of the Eye, Dr. Sym and Dr. J. V. Paterson (£2 2s.); Medical Psychology and Insanity, Sir J. Batty Tuke and Dr. John Keay (£2 2s.); Medical Jurisprudence, Dr. Aitchison Robertson, and Dr. J. Macmillan; Public Health, Dr. Wm. Robertson (£2 2s.); Gynæcology, Dr. Brewis (£2 2s.); Midwifery Lectures, Dr. Ballantyne, Dr. Haig Ferguson, Dr. W. Fordyce, Dr. Lamond Lackie, Dr. Elsie Inglis, Dr. McGibbon, Dr. Barbour Simpson, Dr. Davidson, and Dr. Watson (£3 5s.); Operative Surgery, Mr. Dowden, Mr. Scot Skirving, Mr. Chiene, Mr. H. Wade, Mr. J. W. Struthers, Mr. W. J. Stuart, and Mr. L. Beesly (£3 3s.); Practical Pathology, Dr. Shennan and Dr. James Miller (£3 8s.); Physics, Dr. Turner‡ (£3 3s.); Practical Medicine and Physical Diagnosis, Dr. Fleming, Dr. Lovell Gulland, and Dr. Harry Rainy (£3 3s.); Clinical Medicine, Dr. Bramwell and Dr. Gibson (£2 2s.); Vaccination, Dr. Buist and Dr. W. G. A. Robertson (£1 1s.); Neurology, Dr. Bruce and Dr. Graham Brown; Diseases of Ear, Nose, and Throat, Dr. J. Malcolm Farquharson and Dr. J. S. Fraser (£2 2s.); Tropical Diseases, Major D. G. Marshall, I.M.S. (£2 2s.); Medical Electricity, Dr. Dawson Turner; Meteorology, Dr. Dawson Turner.

Special Classes for Women, Winter Session: Practical Anatomy and Demonstrations, Dr. Ryland Whitaker (£4 4s.); Chemistry (Lectures and Practical), Dr. T. W. Drinkwater (£3 5s. and £3 3s.); Practice of Physic, Dr. E. Matthew (£3 5s.); Surgery, Mr. Beesly (£3 5s.); Midwifery and Diseases of Women, Dr. J. W. Ballantyne; General Pathology, Dr. James Miller (£3 5s.); Physiology (Institutes of Medicine), Dr. Goodall (£3 5s.); Materia Medica, &c., Dr. Craig (£3 5s.); Clinical Medicine, Dr. Lovell Gulland, Royal Infirmary (£3 5s.); Clinical Surgery, Mr. Miles, Royal Infirmary (£3 5s.); Physics, Dr. Dawson Turner (£3 3s.); Vaccination, Dr. W. G. A. Robertson (£1 1s.); Practical Gynæcology, Dr. Brewis (£2 2s.); Diseases of the Eye, Dr. W. G. Sym; Bacteriology, Dr. J. Taylor Grant; Tropical Diseases, Major D. G. Marshall; Fevers, City Hospital. Summer Session: Practical Anatomy, Dr. Ryland Whitaker (£2 2s.); Practical Chemistry, Dr. T. W. Drinkwater (£3 3s.); Materia Medica, &c., Dr. Craig (£3 3s.); Operative Surgery and Surgical Anatomy, Mr. Beesly (£3 3s.); Materia Medica and Therapeutics, Dr. Wm. Craig (£3 3s.); Practical Materia Medica, Dr. Wm. Craig; Medical Jurisprudence and Public Health, Dr. Aitchison Robertson (£3 5s.); Public Health, Dr. W. Robertson; Clinical Medicine, Dr. W. Russell; Clinical Surgery, Mr. Miles, Royal Infirmary (£3 5s.); Practical Physiology and Histology, Dr. Goodall (£3 3s.); Practical Pathology, Dr. James Miller (£3 3s.); Biology, Dr. Newbigin (£3 3s.); Physics, Dr. Dawson Turner (£3 3s.); Ophthalmology, Dr. Sym (£2 2s.); Insanity, Sir J. Batty Tuke and Dr. John Keay (£2 2s.); Practical Gynæcology, Dr. J. W. Ballantyne (£2 2s.); Practical Medicine, Clinical Methods, Dr. W. Russell; Vaccination, Dr. W. G. A. Robertson; Tropical Diseases, Major Marshall; Medical Electricity, Dr. Dawson Turner.

The minimum cost of the education in this School of Medicine for the Triple Qualification of Physician and Surgeon from the Royal Colleges of Physicians and Surgeons of Edinburgh and the Faculty of Physicians and Surgeons of Glasgow, including the fees for the Joint Examinations, is about £115, payment of which is distributed over the period of study. There is no composition fee.

Further particulars regarding the school, also its calendar, may be had on application to the Dean of the School, 11, Bristo-place, Edinburgh.

* Lectures, £3 5s.; Practical, £3 3s.; Analytical, £2 a month, or £5 for three months. † Also in Summer Session. ‡ Also in Winter Session. § Practical, £3 3s.; Analytical, £2 a month, or £5 for three months.

N.B.—Where two or more lecturers appear as teaching the same subjects their lectures are not conjoined, but each gives an independent course.

THE EDINBURGH SCHOOL OF MEDICINE FOR WOMEN.—The Edinburgh School of Medicine for Women provides all the classes required for a complete curriculum. The classes qualify for the University Degree in Medicine, for the Diploma of the Royal Colleges, and for the Triple Qualification. The lecturers of the school are specially recognised by the Court of Edinburgh University for the education of women who propose taking the degree in medicine of the University of Edinburgh. Most of the classes are held in Surgeons' Hall. The office of the school and a sitting-room and other conveniences are provided in the same building for the use of the women students. The clinical instruction of the students is conducted in the wards of the Royal Infirmary, specially set apart for the purpose; in the Royal Hospital for Sick Children; in the City Hospital for Infectious Diseases; at Bangour Asylum; and at the various public dispensaries. The fees and the regulations as to the course of study are the same as for the male students. Further particulars can be obtained from the Dean of the School of Medicine for Women, Surgeons' Hall, Edinburgh.

Clinical Instruction.—ROYAL INFIRMARY, Edinburgh.—This hospital has over 900 beds and 60 cots for children, the average daily number of patients for 1909 being 845. Beds are set apart for clinical instruction by the professors of the University of Edinburgh. Courses of Clinical Medicine and Surgery are also given by the ordinary physicians and surgeons. Special instruction is given on Diseases of Women, Physical Diagnosis, Diseases of the Skin, Diseases of the Eye, the Ear, the Larynx, and the Teeth. Separate wards are devoted to Venereal Diseases, Diseases of Women, Diseases of the Eye, the Ear, Throat and Nose, and the Skin, and also to cases of Incidental Delirium or Insanity. There are also large and complete Medical-Electrical and X Ray and Bathing Departments. Three wards are specially set apart for Clinical Instruction to Women Students. Post-mortem examinations are conducted in the anatomical theatre by the pathologist and his assistants, who also give practical instruction in Pathological Anatomy and Histology. The fees for hospital attendance are as follows—viz: Perpetual ticket, in one payment, £12; annual ticket, £6 6s.: six months, £4 4s.; three months, £2 2s.; monthly, £1 1s. Separate payments amounting to £12 12s. entitle the student to a life ticket. No fees are paid for any medical or surgical appointment. The appointments are as follows:—1. Resident physicians and surgeons are appointed and live in the house free of charge. The appointment is for six months but may be renewed at the end of that period by special recommendation. 2. Non-resident house physicians and surgeons and clinical assistants are appointed for six months. The appointment may be renewed for a like period by special recommendation. 3. Clerks and dressers are appointed by the physicians and surgeons. These appointments are open to all students and junior practitioners holding hospital tickets. 4. Assistants in the Pathological Department are appointed by the pathologist.

Staff: Medical Department.—Consulting Physicians: Sir

J. O. Affleck and Dr. Alexander James. Consulting Gynæcologists: Professor Sir J. Halliday Croom and Emeritus Professor Sir A. R. Simpson. Consulting Physician for Diseases of the Skin: Dr. W. Allan Jamieson. Professors of Clinical Medicine: Sir T. R. Fraser, Dr. W. S. Greenfield, and Dr. John Wyllie. Ordinary Physicians and Lecturers on Clinical Medicine: Dr. Byrom Bramwell, Dr. Geo. Gibson, Dr. R. W. Philip, Dr. W. Russell, and Dr. G. Lovell Gulland. Gynæcologists: Dr. A. H. F. Barbour and Mr. N. T. Brewis. Physician for Diseases of the Skin: Dr. Norman Walker. Assistant Physicians: Dr. J. J. Graham Brown, Dr. Francis D. Boyd. Dr. R. A. Fleming, Dr. Harry Rainy, Dr. Chalmers Watson, Dr. Edwin Bramwell, Dr. Edwin Matthew, and Dr. W. T. Ritchie. Assistant Gynæcologists: Dr. J. Haig Ferguson and Dr. Wm. Fordyce. Assistant Physicians for Diseases of the Skin: Dr. Fred. Gardiner and Dr. R. Cranston Low. Medical Electrician: Dr. Dawson Turner. Assistant Medical Electrician: Dr. Hope Fowler.

Surgical Department.—Consulting Surgeons: Mr. Joseph Bell, Mr. A. G. Miller, Dr. C. W. MacGillivray, and Emeritus Professor John Chiene, C.B. Consulting Ophthalmic Surgeon: Mr. George A. Berry. Consulting Aural Surgeons: Dr. P. McBride and Dr. McKenzie Johnston. Consulting Dental Surgeon: Mr. William Guy. Regius Professor of Clinical Surgery: Mr. F. M. Caird. Professor of Surgery: Mr. Alexis Thomson. Ordinary Surgeons: Mr. J. M. Cotterill, Mr. C. W. Cathcart, Mr. J. W. B. Hodsdon, Mr. D. Wallace, and Mr. Alexander Miles. Ophthalmic Surgeons: Dr. George Mackay and Dr. Wm. G. Sym. Surgeons to Ear and Throat Department: Dr. A. Logan Turner and Dr. J. Malcolm Farquharson. Dental Surgeon: Mr. J. H. Gibbs. Assistant Surgeons: Mr. J. W. Dowden, Mr. A. A. Scot Skirving, Mr. Geo. L. Chiene, Mr. W. J. Stuart, Mr. J. W. Struthers, Mr. Henry Wade, and Mr. Scott Carmichael. Assistant Ophthalmic Surgeons: Dr. J. V. Paterson and Dr. A. H. H. Sinclair. Assistant Surgeons to the Ear and Throat Department: Dr. John S. Fraser and Dr. John D. Lithgow. Pathologist: Dr. Theodore Shennan. Assistant Pathologists: Dr. James Miller and Dr. Murray Drennan. Superintendent: Sir Joseph Fayrer, Bart.

ROYAL HOSPITAL FOR SICK CHILDREN, Sciennes-road, Edinburgh.—This hospital contains 120 beds, and is fitted with every modern improvement. A fully equipped out-patient department (medical and surgical) is conducted daily in a building adjoining the hospital. Systematic courses of instruction, which qualify for graduation in the Edinburgh University and elsewhere, are given from time to time throughout the year by the staff. Students may enter at any time. Full particulars can be obtained from the Registrar at the hospital.

Staff.—Consulting Physicians: Dr. J. Carmichael, Dr. J. Playfair, and Dr. T. M. Burn Murdoch. Consulting Surgeon: Dr. J. Bell. Consulting Surgeon Dentist: (vacant). Pathologist: Dr. W. E. Carnegie Dickson. Ordinary Physicians: Dr. G. H. M. Dunlop, Dr. J. Thomson, and Dr. J. S. Fowler. Surgeon: Mr. H. J. Stiles. Ophthalmic Surgeon: Mr. G. A. Berry. Assistant Surgeon: Mr. C. Balfour Paul. Medical Electrician: Dr. J. W. Spence. Extra Physicians: Dr. W. B Drummond, Dr. J. W. Simpson, and Dr. Dingwall Fordyce. Anæsthetists: Dr. D. C. A. M'Allum and Dr. J. Politachi.

EYE, EAR, AND THROAT INFIRMARY OF EDINBURGH, 6, Cambridge-street, Lothian-road.—Clinical Lectures and Instruction are given in this institution, which is open at 1 o'clock daily for outdoor patients for Eye Diseases; Mondays, Thursdays, and Saturdays at 12 noon, and Tuesdays and Fridays at 4 P.M. for out-door Ear, Nose, and Throat Patients. Special Practical Ophthalmoscopic Classes by arrangement. Patients whose diseases require operations or more than ordinary care are accommodated in the house. Consulting Surgeons: Dr. Joseph Bell, Dr. Logan Turner (Ear, Nose, and Throat Department). Surgeons: Dr. William George Sym, Dr. Malcolm Farquharson, Dr. J. V. Paterson, Dr. E. M. Lithgow, Dr. W. G. Porter, and Dr. John M. Darling. Honorary Clinical Pathologist: Dr. Ian Struthers Stewart. Honorary Anæsthetist: Mr. J. H. Gibbs. Dental Surgeon: Mr. G. W. Watson. Treasurer and Secretary: Mr. J. P. Watson, W.S., 32, Charlotte-square.

UNIVERSITY OF GLASGOW.

The University of Glasgow is both a teaching and a degree-granting body, but admits to graduation only candidates whose preliminary examination and course of study conform to its own regulations. Within certain limits instruction given by recognised medical schools and teachers may be accepted, but not less than one-half of the subjects other than clinical must be taken in this or some other recognised university, and at least two years of the course must be taken in Glasgow University. Six degrees, open both to men and women, are conferred: M.B. and Ch.B. (always conjointly), M.D. and Ch.M.; B.Sc. in Public Health; D.Sc. in Public Health; and B.Sc. in Pharmacy. A Preliminary Examination must be passed in (1) English, (2) Latin, (3) Elementary Mathematics, and (4) Greek, or French, or German, with possible options to students whose native language is not English in the case of the fourth subject. Candidates taking the University preliminary examination are not obliged to pass in all the four subjects at one examination but must do so at not more than two occasions.

For the degrees of M.B. and Ch.B. a curriculum of five years is required. The candidate must, during his curriculum, have attended a course or courses of instruction in each of the following subjects of study, extending over not less than the number of terms specified in each case, and including such class examinations as may be prescribed in connexion with the several courses:—Chemistry (including Organic Chemistry), two terms; with Practical Chemistry, one term; Physics (with practical work), one term; Botany (with practical work), one term; Zoology (with practical work), one term; Anatomy and Practical Anatomy, five terms; Physiology and Practical Physiology, three terms; Materia Medica and Therapeutics (together or separately), each subject, one term; Pathology and Practical Pathology, three terms; Medical Jurisprudence and Public Health (together or separately), each subject, one term; Midwifery and Diseases peculiar to Women and to Infants, two terms; Surgery, two terms; Medicine, two terms. Candidates must attend at least three years the Medical and Surgical Practice of a recognised hospital accommodating at least 80 patients and having a distinct staff of physicians and surgeons. At least nine months' hospital attendance is required on both Clinical Surgery and Clinical Medicine, and the student must have acted for six months as clerk in medical and dresser in surgical wards, and must have had six months' outdoor practice; he must also have attended a course of Mental Diseases and of Practical Pharmacy (25 meetings), must have been properly instructed in Vaccination at a public vaccination station, and must have attended at least 20 cases of labour, or three months of the Practice of a Lying-in Hospital. The University also requires further study in Post-Mortem Examinations, Fevers, Dermatology, Ophthalmology, Gynæcology, Diseases of Children, and Diseases of the Ear and Throat. If a candidate has completed in a University of the United Kingdom a course of study and passed an examination in Botany, Zoology, Physics, or Chemistry, qualifying for a degree in Science or in Arts, he is held to have passed the examinations in such subject or subjects, and there is also power to accept certain Professional Examinations for Medical Degrees of other Universities.

There are four Professional Examinations, the first comprising Botany, Zoology, Physics, and Chemistry; the second comprising Anatomy and Physiology; the third comprising Materia Medica and Therapeutics and Pathology; and the fourth or final, comprising Medical Jurisprudence and Public Health, Surgery and Clinical Surgery, Practice of Medicine and Clinical Medicine, and Midwifery and the Diseases peculiar to Women and to Infants.

The degrees of M.D. (Doctor of Medicine) and Ch.M. (Master of Surgery) are higher degrees in Medicine and Surgery respectively, and candidates (not under 24 years of age) who have previously obtained the double bachelorship may be admitted to either M.D. or Ch.M. on completing the after course prescribed, including an examination in Clinical Medicine for M.D. and an examination in Surgical Anatomy, operations on the dead body, and Clinical Surgery for Ch.M.

Fees.—The Fees for M.B. and Ch.B. are £23 2*s*. The class fee in each subject of the curriculum for M.B. and Ch.B. is £2 2*s*., £3 3*s*., or £4 4*s*., and the present fees for hospital attendance are £10 10*s*. The fee for M.D. is £15 15*s*., and for Ch.M. £15 15*s*.

The great majority of the students take their hospital course at the Western Infirmary, where clinical instruction is given by professors of the University and others. Clinical instruction on Fevers is given at Ruchill and Belvidere

Hospitals, while special courses, largely of a practical nature and embracing work in Hospital or Asylum wards, are conducted by University Lecturers on the Ear, the Throat and Nose, Dermatology, and Insanity. Queen Margaret College, sometime conducted as a separate institution for the higher education of women, was made over to the University in 1892, and in it medical classes for women are conducted under University professors and other lecturers appointed by the University Court, whilst for clinical instruction female students are admitted to the Royal Infirmary.

Professors—Natural Philosophy: A. Gray, LL.D., F.R.S. Materia Medica: Ralph Stockman, M.D. Chemistry: John Ferguson, LL.D. Surgery: Sir William Macewen, M.D., F.R.S. Practice of Medicine: Samson Gemmell, M.D. Midwifery: Murdoch Cameron, M.D. Anatomy: Thomas H. Bryce, M.A., M.D. Zoology: John G. Kerr, M.A., F.R.S. Botany: F. O. Bower, D.Sc., F.R.S. Physiology: D. Noël Paton, M.D. Forensic Medicine: John Glaister, M.D. Pathology: Robert Muir, M.A., M.D., F.R.S.

In this University Bursaries and Prizes to the annual amount of over £1000 are appropriated to students in the Medical Faculty, and there are, moreover, several Scholarships and Fellowships which may be held by medical students who have gone through the Arts course. The designation, money value, subjects of examination or other method of selection, conditions of eligibility, &c., of the Bursaries and Prizes are as follows:—Two Highland Society Bursaries, tenable for five years, open to medical students of Highland descent, £25 each, awarded on results of Preliminary Examination; Mackintosh Mental Science Bursary, open to medical students of either sex attending the Lectures on Insanity, £31; Monteith Bursary, tenable for two years, awarded on results of Second Professional Examination, £21, Anatomy and Physiology; Dr. Thomas Gibson Bursary, tenable for four years, open to medical students preparing to be Missionaries, £36, competition at the First Professional Examination; Coats Scholarship, open to graduates in medicine of not more than three years' standing, holder to prosecute research in pathology, £85, Pathology; John Macfarlane Bursary and Lorimer Bursary, each tenable for three years and open to medical students entering on their second winter session, £48 and £17 respectively; an Armagh Bursary, open to students of either sex presenting themselves for the Final Examination for the degree of M.A. with Honours in Classics, and intending to study Medicine, £52 for three years; William Gardiner Bursary, tenable for two years, open to medical students of either sex, £14, Physiology, Chemistry, and Physics of Professional Examinations; Rainy Bursary, tenable for two years, open to medical students entering on their fourth winter session, £20, Anatomy, Physiology, Chemistry, Botany, and Zoology; two Paterson Bursaries, tenable for four years, open to medical students of first or second session, £25 and £20 respectively, Mathematics and Dynamics; Brunton Memorial Prize, awarded annually to the most distinguished graduate in medicine of the year, £10; Dobbie Smith Gold Medal, awarded annually for an Essay on a Botanical subject; two Arnott Prizes, £20 and £15 respectively, Physiological Physics, &c.; Andrew and Bethia Stewart Bursary, tenable for three years, open to M.A. Graduates of the University, £50, Special Examination; Weir Bursary, awarded on result of Second and Third Professional Examinations, £18; McCunn Medical Research Scholarships, open to medical graduates of Scottish Universities, £100 (see University Calendar).

ANDERSON'S COLLEGE MEDICAL SCHOOL, Dumbarton-road, Glasgow, W.—This medical school took its rise as the Medical Department of Anderson's University, founded in 1795 by the will of Professor John Anderson, F.R.S., and has been active since 1799. It has given 13 professors to the University of Glasgow. The following courses are given, which qualify for all the licensing boards and for the Universities of London, Durham, Edinburgh, and Glasgow (the latter two under certain conditions):—In winter: Anatomy and Practical Anatomy, Professor A. M. Buchanan; Physics, Professor Peter Bennett; Chemistry, Professor J. Robertson Watson; Botany, Professor B. G. Cormack; Zoology, vacant; Physiology, Professor A. J. Ballantyne; Materia Medica, Professor John P. Duncan; Midwifery and Diseases of Children, Professor J. M. Munro Kerr; Surgery, Professor G. Burnside Buchanan; Practice of Medicine, Professor John Cowan; Ophthalmic Medicine and Surgery, Dr. A. Freeland Fergus; Aural Surgery, Dr. J. Galbraith Connal; Diseases of Throat and Nose, Dr. John Macintyre; Public Health (Laboratory Course), Professor Carstairs C. Douglas. In summer: Anatomy, Practical Anatomy, and Osteology; Practical Chemistry; Botany and Practical Botany; Zoology and Practical Zoology; Practical Physiology; Practical Materia Medica and Pharmacy; Medical Jurisprudence (Professor Carstairs C. Douglas); Diseases of Women (Professor J. M. Munro Kerr); Operative Surgery; Ophthalmic Medicine and Surgery; Aural Surgery; Mental Diseases (Dr. John Carswell); and Public Health (Lecture Course and Laboratory Course). The Chemical Laboratory is open daily from 10 to 5. The Dissecting-room is open in winter from 9 A.M. to 6 P.M., and in summer from 6 A.M. to 6 P.M. The students are assisted in their dissections by the Professor and Demonstrators, by whom frequent examinations and demonstrations on the parts dissected are conducted. The supply of subjects for dissection is ample, and students are consequently provided with parts as soon as they may be ready for them. The Dissecting-room is provided with a complete series of dissected specimens, mounted in plaster of Paris, illustrating the anatomy of the human body. Candidates for the Licence in Dental Surgery can obtain the full medical curriculum in Anatomy, Chemistry, Physiology, Surgery, Practice of Medicine, and Materia Medica. The courses special to Dentistry are conducted at the Glasgow Dental Hospital and School.

The new buildings are situated in Dumbarton-road, immediately to the west of the entrance to the Western Infirmary, within two minutes' walk of it, and four minutes' walk of the University. Extensive accommodation is provided for Practical Anatomy, Practical Chemistry, Practical Botany, Practical Zoology, Practical Physiology, Practical Pharmacy, Operative Surgery, and Public Health. Ample provision has also been made for the comfort of students.

Class Fees.—For each course of Lectures (Anatomy, Ophthalmic Medicine and Surgery, Aural Surgery, Diseases of Throat and Nose, Mental Diseases, and Public Health excepted), first session, £2 2*s*; second session (in Anderson's College), £1 1*s*. For Practical Classes (except Anatomy, Chemistry, and Public Health)—namely, Botany, Zoology, Physiology, Pharmacy, and Operative Surgery—first session, £2 2*s*.; second session, £2 2*s*. Anatomy Class Fees: Winter, first session, Lectures and Practical Anatomy, £5 5*s*.; Practical Anatomy alone, £2 2*s*. Second session, Lectures and Practical Anatomy, £5 5*s*.; Practical Anatomy alone, £2 2*s*. Third session, Practical Anatomy, £1 1*s*. Summer, Regional Course or Dental Course (each including nervous system) and Practical Anatomy, £3 3*s*.; Regional Anatomy Course or Dental Course alone, £2 2*s*.; Practical Anatomy alone, £1 11*s*. 6*d*.; Osteology and Practical Anatomy, £2 12*s*. 6*d*.; Osteology alone, £1 11*s*. 6*d*. Special Course of Demonstrations for Dental Students, £2 2*s*. Chemistry: Lectures, £2 2*s*.; Practical Chemistry, £3 3*s*. Botany and Zoology: Reduced fees for Lectures with Laboratory work in Botany or in Zoology, during same summer session, £3 3*s*.; for Lecture Class or Practical Class separately, in Botany or in Zoology, £2 2*s*. Ophthalmic Medicine and Surgery (including Hospital Practice), Aural Surgery, Diseases of Throat and Nose, and Mental Diseases, fee for each course, £1 1*s*. Public Health Laboratory, fee for six months' course, £12 12*s*. Matriculation Fees: For the year, 10*s*.; for one class in winter session alone, 5*s*.; for summer session alone, 5*s*.

Western Infirmary.—Fees: For Hospital Attendance, £10 10*s*.; afterwards free. For Clinical Instruction, winter, £3 3*s*.; summer, £2 2*s*. Pathology: systematic, £4 4*s*.; practical, £3 3*s*. Vaccination fee, £1 1*s*.

Royal Infirmary.—Fees: Hospital Practice and Clinical Instruction, first year, £10 10*s*.; second year, £10 10*s*.; afterwards free. Six months, £6 6*s*.; three months, £4 4*s*. Pathology, both courses, £4 4*s*. Vaccination Fee, £1 1*s*.

Attendance at the dispensaries of the Western and Royal Infirmaries is included in the hospital fee.

Maternity and Women's Hospital.—Fee for six months, £3 3*s*.

Royal Hospital for Sick Children.—Fee for one year, £1 1*s*.

Eye Infirmary.—Fee: Hospital Practice and Clinical instruction, including Lectures at the College, six months, £1 1*s*.

Lock Hospital.—£1 1*s.*

Fever Hospital, Belvidere or Ruchill.—Fee, £1 1*s.*

Hospital for Skin Diseases.—Fee, £1 1*s.*

The Carnegie Trust extends its benefactions to students at Anderson's College Medical School. Full particulars may be obtained from Mr. W. S. McCormick, the Carnegie Trust Offices, Merchants' Hall, Edinburgh.

Certificates of attendance on the lectures at Anderson's College Medical School are received by the Universities of London, Durham, Edinburgh, and Glasgow (the latter two under certain conditions); by the Royal Colleges of Physicians of London and Edinburgh; by the Royal Colleges of Surgeons, England, Edinburgh, and Ireland; by the Royal College of Physicians of Ireland; by the Royal Faculty of Physicians and Surgeons of Glasgow; by the Society of Apothecaries, London; and by the Army, Navy, and East India Boards. The courses of Laboratory Instruction and Lectures in Public Health are recognised by the Royal Faculty and Scottish Colleges; by the Royal College of Physicians and the Royal College of Surgeons, Ireland; and by the Universities of Cambridge, London, &c. Communications relating to the Medical School to be addressed to the Secretary of the Medical Faculty, Anderson's College Medical School, Glasgow, W. Communications relating to the Preliminary Examination in General Education to be addressed to Mr. Alexander Mackay, Educational Institute Office, 34, North Bridge-street, Edinburgh. Communications relating to the Triple Qualification to be addressed to Mr. Alexander Duncan, LL.D., Royal Faculty Hall, 242, St. Vincent-street, Glasgow. Communications relating to the Dental School to be addressed to Mr. D. M. Alexander, 97, West Regent-street, Glasgow.

The Malcolm Kerr Bursary in Anatomy (value about £10) is open to students of the Junior Anatomy Class during Winter Session 1911–12.

The Winter Session will open on Monday, Oct. 16th, 1911, and will close on Thursday, March 21st, 1912.

The Summer Session will open on Tuesday, April 23rd, 1912, and will close on Tuesday, July 2nd, 1912.

ST. MUNGO'S COLLEGE AND GLASGOW ROYAL INFIRMARY.—This College was incorporated in 1889. The Glasgow Royal Infirmary was founded in 1791. The Faculty of Medicine of the College occupies buildings erected for the purposes of a medical school, adjoining and communicating with the Royal Infirmary. The Laboratories, Museums, and Lecture-rooms are equipped and adapted to modern scientific requirements. A complete electric light installation has been added and a powerful Educational Lantern has been provided for demonstration purposes. The Royal Infirmary, which is at the service of the College for the purpose of clinical and practical instruction, is one of the largest hospitals in the kingdom. The winter session will open on Monday, Oct. 16th.

Psychological Medicine.—Practical instruction is given in Hawkhead Asylum, situated within a short distance of Glasgow and having accommodation for 850 patients. Eight resident clinical clerks are appointed annually. These clerkships are open to students attending St. Mungo's College.

Clinical Instruction in Fevers.—Classes are conducted by Dr. Johnston, Superintendent, at the City of Glasgow Fever Hospital, Belvidere, and Dr. Brownlee, Superintendent, at the City of Glasgow Fever Hospital, Ruchill.

Clinical Instruction in Midwifery.—The close proximity of the Maternity Hospital enables the Professor of Midwifery to conduct frequent clinical demonstrations there during the summer session.

The classes in St. Mungo's College qualify for the English, Scotch, and Irish Conjoint Boards and, under certain conditions, for the various universities, including the University of London. Students who have fulfilled the conditions of the Carnegie Trust as regards Scottish birth or extraction, age (16 years), and Preliminary Examination, are eligible for the benefits of this Trust during the whole course of their studies at St. Mungo's College.

The fee for each class is £2 2*s.*, except Zoology and Botany, joint fee £3 3*s.*, Anatomy, Winter Session, £4 4*s.*, Pathology, £4 4*s.*, Physics, £2 4*s.* 6*d.*, Public Health Laboratory, £12 12*s.*, and certain extra classes for which the fee is £1 1*s.* The hospital fee (including clinical lectures) is £21 for a perpetual ticket.

The classes in St. Mungo's College are now open to male and female students equally.

The minimum fees for all the lectures, including hospital attendance, necessary for candidates for the Diplomas of the English or Scotch Colleges of Physicians and Surgeons amount to £65. Further particulars can be obtained from a syllabus which may be procured free on application to the Secretary of the Medical Faculty, 86, Castle-street, Glasgow.

GLASGOW WESTERN MEDICAL SCHOOL.—This School is situated in University-avenue, opposite the principal gate of the University and near the Western Infirmary. Lectures and Demonstrations are given on Chemistry, Anatomy, Medicine, Surgery, Midwifery and Gynæcology, and Ophthalmology. Some of the classes qualify for graduation and for Scotch diplomas.

Class Fees.—For each course of Lectures the fee is £2 2*s.*, or in some cases £1 1*s.* There is no matriculation fee.

Lecturers: Winter Session.—Chemistry: Dr. Neave; Anatomy: Dr. Wright Thomson, Tuesday, Wednesday, and Friday, at 4.15 P.M.; Surgery: Dr. A. Young, at 12 noon; Midwifery: Dr. Balfour Marshall, at 2 P.M.; Medicine: Dr. G. A. Allan, at 3 P.M.

Summer Session.—Chemistry: Dr. Neave; Anatomy: Dr. Wright Thomson, Tuesday and Friday, at 3.15 P.M.; Operative Surgery: Dr. A. Young, Monday, Wednesday, and Friday, at 1 P.M.; Gynæcology: Dr. Balfour Marshall, at 2 P.M.; Medicine: Dr. G. A. Allan, Monday, Tuesday, and Friday, at 4 P.M.; Ophthalmology: Dr. Hinshelwood, Monday and Thursday, at 11 A.M. and 3 P.M. Some of the above hours are liable to alteration. Further particulars can be obtained from the Secretary, Mr. J. N. Morton, 58, Bath-street.

QUEEN MARGARET COLLEGE, University of Glasgow.—Queen Margaret College was founded in 1883 by the Glasgow Association for the Higher Education of Women (instituted in 1877), and handsome buildings and grounds near the University were presented to the College in 1884 by Mrs. John Elder. In 1890 a School of Medicine for women was added to its Arts Faculty. In 1892, when the Universities Commissioners issued an ordinance empowering the Scottish University Courts to make provision for the instruction of women, the Council of the College and Mrs. Elder transferred to the University the College, its buildings, grounds, and endowments, on condition that these should be devoted to the maintenance of University classes for women only. The College then became the Women's Department of the University of Glasgow; its classes are taught by professors of the University and other lecturers appointed by the University Court, and it is governed by the University Court and Senate. The curriculum, regulations, and fees are the same as those of the male students, and the University degrees are open to women on the same conditions as to men. They have access to the University Museum and can borrow books from the University Library, besides having a library of reference in Queen Margaret College. The number of students enrolled in session 1910–11 was 665, of whom about 80 were studying in the Faculty of Medicine and the rest in the Faculties of Arts, Science, Theology, or Law. The School of Medicine is a special feature of the College, and gives full preparation for the medical degrees of the University. In July, 1894, for the first time in the history of any Scottish university, women students graduated in medicine in Glasgow University. 157 women have now taken the degree of M.B., C.M., or M.B., Ch.B. of the University of Glasgow and 17 the degree of M.D. The women students study Physics, Zoology, Botany, Physiology, Pathology, Materia Medica, Medical Jurisprudence, and Public Health in the University Buildings at Gilmorehill, and Chemistry, Anatomy, Surgery, Medicine, and Gynæcology at Queen Margaret College. Excellent facilities for clinical work are given in the Royal Infirmary, in the Maternity, and other hospitals. By a gift of £5000 granted for the purpose by the Bellahouston Trust the University Court was enabled to add to the College a large building for the study of Anatomy and other medical subjects which was opened in October, 1895. The Arthur Scholarship is open every third year to students of first year; other Bursaries are open in Arts and Medicine; and by an ordinance of the Universities Commissioners women are admitted to certain University bursaries, scholarships, and fellowships. A house of residence for the students of the College coming from a distance was opened by the Queen Margaret Hall Co., Limited, in October of 1894. The Winter Session will open on Oct. 16th.

Lecturers (other than University Professors).—Anatomy: Mr. W. K. Hutton. Chemistry: Dr. H. W. Bolam. Medicine: Dr. W. K. Hunter. Surgery: Mr. J. H. Pringle. Ophthalmology: Dr. A. M. Ramsay.

ROYAL INFIRMARY, Glasgow.—This infirmary, which is the largest in Glasgow, is situated in Cathedral-square, Castle-street, and has car communication with every part of the city. St. Mungo's College is in the infirmary grounds. The infirmary has, including the Ophthalmic Department, over 620 beds, the average number occupied in 1910 being 645. When the rebuilding of the infirmary, now in progress, is completed it will have about 700 beds. There are special beds and wards for diseases of women, of the throat, nose, and ear, skin, venereal diseases, burns, and septic cases. Wards are set apart for the teaching of Women Students. At the Out-door Department the attendances in 1910 numbered over 168 000. In addition to the large medical and surgical departments there are departments for special diseases—viz., diseases of women, of the throat and nose, of the ear, of the eye, of the skin, and of the teeth. Five house physicians and nine house surgeons, having a legal qualification in medicine and surgery, who board in the hospital free of charge, are appointed every six months. Clerks and dressers are appointed by the physicians and surgeons. As a large number of cases of acute diseases and accidents of a varied character are received these appointments are very valuable and desirable. There is a modern and fully equipped Electrical Pavilion and year by year the latest and most approved apparatus for diagnosis and treatment has been added. The fees for hospital attendance, including clinical lectures and tutorial instruction, attendance at the out-door department, at the pathological department, post-mortem examinations, and the use of the museum are as follows: For one year, £10 10*s.*; for six months, £6 6*s.*; for three months, £4 4*s.* Students who have paid fees to the amount of £21 to the Glasgow Royal Infirmary shall be permitted to attend in any subsequent year or years one winter and one summer course of instruction in the infirmary without further payment; and students who have paid to any other hospital in the United Kingdom fees, being not less than £21, in virtue of which they are entitled to attend without further payment, shall be admitted as students of the Royal Infirmary on payment of £3 3*s.* for six months or £1 11*s.* 6*d.* for three months.

Staff.—Visiting Physicians: Dr. G. S. Middleton, Dr. T. K. Monro, Dr. W. K. Hunter, Dr. J. M. Cowan, and Dr. J. B. Mackenzie Anderson. Visiting Surgeons: Mr. John Barlow, Mr. J. A. Adams, Mr. David Newman, Mr. J. H. Pringle, Mr. H. Rutherfurd, and Mr. P. Paterson. Consulting Surgeon for Diseases of the Eye: Dr. A. Maitland Ramsay. Consulting Medical Electrician: Dr. J. Macintyre. Surgeon for Diseases of the Throat and Nose: Dr. J. Macintyre. Gynæcologist: Dr. Balfour Marshall. Surgeon for Diseases of the Ear: Mr. J. Kerr Love. Physician for Diseases of the Skin: Dr. Alex. Morton. Pathologist and Curator of Museum: Dr. J. H. Teacher. Assistant Pathologists: Dr. A. M. Kennedy and Dr. Milne McIntyre. Bacteriologist: Mr. David McCrorie. Assistant Bacteriologists: Mr. J. A. Campbell and Dr. Elizabeth T. Fraser. Medical Electrician: Mr. J. R. Riddell. Assistant Medical Electricians: Dr. Samuel Capie and Dr. Katharine M. Chapman. Anæsthetists: Dr. John Donald and Dr. H. P. Fairlie. Vaccinator: Dr. H. H. Borland. Dispensary Physicians: Dr. John Henderson, Dr. Campbell S. Marshall, Dr. James Scott, Dr. J. T. McLachlan, Dr. A. W. Harrington, and Dr. D. H. Macphail. Extra Dispensary Physicians: Dr. Wm. H. Brown, Dr. A. M. Crauford, Dr. David Macdonald, and Dr. J. C. Middleton. Dispensary Surgeons: Mr. A. N. McGregor, Mr. John Patrick, Mr. John A. C. Macewen, Mr. A. C. Faulds, Mr. Thomas Kay, and Mr. Robert Ramsey. Extra Dispensary Surgeons: Mr. James Battersby, Mr. Donald Duff, and Dr. Milne McIntyre. Dispensary Specialists:—Diseases of Women: Dr. A. G. Banks, Dr. E. G. Taylor, and Dr. James Taylor; Diseases of the Ear: Dr. James Adam and Dr. R. S. McKim; Diseases of the Skin: Dr. Alexander Morton and Dr. G. McIntyre; Diseases of the Throat and Nose: Dr. R. Fullerton and Dr. Grant; Diseases of the Eye: Dr. J. Rowan and Dr. H. W. Thomson; Diseases of the Teeth: Mr. W. Taylor and Mr. W. R. Taylor. Superintendent: Dr. J. Maxtone Thom.

GLASGOW WESTERN INFIRMARY.—This hospital adjoins the University of Glasgow. Number of beds upwards of 600. Special wards are set apart for Diseases of Women and for Affections of the Skin. In the out-patient department there are special cliniques for Diseases of Women and for Diseases of the Throat, Ear, Teeth, and Skin. The Clinical Courses are given by the physicians and surgeons, each of whom conducts a separate class, and students require to enter their names at the beginning of the session for the class which they propose to attend. Special instruction is given to junior students by tutors or assistants, and clinical clerks and dressers are selected from the members of the class. All the courses of clinical instruction are recognised by the University of Glasgow and the other boards in the kingdom. In the Pathological Department the course is both systematic and practical, also post-graduate courses, and extends through the winter and following summer; these are likewise recognised by the University for graduation. Fourteen resident assistants are appointed annually, without salary, from those who have completed their course. The fee for hospital attendance is £10 10*s.* and the fees for clinical instruction are £3 3*s.* for the Winter Session and £2 2*s.* for the Summer Session.

A new Clinical Laboratory has just been opened, and students will receive laboratory instruction from the lecturer on clinical methods.

Staff.—Honorary Consulting Physician: Dr. G. P. Tennant. Honorary Consulting Gynæcologist: Dr. W. L. Reid. Visiting Physicians: Dr. Samson Gemmell, Dr. Ralph Stockman, Dr. Wm. MacLennan, Dr. R. Barclay Ness, and Dr. J. W. Nicol (Skin Department). Honorary Consulting Surgeon: Sir Hector C. Cameron. Visiting Surgeons: Sir W. Macewen, Dr. J. C. Renton, Sir George T. Beatson, K.C.B., Dr. T. K. Dalziel, Dr. James H. Nicoll, and Dr. Robert Kennedy. Gynæcologists: Dr. Murdoch Cameron and Dr. John M. Munro Kerr. Assistant Physicians: Dr. W. R. Jack, Dr. James Carslaw, Dr. John S. M'Kendrick, and Dr. R. Spiers Fullarton. Assistant Surgeons: Dr. Duncan Macartney, Dr. Alfred A. Young, Dr. G. B. Buchanan, Dr. John Morton, Dr. G. H. Edington, and Dr. Alex. MacLennan. Dispensary Physicians: Dr. John Gracie, Dr. Frank Charteris, Dr. A. B. Sloan, Dr. Leonard Findlay, Dr. John P. Duncan, Dr. Geo. Allison Allan, and Dr. Jas. R. C. Greenlees. Dispensary Surgeons: Dr. Archd. Young, Dr. M. L. Taylor, Dr. W. W. Christie, Dr. C. C. Cuthbert, Dr. Alex. H. Edwards, and Dr. R. B. Carslaw. Anæsthetists: Dr. James P. Boyd, Dr. R. Home Henderson, Dr. John W. Renton, and Dr. John S. McConville. Dispensary Gynæcologists: Dr. S. Cameron and Dr. David Dickie. Extra Dispensary Physicians: Dr. G. H. Clark, Dr. D. R. Kilpatrick, Dr. G. B. Fleming, Dr. Ivy Mackenzie, and Dr. Hugh Morton. Dispensary Physician for Diseases of the Skin: Dr. J. G. Tomkinson. Extra Dispensary Surgeons: Dr. Wm. Rankin, Dr. J. Mill Renton, Dr. Roy F. Young, and Dr. W. A. Campbell. Dispensary Surgeon for Diseases of the Ear: Dr. Thomas Barr. Assistant Dispensary Surgeon for Diseases of the Ear: Dr. J. Stoddart Barr. Dispensary Surgeon for Diseases of the Throat and Nose: Dr. Walker Downie. Honorary Consulting Physician for Mental Disorders: Dr. L. R. Oswald. Consulting Medical Electrician: Dr. D. J. Mackintosh, M.V.O. Medical Electricians: Dr. J. G. Tomkinson, Dr. Archd. Hay, and Dr. W. F. Somerville. Pathologist: Dr. Robert Muir. Assistant Pathologists: Dr. S. Dunn and Dr. Carl H. Browning. Vaccinator: Dr. J. L. Carstairs. Dental Surgeon: Mr. W. D. Woodburn, L.D.S. Superintendent: Dr. Donald J. Mackintosh, M.V.O. Matron: Miss H. Gregory Smith. Secretary and Treasurer: Henry Johnston, 87, Union-street. Assistant Secretary: J. Matheson Johnston, C.A.

ROYAL HOSPITAL FOR SICK CHILDREN, Glasgow.—The Hospital at Garnethill was opened in December, 1882, and in June, 1903, a country branch consisting of two wards was opened at Drumchapel. The number of beds in the town hospital and country branch together is 100. A specially designed Dispensary, or Out-patient Department, was opened in October, 1888, in West Graham-street. A central site close to the University has been secured and a hospital of at least 200 beds to take the place of the one in Garnethill will be erected thereon shortly. The whole institution is for non-infectious cases and is available to medical students for clinical instruction in the diseases peculiar to childhood. Classes are formed both at Hospital and Dispensary at the beginning of the University session in October. Students may be enrolled at any time. Fee £1 1*s.* per annum, admitting to both Hospital and Dispensary. Further particulars on applying to the House Surgeon, 45, Scott-street, Garnethill, Glasgow. Physicians: Dr. R. Barclay Ness and Dr. George S. Middleton. Surgeons: Mr. T. Kennedy Dalziel and Mr. R. H. Parry.

GLASGOW OPHTHALMIC INSTITUTION, 126, West Regent-street (29 beds and six cots).—Clinical and systematic course of lectures for students during the winter and summer sessions. In-patients, 1145; out- or dispensary patients, 12,429. Operations on Wednesdays and Saturdays. Honorary Consulting Surgeon: Dr. D. N. Knox. Surgeon: Dr. A. Maitland Ramsay. Assistant Surgeons: Dr. John Rowan, Dr. H. Wright Thomson, and Dr. John Gilchrist. Pathologist: Dr. J. H. Teacher. Electrician: Dr. John Gilchrist. Anæsthetist: Dr. R. H. Henderson. House Surgeons: Dr. W. Miller and Dr. William Sewell. This institution is the Ophthalmic Department of the Royal Infirmary. A post-graduate course is given by Dr. Ramsay and assistants during September. Clinical instruction is given in the summer session to students of the University and Queen Margaret College and in winter to students of St. Mungo's College and to all who take the class.

GLASGOW EYE INFIRMARY, Berkeley-street and Charlotte-street.—This institution, the largest of its kind in Scotland, was founded in 1824. The Infirmary now consists of two large buildings—that in Berkeley-street being occupied as the Infirmary proper, and that in Charlotte-street (new buildings opened June, 1894) as a dispensary. The Infirmary is devoted exclusively to the treatment of Diseases of the Eye, and is intended primarily to provide treatment, and, when necessary, board and lodging, for those who are unable to do so for themselves. The average number of new patients for the last ten years has been 23,578·2, and the total number of cases in 1910 was 28,681.

Gentlemen may attend as students on payment to the treasurer of the following fees:—For six months £1 1*s*., 12 months £2 2*s*. All students when duly entered in the Infirmary Register may attend the clinical instruction of any or every member of the medical staff on production of their tickets. The days on which the surgeons respectively attend to receive patients may be ascertained at the Infirmary. Students have the privilege of being present in the Dispensaries at such hours as are arranged. They may enter the wards along with the surgeon whose clinique they are attending when he visits his patients. They may also be present at operations under the sanction of the surgeon operating, but no student may enter the wards or operating-room except under the aforesaid regulation. Students may be allowed the use of the journals and case-books for examination on applying to the House Surgeon. The wards and dispensary are recognised by the University of Glasgow for the purpose of instruction in ophthalmology for graduation in medicine. Secretary and Acting Treasurer: Harold John Black, 88, West Regent-street, Glasgow. The medical session opens in October. The Medical Staff is as follows:—Surgeons: Dr. A. Freeland Fergus, Dr. Andrew Wilson, Dr. James Hinshelwood, Dr. Leslie Buchanan, Dr. W. Ernest F. Thomson, and Dr. A. J. Ballantyne. Extra Surgeons: Dr. A. Lewis M'Millan, Dr. Henry L. G. Leask, and Dr. W. Cochrane Murray. Assistant Surgeons: Dr. Brownlow Riddell, Dr. W. B. Inglis Pollock, and Dr. Samuel Capie. Pathologist: Dr. M. Logan Taylor. Honorary Medical Electrician: Dr. Robert Morton. Honorary Anæsthetist: Dr. J. Wishart Kerr. House Surgeon: Dr. J. Alex. Doctor. Assistant House Surgeon: Dr. W. Barrie Brownlie.

UNIVERSITY OF ST. ANDREWS (UNITED COLLEGE. ST. ANDREWS AND UNIVERSITY COLLEGE, DUNDEE).

The following are extracts from the Regulations for Degrees in Medicine contained in Ordinance No. 5 of the University Court of the University of St. Andrews. These regulations came into force on August 2nd, 1910. Four degrees in Medicine and Surgery shall be conferred by the University of St. Andrews—viz., Bachelor of Medicine (M.B.), Bachelor of Surgery (Ch.B.), Doctor of Medicine (M.D.), Master of Surgery (Ch.M.), and a Diploma in Public Health The whole curriculum may be taken at University College, Dundee, or the first two years of the course may be taken at St. Andrews and the remaining three years in Dundee. The degrees of M.B. and Ch.B. shall always be conjoined. Before commencing his medical studies each student shall pass a Preliminary Examination in (*a*) English, (*b*) Latin, (*c*) Elementary Mathematics, and (*d*) one of the following optional subjects:—(α) Greek, (β) French, (γ) German, (δ) Italian, (ε) any other approved Modern Language. A degree in Arts or in Science in any of the Universities of the United Kingdom and in some colonial or foreign universities shall exempt from the Preliminary Examination. The Preliminary Examination for graduation in Medicine and Surgery, Arts or Science, of the University of St. Andrews is accepted as equivalent to the Registration Examination required by the General Medical Council (the certificate to include the required subjects). Also the Final Examination for a degree in Arts or Science and the Final Examination for the Diploma of L.L.A.

Degree of Bachelor of Medicine and Bachelor of Surgery.—Candidates must have been engaged in medical study for at least five years. In each of the first four years the candidate must have attended at least two courses of instruction in one or more of the subjects of study specified below, each course extending over a session of not less than five months, either continuous or divided into two terms, or, alternatively, one such course along with two courses, each extending over a session of not less than two and a half months. During the fifth or final year the candidate shall be engaged in clinical study for at least nine months at the Infirmary of Dundee or at one or more of such public hospitals or dispensaries, British or foreign, as may be recognised for the purpose by the University Court. The candidate must have received instruction in each of the following subjects of study, including such examinations as may be prescribed in the various classes—viz.: Anatomy, Practical Anatomy, Chemistry, Materia Medica, Physiology, or Institutes of Medicine, Practice of Medicine, Surgery, Midwifery and the Diseases peculiar to Women and Infants, Pathology, Practical Chemistry, Physics (including the Dynamics of Solids, Liquids, and Gases, and the Rudiments of Sound, Heat, Light, and Electricity), Elementary Botany, Elementary Zoology, Practical Physiology, Practical Pathology, Forensic Medicine, and Public Health. The candidate must have attended for at least three years the Medical and Surgical Practice either of the Infirmary of Dundee or of a General Hospital elsewhere which accommodates not fewer than 80 patients and possesses a distinct staff of physicians and surgeons and is recognised for the purpose by the University Court. Additional subjects of study are Practical Pharmacy, Mental Diseases, Practical Midwifery, Operative Surgery, Vaccination, Children's Diseases, Fevers, Ophthalmology, Diseases of the Ear, Throat, and Nose, Anæsthetics, and Post-mortem Examinations.

With respect to the places and institutions at which the studies of the candidate may be prosecuted the following regulations shall have effect:—1. Two of the five years of medical study must be spent in the University of St. Andrews. 2. The remaining three years may be spent in any University of the United Kingdom or in any Indian, Colonial, or Foreign University recognised for the purpose by the University Court, or in such medical schools or under such teachers as may be recognised for the purpose by the University Court.

Women shall be admitted to graduation in Medicine, subject to the provisions of Ordinance No. 18 [General No. 9—Regulations for the Graduation of Women and for their Instruction in the Universities]: Provided always that every candidate for graduation shall produce evidence of having satisfied the conditions herein laid down with respect to the Preliminary Examination, and shall be examined in all the subjects necessary for graduation by the Examiners of the University of St. Andrews. All the classes necessary for graduation shall be taken in the University of St. Andrews, except in so far as instruction obtained elsewhere is allowed by the said Ordinance.

Professional Examinations for the Degrees of Bachelor of Medicine and Bachelor of Surgery.—Each candidate shall be examined both in writing and orally, and also clinically where the nature of the subject admits, in the following divisions—viz., first, in Botany, Zoology, Physics, and Chemistry; second, in Anatomy and Physiology; third, in Materia Medica and Pathology and Forensic Medicine and Public Health; and fourth, in Surgery, Clinical and Operative Surgery, Practice of Medicine and Clinical Medicine, and Midwifery and Gynæcology (Systematic and Clinical).

The fee to be paid for the degrees of Bachelor of Medicine and Bachelor of Surgery shall be 22 guineas and the proportion of this sum to be paid by a candidate at each division of the examination shall be regulated from time to time by the University Court. The fee to be paid for the degree of

Doctor of Medicine shall be 15 guineas. The fee to be paid for the degree of Master of Surgery shall be 15 guineas.

The whole medical curriculum can be taken in University College or the first two years in United College.

Bursaries, United College, St. Andrews.—Fourteen Taylour Thomson Bursaries for female Medical students of the annual value of from £20 to £30 each, tenable for one or two years. The Bursaries are awarded in the order of merit, the most valuable ones being given to those students who obtain the highest marks in the Preliminary Examination and who are prepared to take two Anni Medici at the United College, St. Andrews.

University College, Dundee.—(*a*) Open to either sex. Eleven Entrance Bursaries of £15, tenable for one year. (*b*) Open to either sex: Four £20 and three £15, second year. (*c*) Four £20 and two £15, third year. (*d*) Two £20, fourth year. (*e*) Two £20, fifth year. (*f*) Bute Bursary, founded in 1893 by the late Most Honourable the Marquis of Bute, K.T. This Bursary consists of the free proceeds of £1000. (*g*) Two Bursaries of the annual value of £25, tenable for three years at either University College, Dundee, or at any Scottish University (local candidates only).

Professors—Natural Philosophy: William Peddie, D.Sc., F.R.S.E. Chemistry: Hugh Marshall, D.Sc., F.R.S. Edin. Natural History: D'Arcy W. Thompson, M.A., C B. Botany: Patrick Geddes, F.R.S.E. Anatomy: J. Yule Mackay, M.D., LL.D. Physiology: E. W. Reid, B.A., D.Sc., M.B, M.R.C.S, F.R.S. Pathology: L. R. Sutherland, M.B., C.M. Surgery: D. MacEwan, M.D. Medicine: Alexander M. Stalker, M A., M.D. Midwifery: J. A. C. Kynoch, M.B., F.R.C.P. & S.Edin. Materia Medica: C. R. Marshall, M.A., M.D.

United College of St. Salvator and St. Leonard.—Professors—Natural Philosophy: A. S. Butler, M.A. Natural History: W. C. MacIntosh, M.D., LL.D., F.R.S. Chemistry: James C. Irvine, D.Sc., Ph.D. Anatomy: James Musgrove, M.D., C.M. Physiology: Percy T. Herring, M.D.

For further particulars apply to Professor Kynoch, Dean of the Medical Faculty, University College, Dundee.

UNIVERSITY COLLEGE, Dundee.—This College is one of the constituent colleges of the University of St. Andrews. In the medical buildings there are spacious and well-equipped laboratories and work-rooms for Anatomy, Physiology, Materia Medica, Pathology, Ophthalmology, Public Health, Medicine, Surgery, and Gynæcology. The complete medical curriculum can be taken in Dundee. For classes, fees, &c., see under University of St. Andrews.

ROYAL INFIRMARY, Dundee.—The Infirmary contains 400 beds, including special wards for the Diseases of Women, Children, Eye, Ear and Throat, Skin, and for Obstetric cases. There is in addition an Extern Obstetric Department. There were during last year 20,236 out-patients and 6690 home patients. The Royal Infirmary offers exceptional facilities for practical work to students. Appointments: Five qualified Resident Medical Assistants are appointed every six months and one non-resident Obstetric Assistant. Clinical Clerks and Dressers are attached to the Physicians and Surgeons, and students are appointed as assistants in the Pathological Department. There are in connexion with the clinical courses Tutorial Classes in Medicine and Surgery. Instruction is also given in Practical Pharmacy and Materia Medica and in Practical Dentistry. Further information can be obtained from Dr. Fraser, Medical Superintendent.

ROYAL and DISTRICT ASYLUMS, Dundee (five miles from City). Number of patients, 490.—Physician Superintendent: Dr. William Tuach-Mackenzie. Lectures on Mental Diseases and clinical instruction in connexion with University College, Dundee (University of St. Andrews), are given during the Summer Session at University College and at the Royal and District Asylums by Dr. Tuach-Mackenzie. The course consists of 12 Lectures and 14 Clinical Lectures and Demonstrations. There are two paid qualified Resident Assistants and two unpaid Resident Clinical Assistants.

UNIVERSITY OF ABERDEEN.

The University of Aberdeen grants four degrees in Medicine and Surgery—viz., Doctor of Medicine (M.D.), Master of Surgery (Ch.M.), Bachelor of Medicine (M.B.), and Bachelor of Surgery (Ch.B.). The two degrees of M.B. and Ch.B. are not conferred separately and the higher degrees of M.D. and Ch.M. are only granted to holders of the M.B. and Ch.B. degrees.

Degrees of M.B. and Ch.B.—Before commencing his medical studies each student must pass a Preliminary Examination in (1) English, (2) Latin, (3) Mathematics, and (4) Greek, or French, or German. In the case of a candidate whose native language is not English an examination in the candidate's native language may be substituted for one in French or German, and an examination in any other classical language for one in Latin or Greek. The curriculum for the degrees extends over a period of five years, during which attendance is required in the following subjects: Botany, Zoology, Physics, Chemistry (Systematic and Practical), Anatomy (Systematic and Practical), Physiology (Systematic and Practical), Materia Medica and Therapeutics, Practical Pharmacy, Pathology (Systematic and Practical), Medical Jurisprudence and Public Health, Surgery, Medicine, and Midwifery.

Candidates must attend for at least three years the medical and surgical practice of a recognised hospital accommodating at least 80 patients and having a distinct staff of physicians and surgeons, and they must have attended courses of at least nine months in clinical medicine and clinical surgery. The candidate must have acted as clerk in the medical and dresser in the surgical wards of a hospital and must have attended for at least six months the practice of a dispensary or the out-practice of a hospital, &c. Attendance is also required on courses in Mental Diseases, Fevers, Ophthalmology, Post-mortem Examinations, and other special subjects. The candidate is also required to have been properly instructed in Vaccination and to have attended at least 12 Midwifery cases.

Professional Examinations are held twice in each year—namely, in March and July, directly after the close of the winter and summer sessions.

The fee for the degrees of M.B. and Ch.B. amounts to £23 2*s*. Matriculation fee for the winter and summer sessions, £1 1*s*.; summer session alone, 10*s*. 6*d*.

Besides the Royal Infirmary, students have the opportunity of attending the following institutions: City Fever Hospital, Sick Children's Hospital, General Dispensary, and Lying-in and Vaccine Institutions (daily), Royal Lunatic Asylum, Ophthalmic Institution, &c.

Degrees of M.D. and Ch.M.—Candidates for either of these degrees must already hold the degrees of M.B. and Ch.B. of Aberdeen. A thesis has to be presented for approval by the Medical Faculty and an examination has to be passed in Clinical Medicine or Clinical Surgery as the case may be. Fee for each of the degrees £10 10*s*.

A diploma in Public Health is granted by the University to graduates in Medicine of a University in the United Kingdom, after a special examination. The diploma can be entered on the Register of the General Medical Council.

Application for further information should be addressed to the Secretary of the Medical Faculty.

Professors—Physics: C. Niven, M.A., D.Sc., F.R.S. Physiology: J. A. MacWilliam, M.D. Medicine: David White Finlay, M.D. Chemistry: F. R. Japp, LL.D., F.R.S. Anatomy: R. W. Reid, M.D., F.R.C.S. Surgery: John Marnoch, M.B., C.M. Materia Medica: J. T. Cash, M.D., F.R.S. Midwifery: W. Stephenson, M.D. Forensic Medicine: Matthew Hay, M.D., LL.D. Botany: J. W. H. Trail, M.D., F.R.S. Pathology: Geo. Dean, M.B. Natural History: J. Arthur Thomson, M.A.

Scholarships and Prizes.—In the Faculty of Medicine of the University of Aberdeen there are the following Bursaries, Scholarships, and Prizes:—Bursaries: about 15 Bursaries (competition and presentation) are open each year, of £15 to £30 per annum in value, most of them being tenable for three years; certain other Bursaries are not confined to the Faculty of Medicine, but may be held by Arts Students. Scholarships: five Post-Graduate Scholarships, value £36 to £160 per annum. Prizes and Medals: 13 Gold Medals and Prizes for proficiency in special departments, &c.

Clinical Instruction.—ABERDEEN ROYAL INFIRMARY.—Contains 251 beds. Consulting Physician: Dr. Angus Fraser. Physicians: Professor Finlay, Dr. George M. Edmond, and Dr. Ashley W. Mackintosh. Assistant Physicians: Dr. A. H. Lister, Dr. W. R. Pirie, and Dr. Thos. Fraser. Consulting Surgeons: Professor Alexander Ogston, Dr. J. C. O. Will, and Dr. J. Mackenzie Booth. Surgeons: Mr. J. S. Riddell, Professor John Marnoch, and Mr. H. M. W. Gray. Assistant Surgeons: Dr. Wallace Milne,

Dr. Fred. K. Smith, and Mr. George H. Colt. Ophthalmic Surgeon: Dr. C. H. Usher. Assistant Ophthalmic Surgeon: Dr. W. Clark Souter. Gynæcologist: Professor W. Stephenson. Pathologist: Professor George Dean. Assistant Pathologist: Dr. G. M. Duncan. Dental Surgeon: Dr. J. M. P. Crombie. Anæsthetist: Dr. A. W. Falconer. Assistant Anæsthetists: Dr. James Robertson and Dr. J. Johnston. Medical Electrician: Dr. J. R. Levack. Assistant Medical Electrician: Dr. Frederick Philip. Dermatologist and Lecturer on Diseases of the Skin: Dr. J. F. Christie. Medical Superintendent and Clinical Registrar: Dr. William Sinclair. Clerk and Treasurer and Factor for the Hospital Lands: Mr. A. Scott Finnie, 343, Union-street, Aberdeen.

ABERDEEN ROYAL LUNATIC ASYLUM.—Contains, with hospital attached to main institution and agricultural branch, about 986 beds. Medical Superintendent: Dr. William Reid. Assistant Physicians: Dr. Arthur Kellas, Dr. J. Scott, Annandale, and Dr. Herbert S. Milne. Clerk, Treasurer, and Factor: Mr. A. Scott Finnie, 343, Union-street, Aberdeen. Clinical instruction is given to students during three months in summer.

SCOTTISH MEDICAL CORPORATIONS GRANTING DIPLOMAS.

ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH, ROYAL COLLEGE OF SURGEONS OF EDINBURGH, ROYAL FACULTY OF PHYSICIANS AND SURGEONS OF GLASGOW.

These Colleges have made arrangements by which, after one series of examinations, held in Edinburgh or Glasgow, or both, the student may obtain the diplomas of the three Bodies.

The three Bodies grant their Single Licences only to candidates who already possess legal qualifications in Medicine or Surgery. Copies of the Regulations for the Single Licence of any of the Bodies may be had on application to the respective secretaries.

Professional Education.—I. The candidate must produce certificates or other satisfactory evidence of having attended the following separate and distinct courses of instruction: Physics, three months; Elementary Biology, three months; Chemistry, six months; Practical or Analytical Chemistry, three months; Anatomy, during at least six months; Practical Anatomy, twelve months; Physiology, six months; Materia Medica, three months; Pathology (including Practical Pathology), six months; Practice of Medicine, six months; Clinical Medicine, nine months; Principles and Practice of Surgery, six months; Clinical Surgery, nine months; Midwifery and the Diseases of Women and Children, three months; Medical Jurisprudence and Public Health, three months. The certified attendance on lectures, demonstrations, and practical work must not be less than three-fourths of the total number of roll-calls. II. The candidate must also produce the following certificates:—(*a*) Of having personally attended not less than six cases of labour, or alternatively attendance on 12 cases of labour, at least five of these to be conducted personally under the direct superintendence of the practitioner who signs the certificate, who must be a registered medical practitioner, but the practical midwifery applicable to students commencing medical study on and after Oct. 1st, 1908, is as follows: 1. Every student before commencing the study of Practical Midwifery shall have attended a course of lectures on Surgery and Midwifery and be required to have held the offices of Clinical Medical Clerk and Surgical Dresser. 2. Every student shall be required either—(1) to have attended the indoor practice of a lying-in hospital or the lying-in wards of a general hospital for a period of three months to the satisfaction of the medical officer in charge, and after having received therein practical instruction in the conduct of labour, under the personal supervision of a medical officer, to have conducted 12 cases of labour under official medical supervision; or (2) to have conducted not less than 12 cases of labour, subject to the following conditions—That he has during one month given regular daily attendance upon the indoor practice of a lying-in hospital or the lying-in wards of a general hospital or Poor-law infirmary recognised for that purpose by any of the licensing bodies, and that he has therein conducted cases of labour under the personal supervision of a medical officer of the hospital or infirmary, who shall, when satisfied of the student's competence, authorise him to conduct outdoor cases under official medical supervision. 3. No certificate that the student has conducted the above-mentioned 12 cases of labour shall be accepted unless it is given by a member of the staff of a lying-in hospital or of the maternity charity of a general hospital or of a dispensary having an obstetric staff recognised for that purpose by any of the licensing bodies or of a Poor-law infirmary having a resident medical officer so recognised. (*b*) Of having attended, for two and a half months, instruction in Practical Pharmacy; the certificate to be signed by the teacher, who must be a member of the Pharmaceutical Society of Great Britain, or the superintendent of the laboratory of a public hospital or dispensary, or a registered practitioner who dispenses medicines to his patients, or a teacher of a class of Practical Pharmacy. (*c*) Of having attended for 27 months the Medical and Surgical practice of a public general hospital containing on an average at least 80 patients available for clinical instruction and possessing distinct staffs of physicians and of surgeons. Evidence must be produced that the candidate has acted as Surgical Dresser and Medical Clinical Clerk for not less than three months in the wards in each case, and has received practical instruction in administration of anæsthetics. (*d*) Of having attended for six months the practice of a public dispensary specially recognised by any of the above authorities, or the out-patient practice of a recognised general hospital or of having acted for six months as pupil to a registered practitioner who either holds such a public appointment, or has such opportunities of imparting practical knowledge as shall be satisfactory to the coöperating authorities; this attendance should be made after the student has passed the First and Second examinations. (*e*) Of having been instructed in the Theory and Practice of Vaccination by a Public Vaccinator authorised by the Local Government Board to grant certificates of proficiency in vaccination and of having performed operations under the teacher's inspection during a period of not less than six weeks.

The above Course of Hospital Practice, and the above Courses of Clinical Medicine and Clinical Surgery shall be attended at a recognised Public General Hospital, possessing distinct staffs of Physicians and of Surgeons, and containing on an average not less than 80 patients available for Clinical Instruction.

In addition to the courses above prescribed, candidates are required to attend the following courses: Diseases and Injuries of the Eye, three months; Insanity, three months; Infectious Diseases, three months.

The curriculum lasts for five years; the fifth year should be devoted to clinical work at one or more public hospitals or dispensaries. The period of three years devoted to hospital practice may include clinical instruction in special subjects, and must also include instruction in administration of anæsthetics and attendance at post-mortem examinations. The student's regularity of attendance in the wards and out-patients' departments of the hospitals and at the post-mortem examinations should be duly ascertained and noted on the certificate.

Students are recommended to pay particular attention to practical work in connexion with all the departments of study, and to avail themselves of opportunities of acquiring practical acquaintance with special departments of Clinical Study, such as Diseases of the Ear, Throat, and Skin, Diseases of Children, and Operative Surgery. The examinations shall be so conducted as to test practical knowledge.

Candidates shall be subjected to four professional examinations:

First Examination.—The First examination shall embrace the following subjects—(1) Physics, (2) Chemistry, including Practical Chemistry, and (3) Elementary Biology. The fees payable for admission to the First examination shall be for the whole examination, £5; for each subject separately, £2 10*s.*; and for re-entry, £2.

Second Examination.—The Second examination shall embrace Anatomy and Physiology including Histology; and candidates may be admitted to this examination at the end of the second year of medical study. The fees payable for admission to the Second examination shall be—for the whole examination, £5, and for re-entry after rejection, £3 for both subjects, and for each of the subjects

separately, £3, and for re-entry for each subject after rejection, £2.

Third Examination.—The Third examination shall embrace Pathology and Materia Medica with Pharmacy. The fees payable for admission to the Third examination shall be—for the whole examination, £5; for re-entry in both subjects after rejection, £3; and for each of the subjects separately, £3, and for re-entry for each subject after rejection, £2.

Final Examination.—The Final examination shall not be taken earlier than the end of the fifth year of study and shall embrace the following subjects:—Medicine, including Therapeutics, Medical Anatomy, and Clinical Medicine; Surgery, including Surgical Anatomy, Clinical Surgery, and Diseases and Injuries of the Eye; Midwifery and Diseases of Women and of New-born Children; and Medical Jurisprudence and Public Health, but it is optional to candidates who have passed the Third Examination to be admitted to the subject of Medical Jurisprudence and Public Health on lodging certificates of having attended the necessary course in that subject at any time; but the subjects of Medicine, Surgery, and Midwifery shall be taken together at any time after the end of the fifth Winter Session, provided that a period of 24 months has elapsed since passing the Second Examination. All candidates shall be subjected, in addition to the written and oral examinations, to clinical examinations in Medicine and Surgery, which shall include the Examination of Patients, Physical Diagnosis, the Clinical use of the Microscope, Examination of the Urine and Urinary Deposits, Surgical Appliances, Bandages, Surface Markings, &c. The fees payable for the Final examination shall be,—for the whole examination, £15, for re-entry after rejection, £5, and for the subjects of Medical Jurisprudence and Public Health when taken separately, £5, with £3 for re-entry in that subject.

Candidates who enter on the footing of having passed the earlier examination at another Board shall pay the fees in respect of these examinations, as well as the Final examination fees.

There are six periods of examination annually, four in Edinburgh and two in Glasgow, and candidates may present themselves at either examining centre irrespectively of the place of the previous examination. The Registrar in Edinburgh is Mr. J. Robertson, solicitor, 54, George-square; and the Registrar in Glasgow, Mr. A. Duncan, LL.D., 242, St. Vincent-street, to whom fees and certificates must be sent for the respective examinations.

ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH: THE MEMBERSHIP AND FELLOWSHIP.

In addition to the diplomas granted by the Scottish Conjoint Board the Royal College of Physicians grants its Single Licence to candidates already possessing legal qualifications for professional practice.

The Royal College of Physicians of Edinburgh grants a *Membership* and a *Fellowship*.

Membership.—A candidate, who must be a Licentiate of the College or a graduate of a British or Irish University and 24 years of age, is examined in medicine, therapeutics, and in any branch of the departments of medicine, such as general pathology, psychology, public health, obstetrics, tropical medicine, or medical jurisprudence. The fee for the Membership is £36 15*s*., 15 guineas of which will be returned to any successful candidate who was already a Licentiate of the College at the time of qualifying for the Membership.

Fellowship.—The Fellows are selected, save with rare exceptions, from the ranks of the *Members*. They must be 25 years of age. The fee is £64 18*s*.

The College grants its *Single Licence* on terms similar to those of the Royal College of Surgeons of Edinburgh, as mentioned in the next section.

Further information can be obtained from the secretary.

ROYAL COLLEGE OF SURGEONS OF EDINBURGH: THE FELLOWSHIP.

The Royal College of Surgeons of Edinburgh grants a diploma of Fellowship after examination to the holders of the surgical degrees of diplomas of such British examining bodies, as well as of the holders of such surgical degrees of the Universities of Canada, Australia, New Zealand, and the Indian Empire as are recognised by the College. The candidates for the examination must be 25 years of age and must have been engaged in practice for at least two years. The examination is of a practical nature, partly written and partly *viva voce*, and must include surgery and surgical anatomy, operative surgery, and clinical practice. One optional subject must also be taken, the range of these specialisms covering nearly every branch of medicine. The fee to be paid on entering for examination for Fellowship is £45, £10 of which is remitted to those who already hold the Licentiateship of the College. Candidates rejected at the examination obtain repayment of fee less £10 retained for examination expenses. One month's notice of intention to present himself for examination must be given by the candidate to Mr. D. L. Eadie, 54, George-square, Edinburgh, clerk to the College, together with credentials signed by two Fellows of the College, one of whom must be a resident in Edinburgh, unless a special application be made to the President and the Council of the College.

SINGLE LICENCE.

The Royal College of Surgeons of Edinburgh admits to the examination for its Single Licence any candidate who already holds a Diploma in Medicine of any British, Indian, or Colonial university or of any British or Colonial College of Physicians, or of the Society of Apothecaries of London or Apothecaries' Hall, Dublin, granted under the provisions of the Medical Act, 1886, whose preliminary examination and course of professional study is proved to be sufficient to fulfil the requirements of the College, or to those who have passed a full examination for any of the above. Female practitioners are now admitted to the Licence of the College but not to the Fellowship, and the regulations for the Licence apply to practitioners of either sex.

Every candidate for a surgical diploma must have followed his course of study in a university, or in an established school of medicine, or in a provincial school specially recognised by the College of Surgeons of that division of the United Kingdom in which it is situate.

Under the title Established School of Medicine are comprehended the medical schools of those cities of Great Britain and Ireland in which Diplomas in Surgery are granted, and such colonial and foreign schools as are similarly circumstanced in the countries in which they exist.

Professional Examination for the Single Diploma of the College.—Candidates for the Diploma of the College will be subjected to one professional examination, partly in writing and partly practically and orally.

Opportunities for the examinations will be presented four times in each year. On each of these occasions the candidates will assemble to write answers to the questions proposed, and the clinical and oral examinations shall be conducted on the days immediately succeeding.

Unsuccessful candidates will be remitted to their studies for a period to be determined by the judgment of the examiners, but not in any case for less than three months.

The examination will embrace the principles and practice of surgery (including operative surgery and surgical pathology), clinical surgery, and surgical anatomy, and will not take place before the termination of the full period of study.

Applications for examination must be made to Mr. D. L. Eadie, not later than one week prior to the date of examination.

On the production of the required documents Mr. Eadie will give the candidate an order authorising the examiners to admit him to examination.

The fee of £15 15*s*. payable to the College must be lodged in the hands of Mr. Eadie not later than one week preceding the examination day. The sum of £10 10*s*. will be returned to each unsuccessful candidate. Under special circumstances candidates can be examined on days other than those fixed by the regulations. The fee for a special examination is as follows, viz., £20 for examination, of which £10 will be returned to candidates remitted on examination.

In order to test more effectually the practical knowledge of candidates recent dissections and anatomical specimens will be employed during examination. They will also be subjected to a practical clinical examination in the Surgical Hospital, including the application of surgical apparatus, bandages, surface markings, &c., and may, if it be considered necessary to test their knowledge, be required to perform operations on the dead body.

THE ROYAL FACULTY OF PHYSICIANS AND SURGEONS OF GLASGOW.

Like the preceding corporations, the Royal Faculty of Physicians and Surgeons of Glasgow grants a Fellowship and a Licence to be held as separate qualifications.

Fellowship.—The Fellowship of the Faculty is granted after examination in medicine or surgery, together with an optional subject, which may be anatomy or physiology or be selected from any special branch of medicine or surgery, and 14 days' notice must be given by the candidate of his intention to present himself to Mr. Alexander Duncan, LL.D., the Faculty Hall, Glasgow. The fee for the Fellowship is £30, £10 of which sum are returned to any successful candidate who already holds the Licence of the Faculty. An additional sum of £20 is required in the case of candidates resident within seven miles of Glasgow. In certain circumstances Fellows may be elected as a mark of distinction.

Licence.—The Licence of the Royal Faculty is granted as a separate qualification to qualified practitioners in Medicine after examination in surgery, including surgical anatomy and clinical surgery. The fee is 15 guineas.

SCOTTISH PROVINCIAL ANCILLARY SCHOOLS AND HOSPITALS.

The hospitals which are recognised by the Scottish Conjoint Boards, as places where professional study for their diplomas can be pursued are all those institutions which feed the medical faculties of the universities. In addition the Scottish Boards recognise all the places which are recognised by the English Conjoint Board (see p. 602) and the Irish Conjoint Board (see p. 624).

III.—IRELAND.

THE UNIVERSITIES.

UNIVERSITY OF DUBLIN (TRINITY COLLEGE).

Matriculation.—All students in the School of Physic intending to practise Physic must pass a matriculation examination. This may be either the Public Entrance of Trinity College and a Junior Freshman Term or a special Medical Preliminary, or, for Extern Students, an examination recognised by the General Medical Council. No student can be admitted for the winter course after Nov. 25th.

Degrees in Medicine (M.B.), Surgery (B.Ch.), and Midwifery (B.A.O.).—Candidates for these degrees must be of B.A. standing and must be for at least five academic years on the books of the Medical School, reckoned from the date of matriculation. The Arts course may be concurrent with the Medical course and the B.A. degree need not be taken before the final medical examinations, but the Medical degrees are not conferred without the Arts degree. The following courses must be attended:—(1) Lectures—Systematic, Descriptive and Applied Anatomy, Chemistry and Practical Chemistry, Surgery and Operative Surgery, Histology, Botany, Zoology, Physics and Practical Physics, Physiology and Practical Physiology, Practice of Medicine, Midwifery, Pathology, Materia Medica and Therapeutics, Medical Jurisprudence and Hygiene; (2) three courses of nine months' attendance on the Clinical Lectures of Sir Patrick Dun's or other recognised Dublin Hospital (see p. 625) (two years at a recognised London or Edinburgh hospital before the commencement of the Dublin curriculum may be counted as one year spent in such Dublin hospital); (3) Practical Vaccination, one month's instruction; (4) Mental Disease, three months; (5) Practical Midwifery with Clinical Lectures, including not less than 30 cases, six months; (6) Ophthalmic Surgery, three months. Three groups of examinations have to be passed. Preliminary Scientific Examination, including Physics and Chemistry, Botany, and Zoology. The Intermediate Medical, Part I., including Anatomy and Institutes of Medicine (Practical Histology and Physiology). The Intermediate Medical, Part II., including Applied Anatomy and Applied Physiology; and the Final Examination, which is divided into Part I., Materia Medica, Jurisprudence, and Pathology; and Part II., Medicine, Surgery, Midwifery, Gynæcology, Clinical Medicine, Mental Diseases, Clinical Surgery, Operations, and Clinical Ophthalmology. Part I. may be passed in the fourth year and Part II. in the fifth year. Fee for the *Liceat ad Examinandum*, £10. Fee for the degrees, £17.

Doctor in Medicine.—A Doctor in Medicine must have passed all the qualifying examinations and must be a B.A. of three years' standing. He must also read a thesis before the Regius Professor of Physic. Total amount of fees for this degree, £13.

Master in Surgery.—A Master in Surgery must be a Bachelor in Surgery of the University of Dublin of not less than three years' standing, and must produce satisfactory evidence of having been engaged for not less than two years from the date of his registration in the study, or study and practice, of his profession. He must then pass an examination in the following subjects: 1. Clinical Surgery. 2. Operative Surgery. 3. Surgical Pathology. 4. Surgery. 5. Surgical Anatomy (on the dead subject), and one of the following optional subjects:—1. Surgery in one of the following branches—viz., Ophthalmic and Aural, Gynæcological and Dental. 2. Mental Disease. 3. Medical Jurisprudence and Hygiene. 4. Advanced Anatomy and Physiology. 5. Comparative Anatomy. Fee for the degree of Master in Surgery, £11.

Master in Obstetric Science.—A Master in Obstetric Science must be fully qualified and produce a certificate of having attended a summer course in Obstetric Medicine and Surgery. He is then required to pass an examination in the following subjects:—1. Practice of Midwifery. 2. Gynæcology. 3. Anatomy of Female Pelvis and Elementary Embryology. 4. Clinical Gynæcology. Fee for the degree of Master in Obstetric Science, £5.

University Diplomas.—Candidates for the diplomas in Medicine, Surgery, or Obstetric Science must be matriculated in Medicine and must have completed two years in Arts and five years in Medical Studies. The Course and Examination necessary for the diplomas are the same as for the degrees. A diploma in Medicine, Surgery, and Midwifery is a registrable qualification conferred upon candidates who have completed a full five years' course in Medicine and two years in Arts. The diploma, like the degree, qualifies for registration. A diplomate, on completing his course in Arts and proceeding to the degree of B.A., may become a Bachelor by paying the degree fees. Fee for the *Liceat ad Examinandum*, £10. Fee for the diplomas in Medicine, Surgery, and Midwifery, £11.

Professors and Lecturers.—Natural Philosophy: M. W. J. Fry, M.A. Anatomy and Surgery: A. F. Dixon, D.Sc., M.B. University Anatomist: Sir C. B. Ball, Bart., M.D., M.Ch. Physic (Regius): James Little, M.D. Surgery (Regius): Sir C. B. Ball, Bart., M.Ch. Surgery: E. H. Taylor, M.D. Botany: H. H. Dixon, D.Sc. Physics: W. E. Thrift, F.T.C.D. Pathology: A. C. O'Sullivan, M.D., F.T.C.D. Institutes of Medicine: W. H. Thompson, M.D., D.Sc. Medicine: James Craig, M.D. Materia Medica: W. G. Smith, M.D. Midwifery: J. H. Wilson, F.R.C.P.I. Jurisprudence and Hygiene: H. T. Bewley, M.D. Chemistry: Sidney Young, D.Sc. Comparative Anatomy and Zoology: H. W. Mackintosh, M.A.

Clinical instruction.—The hospital facilities for clinical instruction available in Dublin will be described below.

THE NATIONAL UNIVERSITY OF IRELAND.

Matriculation.—All students intending to proceed to the medical degree of the University of Ireland must pass a matriculation examination, the next examination taking place in September in Dublin and at certain local centres. The examination is in (1) Latin or Greek; (2) French, German, or any approved modern language, including Irish; (3) English or History and Geography; (4) Mathematics; and (5) one other subject not already selected, such as Chemistry. In this group of subjects the student must, of course, to satisfy the regulations of the General Medical Council, take Latin, English, and Mathematics.

The following are the regulations for external students proceeding to medical degrees; it is probable that they are subject to modification:—

Degrees of M.B., B.Ch., and B.A.O.—Printed forms of application for admission to any medical examination may be had from "The Registrar, The National University of Ireland, Dublin." Each candidate must send to the Registrar a printed form of application for admission, accurately filled up and signed by the candidate, together

with the prescribed fee. 1. Students who pass the First Medical Examination in 1910, or have passed that examination in any year previously in the Royal University, may take Practical Chemistry, if the prescribed course of instruction has been pursued, at a special examination before or with the Second Examination in Medicine of the National University of Ireland, and on passing this special examination shall be regarded as having passed the First Examination in Medicine of the National University. 2. Students who have completed two years of study and who pass the Second Examination in Medicine in 1910 may, on completion of the courses required for the Third Examination of the late Royal University of Ireland, take either (*a*) an examination equivalent to the Third Medical Examination of the late Royal University of Ireland in autumn, 1911, or (*b*) an Examination in Anatomy and Physiology in spring, 1911. In the latter case they will subsequently conform to the new Regulations; in the former case they conform to the new Regulations, omitting Materia Medica at the new Third Examination. 3. Students who, in October, 1910, have completed three years of study, and have passed the Third Medical Examination in 1910, may conform either to the new Regulations (omitting Materia Medica), or may finish their studies under the Regulations prescribed by the Royal University. 4. Students who have completed four years of study in October, 1910, may finish their studies under the Regulations prescribed by the Royal University.

Degree of M.D., M.Ch., M.A.O.—Candidates may present themselves for the examination for this degree after an interval of three academic years from the time of obtaining the M.B., B.Ch., B.A.O. degrees, but in the case of candidates who have obtained a degree in Arts an interval of two years will be sufficient. All further information concerning fees, dates of examinations, production of certificates, and so on can be obtained from the Registrar of the University. The same formalities have to be complied with for proceeding to the degree of M.Ch. and M.A.O.

The Constituent Colleges of the National University of Ireland at which the full curriculum for medical degrees can be obtained are University College, Dublin; University College, Cork; and University College, Galway.

UNIVERSITY COLLEGE, DUBLIN.—The University and the College were created by the Irish University Act, 1908, and by Charters issued in December, 1908. Former students of the Cecilia-street School of Medicine who graduated in the Royal University may become graduate members of the new College. The constitution of the College, like that of the Constituent Colleges of Cork and Galway, provides for a governing body, an academic council consisting of professors and coöpted lecturers, a body of graduate members, and a body of student members matriculated in the University. The first professors and lecturers were appointed by the Dublin Commissioners Irish Universities Act, 1908. The College teaching staff includes 50 professors in all the Faculties of the University. As in the other Constituent Colleges of the National University students do not live within the College, but the statutes make provision for the entrance of the students under officers of residence who have supervision of the lodgings of students approved by the College, and of the conduct of students outside the College. There are also approved places of residence in connexion with the College. The courses for Degrees in all Faculties are submitted to the University for consideration, and on approval become binding on the students of the College. Matriculated students on entering the College are required to attend before the President and sign the Observance of Rules of the College, becoming student-members. Students' societies have been formed for debating and reading of papers in connexion with the Faculties of Medicine, Science, and Law, as well as societies of a more general character. The athletic clubs are well patronised, and the annual sports in May attract large fields of competitors. In the first Session 1909–10 the number of students entered in the College in all Faculties was 530; in the Session 1910–11 the number increased to 700, of whom over 300 were students of the Faculty of Medicine. The great majority of the students are proceeding to the Degrees of the National University of Ireland. The teaching is conducted in the College, St. Stephen's Green, in the Medical School, Cecilia-street, and in the University Buildings, Earlsfort-terrace. The new buildings will be erected on the Earlsfort-terrace site, about five acres in extent, which has been recently increased by a valuable addition, the gift of Lord Iveagh. Short as has been the period since the establishment of the College the foundation of a College library has already been made, now reaching to 40,000 volumes. The list of medical journals and periodicals to be taken annually has been made out so as to greatly extend the list at present available in Dublin, taking into account the journals available in the institutions in the city. The College is connected indirectly through its staff with many of the hospitals of the city, and the students may take their courses of clinical instruction at any hospital recognised by the University.

Degrees of M.B., B.Ch., and B.A.O.—The courses taken for the first year include Physics, Chemistry (Theoretical and Practical), Botany, Zoology, and Dissections. The second year is devoted to Anatomy and Physiology. Clinical attendance is taken in the third, fourth, and fifth years. The third year includes Materia Medica, Sanitary Science, Medical Jurisprudence, and Pathology, and a Third Examination is held at the end of the third year in these subjects. Applied Anatomy is introduced into the final year. The Final Examination includes the Written and Clinical Examinations in Medicine, Midwifery, and Surgery. The Dental course is kept at a high standard to facilitate a Dental student in obtaining the primary Medical degrees, the first two years in the Dental course being the same as the first two years in Medicine. The degree of M.D. may be obtained either by examination or on published work.

The courses for the D.P.H. are on the ordinary lines, and the Bacteriological Laboratory is open for research throughout the session.

The following is the teaching staff of this school:—

Dean of the Faculty (of the College): Professor McLoughlin.

Professors.—Anatomy: Edward Patrick McLoughlin, B.A., M.B., B.Ch., B.A.O. Physiology: Bertram James Collingwood, B.A., M.D. Zoology: George Sigerson, M.D. Chemistry: Hugh Ryan, M.A., D.Sc. Physics: John A. McClelland, M.A., D.Sc., F.R.S. Pathology and Bacteriology: Edmund J. McWeeney, M.A., M.D., D.P.H., F.R.C.P. Irel. Medicine: Sir Christopher J. Nixon, Bart., M.D., LL.D., F.R.C.P. Irel. Surgery: John S. McArdle, M.Ch., F.R.C.S. Irel. Midwifery and Gynæcology: Alfred J. Smith, M.B., F.R.C.S. Irel. Materia Medica and Therapeutics: Martin Dempsey, B.A., M.D., F.R.C.P. Irel. Hygiene and Medical Jurisprudence: J. N. Meenan, M.B., B.Ch., B.A.O., D.P.H. Botany: J. Bayley Butler, M.A., M.B., B.Ch., B.A.O.

Lecturers.—Ophthalmology: Louis Werner, M.B., F.R.C.S. Irel. Special Pathology: W. M. Crofton, B.A., M.B., B.Ch., B.A.O. Dental Surgery: E. Sheridan, F.R.C.S. Irel., L.D.S. Dental Mechanics: J. L. Potter, L.D.S.

Assistants and Demonstrators.—Anatomy: Dr. G. Keating, Mr. H. S. Meade, and Dr. H. Barnwille. Chemistry: Mr. G. Ebrill and Mr. T. Dillon. Medicine: Dr. J. F. O'Carroll. Pathology and Bacteriology: Mr. T. T. O'Farrell and Dr. W. D. O'Kelly. Pharmacy: Mr. M. Hayes. Physics: Mr. J. Nolan. Surgery: Dr. A. Blayney. Physiology: Dr. S. A. McSwiney.

Session 1911–12, Michaelmas and Hilary Terms: The dissecting room opens on Oct. 1st. An introductory class for students beginning the study of medicine is held from Oct. 10th to Oct. 17th. Ordinary medical lectures begin on Oct. 17th. Term examination is held on Dec. 16th and subsequent days. Recess begins Dec. 21st. Lectures are resumed on Jan. 10th, and the winter lectures terminate on March 23rd. Trinity Term: Lectures begin on April 16th and end on June 30th. All the University Examinations in Medicine are held in spring (end of March) and autumn, the first examination in spring being limited to Part I. (Physics and Chemistry). A First Examination in Medicine is also held in June.

Scholarships.—Entrance Scholarship Examination: A general Entrance Scholarship Examination is held for all Faculties, the value of the scholarships tenable for one year in the Faculty of Medicine varying from £40 to £20. The scholarships offered in the professional subjects are as follows:—Six scholarships of £30 each are offered in the second year of study, tenable for one year. The subjects are those of the first medical year—viz., Physics, Chemistry, Botany, and Zoology. Candidates must have attended the courses of the first medical year in the College in 1910–11, and must have passed the First Medical Examination of the University in 1911. Six scholarships of £30 each are also offered in the third year of study, tenable for one year. The

subjects are Anatomy and Physiology. Medical students who have pursued Honours second year courses in subjects of the Faculty of Science in the College in 1910–11 may, if they so desire, compete for the scholarships in such subjects, instead of presenting Anatomy and Physiology. Candidates must have attended the courses of study of the second medical year in the College in the year 1910–11. Six scholarships of £30 each are offered in the fourth year, tenable for one year, the subjects being Anatomy, Physiology, and Materia Medica. Candidates must have attended the courses of study in those subjects in the College, and must have passed the Second Medical Examination in the year 1911. Six fifth year scholarships of £30 each, tenable for one year, are offered for competition in the subjects of Medicine, Surgery, Pathology, Midwifery, Medical Jurisprudence, and Sanitary Science as follows: Group I., in Pathology, Medical Jurisprudence, and Sanitary Science; Group II., Medicine, Midwifery, and Surgery. The subjects are not to include clinical (or practical) examination. Candidates for these scholarships must have passed the Third Medical Examination of the University, and must not have passed, or have been candidates for, the M.B., B.Ch., and B.A.O. degrees. They must have been students of the College in the year 1910–11. They must have attended in the College the courses of lectures in the subjects they select for the examination. Candidates may select either group. Exhibitions are offered to students of the College for distinction in the University Examinations in Medicine as follows: one of £20 and one of £10 each at each of the First, Second, Third, and Final Examinations. A gold medal is also offered to the student of the College of highest merit at the M.B., B.Ch., and B.A.O. Examinations of the year.

UNIVERSITY COLLEGE, CORK: THE SCHOOL OF MEDICINE.—The building is provided with a very large, well-ventilated dissecting room supplied with electric light, with physiological, toxicological, pathological, and pharmaceutical laboratories, materia medica, anatomical and pathological museums, as well as a collection of surgical and obstetrical instruments and appliances. There are well-appointed physical, chemical, and biological laboratories, and a large natural history museum in the adjoining building, and part of the College ground is laid out as a botanical garden. The plant houses are well filled with plants and are open to the students in the class of Botany. The Library contains over 50,000 volumes and is open daily during term time to students. The Medical Museum occupies a large room erected at the northern end of the medical buildings. It consists of (1) an anatomical museum and bone-room, occupying the gallery; (2) pathological museum; and (3) materia medica museum. The two latter collections are on the ground floor. There is a large and representative collection of surgical instruments. The Students' Club is open to all men students of the College who pay the annual subscription of 2*s.* 6*d.* The club is a detached building containing reading, smoking, and refreshment rooms, kitchen, and lavatory. There is also a ladies' club, subscription 1*s.* The Rugby Football Club shares the Mardyke ground with two other clubs, and there is also a practice ground within the walls of the College. There are also Gaelic football, Association football, cricket, hockey, hurling, lawn tennis, and athletic clubs, the last of these holding a public meeting once in each year in the Mardyke grounds.

Dean of the Faculty.—Professor A. E. Moore, M.B., B.Ch., B.A.O.

Professors.—Anatomy: D. P. Fitzgerald, M.B., B.Ch. Botany: H. A. Cummins, M.D., C.M.G. (Major, R.A.M.C.). Chemistry: A. E. Dixon, M.D. Experimental Physics: W. Bergin, M.A. Materia Medica: John Dundon, M.B., B.Ch., B.A.O., F.R.C.S. Eng., F.R.C.S. Irel. Medicine: W. Ashley Cummins, M.D., M.Ch. Obstetrics and Gynæcology: H. Corby, B.A., M.D., M.Ch. Pathology: A. E. Moore, M.B., B.Ch., B.A.O. Physiology: D. T. Barry, M.D., F.R.C.S. Surgery: C. Yelverton Pearson, M.D., M.Ch., F.R.C.S. Zoology: Marcus Hartog, M.A., D.Sc., F.L.S., F.R.H.S. Hygiene: Mr. D. D. Donovan. Medical Jurisprudence: Dr. P. T. O'Sullivan. Ophthalmology: Dr. A. W. Sandford.

Lecturer.—Mental Diseases: Dr. J. J. Fitzgerald.

Demonstrators.—Anatomy: Dr. W. F. O'Connor. Chemistry: Mr. J. Taylor, M.Sc., and Dr. J. L. McKee, Ph.D. Experimental Physics: Mr. P. Belas, B.A. Midwifery: Dr. M. Cagney. Pathology: Dr. W. Magner. Physiology: Dr. Denis Murphy. Surgery: Dr. C. B. Pearson. Zoology: Mr. J. C. Johnson, M.A.

Terms.—The First Term will commence on Oct. 2nd, 1911, and end on Dec. 22nd. The Second Term will commence on Jan. 9th, 1912, and end on March 30th. The Third Term will commence on April 22nd, 1912, and end with the session on June 30th. (*Note.*—The Easter Recess for the Medical Faculty includes the Friday and Saturday before Easter and Easter Monday.) Lectures in Chemistry, Experimental Physics, and Zoology will commence on Oct. 16th, 1911. Students who have been admitted as matriculated students are required to attend before the President and sign the Roll of Matriculated Students. Students who may be candidates for degrees in the National University of Ireland must have passed the Matriculation Examination of that University, and medical students must have passed a preliminary examination recognised by the General Medical Council. Candidates will be examined in Irish, Greek, or French or German, Latin, History, Geography, English, and Mathematics.

Admission of Medical Students.—Students in the Faculty of Medicine who have passed the First Professional Examination of the Conjoint Examinations of the Royal College of Physicians and the Royal College of Surgeons in Ireland, or of the Royal College of Physicians and Royal College of Surgeons of Edinburgh and the Faculty of Physicians and Surgeons of Glasgow, or of the Royal College of Physicians, London, and Royal College of Surgeons, England, may be admitted to the rank of second year students on making application to the Council and submitting a certificate of having passed the examination. Similarly, students who have passed the Second Professional Examination of the same Colleges may be admitted to the rank of third year students; and those who have passed the Third Professional Examination of the Dublin Colleges, or of the Edinburgh Colleges and Glasgow Faculties, may be admitted to the rank of fourth year students.

Class Fees.—Anatomy, £3; Physiology, £3; Practical Anatomy, £3; Practical Physiology, £3; Practical Pathology, £3; Operative Surgery, £3; Operative Surgery repeated, £2; Practical Chemistry, £3; first year—Botany Lectures, £2; first year—Botany Lectures, practical work, £1; first year—Zoology Lectures, £2; first year—Zoology Lectures, practical work, £1; first year—Physics Lectures, £2; first year—Physics Lectures, practical work, £1; all other subjects, £2; re-attendance, £1. Except for Operative Surgery the fees for practical classes are not reduced on re-attendance. Students who are signed up for all their Practical Anatomy can attend in the dissecting-room (without subjecst) by paying £1 per term, this fee admitting to all demonstrations. Students who have passed their Anatomical Examination can attend in the dissecting-room (without subjects) by paying £1 for the session or 10*s.* for a term.

Residence of Students.—There is no accommodation for the residence of students within the College, but students not living at home, or with relatives or friends, sanctioned by their parents or guardians, are required to live in a hostel or in recognised lodgings, a list of which can be obtained from the Secretary. All students are required to register their addresses each session in the book kept for that purpose in the hall porter's office, and to immediately notify to the registrar any change of address during the session. St. Anthony's Hall, adjoining the College, is the property of, and is occupied by, the Franciscan Order. A number of sets of rooms, together with recreation and common rooms, are provided for lay students who may desire to live there. For full particulars apply to the Very Rev. Superior, St. Anthony's Hall, Fernhurst-avenue. The Ursuline Convent, Blackrock, has a house of residence, quite separate from their Secondary School, for Catholic women students. Separate bedrooms, dining, and recreation rooms will be provided. For terms and details apply to the Rev. Mother Superior, Ursuline Convent, Blackrock, Cork. Girls' Friendly Society Lodge, Dyke Parade, provides for other women students. For terms apply to Miss Roy. Women students coming from a distance and not living with friends or relatives are strongly urged to reside in a hostel.

Scholarships.—Medicine: (*a*) Second Year.—In this year six scholarships, each of the value of £30, will be awarded on the result of the first University Examination in Medicine.

(*b*) Third Year.—Six scholarships, each of the value of £30, will be awarded on the result of the Second University Examination in Medicine. (*c*) Fourth Year.—The Six scholarships obtained at the commencement of the third year by candidates may be continued for a fourth year should the conduct and progress of the holders have been satisfactory. (*d*) Fifth Year.—In this year six scholarships, each of the value of £30, will be awarded on the result of the Third Examination, provided that the Professor of Medicine has expressed his approval of the work done by the candidates in his department. (*e*) Blayney Scholarship.—This scholarship, worth about £32, will be awarded to the candidate obtaining the highest marks in Honours at the M.B., B.Ch., B.A.O. Examination, provided that (*a*) the candidate has been a student in University College, Cork, for at least the three years previous to the examination; (*b*) that not more than three years have elapsed from the passing of his Second Medical Examination; and (*c*) that the whole examination is taken at one time.

The Charles Gold Medal.—In January, 1909, the governing body of University College, Cork, received from John James Charles, M.D., F.R.S.E., formerly Professor of Anatomy and Physiology in Queen's College, Cork, £125 Guaranteed Preference Stock of the London and North-Western Railway Company, as well as a die, to provide a gold medal for competition amongst the students attending the courses of Anatomy or of Physiology in University College, Cork.

Clinical Instruction.—Students may attend the South Infirmary, Cork North Charitable Infirmary, the Mercy Hospital, the Cork District Lunatic Asylum, the Victoria Hospital for Diseases of Women and Children, the County Lying-in Hospital, the Cork Maternity, the Cork Fever Hospital, the Cork District Hospital, and the Cork Ear, Eye, and Throat Hospital.

South Infirmary and County of Cork General Hospital (100 beds).—Staff: Consulting Physician: Dr. P. J. Cremen. Physicians: Dr. P. T. O'Sullivan and Mr. Norman I. Townsend. Surgeons: Mr. H. R. Townsend, Mr. T. Gelston Atkins, and Mr. Henry Corby. Ophthalmic Surgeon: Mr. A. W. Sandford. Physicians for Extern Patients: Mr. E. W. Allsom and Dr. E. V. Cantillon. Surgeon for Extern Patients: Mr. R. P. Crosbie. Pathologist: Dr. A. E. Moore. Dentist: Mr. T. C. Butterfield. Honorary Secretary: Mr. N. I. Townsend. Clinical instruction is given daily in the wards. Special instruction on Ophthalmic Surgery and Diseases of Women and Children will be given in the special wards for such cases. Fee for perpetual ticket, £18 18*s.*; for 12 months, £8 8*s.*; for six months, £5 5*s.*; for three months, £3 3*s.* Two resident pupils will be appointed by competitive examination. Clinical prizes will be given by the staff at the close of the session.

Cork North Charitable Infirmary and County and City of Cork General Hospital (100 beds).—Staff: Honorary Consulting Surgeon: Dr. N. J. Hobart. Physicians: Mr. D. D. Donovan and Dr. Edward Magner. Surgeons: Mr. Jeremiah Cotter, Mr. C. Y. Pearson, Mr. N. H. Hobart, and Mr. D. J. O'Mahony. Assistant Physician: Mr. R. B. Dalton. Assistant Surgeons: Mr. John Dundon and Mr. Richard P. Byrne. Pathologist: Vacant. Surgeon Dentist: Mr. William Pericho. Dispensing Chemist: Mr. M. Tucker. Honorary Secretary: Mr. R. B. Dalton. Clinical instruction is given daily in the wards by the physicians and surgeons. Special instruction is given to Junior Students on two days weekly. Fee for perpetual ticket, £18 18*s.*; for 12 or nine months, £8 8*s.*; for six months, £5 5*s.*; and for three months, £3 3*s.* Three resident pupils are appointed quarterly by the medical staff. All resident pupils are required to be registered pupils of the Hospital.

Mercy Medical Hospital.—Staff: Consulting Physician: Dr. P. J. Cremen. Consulting Surgeon: Dr. J. Cotter. Consulting Ophthalmic Surgeon: Dr. J. J. McMahon. Physician: Dr. D. J. O'Connor. Surgeons: Mr. J. Giusani and Mr. J. Dundon. Ophthalmic Surgeon: Mr. J. M. Browne. Surgeon Dentist: Mr. H. O'Keeffe. Resident Surgeon: Mr. P. Cullinan. Pathologist: Dr. M. A. Shinkwin. This hospital contains 80 beds for medical and surgical cases. There is also a daily extern for medical and surgical cases, as well as for diseases of the eye, ear, and throat. Extern medical attendances, 2800; surgical attendances, 1696; ophthalmic attendances, 5716; dental attendances, 1230; operations successfully performed, 630; intern patients, 1167. Honorary Secretary to the Staff: Dr. James Browne.

Cork District Lunatic Asylum.—Psychological Medicine: A course of Clinical Lectures on Mental Disease and Allied Neuroses will be delivered in the Cork District Lunatic Asylum on Mondays and Thursdays, commencing the first Thursday in February, by the Resident Medical Superintendent. All students wishing to enter for the course are expected to attend at the Asylum at 2.30 P.M. on that day. All information may be had at the Asylum.

Victoria Hospital for Diseases of Women and Children (Cork).—Honorary Staff: Dr. Ashley Cummins, Dr. C. Yelverton, Dr. P. Lee, Dr. Hobart, and Dr. C. B. Pearson. Lady Superintendent: Mrs. George Armstrong. There are 70 beds. Clinical instruction on Diseases Peculiar to Children is given. The extern department is open daily at 9.30.

County and City of Cork Lying-in Hospital (Erinville, Western-road; founded 1798).—Staff: Honorary Consulting Physicians: Dr. W. E. Ashley Cummins, Dr. Cotter, and Mr. D. D. Donovan. Honorary Obstetric Surgeon: Mr. C. Yelverton Pearson. Physicians: Dr. Norman I. Townsend, Dr. N. H. Hobart, Dr. Lucy E. Smith, and Dr. Daniel J. O'Connor. Assistant Physicians: Dr. P. J. O'Brien and Dr. E. V. Cantillon. This hospital contains 20 beds. Fee for six months' attendance, including clinical lectures, £3 3*s.* For further particulars apply to N. J. Hobart, honorary assistant secretary to staff.

Cork Maternity (Bachelor's Quay).—Staff: Honorary Consulting Surgeon: Dr. H. Macnaughton-Jones. Consulting Obstetric Physicians: Dr. T. Gelston Atkins and Dr. Henry Corby. Obstetric Physicians: Dr. John Booth, Dr. Richard Crosbie, and Dr. Michael Cagney. Three resident pupils are taken into the Maternity. Poor women are attended at their own homes. Between 400 and 500 are now annually entered on the Maternity register. Clinical lectures are delivered during the session. There is an extern department for the treatment of women's and children's diseases. Fee for attendance at clinical lectures and certificate, £3 3*s.* For further particulars apply to Dr. Henry Corby, secretary to staff.

Cork Fever Hospital.—Staff: Ordinary Physicians: Dr. T. B. Moriarty and Dr. D. J. Flynn. Extraordinary Physician: Mr. T. Callaghan. Resident Medical Officer and Registrar: Mr. A. G. Sutton. Upwards of 200 cases of various forms of fever and zymotic disease are treated yearly in this hospital. The Resident Medical Officer gives instruction in Practical Pharmacy, a certificate of which is necessary for the National University and Colleges of Physicians and Surgeons of Edinburgh.

Cork District Hospital (Douglas-road; 1200 beds).—Staff: Dr. W. E. Ashley Cummins, Dr. J. Giusani, Mr. D. Morrissy, and Mr. James T. O'Connor. Resident Medical Officers: Dr. Alice Barry and Dr. Michael C. Ahern. This hospital includes special buildings for fever and other infectious diseases (100 beds); for children's diseases (100 beds); and a Lock hospital, the only one in the South of Ireland (80 beds). It affords an extensive field for the study of all classes of diseases, acute and chronic, including special departments for gynæcology and diseases of the skin and nervous system. The physicians and surgeons visit the hospitals every morning at 10 o'clock. Lectures and clinical instruction are given daily in the wards by the physicians and surgeons. Three prizes are given at the end of the session for the best clinical reports—one in Medicine, one in Surgery, and one in Fever. Further particulars may be obtained from Dr. W. E. Ashley Cummins, 17, St. Patrick's-place, honorary secretary, medical staff.

Cork Eye, Ear, and Throat Hospital (Western-road).—Staff: Visiting Surgeon: Dr. Arthur W. Sandford. Consulting Physician: Dr. W. E. Ashley Cummins. This hospital is open to students attending the University College and others. Certificates of attendance for three or six months can be obtained. The hospital contains 35 beds. Over 4000 cases are treated during the year. Clinical instruction is given to students attending the hospital, with demonstrations on the use of special instruments. A course of Lectures on Ophthalmic Surgery is delivered during the session. For further information apply to Dr. Arthur Sandford, 13, St. Patrick's-place, Cork.

UNIVERSITY COLLEGE, GALWAY: SCHOOL OF MEDICINE.—The College contains well-lighted and ventilated dissecting-room and anatomical lecture theatre; physiological, pathological, pharmaceutical, chemical, and physical laboratories; anatomical, pathological, gynæcological, and materia medica museums; as well as a large natural history and

geological museum and an extensive library in which students can read and from which they can borrow books. New Chemical and Pathological Laboratories are in process of construction. There are eight Junior Scholarships in Medicine of the annual value of £25 each. Two are tenable by matriculated students of the first, second, third, and fourth years respectively. In addition Sessional Class Prizes are awarded. The Scholarship Examinations are held at the beginning of each session. There are extensive grounds, a portion of which is occupied by a Botanic Garden and a portion is at the disposal of the College Athletic Union. There are several student societies in the College, including a Biological Society. There are abundant facilities for research and Post-graduate work in the Chemistry, Physiology, and Pathology departments.

Professors—Natural Philosophy: A. Anderson, M.A., LL.D. Chemistry: A. Senier, Ph D. Natural History: R. J. Anderson, M.A., M.D. Anatomy and Physiology: J. P. Pye, M.D., D.Sc. Medicine: J. I. Lynham, M.D. Surgery: W. W. Brereton, L.R.C.S.I. Materia Medica: N. W. Colahan, M.D. Midwifery: R. J. Kinkead, M.D.

Lecturers—Pathology: T. Walsh, B.A., M.D., D.P.H. Chemistry: A. Robeson, Ph.D., D.Sc.

Clinical Instruction is given in the Galway Hospital and in the Galway Union and Fever Hospitals.

Galway County Hospital (60 beds).—Medical Officers: Dr. N. W. Colahan, Dr. J. P. Pye, Dr. W. W. Brereton, Dr. R. J. Kinkead, Dr. J. I. Lynham, Dr. McDermott, and Dr. G. Walsh. Clerk: S. J. Leonard. Patients, 600.

Galway Union and Fever Hospitals (120 beds).—Medical Officers: Dr. N. W. Colahan and Dr. M. J. McDonagh. A new Fever Hospital has just been built. A prospectus giving details of the courses of study and examination for degrees and of the subjects for public and private foundation scholarships may be had on application to the Registrar.

QUEEN'S UNIVERSITY OF BELFAST.

There are six degrees in the Faculty of Medicine of the University—viz., Bachelor of Medicine (M.B.), Bachelor of Surgery (B.Ch.), Bachelor of Obstetrics (B.A.O.), Doctor of Medicine (M.D.), Master of Surgery (M.Ch.), and Master of Obstetrics (M.A.O.). The University also grants a Diploma in Public Health, particulars of which will be found in the University Calendar. The degrees of M.B., B.Ch., and B.A.O. are the primary degrees in the Faculty of Medicine, and are conferred at the same time and after the same course of study. No student is admitted to the final examination for these degrees until he has shown: (1) that he is a matriculated student of the University; (2) that he has completed the prescribed course of study in the Faculty of Medicine extending over a period of not less than five academic years from the date of his registration as a student of Medicine by the General Council of Medical Education and Registration of the United Kingdom; (3) that he has passed the several examinations prescribed; (4) that he has attended in the University during three academic years at least the courses of study prescribed for such degrees (the Senate may accept, for not more than two academic years of the required five, courses of study pursued in any other University or School of Medicine approved by the Senate); and (5) that he has attained the age of 21 years. Every candidate for admission as a matriculated student of the University shall pass such Matriculation Examination or fulfil such other test of fitness as may be prescribed by the Senate, which may prescribe the conditions under which students who have passed the Matriculation or Entrance Examination of any other University or College approved for that purpose (or who have fulfilled such other test of fitness as may be prescribed) may be exempted from passing the Matriculation Examination of the University.

The Matriculation Examination.—Entrants to the University who desire to proceed to a degree in the Faculty of Medicine shall be required to pass in five subjects, to be selected from (1) English; (2) Mathematics; (3) Latin; (4 and 5) any *two* of the following (of which *one* must be a Language)—(*a*) Greek, (*b*) French, (*c*) German, (*d*) Physics, (*e*) Chemistry. There shall be two examinations for Matriculation, one in summer and one in autumn. All the subjects offered by a candidate for Matriculation shall be passed at one examination. Entrants (other than those who are matriculated students of the Royal University of Ireland) who have passed the Senior Grade of the Intermediate Education Board for Ireland in the subjects already prescribed in or after the year 1906 shall, on making formal application to the secretary, be admitted as matriculated students. Two examinations for Matriculation, each covering a period of six days, will be held during 1911. The autumn examination will commence on Monday, Oct. 2nd. Candidates must lodge their entrance forms, duly filled up, with the Secretary, and pay the prescribed fee of £1 1*s.*, not later than Sept. 2nd, or with a late fee of 10*s.*, not later than 14 days before the examination, after which no entry will be received. Entrance forms may be had from the secretary.

Entrance Scholarships.—Candidates who intend to present themselves for the Entrance Scholarships to be awarded after the October Matriculation Examination must give notice to the secretary of the subjects in which they propose to be examined not later than Sept. 30th, 1911. Information as to the scholarships which will be open for competition and the subjects which may be taken may be obtained from the secretary.

PRIMARY DEGREES OF M.B., B.CH., B.A.O.

All candidates for these degrees shall satisfy the examiners in the subjects of four examinations known as the First, Second, Third, and Fourth Medical Examinations respectively. Two examinations for each of these will be held in the spring and summer.

The First Medical Examination.—The subjects of this examination are Chemistry (Inorganic and Organic), Experimental and Practical Physics, Botany and Zoology, and Practical Botany and Zoology. The examination will be divided into two parts which may be taken separately: I., Chemistry, Practical Chemistry and Experimental Physics (including laboratory work); II., Botany and Zoology (including laboratory work).

The Second Medical Examination.—The subjects are Anatomy and Practical Anatomy, Physiology and Practical Physiology. Candidates who have previously passed the First Medical Examination may present themselves for this examination at the close of their second year.

The Third Medical Examination.—The subjects are: (1) Pathology and Practical Pathology; (2) Materia Medica, Pharmacology and Therapeutics; (3) Medical Jurisprudence; (4) Hygiene. Candidates who have previously passed the Second Medical Examination may present themselves for this examination at the close of the third year. Attendance on a course in any subject of the Third Medical Examination shall not entitle a student to a certificate of attendance unless he has previously passed in all the subjects of the First Medical Examination.

The Fourth Medical Examination.—The subjects are: (1) Medicine; (2) Surgery; (3) Midwifery; (4) Ophthalmology and Otology. This examination may be taken in two parts: I., Systematic; II., Clinical, Practical and Oral. Candidates who have previously passed the Third Examination may present themselves for Part I. of the Fourth Examination at the close of the fourth year, provided that they have fulfilled the necessary requirements as to attendance, &c., on the courses of instruction in the subjects of examination. Candidates who have passed Part I. of this examination may present themselves for Part II. at the close of the fifth year, provided that they have fulfilled the necessary requirements as to hospital attendance on the various clinical courses in the subjects of examination. Parts I. and II. may be taken together at the close of the fifth year. Attendance on a course in any subject of the Fourth Medical Examination shall not entitle a student to a certificate of attendance unless he has previously passed in all the subjects of the Second Medical Examination.

Courses of Study.—Candidates who desire to enter for any of the Medical Examinations must furnish satisfactory certificates of attendance on the various courses dealing with the subjects of the respective examinations.

Candidates for the Final Examination for the Degree of M.B., B.Ch., and B.A.O. are required to furnish the following certificates in addition to those granted for attendance on the necessary academic courses:—(1) Of having attended the medical and surgical practice of a hospital or hospitals, approved by the University, for at least 27 months. Such attendance shall only be reckoned from the beginning of the third year of medical study. (2) Of having acted as a dresser for at least three months in the surgical wards, and as a clinical clerk for at least three months in the medical wards, of a hospital recognised by the

University. These attendances must not be concurrent. (3) Of having received practical instruction in the methods of administration of Anæsthetics. (4) In Practical Midwifery. Every student shall be required either—(*a*) To have regularly attended the indoor practice of a lying-in hospital or the lying-in wards of a general hospital for a period of three months, and after having received therein practical instruction in the conduct of labour, under the personal supervision of a medical officer, to have conducted 20 cases of labour under official medical supervision; or (*b*) to have conducted not less than 20 cases of labour, subject to the following conditions: That he has during one month given regular daily attendance upon the indoor practice of a Lying-in Hospital or the lying-in wards of a general hospital or Poor-law infirmary having a resident medical officer recognised for that purpose by the University; and that he has therein conducted cases of labour under the personal supervision of a medical officer of the hospital, who shall, when satisfied of the student's competence, authorise him to conduct outdoor cases under official medical supervision. No certificate that the student has conducted the above-mentioned 20 cases of labour shall be accepted unless it is given by a member of the staff of a lying-in hospital or of the maternity charity of a general hospital, or of a dispensary having an obstetric staff recognised for that purpose by the University, or of a Poor-law infirmary having a resident medical officer so recognised. Every student before commencing the study of Practical Midwifery shall be required to have held the offices of clinical medical clerk and surgical dresser, and to have attended a course of lectures on Surgery and Midwifery. (5) In Gynæcology. Every student shall present a certificate of having received clinical instruction in Diseases of Women, either in a special hospital for diseases of women recognised by the University or in a special ward for diseases of women in a general hospital similarly recognised. (6) In Diseases of Children. Every student shall present a certificate of having received clinical instruction in Diseases of Children for a period of three months, either in a children's hospital or in a children's ward of a general hospital recognised by the University. (7) In Mental Diseases and Infectious Diseases. Every student shall present a certificate of having attended approved courses of instruction. (8) In Vaccination. Every student shall present a certificate of having attended lectures and practical instruction in Vaccination by a teacher recognised by the Local Government Board. (9) In Ophthalmology and Otology. Every student shall present a certificate of attendance for a period of three months at a hospital recognised by the University for clinical instruction in Diseases of the Eye and Ear.

The following order of study and examinations is recommended:—

First Year.

Winter Session.—Chemistry, Practical Chemistry, Experimental Physics (including Laboratory work), Anatomy (Elementary), and Practical Anatomy.

First Examination, Part I. (fee £1 1*s*.).

Summer Session.—Botany, Zoology, and Practical Botany and Zoology.

First Examination, Part II. (fee £1 1*s*.).

Second Year.

Winter Session.—Anatomy, Practical Anatomy, Physiology, and Practical Physiology (Physical and Chemical).

Summer Session.—Practical Anatomy (including Demonstrations), Physiology (continued), and Practical Histology.

Second Examination (fee £1 1*s*.).

Third Year.

Winter Session.—Pathology; Materia Medica, Pharmacology, and Therapeutics; Hygiene; and Hospital Practice.

Summer Session.—Practical Pathology, Practical Pharmacy, Medical Jurisprudence, and Hospital Practice.

Third Examination (fee £1 1*s*.).

Fourth Year.

Winter Session.—Surgery, Medicine, Midwifery, and Hospital Practice.

Summer Session.—Operative Surgery, Ophthalmology, Vaccination, and Hospital Practice.

The following Hospital courses should be taken during the Fourth or Fifth Year:—Diseases of Children, Mental Diseases, Practical Midwifery and Gynæcology, and Fevers.

Fourth Examination, Part I. (Systematic) (fee £1 1*s*.).

Fifth Year.

Winter Session.—Clinical Medicine, Clinical Surgery, Clinical Gynæcology, Clinical Ophthalmology, and Hospital Practice.

Summer Session.—Hospital Practice.

Fourth Examination, Part II. (Clinical, Practical, and Oral Examinations), fee £1 1*s*.

Admission to degrees of M.B., B.Ch., and B.A.O.—fee £10 10*s*.

DEGREES OF M.D., M.CH., AND M.A.O.

These degrees shall not be conferred until the expiration of at least three academic years, or in the case of graduates of the University in Arts or Science of at least two academic years, after admission to the primary degrees in the Faculty of Medicine. Every candidate must show that in the interval he has pursued such courses of study, or been engaged in such practical work as may be prescribed. These degrees may be conferred by the Senate either (*a*) after an examination, which includes written, oral, clinical, and practical examinations; or (*b*) on the submission of a thesis or other evidence of original study or research, to be approved by the Faculty of Medicine after an oral or other examination of the candidate on the subject thereof. On application for these degrees a fee of £2 2*s*., and on admission to them a fee of £2 2*s*., must be paid.

The subjects of the examination for the degree of M.D. are:—The Principles and Practice of Medicine, and one other special subject to be selected by the candidate from: (i.) Human Anatomy, including Embryology; (ii.) Physiology; (iii.) Pathology; (iv.) Pharmacology and Therapeutics; (v.) Sanitary Science and Public Health; (vi.) Forensic Medicine and Toxicology.

The subjects of the examination for the degree of M.Ch. are:—(1) Surgery, Theoretical and Practical, including Ophthalmology and Otology. (2) Surgical Pathology. (3) Surgical Anatomy and Operative Surgery, with the use of surgical instruments and appliances.

The subjects of the examination for the degree of M.A.O. are:—(1) Midwifery. (2) Diseases of Women and Children. (3) Pathology in its special bearing on Midwifery, and Diseases of Women and Children.

Scholarships.—At entrance for Students of Medicine and Science together Eight Scholarships tenable for one year. Of these, three (of the value of £30, £20, and £15 respectively) will be offered for competition in literary subjects, and five (of the value of £30, £20, £20, £15, and £15) in scientific subjects. Four Scholarships of the value £40, £30, £20, £15, tenable for one year, will be open for competition in connexion with the Summer First Medical Examination. Four Scholarships of the value £40, £30, £20, and £15, tenable for one year, will be open in connexion with the Summer Second Medical Examination. Four Scholarships of value £40, £30, £20, and £15 will be open in connexion with the Summer Third Medical Examination. Four Scholarships of value £30, £30, £30, and £20, tenable for one year, will be open in connexion with the Summer Fourth Medical Examination. Grants from a Post-Graduate Research Fund may be obtained by graduates in medicine of not more than two years' standing.

The Medical School.—The Donald Currie Chemical Buildings contain a lecture theatre, a preparation room, a chemical museum, a large class-room for elementary practical chemistry, laboratories for qualitative and quantitative analysis, rooms for water and gas analysis, dark room for photographic purposes, balance room, &c., provided with all modern appliances. Special facilities are given to those who wish to pursue original research. The Anatomical Department contains a large and well-lighted dissecting-room, a lecture-room, a professor's and demonstrator's room, a bone-room, and a laboratory for microscopic and photographic work. The Medical Museum is in the same building. The Jaffé Laboratories for Physiology comprise a lecture theatre, laboratories for practical work in chemical physiology, histology, and experimental physiology, and in addition small private research rooms, including balance, galvanometer, and centrifuge rooms. The Musgrave Pathological Laboratory.—In this department opportunity is afforded for research in pathology and bacteriology. The department is in touch with most of the hospitals in Belfast, and there is an ample supply of material for investigation by graduates in morbid histology, clinical pathology, and the bacteriology of infectious diseases. A course in pathology or bacteriology is given to graduates, and members of this class have an opportunity of seeing the methods employed in the various investigations carried out in the department for the Public Health Committee of the corporation in connexion with water-supply, sewage disposal, meat- and milk-supply, the diagnosis of cases of infectious diseases, &c. The certificate issued to members of the class in bacteriology qualifies for the D.P.H. degree. The Pharmaceutical Laboratory is fitted and equipped for the work of practically instructing students in the compounding and dispensing of medicines. Lectures will commence on Oct. 10th, 1911.

The Teaching Staff of the Faculty of Medicine.—Professors—Natural Philosophy: W. Blair Morton, M.A. Chemistry: E. A. Letts, Ph D., D.Sc. Zoology: Gregg Wilson, M.A., D.Sc. Botany: D. T. Gwynne-Vaughan, M.A. Anatomy: J. Symington, M.D., F.R.S. Physiology (Dunville Professor): T. H. Milroy, M.D., B.Sc. Materia Medica: Sir William Whitla, M.A., M.D. Pathology (Musgrave Professor): W. St. Clair Symmers, M.B. Medicine: J. A. Lindsay, M.A., M.D., F.R.C.P. Lond. Surgery: T. Sinclair, M.D., M.Ch., F.R.C.S. Eng. Midwifery: Sir John Byers, M.A., M.D., M.Ch., M.A.O. Lecturers—Medical Jurisprudence: W. St. C. Symmers, M.B., and T. Houston, M.D. Ophthalmology and Otology: Cecil Shaw, M.D., M.Ch. Hygiene: W. J. Wilson, M.D., D.P.H. Bio-Chemistry: J. A. Milroy, M.D. Physics: R. Jack, D.Sc. Organic

Chemistry: A. W. Stewart, D.Sc. Vaccination: J. M'Liesh, M.B., D.P.H. Assistants and Demonstrators—Anatomy: J. S. Dickey, M.D., R. A. Kerr, M.B., and P. T. Crymble, M.B., F.R.C.S. Eng. Applied Anatomy: P. T. Crymble, M.B., F.R.C.S. Eng. Physiology: J. H. Harbison, B.A., M.B. Practical Pharmacy: V. G. L. Fielden, M.B., Ph.C. Riddel Demonstrator in Pathology and Bacteriology: C. Dickson, M.D., D.P.H. Pathological Neurology: W. J. Maguire, M.D. Clinical Pathology: T. Houston, M.D. Medicine: J. E. MacIlwaine, M.D. Surgery: Howard Stevenson. Midwifery: C. G. Lowry. University Clinical Lecturers—Medicine: H. L. McKisack, M.D., M.R.C.P. Surgery: Sir Peter R. O'Connell, M.D., M.Ch. Midwifery, &c.: R. J. Johnstone, M.B., F.R.C.S. Eng. Ophthalmology: Henry Hanna, M.A., B.Sc., M.B. Internal Examiner in Sanitary Science: H. W. Bailie, L.R.C.P. & S. Edin., L.F.P.S. Glasg., D.P.H.

Clinical instruction.—The following institutions are recognised by the University as affording proper opportunities for clinical instruction: the Royal Victoria Hospital, the Mater Infirmorum Hospital, the Union Hospitals, the Belfast Hospital for Sick Children, the Belfast Maternity, the Ulster Hospital for Women and Children, the Ulster Eye, Ear, and Throat Hospital, the Belfast Ophthalmic Hospital, the Purdysburn Fever Hospital, and the Belfast District Lunatic Asylum.

The staffs of the various institutions are as follows:—

The Royal Victoria Hospital (300 beds).—Physicians: Professor Sir William Whitla, Professor James A. Lindsay, Dr. William Calwell, and Dr. H. L. McKisack, Surgeons: Mr. J. Walton Browne, Professor T. Sinclair, Mr. A. B. Mitchell, and Mr. T. S. Kirk. Gynæcologist: Professor Sir John Byers. Surgeon for Diseases of the Eye, Ear, and Throat: Mr. James A. Craig. Pathologist: Professor W. St. C. Symmers. Physician for Diseases of the Skin: Dr. W. Calwell. Physician in charge of Out-patients: Dr. J. S. Morrow. Assistant Physician: Dr. J. E. McIlwaine. Surgeons in charge of Out-patients: Mr. Robert Campbell and Mr. Andrew Fullerton. Gynæcologist in charge of Out-patients: Mr. R. J. Johnstone. Assistant Surgeon to the Eye, Ear, and Throat Department: Mr. Henry Hanna. Assistant to the Pathologist: Mr. P. T. Crymble. Administrators of Anæsthetics: Dr. V. G. L. Fielden and Mr. S. T. Irwin. Medical Electrician: Dr. J. C. Rankin. Hæmatologist: Dr. Thomas Houston. Medical Tutor: Dr. Foster Coates. Surgical Tutor: Mr. Howard Stevenson. Registrars: Dr. Fred C. Smyth and Mr. H. Norman Barnett.

Mater Infirmorum Hospital (160 beds).—Consulting Physician: Sir Alexander Dempsey. Physicians: Dr. W. J. Maguire and Mr. W. M'Lorinan. Surgeons: Sir Peter R. O'Connell, Dr. J. B. Moore, and Mr. John O'Doherty. Gynæcologist: Sir Alexander Dempsey. Ophthalmic Surgeons: Dr. C. E. Shaw and Mr. H. Mulholland. Pathologist: Dr. W. St. Clair Symmers. Registrar: Dr. W. Hill. Dental Surgeons: Mr. J. McStay and Mr. Maurice Maguire. House Physician: Dr. Wisely. House Surgeon: Dr. Genuley.

Union Infirmary (600 beds).—Visiting Physicians: Mr. R. Hall and Dr. J. M'Liesh. Visiting Surgeon: Mr. J. Fulton. Ophthalmic Surgeon: Mr. J. A. Craig.

Hospital for Sick Children, Queen-street (52 beds).—Consulting Physicians: Dr. B. Smyth, Sir J. W. Byers, and Dr. F. H. Sinclair. Attending Physicians: Dr. J. McCaw and Dr. R. L. Leathem. Honorary Attending Assistant Physicians: Dr. M. B. Smyth and Dr. J. Colville. Consulting Surgeons: Sir J. Fagan and Mr. W. G. Mackenzie. Attending Surgeons: Mr. T. S. Kirk and Mr. R. Campbell. Honorary Attending Assistant Surgeons: Mr. A. Fullerton and Mr. P. T. Crymble. Ophthalmic Surgeon: Mr. W. K. Cready. Pathologist: Professor W. St. C. Symmers. Surgeon-Dentist: Mr. N. White. Anæsthetists: Dr. W. Burnside, Dr. H. N. Barnett, Dr. R. Hill, and Dr. J. Rusk. Honorary Attending Physicians to Convalescent Home (Carrickfergus): Dr. James A. Clarke and Dr. J. Houston.

Maternity Hospital, Townsend-street (33 beds).—Consulting Physician: Dr. B. Smyth. Consulting Surgeon: Mr. J. Campbell. Visiting Physicians: Dr. H. D. Osborne, Sir J. W. Byers, Dr. R. J. Johnstone, and Dr. M. B. Smyth.

Ulster Hospital for Women and Children (28 beds).—Consulting Staff, Children's Department—Physicians: Dr. J. D. Williamson and Dr. R. W. Leslie. Surgeons: Dr. A. B. Mitchell and Dr. H. Stevenson. Ophthalmic Surgeon: Dr. H. H. B. Cunningham. Women's Department: Dr. M. B. Andrews and Dr. C. G. Lowry. Pathologist: Dr. T. Houston. Anæsthetist: Dr. V. Fielden. Obstetric Physician: Dr. J. D. Williamson.

Benn Ulster Eye, Ear, and Throat Hospital (30 beds).—Acting Surgeon: Mr. W. M. Killen. Assistant Surgeon: Mr. H. Hanna.

Ophthalmic Hospital, Great Victoria-street (30 beds).—Consulting Physician: Sir W. Whitla. Surgeon: Mr. J. W. Browne. Assistant Surgeon: Mr. C. E. Shaw. Clinical instruction daily. Fee for three months £2 2*s*.

City Fever Hospital, Purdysburn (230 beds).—Physician in Charge: Dr. A. Gardner Robb.

District Lunatic Asylum (1000 beds).—Consulting and Visiting Physician: Dr. R. J. Purdon. Resident Medical Superintendent: Dr. W. Graham. Assistant Medical Officers: Dr. J. Patrick and Dr. S. J. Graham.

IRISH MEDICAL CORPORATIONS GRANTING DIPLOMAS.

ROYAL COLLEGE OF PHYSICIANS OF IRELAND.

The College issues its Licences in Medicine and in Midwifery to practitioners whose names appear on the Medical Register of the United Kingdom.

The Licence in Medicine.—The subjects of examination are: Practice of Medicine, Clinical Medicine, Pathology, Medical Jurisprudence, Midwifery, Hygiene, and Therapeutics.

The Licence in Midwifery.—Candidates must produce certificates of registration. A registered medical practitioner of five years' standing may be exempted from the examination by printed questions.

Fees.—Fee for the Licence to practise Medicine, £15 15*s*. Fee for examination for the Licences in Medicine and Midwifery, if obtained within the interval of a month, £16 16*s*.—to be lodged in one sum. (*Any candidate who has been rejected at the examination for the Licence in Medicine loses this privilege and will be required to pay the full fee of five guineas for the Licence of Midwifery.*) Fee for special examination for the Licence to practise Medicine, £21. Fee for examination for the Licence to practise Midwifery, £5 5*s*. Fee for special examination for the Licence to practise Midwifery, £10 10*s*. The examinations for these Licences are held in the three days preceding the first Friday in February, May, and November.

The Membership.—Examinations for Membership are held in January, April, July, and October. The fee for the examination is £21 to Licentiates of the College, or £36 15*s*. to non-Licentiates. Further particulars can be obtained from the Registrar of the Royal College of Physicians of Ireland, Kildare-street, Dublin.

The Fellowship.—Fellows are elected by ballot. Applicants must have been a Member of the College for at least one year and must have attained the age of 27 years. There is a fee of £35 in addition to a stamp duty of £25.

ROYAL COLLEGE OF SURGEONS IN IRELAND.

The Licence in Surgery.—A candidate whose name is entered either on the Medical Register for the United Kingdom, the Colonial Medical Register, or the Foreign Medical Register of the year in which he presents himself for examination, and who satisfies the Council that he has passed through a course of study and Examinations equivalent to those required by the Regulations of the Conjoint Board of the Royal College of Physicians of Ireland and the Royal College of Surgeons in Ireland, preceded by the passing of an Examination in Arts recognised by the General Medical Council, may, at the discretion of the Council, be admitted to the Examination.

Candidates are examined in Surgery, Clinical Surgery, Operative Surgery on the subject, Surgical Appliances, and Ophthalmic Surgery. The examination is partly written, partly *viva voce*, and partly practical. The fee is £26 5*s*., of which £5 5*s*. is retained by the College in the case of unsuccessful candidates.

Candidates are required to lodge their applications, declarations, and certificates with the Registrar at least 21 days before the date of the Examination.

Diploma in Midwifery.—A diploma in Midwifery is granted after examination to persons possessing a registrable qualification. Candidates must produce evidence of (*a*)

attendance at a course of lectures on Midwifery and Diseases of Women and Children in some school recognised by the Council; (*b*) attendance on six months' practice in connexion with a recognised lying-in hospital or dispensary for lying-in women and children; and (*c*) of having conducted at least 30 labour cases. The fee for the examination is £15 15*s*., of which £5 5*s*. is retained by the College in case the candidate is unsuccessful.

Fellowship Examinations.—A candidate for the Fellowship shall make application to the President and Council to be admitted to examination. All the required evidences of study or qualification, fees, and testimonials as to character must be submitted previously to the application being considered, and the candidate shall then, if approved by the Council, be admitted to the next sessional examination. In order that these regulations may be carried out candidates are required to lodge their applications complete with the Registrar at least seven days before the date of examination. Sessional Fellowship Examinations commence as follows:—The primary on the first Monday in March, the third Monday in July, and the third Monday in November; the Final on the second Monday in March, the third Wednesday in July, and the fourth Monday in November. Special examinations will not be granted by the Council under any circumstances.

Candidates are required to pass two examinations—Primary and Final. Candidates may present themselves for the Final Examination immediately after passing the Primary part, provided they have complied with the necessary regulations. The subjects for the Primary Examination are (*a*) Anatomy, including Dissections; and (*b*) Physiology and Histology.

The subjects for the Final Examination are Surgery, including Surgical Anatomy, and Pathology. The examination is partly written and partly *viva voce*, and includes the examination of patients, and the performance of operations on the dead body. Candidates must pass in all subjects at one examination.

The conditions of admission to the Primary Examination are that the candidate must produce evidence of having completed examinations in Anatomy, Physiology, and Histology under a licensing body whose degrees entitle the holder to have his name placed on the Medical Register. For admission to the Final Examination the candidate must have passed the Primary Examination, and must be a Licentiate or Graduate in Surgery of a university or licensing body recognised by the General Medical Council; all such candidates must not be less than 25 years of age. The fees for the examinations are as follows:—Primary Examination, each admission, £5 5*s*.; Final Examination, each admission, £5 5*s*. Of these examination fees £10 10*s*. will be reckoned as part of the £42 fee payable upon admission to the Fellowship. The fee to be paid is £42, except when the new Fellow is a Licentiate of the College, in which case it is £26 5*s*.

In cases of rejection the examination fees are retained by the College and are not allowed for in the fees for re-examination.

A rejected candidate will not be again admitted to examination until after a period of three months.

Further particulars can be obtained from the Registrar of the College, Stephen's-green, West Dublin.

ROYAL COLLEGE OF PHYSICIANS OF IRELAND AND ROYAL COLLEGE OF SURGEONS IN IRELAND.

Every candidate for the Conjoint Examinations of the Colleges shall produce evidence of having before entering on medical studies passed a Preliminary Examination in general education recognised by the Royal Colleges. Each candidate before receiving his diplomas must produce a registrar's certificate or other satisfactory evidence that he has attained the age of 21 years.

Preliminary Examination.—The subjects for examination are identical with those prescribed for the Preliminary Examination by the General Council of Medical Education and Registration.

Professional Examinations.—Every candidate must pass four Professional Examinations—at the end of the first, second, third, and fifth years respectively of his professional studies. No candidate shall be admitted to the Final or Qualifying Examination within three months of his rejection at the Final or Qualifying Examination by any other licensing body.

First Professional Examination.—Every candidate is required, before admission to the First Professional Examination, to produce evidence—(1) of having passed in the subjects of the Preliminary Examination; and (2) of having attended a course of—(*a*) lectures on Theoretical Chemistry, six months; (*b*) Practical Chemistry, three months; (*c*) Biology, three months; and (*d*) Physics.

The subjects of the First Professional Examination are the following:—1. (*a*) Chemistry; (*b*) Physics. 2. Biology. The fee for this examination is £15 15*s*.

Second Professional Examination.—Candidates are not admissible to this examination till they have passed in the subjects of the First Professional Examination, and they must produce evidence of having attended (*a*) the practice of a medico-chirurgical hospital for nine months; (*b*) anatomical dissections, six months; and Lectures on (*a*) Anatomy, six months; (*b*) Physiology, six months; (*c*) Practical Physiology and Histology, three months.

The subjects of the Second Professional Examination are the following:—(1) Anatomy; and (2) Physiology and Histology. The fee for this examination is £10 10*s*.

Third Professional Examination.—Every candidate is required, before admission to the Third Professional Examination, to produce evidence of having passed the Second Professional Examination and certificates of having attended courses of instruction in (*a*) the practice of a medico-chirurgical hospital for nine months; (*b*) Pathology—(1) Systematic, (2) Practical, three months each; (*c*) Materia Medica, Pharmacy, and Therapeutics, three months; (*d*) Forensic Medicine and Public Health, three months.

The subjects for the Third Professional Examination are the following:—(1) Pathology; (2) Materia Medica, Pharmacy, and Therapeutics; (3) Public Health and Forensic Medicine. The fee for this examination is £9 9*s*.

Final Professional Examination.—Before admission to the Final Examination candidates must have passed the Third Professional Examination and produced evidence of having attended in Division I. the practice of a medico-chirurgical hospital for nine months (unless such evidence has been previously produced for admission in Division II.); the practice of a recognised fever hospital or the fever wards of a recognised clinical hospital, three months; clinical instruction in Mental Diseases, one month (12 attendances); Lectures on Medicine, six months at a recognised medical school; of having performed the duties of medical clinical clerk in a recognised hospital for three months; of having attended a course of instruction in post-mortem examinations and demonstrations during one session. In Division II. of having attended the practice of a medico-chirurgical hospital for nine months (unless such evidence has been previously produced for admission to Division I.); clinical instruction in Ophthalmic and Aural Surgery, three months; lectures on Surgery, six months at a recognised medical school; instruction in Operative Surgery, three months at a recognised medical school; of having performed the duties of surgical dresser in a recognised hospital for three months; of having attended a course of instruction in the practical administration of general anæsthetics. In Division III. of having attended a midwifery hospital or maternity and having been present at 20 labours, six months; instruction on vaccination, six attendances to be certified by a public vaccinator; lectures on midwifery (including diseases peculiar to women and to new-born children), six months at a recognised medical school. Candidates are recommended to present themselves in all the subjects of the Final Examination at one time, but a candidate at or after the end of the fourth year may present himself in any one of the Divisions I., II., or III., provided he has completed his curriculum as far as concerns the division in which he presents himself. The examination in at least one of the divisions must be deferred till the end of the fifth year.

The subjects of the Final Examination are: (1) Medicine, including Fevers, Mental Diseases, and Diseases of Children; (2) Surgery, Operative and Ophthalmic; and (3) Midwifery and Gynæcology, Vaccination, and Diseases of New-born Children. The fee is £6 6*s*. Further particulars can be obtained from Alfred Miller, the Secretary of the

Committee of Management, Royal College of Physicians, Kildare-street, Dublin.

ROYAL COLLEGE OF SURGEONS IN IRELAND (SCHOOLS OF SURGERY).—The schools of surgery are attached by Charter to the Royal College of Surgeons and have existed as a department of the College for over a century. They are carried on within the College buildings and are specially subject to the supervision and control of the Council, who are empowered to appoint and remove the professors and to regulate the methods of teaching pursued. The buildings have been reconstructed, the capacity of the dissecting-room nearly trebled, and special pathological, bacteriological, public health, and pharmaceutical laboratories fitted with the most approved appliances in order that students may have the advantage of the most modern methods of instruction. There are special rooms set apart for lady students. The entire building is heated by hot-water pipes and lighted throughout by the electric light. Winter Session commences Oct. 15th; Summer Session, April 1st. Prospectuses and guide for medical students can be obtained post free on written application to the Registrar, Royal College of Surgeons, Stephen's-green, W., Dublin.

Scholarships and Prizes.—At the College there are offered the Class Prizes: two Gold Medals, two Scholarships, and a Bequest. The Class Prizes having the value of £100 are open to students of the class and are awarded for proficiency in the class examination. The Stoney Gold Medal is confined for competition to the Anatomy Class and the Surgery Gold Medal to the Practical Surgery Class. They are each of the value of £3 15*s.*, and are open to students of the respective classes. The Carmichael Scholarship of the value of £15 is open to students of the third year and is awarded on the result of examination in anatomy, physiology, histology, chemistry, materia medica, and pharmacy. The Mayne Scholarship of the value of £8 is open to students of the third and fourth year and is obtained by merit in the subjects of surgery, medicine, pathology, midwifery, and diseases of women. The Barker Bequest of £26 5*s.* is awarded for the best Dissection and is open to all medical students.

APOTHECARIES' HALL OF IRELAND.

The Licence of this Hall is granted to students who present certificates of having fully completed the course of study as laid down in the curriculum and who pass the necessary examinations. The diploma of the Apothecaries' Hall of Ireland entitles the holder to be registered as a practitioner in medicine, surgery, and midwifery, with also the privileges of the Apothecary's Licence. There are four professional examinations, the total fees for which amount to 21 guineas. Ladies are eligible for the diploma. Registered medical practitioners will receive the diploma of the Hall upon passing an examination in the subject or subjects not covered by their previous qualifications and on paying a fee of 10 guineas.

The fees payable for each examination are as follows:—first professional, £5 5*s.*; second, £5 5*s.*; third, £5 5*s.*; final examination, £6 6*s.* If a candidate gives three clear days' notice of his inability to attend he may present himself at the ensuing examination without a further fee. A candidate is allowed for each professional examination which he has completed at any other licensing body except the final. If he has passed in some only of the subjects in a given examination he has to pay the whole of the fee for that examination. The fees for re-examination are for each subject £1 1*s.*, except in the subjects of surgery, medicine, and anatomy, and the fees for which are 2 guineas each. The fee for the third and final or final alone is £15 15*s.* when the other examinations have been taken elsewhere. All examination fees are to be lodged in the National Bank of Ireland, College Green, to the credit of the Examination Committee. Applications and schedules, together with bank receipt for the fee, must be lodged with the Registrar, Apothecaries' Hall, 40, Mary-street, Dublin, at least 14 clear days before the first day of examination.

There are four examinations—first, second, third, and final. They are held quarterly on the first Monday in January, April, July, and October. The first examination comprises biology, physics, theoretical and practical chemistry (with an examination at the bench). Pharmacy is put down in this examination, but it may be taken at any of the first three examinations. Candidates holding a Pharmaceutical licence are exempt from this subject. The second examination comprises anatomy of the whole body (including practical dissections), physiology, and practical histology. The third examination comprises pathology, materia medica, medical jurisprudence, and hygiene. The final examination comprises medicine, including clinical and oral, surgery, including operations, clinical and oral, ophthalmic surgery, clinical only, midwifery, and gynæcology.

Candidates who desire to obtain the Letters Testimonial of the Apothecaries' Hall in Ireland must before proceeding to the final examination produce evidence of having attended courses of instruction as follows:—One course each (of six months) of the following: anatomy (lectures), chemistry (theoretical), midwifery, practice of medicine, physiology, surgery, and dissections, two courses of six months each. Courses of three months: materia medica, medical jurisprudence, chemistry (practical), practical physiology and histology, operative surgery, physics, clinical ophthalmology, biology, clinical instruction in mental disease, pathology, and a course in vaccination. Medico-chirurgical hospital, 27 months to be distributed, at the student's own discretion, over the last four years of his study. The candidate may substitute for nine months in this hospital attendance, six months as a resident pupil. He will be required to present a certificate of having taken notes of at least six medical and surgical cases recorded under the supervision respectively of a physician and surgeon of his hospital. Three months' study of fever—which may be included in his 27 months' hospital attendance—in a hospital containing fever wards, and having taken notes of five cases of fever—viz., either typhus fever, typhoid fever, scarlet fever, small-pox, or measles. Six months' practical midwifery and diseases of women during the winter or summer of the third or the fourth year at a recognised lying-in hospital or maternity. Three months' practical pharmacy in a recognised clinical hospital or a recognised school of pharmacy, or a year in the compounding department of a licentiate apothecary or a pharmaceutical chemist. Each candidate before receiving his diploma must produce evidence that he has attained the age of 21 years. The details of the course of education required and syllabus of the examinations will be supplied on application to the Registrar at 40, Mary-street, Dublin.

HOSPITALS AFFORDING PRACTICE RECOGNISED BY THE IRISH UNIVERSITIES AND CORPORATIONS.[1]

ADELAIDE MEDICAL AND SURGICAL HOSPITALS, Peter-street, Dublin.—Fee for nine months' hospital attendance, £12 12*s.*; six months, £8 8*s.* Summer, three months, £5 5*s.*

Staff.—Physicians: Dr. James Little, Dr. Wallace Beatty, Dr. H. T. Bewley, and Dr. G. Peacocke. Surgeons: Mr. F. T. Heuston, Mr. T. E. Gordon, and Mr. L. G. Gunn. Obstetric Surgeon: Sir W. J. Smyly. Ophthalmic Surgeon: Sir H. R. Swanzy. Throat Surgeon: Dr. S. Horace Law. Pathologists and Bacteriologists: Dr. J. Alfred Scott and Dr. W. Geoffrey Harvey. Dental Surgeon: Mr. John Stanton. Assistant Physician: Dr. W. G. Harvey. Assistant Surgeon: Mr. W. Pearson.

Two resident surgeons are elected yearly and four resident pupils half-yearly. At the termination of the session prizes in Clinical Medicine and Surgery and in Dermatology will be awarded.

Hudson Scholarship.—In addition to the junior prizes the Hudson Scholarship, £30 and a gold medal, as well as a prize of £10, together with a silver medal, will be awarded at the end of the session for proficiency in medicine, surgery, and gynæcology.

The certificates of attendance are recognised by all the Universities and licensing bodies in the United Kingdom. Further particulars may be obtained from Dr. H. T. Bewley.

COOMBE LYING-IN HOSPITAL AND GUINNESS DISPENSARY FOR THE TREATMENT OF DISEASES PECULIAR TO WOMEN, Dublin.—This hospital contains nearly 70 beds and

[1] This list of the institutions recognised by the Conjoint Board of Ireland is supplemented in the regulations of the Colleges by those hospitals mentioned as recognised institutions in Scotland and England. The recognised facilities for clinical instruction in Belfast, Cork, and Galway have been described in connexion with the Belfast and National Universities.

consists of two divisions, one of which is devoted to lying-in cases and the other to the treatment of diseases peculiar to women. The practice of this hospital is one of the largest in Ireland. Lectures are delivered, practical instruction given, and gynæcological operations are performed in the theatres daily. There is a general dispensary held daily, at which instruction is given on the Diseases of Women and Children. There is a special afternoon dispensary held by the Master and his assistants, at which practical instruction in gynæcology is given. There is no extra charge for attendance at this dispensary. There is accommodation for intern pupils who enjoy exceptional advantages of acquiring a thorough knowledge of this branch of their profession. Lady medical students can reside in the hospital. The residents' quarters are comfortable. Clinical assistants are appointed from amongst the pupils as vacancies occur. Certificates of attendance at this hospital are accepted by all licensing bodies. Fees: Extern pupils for full course of six months, £8 8*s*.; three months, £4 4*s*. Intern pupils, one month, £4 4*s*.; each consecutive month, £3 3*s*.; six months, £18 18*s*.; board and lodging in the hospital, 20*s*. per week. Lady students' intern, one month, £5 5*s*.; each consecutive month, £4 4*s*. Registration fee, in advance, 10*s*. 6*d*. Students can enter for attendance at any time, but preference is given to those entering from the first day of the month. Further particulars may be had on application to the Master or the Registrar at the hospital.

Staff.—Consulting Physicians: Sir John W. Moore and Sir J. M. Redmond. Consulting Surgeons: Dr. F. T. Heuston and Dr. F. W. Kidd. Pathologist: Dr. E. J. McWeeney. Pathological Analyst: Sir C. A. Cameron. Master: Dr. M. J. Gibson. Assistant Master: Dr. R. A. MacLaverty and Dr. Louis A. Cassidy. Registrar: Fred. A. Heney.

SIR PATRICK DUN'S HOSPITAL, Grand Canal-street, Dublin.—Classes for clinical instruction both in Medicine and Surgery are held each morning from 9 o'clock from Oct. 1st till the end of June. Special classes for students commencing their hospital studies will be held in the wards during the months of October, November, and December. They will embrace the elements of Medicine and Surgery, including note-taking. The surgical operating theatre, which has recently been erected, is equipped upon the most approved principles and is thoroughly in accord with modern surgical requirements. Instruction in the Diseases of Women is given Tuesday and Friday at 10 A.M. There is a special wing devoted to fever cases. Pathological and Bacteriological Demonstrations will be given on Fridays at 10.30 A.M., when there is suitable material, during the Winter and Summer Sessions in the new Pathological Laboratory. A new department has been opened for the special treatment of Throat, Nose, and Ear Diseases under the direction of Dr. R. H. Woods. Instruction will be given in these subjects and in the use of the Laryngoscope and Otoscope to senior students on Mondays and Thursdays. Arrangements have been made to give practical instruction in anæsthetics to senior students. Practical demonstrations are given in Dentistry on Wednesdays in the new Special Dispensary. Opportunities are given the members of the hospital class of seeing the various applications of the X rays to the diagnosis and treatment of injury and disease. Opportunities are also afforded in the out-patient department for the diagnosis and treatment of the numerous minor ailments not met with in the hospital wards. A Resident Surgeon, with salary, is appointed annually. The election takes place at the end of December. Five Resident Pupils are appointed each half-year. Six Surgical Dressers and six Clinical Clerks are appointed each month.

Prizes and Medals.—Clinical medals and prizes amounting to about £15 each will be awarded in Medicine and in Surgery respectively in accordance with the will of the late Rev. Samuel Haughton, M.D., S.F.T.C.D. Candidates who fail to obtain these medals and prizes will be awarded special certificates in Medicine and in Surgery provided they show sufficient merit. The next examination will be held in April, 1912.

Fees.—Winter and summer session, £12 12*s*.; winter session (six months), £8 8*s*.; and summer session (three months), £5 5*s*. Special certificate in anæsthetics, £1 1*s*. The practice of this hospital is open to students of medicine in attendance on schools other than the School of Physic, the certificates being recognised by the Royal University and Royal Colleges of Surgeons of England, Ireland, and Scotland.

Consulting Physicians: Dr. J. M. Purser and Dr. J. Magee Finny. Physicians: Dr. W. G. Smith, Dr. H. C. Drury, Dr. James Craig, and Dr. T. Henry Wilson Assistant Physician: Dr. E. J. Watson. Surgeons: Sir Charles B. Ball, Bart., Dr. E. H. Taylor, and Dr. C. A. K. Ball. Pathologist: Dr. A. C. O'Sullivan. Department for Throat, Nose, and Ear: Dr. R. H. Woods. Assistant Surgeon: Dr. C. M. Benson. X Ray Department: Dr. E. J. Watson. House Surgeon: Dr. G. E. Craig.

Further information will be supplied by the Secretary to the Medical Board, Dr. H. C. Drury.

JERVIS-STREET HOSPITAL, Dublin.—Founded 1718; rebuilt 1886. 130 beds. A new out-patient department has been completed and contains all modern requirements. Physicians: Dr. F. X. Callaghan and Dr. R. J. Rowlette. Surgeons: Mr. W. Stoker, Mr. L. A. Byrne, Mr. J. L. Keegan, and Mr. P. Hayden. Assistant Surgeon: Mr. T. W. Conway. X Rayist: Dr. H. W. Mason. Gynæcologist: Dr. McArdle. Ophthalmic Surgeon: Mr. P. Maxwell. Pathologist: Mr. E. J. McWeeney. Dentist: Mr. A. K. MacDonald. Secretary: Mr. Kiernan O'Dea.

MATER MISERICORDIÆ HOSPITAL,[2] Dublin.—Consulting Physician: Sir Francis R. Cruise. Physicians: Sir Christopher Nixon, Bart., Sir Joseph Redmond, Dr. John Murphy, and Dr. Martin Dempsey. Surgeons: Sir Arthur Chance, Sir John Lentaigne, and Mr. Alexander Blayney. Assistant Physician: Dr. John O'Donnell. Temporary Assistant Surgeon: Mr. D. Farnan. Gynæcologist: Dr. Robert Farnan. Ophthalmic Surgeon: Mr. Louis Werner. Surgeon for Diseases of Throat and Nose: Mr. Patrick Dempsey. Dental Surgeon: Mr. E. Sheridan. Pathologist: Professor Edmond McWeeney. Assistant Pathologist: Dr. W. D. O'Kelly. X Rayist: Mr. Maurice Hayes. Anæsthetist and Surgical Registrar: Dr. Patrick O'Farrell. This hospital, the largest in Dublin, at present containing 345 beds, is open at all hours for the reception of accidents and urgent cases. Clinical instruction will be given by the Physicians and Surgeons at 9 A.M. daily. A course of Clinical Instruction on Fever will be given during the winter and summer sessions. A certificate of attendance upon this course, to meet the requirements of the licensing bodies, may be obtained. Ophthalmic Surgery will be taught in the Special Wards and in the Dispensary. Surgical Operations will be performed daily at 11 o'clock. Connected with the hospital are extensive Dispensaries, which afford valuable opportunities for the study of general Medical and Surgical Diseases, and Accidents. Instruction will be given on Pathology and Bacteriology. Two House Physicians, six House Surgeons, and 20 resident pupils will be elected annually. Dressers and Clinical Clerks will also be appointed, and certificates will be given to those who perform their duties to the satisfaction of the staff. Leonard Prizes will be offered for competition annually. For further particulars see prospectus. Certificates of attendance upon this hospital are recognised by all the Universities and licensing bodies in the United Kingdom. Private Wards have been opened for the reception of Medical and Surgical cases. A Training School and a Home for Trained Nurses have been opened in connexion with the Hospital.

Terms of attendance.—Nine months, £12 12*s*.; six winter months, £8 8*s*.; three summer months, £5 5*s*. Entries can be made with any of the physicians or surgeons, or with the Registrar, Dr. Martin Dempsey, 35, Merrion-square. A prospectus containing in detail the arrangements for Clinical Instruction, Prizes, &c., may be obtained from the Secretary, Medical Board.

MEATH HOSPITAL AND COUNTY DUBLIN INFIRMARY.[2]—Physicians: Sir John William Moore, Dr. J. Craig, and Dr. Edward E. Lennon. Surgeons: Sir L. H. Ormsby, Mr. W. J. Hepburn, Mr. William Taylor, Mr. R. Lane Joynt, and Mr. F. C. Dwyer. Gynæcologist: Dr. F. W. Kidd. Clinical Assistants: Dr. William Boxwell and Dr. Henry Stokes. Pathologist: Professor Arthur H. White. This hospital was founded in 1753 and now contains 160 beds available for clinical teaching. A building containing 40

[2] No returns.

beds for the isolated treatment of fevers is attached to the hospital. The certificates of this hospital are recognised by all the universities and licensing bodies of the United Kingdom. Six Medical Clinical Clerks and 12 Surgical Resident Pupils and Dressers are appointed every six months, and a House Surgeon and two Clinical Assistants are elected annually. The session will open on Oct. 1st. A prospectus giving the complete arrangements for the Medical and Surgical classes for the coming session may be obtained from the Secretary of the Medical Board, Mr. William Taylor, 47, Fitzwilliam-square, Dublin.

MERCER'S HOSPITAL.—This hospital, founded in 1734, is situated in the centre of Dublin, in the immediate vicinity of the Schools of Surgery of the Royal College of Surgeons, the Catholic University School of Medicine, and within five minutes' walk of Trinity College. It contains 120 beds for medical and surgical cases, and arrangements have been made with the medical officers of Cork-street Fever Hospital whereby all students of this hospital are entitled to attend the clinical instruction of that institution and become eligible for the posts of Resident Pupil, &c. There are a large out-patient department and a special department for diseases peculiar to women. There are also special wards for the treatment and study of children's diseases. During the past few years the hospital has undergone extensive alterations in order to bring it up to modern requirements.

Appointments.—A House Surgeon is appointed annually. Five Resident Pupils, each for six months, and Clinical Clerks and Dressers are appointed monthly from amongst the most deserving members of the class.

Fees.—Winter, six months, £8 8*s.*; Summer, three months, £5 5*s.*; nine months, £12 12*s.*

Consulting Physician: Dr. J. Magee Finny. Consulting Surgeon: Mr. H. Fitzgibbon. Consulting Gynæcologist: Dr. J. H. Glenn. Consulting Ophthalmic Surgeon: Mr. J. B. Story. Physicians: Dr. E. L'Estrange Ledwich and Dr. J. Lumsden. Surgeons: Mr. R. C. B. Maunsell, Mr. S. S. Pringle, and Mr. W. Ireland de C. Wheeler. Gynæcologist: Dr. A. N. Holmes. Radiologist: Dr. W. H. Mason. Pathologist: Dr. J. T. Wigham.

For further particulars apply to Mr. Seton Pringle, Hon. Sec.. Medical Board, 27, Lower Baggot-street, Dublin.

NATIONAL MATERNITY HOSPITAL, Holles-street, Dublin.—Established 1894. Masters: Dr. A. J. Horne and Dr. R. J. White. Intern cases, 898; extern cases, 1135; dispensary cases, 4447. Comfortable quarters have been recently provided for students, and a large number of cases at the hospital give great opportunities for practical work. Arrangements are also made for post-graduate and special courses. Certificates of attendance at the hospital are recognised by all the licensing bodies. For further particulars apply to the Masters.

RICHMOND, WHITWORTH, AND HARDWICKE HOSPITALS, North Brunswick-street, Dublin.[3]—These hospitals contain 270 beds—86 for Surgical cases, 64 for Medical cases, and 120 for Fever and other Epidemic Diseases. A Resident Physician and a Resident Surgeon are appointed each half year and are paid for their services. 12 Resident Clinical Clerks are appointed each quarter and provided with furnished apartments, fuel, &c. These appointments are open not only to advanced Students but also to those who are qualified in Medicine and Surgery. The Dressers are selected from among the best qualified of the pupils without the payment of any additional fee. For prospectuses apply to Dr. Travers Smith, Hon. Secretary, 20, Lower Fitzwilliam-street, Dublin.

ROTUNDA HOSPITAL, Dublin.—This institution is the largest combined gynæcological and maternity hospital in the British empire. Qualified men who take out a course of three months' duration obtain (if they show keenness and capacity) one or more forceps applications and a certain number of minor gynæcological operations. Students can enter at any time for the practice of the hospital and have access, not alone to the maternity and gynæcological wards, but also to the pathological laboratory attached to the hospital. The residential quarters have undergone considerable improvement and afford comfortable accommodation. Valuable appointments are periodically filled by qualified students who have obtained the hospital diploma. Women students can reside in the hospital on terms similar to those enjoyed by men. Master: Dr. Henry Jellett. Assistants: Dr. B. A. H. Solomons and Dr. Madill. Pathologist: Dr. R. J. Rowlette. Assistants: Dr. Allen and Dr. English. For further particulars apply to Dr. Henry Jellett, Master.

ROYAL CITY OF DUBLIN HOSPITAL.—Founded 1832; enlarged 1851; rebuilt 1893. 124 beds. Consulting Physician: Dr. H. Benson. Physicians: Dr. A. R. Parsons and Dr. T. G. Moorhead. Consulting Surgeon: Mr. H. Fitzgibbon. Surgeons: Mr. G. J. Johnston, Mr. H. Moore, and Mr. R. A. Stoney. Ophthalmic and Aural Surgeon: Mr. A. H. Benson. Gynæcologist: Mr. G. Fitzgibbon. Anæsthetist: Mr. G. P. Meldon. Dental Surgeon: Mr. D. L. Rogers. Secretary: Mr. T. Spunner.

ROYAL VICTORIA EYE AND EAR HOSPITAL, Dublin.—Established 1844. Incorporated 1897. 82 beds. Consulting Physician: Dr. J. Little. Consulting Dental Surgeon: Mr. A. W. W. Baker. Surgeons: Sir Henry Swanzy, Mr. J. B. Story, and Mr. Arthur H. Benson. Junior Surgeon: Mr. P. W. Maxwell. Assistant Surgeons: Mr. L. Werner, Mr. R. J. Montgomery, Mr. H. C. Mooney, and Mr. F. C. Crawley. Clinical Assistant: Miss K. F. Lynn. Physician to Dispensary for Throat: Dr. R. A. Hayes. Surgical Radiographer: Mr. W. S. Haughton. Registrar: Mr. E. Parker. In-patients, 1426; out-patients, 10,132. Two house surgeons appointed annually.

DR. STEEVENS' HOSPITAL, Dublin.—Established 1720. 200 beds. Consulting Physicians: Dr. J. Little, Dr. J. M. Purser, and Dr. H. C. Tweedy. Consulting Surgeon: Sir C. B. Ball. Physicians: Dr. R. A. Hayes, Dr. T. P. C. Kirkpatrick, and Dr. W. A. Winter. Assistant Physician: Dr. J. J. Purser. Surgeons: Mr. R. B. McCausland, Mr. R. L. Swan, and Mr. W. S. Haughton. Assistant Surgeon: Mr. W. C. Stevenson. Anæsthetist: Dr. F. O'Brien Kennedy. Obstetric Physician and Gynæcologist: Dr. E. H. Tweedy. Ophthalmic and Aural Surgeon: Mr. J. B. Story. Pathologist: Dr. W. M. Crofton. Dental Surgeon: Mr. G. M. P. Murray. Resident Surgeon: Dr. G. C. Sneyd. Secretary: Mr. G. E. Pepper. Patients, 1571.

ST. VINCENT'S HOSPITAL AND DISPENSARY, Dublin.[4]—Established 1834. 160 beds. Physicians and Lecturers on Medicine: Dr. M. F. Cox, Dr. M. McHugh, and Dr. W. J. Dargan. Physician for Extern Department: Dr. J. Meenan. Surgeon for Extern Department: Mr. D. J. Kennedy. Surgeons and Lecturers on Surgery: Mr. J. S. McArdle, Mr. R. F. Tobin, and Mr. P. J. Fagan. Gynæcologist and Lecturer on Gynæcology: Mr. A. J. Smith. Pathologist and Lecturer on Pathology: Dr. T. T. O'Farrell. Surgeon-Dentist and Lecturer on Dentistry: Mr. J. J. Murphy. Pharmacist and Lecturer on Pharmacy: R. Shaw.

UNIVERSITY OF BRUSSELS.

British and other practitioners holding registrable qualifications are admitted to the examination for the Doctorate of the University of Brussels without further curriculum. It is essentially a practitioner's examination and is separate from that intended for the Belgian students who take up the medical curriculum of the University. The fees are—For matriculation, £8 12*s.*; for 1st Part, £4 4*s.*; for 2nd Part, £4 8*s.*; for 3rd Part, £4 8*s.*; for legalisation of diploma, 8*s.*—total, £22. Candidates who have paid in advance the fees for the three examinations, and are unsuccessful in the first, recover the fees paid for the second and third; those who fail in the second recover the fees paid for the third examination. Unsuccessful candidates are allowed to come up again three months after rejection on payment of examination fees only, provided this second appearance be in the course of the same academical year (Oct. 1st to June 30th), otherwise they must renew the payment of the matriculation fee of £8 12*s.* The examination consists of three parts, viz.—1st Part: General Medicine; Materia Medica and Pharmacology; General Surgery; and Theory of Midwifery. 2nd Part: General Therapeutics; Pathology and Morbid Anatomy, with use of the microscope; Special Therapeutics and Medicine of Internal Diseases, including Mental Diseases; and Special Surgery. 3rd Part: Public and Private Hygiene; Medical Jurisprudence; Clinical Medicine; Clinical Surgery; examination in Operative Surgery, consisting of some of the usual

[3] No returns.

[4] No returns.

operations on the dead subject—viz., Amputation, Ligature of an Artery, &c.; Ophthalmology; examination in Midwifery, consisting in obstetrical operation on the mannikin (model of pelvis); and examination in Regional Anatomy with Dissection. The time required for the three examinations seldom exceeds ten days, and is usually less. Candidates have the option of passing each part separately, or of taking the three together, and the latter is the usual course; also of demanding a written examination on payment of an additional fee of one guinea for each part, a rule of which candidates rarely or never avail themselves. The examinations, which are *viva voce*, begin on the first Tuesday in November, December, March, May, and middle June. Candidates should appear with their medical registration certificate or their diplomas at the Secretary's office not later than 2 P.M. on the day preceding the examination. Most of the examiners speak English, and those who do not examine through the medium of an interpreter. Great importance is attached to practical knowledge, but candidates must also possess sound theoretical knowledge, the standard required varying with the subject. Pathological and other specimens are not usually shown. There are in England at present over 600 graduates holding this degree, and a British Association of Brussels Medical Graduates has been in existence for many years. Applications should be made to the Secrétariat, 14, Rue des Sols, Bruxelles.

THE NAVAL, MILITARY, AND INDIAN MEDICAL SERVICES.

THE conditions of service in the medical departments of the Army and Indian Army remain, with certain modifications, the same as for 1910, but the conditions of medical service in the Royal Navy have been modified with the intention of making the Service compare more favourably with the sister Services, as well as with the circumstances under which much civilian practice is carried on.

A new Order in Council was made on August 8th, 1911, based, it is understood, on the report of Sir John Durnford's Committee, appointed two years ago. This Order appeared on Friday, August 18th, and will, we fear, be a disappointment to all but the senior officers of the Service. The old ranks of inspector and deputy inspector-general become surgeon and deputy surgeon-general, as they used to be in the army. Pay is increased by 1*s.* daily every alternate year till 28 years' service, when it is £1 15*s.* a day, and for fleet-surgeons does not rise any higher. Deputy Surgeons-General get a rise of 3*s.* daily. Senior medical officers of battleships and cruisers with complements of 650 and upwards get 3*s.* 6*d.* daily charge pay, which is very right and has often been asked for. The fleet-surgeon at Shotley is given 5*s.* charge pay, and staff-surgeons there may get 2*s.* 6*d.* The surgeon who after entry desires to take up a post of house surgeon may perhaps be allowed to do so, but he cannot count that time for promotion. The surgeon who passes the staff surgeon's examination at his first attempt may secure 18 months' earlier promotion by getting a special certificate (or 12 months' if he only attains a first class), provided the Admiralty thinks him deserving and the director-general does not reduce the period. A surgeon who has passed this examination before eight years may, as at present, retire with a gratuity of £1000 if he so choose; but if he has not passed at eight years he will be compulsorily retired on any gratuity the Admiralty thinks right, not exceeding £500. We doubt whether the added inducements are likely to complete the 10 per cent. shortage in the department, but, on the other hand, the service is in many respects so good a one, and the disabilities of civilian practice are just now so much in evidence, that this surmise may be unduly pessimistic.

We would strongly urge on the authorities the advisability of removing legitimate grievances *now;* the reforms could for the most part be effected at the expense of little but tact and a consideration of what is justly due to the naval medical officers. Every naval medical officer who has written to our columns, and this is not a small number, has expressed dissatisfaction with the position in which the cabin question has been left by recent regulations. Allotment to the medical officer of cabin accommodation inferior to that to which he is entitled still takes place, and cannot, at any rate cannot always, be explained by the cramped space on that elaborate box of tricks, a modern man-of-war. Another innovation sadly wanted is a regulation to ensure that the senior medical officers in hospitals should have proper disciplinary power over their subordinates and patients. Other points, such as the supply and use of boats, for example, might well be settled in accordance with the just desires of the Naval Medical Service, for the Admiralty will be prudent to aim at making the Service more popular. And the same may be said of all three services. For that there is now no competition for commissions in the Naval Medical Service and no keen competition for those in the Army Medical Corps or the Indian Medical Service seems undeniable, and this is the more unfortunate a position since fewer men are now entering the medical profession as a whole. It is no longer easy for all hospitals to obtain suitable residents, while assistants are scarce and even junior partners are not to be found directly they are wanted. The Services will therefore have to be careful to increase their popularity, and the point is that it may be economical of them to do so now. By small concessions they may be avoiding having later to pay a heavy price to attract men. We would also suggest that it is unwise to let any of these departments run below the normal strength if it is possible to maintain them at par.

Though reform may be wanted in the Naval Medical Service, its present state is not without material advantages. At one time not so very long ago the Naval Medical Service was not looked upon as one in which an educated gentleman could serve with dignity, while complaints were heard of many of the conditions of service. But the old order of things is giving place to the new, and a comparison of the lot of the naval medical officer with that of the civil practitioner will show that the trials of the civil branch of the profession are greater than those of the naval branch, and probably when all things are considered the naval surgeon is in a far better position than the average lay professional man. In the junior ranks of the Service the pay is better than the average income of the lay medical man of the same age, and promotion is not always slow. With £20 a month the young naval surgeon can, if he is not extravagant, get along very comfortably, though he will require at the commencement of his career £50 or £60 for outfit. A private income is certainly not necessary. After 20 years of service a naval surgeon is entitled to a pension of £365 a year, which compares very favourably with the prospects of many medical men on the civil side of the profession, and in case of illness there is the half-pay rate, while pensions are provided for widows and children. In this way the young naval officer is relieved of the most serious anxiety which can press upon a married man, but he ought not to marry young without due consideration, a warning which, however, applies to most medical men. With regard to the Medical Services of the Army and Indian Army, a comparison with that of the Navy shows that though the Army and Indian Service are better paid, promotion in the case of the army has been rendered less certain; in both services expenses are higher and the work more fatiguing, while in the Indian Service there is a greater liability to disease and death. The young surgeon, too, on board his vessel probably gets a better chance in the Navy than in the Army. So long as the new surgeon is adequately good at his profession, is kind and unselfish towards his patients is not too self-assertive, and has any positive accomplishments or skill at any sport or game, he should get on very well, especially if he is good-humoured and helpful. And if a man has not these qualities and readiness where should he be advised to practise?

The conditions of entry into the Royal Naval Medical Service were altered quite recently. Formerly, candidates on passing the examination in London at once received their commissions as surgeons in the Royal Navy. They are now merely appointed acting surgeons. Then, after courses of instruction, they will be again

examined, and if they pass this examination also will be duly commissioned. Their seniority—that is, their place on the list throughout their service—will depend on the marks they get in both examinations. The standard of marking is not disclosed, and proficiency in the second examination in subjects which have been studied only through perhaps three or six months may avail as much in fixing their places as success in the first examination, which is the outcome of the industry and training of at least five years. This point should be cleared up by the Admiralty, as the uncertainty will operate to discourage application from the best candidate, the most highly educated, those most desired by the service, who will be rather shy to trust their hard-won pre-eminence to so doubtful a fortune. An extra 10 per cent. for the second examination would give plenty of inducement to the acting surgeons to be attentive to the important instruction in tropical diseases and naval hygiene they receive at Haslar. The relative proportions should be mentioned if the best candidates are not to be frightened away. The entrance examination is also altered. Voluntary subjects and hygiene are done away. The examination will deal with medicine and surgery only. In each subject there is a written, a clinical, and an oral examination, and 400 marks are given for each of the six examinations. This scheme gives a material advantage in the competition to less broadly educated candidates. Confidential reports as to the character of a candidate are now to be obtained from the dean of his medical school. Certain additional marks are given to candidates who possess certificates from the Officers' Training Corps. Nominated candidates, except those nominated by colonial universities, are no longer allowed.

ROYAL NAVY MEDICAL SERVICE.

REGULATIONS FOR THE ENTRY OF CANDIDATES FOR COMMISSIONS IN THE MEDICAL DEPARTMENT OF THE ROYAL NAVY.

Every candidate for admission into the Medical Department of the Royal Navy must be not under 21 nor over 28 years of age on the day of the commencement of the competitive examination. He must produce an extract from the register of the date of his birth; or, in default, a declaration made before a magistrate, from one of his parents or other near relative, stating the date of birth.

He must be registered under the Medical Act in force, as qualified to practise medicine and surgery in Great Britain and Ireland.

He must declare (1) his age and date and place of birth; (2) that he is of pure European descent and the son either of natural-born British subjects or of parents naturalised in the United Kingdom; (3) that he labours under no mental or constitutional disease or weakness, nor any other imperfection or disability which may interfere with the most efficient discharge of the duties of a medical officer in any climate; (4) that he is ready to engage for general service at home or abroad, as required; (5) whether he holds, or has held, any commission or appointment in the public services; (6) that he is registered under the Medical Act, giving the date of his registration as a medical student, or of his beginning professional study [1]; and (7) whether he has previously been examined for entry in the Naval Service, and, if so, when.

The certificates of registration and birth must accompany the declaration, which is to be filled up and returned as soon as possible, addressed to the Director-General, Medical Department, Admiralty, London, S.W., to permit of reference to the candidates medical school. The Dean or other responsible authority of such school will be requested by the Medical Director-General to render a confidential report as to the candidate's character, conduct, professional ability, and fitness to hold a commission in the Royal Navy. The candidate will then be interviewed by the Medical Director-General, and his physical fitness will be determined by a board of Naval Medical Officers. The Medical Director-General will then decide whether he may be allowed to compete. If accepted, the candidate will be eligible to present himself at the entrance examination, which will be held twice a year. Notification of the exact date of this, as well as the number of commissions to be competed for, will be advertised in THE LANCET. Candidates will be examined in the following subjects: (*a*) Medicine, including Medical Pathology and Therapeutics; and (*b*) Surgery, including Surgical Pathology and Clinical Surgery. The examination will be partly written and partly practical, marks being allotted under the following scheme:—

Medicine.		*Surgery.*	
Paper	400	Paper	400
Clinical...	400	Clinical...	400
Oral	400	Oral	400
Total	1200	Total	1200

No candidate will be considered eligible who obtains less than 50 per cent. of marks in each subject. The examination will be held in London and will occupy four days.

The appointments announced for competition will be filled from the list of qualified candidates, arranged in order of merit; but should it at any time be considered expedient to grant Commissions beyond those periodically competed for, the Admiralty have power to admit annually not more than six candidates, according to requirements, specially recommended by the governing bodies of such colonial universities as may be selected and whose qualifications are recognised by the General Medical Council. Candidates so proposed are to be approved by the Director-General of the Medical Department of the Navy. Colonial candidates will have to pass a physical examination before a board of Naval Medical Officers in the colony, and will be required to register their qualifications on arrival in England. They will be allowed, if they wish it, to compete at the next examination for entrance and take their position according to the order of merit; should they decide not to compete they will be placed at the bottom of the list. A fee of £1 will have to be paid by each candidate to entitle him to take part in the competition.

Candidates who have served in the Officers' Training Corps, and who are in possession of the certificates laid down in the regulations for that Corps, will be credited at the entrance examination with additional marks as follows: Candidates in possession of Certificate A will receive 1 per cent., and those who possess Certificates A and B, 2 per cent. of the maximum number of marks allotted.

A candidate will not be allowed to compete at more than two examinations.

A candidate successful at the entrance examination will be appointed as acting surgeon in the Royal Navy and will be required to pass through such courses of instruction as the Admiralty may decide. At the end of the courses the acting surgeon will be examined and after he has passed will be given a commission as surgeon in the Royal Navy. The commission will date from the day of passing the entrance examination. The number of marks gained at this examination, together with those gained at the entrance examination, will decide a candidate's place on the list for seniority. An acting surgeon who fails to qualify in the above examination will be allowed a second trial at the next examination, the period between the two examinations not being counted as service for either promotion, withdrawal with gratuity, or retirement after 20 years' service, and should he qualify he will be placed at the bottom of his list; should he again fail his appointment will not be confirmed and he will be required to withdraw.

A gold medal, a silver medal, and three navy regulation pocket cases will be awarded as prizes in connexion with these examinations, and the gold medallist will have a distinguishing mark after his name in the Navy List.

Surgeons on entry are only required to provide themselves with a regulation pocket case of instruments.

Promotion.

An Inspector-General of Hospitals and Fleets will be selected from amongst Deputy Inspectors-General who have in that rank three years' full pay service and who have not at any time declined foreign service except for reasons which the Lords Commissioners of the Admiralty regard as good and sufficient.

A Deputy Inspector-General of Hospitals and Fleets will be selected for ability and merit from amongst Fleet Surgeons, but must have served in a ship of war at sea for two years as a Fleet Surgeon, or for five years as Fleet and Staff Surgeon combined.

(*a*) Subject to the approval of the Lords Commissioners of the Admiralty rank as Fleet Surgeon will be granted to Staff Surgeons at the expiration of eight years from the date of promotion to Staff Surgeon, provided they are recommended by the Medical Director-General, have served in a ship of war at sea for three years, and have not declined service except for reasons which in the opinion of the Lords Commissioners of the Admiralty are satisfactory. (*b*) Special promotions from the rank of Staff Surgeon to that of Fleet Surgeon will be made at their Lordships' discretion in cases of distinguished service or conspicuous professional merit. Such promotions will be exceptional and will not exceed the rate of one in two years; the total number at any one time of Fleet Surgeons holding that rank by such special promotions will not exceed six.

(*a*) Rank as Staff Surgeon will be granted, subject to their Lordships' approval, to surgeons at the expiration of eight years from the date of entry, provided they are recommended by the Medical Director-General, have served in a ship of war for three years, and have passed such examination as may be required after completion of five years from the date of entry in the rank of surgeon. (*b*) Special promotions will be made at their Lordships' discretion to the rank of Staff Surgeon in cases of distinguished service or conspicuous professional merit. Such promotions will be exceptional and not exceed the rate of one a year. The total number at any one time of Staff Surgeons holding that rank by such special promotions will not exceed eight. No officer will be so promoted unless he passes the examination prescribed for other surgeons, but in such a case the requirement of five years' time in rank of surgeon will be dispensed with. (*c*) When a surgeon's promotion to the rank of Staff Surgeon has been retarded by failure to pass the qualifying examination he will, should he pass and be promoted, be dealt with as follows. He will be granted the seniority as Staff Surgeon he would have received had he passed in ordinary course. He will reckon service for increase of full and half pay only from the date of appointment to full pay as Staff Surgeon. If on half pay, or if placed on half pay when promoted, he will receive the lowest rate of half pay of the new rank from the date of passing the qualifying examination. Where delay in passing the qualifying examination may be due to unavoidable circumstances special consideration will be given. (*d*) The seniority of surgeons on entry will be determined by the sum total of the marks they obtain at the London examination and those at the conclusion of the Haslar course and their names will then be placed in the official navy list, except in the case of candidates who hold, or are about to hold, a post as resident medical officer or surgical officer to a recognised civil hospital. These candidates will retain the position in the list which they obtained on entry, and when their period of service as resident officer is over they will join the next Haslar course and will be required to obtain qualifying marks. Surgeons entered without competition will take seniority next after the last surgeon entered at the same time by competition. (*e*) The examination for promotion to the rank of staff surgeon will be held by the Examining Board, to which a naval medical officer will be attached to conduct the examination in naval hygiene. The subjects of examination will be in writing and will include medicine, surgery, pathology, general hygiene, naval hygiene. (*f*) A candidate who at the time of passing the examination for entry into the medical branch of the Royal Navy holds, or is about to hold, an appointment as resident medical or surgical officer in a recognised civil hospital, will perhaps be allowed to serve in such civil appointment provided that the period of such service after the date of entry into the Royal Navy does not

[1] If any doubt should arise on this question the burden of clear proof that he is qualified will rest upon the candidate himself.

exceed one year. Pay from naval funds will be withheld from officers while thus serving, who will not be promoted earlier to staff surgeon, if they have joined after Jan. 1st, 1910.

A Surgeon who, on attaining eight years' seniority in that rank, has failed to pass the examination for the rank of Staff-Surgeon will be compulsorily retired with such gratuity as the Admiralty may see fit to award, but not exceeding £500. This rule is not, however, to apply in cases where, in the opinion of the Admiralty, failure to qualify is due to unavoidable circumstances, nor to surgeons who entered before July 1st, 1911, and who elect to receive pay at the old rates. Surgeons are to be eligible for accelerated promotion to Staff Surgeon according to the class of certificate obtained in the examination for the rank of Staff Surgeon as follows:—Special certificate, 18 months; first-class certificate, 12 months. The above acceleration of promotion is only to be granted in the case of an officer considered to be deserving of advancement, and the Admiralty will have power to reduce the several periods if considered advisable, on the recommendation of the Director-General of the Medical Department. No surgeon who has failed to pass for staff surgeon will be granted accelerated promotion on the result of any subsequent examination, whatever may be the class of certificate obtained.

No restriction is to be placed upon the number of special promotions which may be made to the ranks of staff and fleet surgeon for gallantry in action.

The medical officers in charge of the following hospitals and sick quarters will be granted charge pay: Haslar, Plymouth, Chatham, Malta, Hong-Kong, Bermuda, Portland, Yarmouth, Haulbowline, Cape, Gibraltar, and Yokohama. The rate of charge pay will be as follows:—

	s. d.	
Inspectors-General	10 0	a day.
Deputy Inspectors-General	7 6	,,
Fleet Surgeons of over 4 years' seniority	5 0	,,
Fleet Surgeons of under 4 years' seniority and Staff Surgeons of over 4 years' seniority	2 6	,,

The hospital allowances for naval medical officers at home and abroad, in lieu of provisions, for themselves and servants, and for fuel and lights, are as follows:—

—	At home.	Abroad.
	£	£
Deputy Inspectors-General	67	112
Fleet Surgeons and Staff Surgeons of over 4 years' seniority	53	112
Staff Surgeons of under 4 years' seniority and Surgeons	39	108*

* Except at Malta, where the allowance will be £70, but servants will be provided at the public expense. These allowances are also granted to medical officers of marine divisions and dockyards.

Charge pay at the Training Establishment at Shotley is to be granted to Fleet and Staff Surgeons in charge of medical duties as follows:—Fleet Surgeons of four years' seniority 5*s.* a day; Fleet Surgeons under four years' seniority, and Staff Surgeons, 2*s.* 6*d.* a day; the Medical Officer in charge of the medical duties of a ship-of-war at sea with a complement of not less than 650 officers and men is to receive charge pay at the rate of 3*s.* 6*d.* a day.

An allowance of 5*s.* a day, in addition to full pay, is granted to the senior medical officer, being a Fleet or Staff Surgeon, of a flag-ship bearing the flag of a Commander-in-Chief. An allowance of 2*s.* 6*d.* a day is granted to the senior medical officer, being a Fleet or Staff Surgeon, of the ship bearing other flags or broad pendants. The following charge allowances may be granted to medical officers in charge of hospital ships: if above the rank of fleet surgeon, 5*s.* a day; and if of the rank of fleet surgeon or junior, 3*s.* 6*d.* a day. The Fleet and Staff Surgeons serving at the Admiralty and the Marine Rendezvous will be granted the Hospital allowance of £53 a year in addition to the usual lodging money. Medical officers conducting the courses of instruction at Haslar Hospital will receive the following allowances: two senior officers employed upon this duty, £150 a year each; the junior officer assisting, £50 a year; and the junior officer instructing the Sick Berth Staff, £50 a year. The junior officer instructing the Sick Berth Staff at Plymouth, £50 a year. Medical officers employed elsewhere than at a hospital, and not victualled in kind, receive an allowance of 1*s.* 6*d.* a day in lieu of provisions, fuel, and lights. The travelling allowances, extra pay, lodging money, and compensation for losses are fixed for naval medical officers according to their relative rank in the service.

Inspector-General	1 18 0	693 10 0

Candidates will do well to notice that the regulations issued to applicants do not put any limit on the amount of half-pay service which they may be compelled to undergo, also that time on half-pay counts only one-third towards retirement.

Retirement.

Compulsory retirement will be as follows:—

Inspector and Deputy Inspector-General of Hospitals and Fleets.	At the age of 60, or at any age, if he has had three years' non-employment in any one rank, or after four years' continuous non-employment in any two ranks combined. Except that if in any particular case the Lords Commissioners of the Admiralty may consider that the interests of the public service will be materially advanced by the further retention of an Inspector-General of Hospitals and Fleets on the active list, the age for the retirement of such Inspector-General may be extended to 62.	To be retired irrespective of age if found physically unfit for service.
Fleet Surgeon, Staff Surgeon, and Surgeon.	At the age of 55, or at any age, if he has had three years' non-employment in any one rank, or after four years' continuous non-employment in any two ranks combined.	

The special attention of candidates is directed to the following rules under which officers are allowed to withdraw from the service after four years' full pay service in the Royal Navy, with the advantage of joining the Reserve of Naval Medical Officers:—

After four years' service in the Royal Navy, an officer, if he wishes, may pass from active service to the Reserve of Naval Medical Officers, when he will reap the following advantages:—

(1) He will be granted a gratuity of £500 on passing into the Reserve.

(2) His name will be retained in the Navy List; he will retain his naval rank and be entitled to wear his naval uniform under the regulations applying to officers on the retired and reserved lists of His Majesty's Navy.

(3) If he agree to remain in the Reserve for four years he will receive a retaining fee of £25 per annum. If at the expiration of this period he agree to remain in the Reserve for a further period of four years he will continue to receive the same retaining fee.

Should an officer prefer it, however, he may simply enter the Reserve for a period not exceeding eight years, with power to give six months' notice of his intention to resign his position at any time (in which case he will receive no retaining fee). He may also adopt this method of Reserve service after the expiration of four years served under the conditions referred to in (3), by renouncing his retaining fee for his last four years' service in the Reserve.

No officer will be allowed to remain in the Reserve for a longer period than eight years.

Officers of the Reserve will be liable to serve in the Royal Navy in time of war or emergency. When called up for such service they will receive the rate of pay—viz., 17*s.* a day and allowances—to which they would have been entitled after four years' service on the active list.

Voluntary retirement and withdrawal will be allowed as follows. (*a*) Every officer will have the option, subject to their Lordships' approval, of retiring after 20 years' full-pay service on the scale of retired pay provided in the table below, or with a gratuity on the scale provided in that table if not eligible for retired pay. (*b*) At the expiration of four, eight, 12, or 16 years' full-pay service every officer will be permitted, subject to their Lordships' approval, to withdraw from the Naval Service, receiving a gratuity on the scale laid down in the table below. The name of an officer so withdrawing will be removed from the list of the Navy, with which all connexion will then be severed, except in the case of officers who withdraw after four years who are liable to serve in the Reserve. (*c*) Voluntary retirement and withdrawal at the discretion of their Lordships will be allowed, as a rule, only when an officer is unemployed or serving at home. Under special circumstances, however, it may be permitted in the case of an officer serving abroad, provided he pays his passage home, and, if necessary, that of his successor. (*d*) Applications from officers to retire or withdraw or resign their commissions will receive every consideration, but no officer will, as a rule, be permitted to resign under three years from the date of entry. In order that arrangements may, as far as possible,

be made for the relief of officers who may wish to withdraw on a gratuity it is desirable that six months' notice of their wish should be forwarded for the consideration of their lordships. The Admiralty reserve to themselves power to remove any officer from the list for misconduct.

Gratuities and retired pay will be awarded on retirement and withdrawal on the undermentioned scale:—

Rank.	Gratuities.	Daily.	Yearly.
Surgeon, Staff Surgeon, and Fleet Surgeon—	£ s. d.	£ s. d.	£ s. d.
After 4 years' full-pay service	500 0 0	—	—
After 8 years' full-pay service (including service allowed by (f))	1000 0 0	—	—
After 12 years' full-pay service (including service allowed by (f))	1500 0 0	—	—
After 16 years' full-pay service (including service allowed by (f))	2250 0 0	—	—
Fleet Surgeon—			
After 20 years' service (including proportion of half-pay time)	—	*1 0 0	365 0 0
After 24 years' service (including proportion of half-pay time)	—	*1 2 6	410 12 6
After 27 years' service (including proportion of half-pay time)	—	*1 5 0	456 5 0
After 30 years' service (including proportion of half-pay time), or on compulsory retirement at the age of 55	—	*1 10 0	547 10 0
Deputy Inspector-General ...	—	1 15 0	638 15 0
Inspector-General	—	2 0 0	730 0 0

* To obtain this rate an officer must hold the commission of Fleet Surgeon.

An officer retired with less than 20 years' service on account of disability, contracted in and attributable to the Service, will receive the half pay of his rank, or, with the consent of their Lordships, a gratuity on the scales given in the above table and in the paragraph following this under (*b*), but such officer will not be entitled to receive any special compensation for the disability in addition to the gratuity as above.

An officer retired with less than 20 years' service on account of disability, contracted in but not attributable to the Service, will receive—(*a*) if he has over eight years' full-pay service, either a gratuity on the scale given above or half-pay according as their Lordships think fit; (*b*) if he has less than eight years' full-pay service, such gratuity as their Lordships think fit, not exceeding the rate of £125 for each year of full-pay service. If the health of a surgeon breaks down before he completes 20 years' service, even if his disability be contracted in the Service or be due to climatic causes, he is liable at once to be placed on the retired list, receiving only a gratuity. This point should be well noted, as the position is a most unjust one.

In circumstances other than those specified in the last two paragraphs, and other than misconduct, neglect of duty, &c., an officer retired with less than 20 years' service will not be allowed half pay or retired pay, but will receive a gratuity on the scale laid down in the table above if he has eight years' full-pay service, and on that provided in the last paragraph (*b*) should his full-pay service not amount to eight years. The power vested in their Lordships of granting reduced rates of half pay and retired pay in cases of misconduct is extended to the award of gratuities on retirement, and the gratuity awarded will be reduced to such an amount as is thought fit. An officer retiring after 20 years' full-pay service will be eligible, if recommended by the Medical Director-General for distinguished or meritorious service, to receive a step of honorary rank, such step to be awarded at their Lordships' discretion, and not to confer any claim to increase of retired pay or of widow's pension. All retired officers will be liable, till the age of 55, to serve in time of declared national emergency, in a rank not lower than that held on retirement. This liability does not exist in cases of officers who withdraw from the Naval Service receiving a gratuity after 8, 12, or 16 years' full pay service. Retired officers will receive special consideration as regards appointments on shore connected with the Admiralty.

Widow's Pension.

When an officer retires or withdraws *on a gratuity* his widow and children will have no claim to pension or compassionate allowance. In respect to other officers on the active or retired list, the widow's pension ranges from £50 per annum for a surgeon's widow up to £120 for the widow of an Inspector-General; for each child an allowance is granted ranging from £9 to £20 per annum. Officers serving in the reserve who during re-employment are injured on duty, or lose their lives from causes attributable to the service, come under the same regulations as regards compensation for themselves, or pensions and compassionate allowances for their widows and children, as officers of the same rank on the permanent Active List.

Miscellaneous.

A special cabin will be appropriated to the Fleet or Staff Surgeon or the Surgeon in charge of the medical duties in each ship. Special regulations have been made as regards the mess expenses of medical officers appointed to the several divisions of Royal Marines for limited periods.

Every medical officer will be required to undergo a post-graduate course of three months' duration at a Metropolitan Hospital once in every eight years (should the exigencies of the Service permit), and this as far as possible during his Surgeon's, Staff Surgeon's, and Fleet Surgeon's period of service. While carrying out this course the medical officer will be borne on a ship's books for full pay and will reside at the Royal Naval College, Greenwich. The repayment of travelling expenses to and from his home or port will be governed by the King's Regulations; the fees for each course (not exceeding £25) will be paid by the Admiralty on the production of vouchers at the end of the course. The medical officer will be required to produce separate certificates of efficient attendance in the following: (1) the medical and surgical practice of the hospital, including instruction in anæsthetics; (2) a course of operative surgery on the dead body; (3) a course of bacteriology; (4) a course of ophthalmic surgery, particular attention being paid to the diagnosis of errors of refraction; and (5) a practical course of skiagraphy.

Relative rank is accorded to medical officers as laid down in the King's Regulations and Admiralty Instructions.

We recognise that the Admiralty has made a considerable effort to render the Medical Service attractive to men of a good professional stamp. By the regulations promulgated in 1903 promotion was accelerated, special promotion in the lower grades was made possible in cases of distinguished service or conspicuous professional merit, and encouragement to enter the service, in the shape of earlier promotion, was given to men who have held resident posts in recognised hospitals. A feature of the regulations is the permission to withdraw at the end of four years with a gratuity of £500. The new Order in Council, founded, it is presumed, on the recommendations of Sir John Durnford's Committee, grants a small increase of pay to medical officers all round, and senior medical officers are put in a materially better position if they are serving in large battle-ships or cruisers. Deputy-Surgeon-Generals get the 3*s.* daily that they did not get when pay was last re-adjusted. The rewards now offered to those who pass the examination for Staff Surgeon and the severe penalties held before those who fail should ensure the medical officers of eight years' service being men of ability and industry. But we regret that there is no mention of specialist pay which can be got by young officers of energy in the Army and Indian Service, nor is there any acceleration of promotion for scientific work.

If pay has been increased, in respect of allowances, the medical officers of the navy, up to the senior ranks, are not as well off as those of the Royal Army Medical Corps. There will also be discontent until the medical officers are unhampered in the performance of their important work by the executive officers. The medical officers should have control over the sick bay staff in ships, and over nurses and other attendants in hospitals, and executive officers should no longer figure as presidents of "medical surveys." The authority of the Director-General must be made adequate. More care must also be taken that medical officers are assigned fitting cabin accommodation. To make the service thoroughly efficient the medical officers must be given authority and position commensurate with their responsibilities, as has been done in the case of the Engineer department.

ARMY MEDICAL SERVICE.

During recent years the medical service of the Army has passed through many stages of evolution, and we consider that in all essential matters the changes have been distinctly in the direction of advance and improvement, not only for the officers composing this service, but in relation to the Army at large. The formation of the Royal Army Medical Corps by the Royal Warrant of 1898, when Lord Lansdowne was War Minister, marked the first great step; then came a period of strain during the war in South Africa, when the medical services were exposed to fierce criticism. The outcome of this was the appointment of a committee of inquiry in 1901 by Mr. Brodrick (now Lord Midleton), over which he himself presided. A Royal Warrant embodying the recommendations of Mr. Brodrick's committee was issued in 1902, which regulates the existing conditions of service; in 1907 free passages to India were granted for the wives and families of medical officers, whether employed on duty or not, an important concession, and one evidencing the liberal spirit of the War Office towards the medical service.

Since 1907 several important changes have been made from time to time. Prior to this date promotion from the rank of Major to Lieutenant-Colonel was made by seniority after the passing of an examination on attaining 20 years' service, the establishment of Lieutenant-Colonels being unlimited. Under a new clause introduced in the Royal Warrant the establishment of Lieutenant-Colonels was made a fixed number and limited to 120. Under present rules no promotion to the rank of Lieutenant-Colonel can take place unless three conditions are fulfilled—(1) there is a vacancy on the fixed establishment; (2) the officer has passed an examination for promotion; (3) he is selected as suitable for promotion. In the Colonels grade another

important and far-reaching change has been made since Jan. 9th, 1907. An officer promoted to the rank of Colonel after this date will, on completing four years' service in the rank, be placed on half-pay unless further promoted or retired from the service. Officers of the substantive rank of Colonel were also removed from the Royal Army Medical Corps, and have been since shown in the Army List as belonging to the Army Medical Service; they have also a distinctive uniform.

REGULATIONS FOR ADMISSION TO THE ROYAL ARMY MEDICAL CORPS
(ISSUED WITH ARMY ORDERS DATED JUNE 1ST, 1909).

A candidate for a commission in the Royal Army Medical Corps must be 21 years and not over 28 years of age at the date of the commencement of the entrance examination, and must be unmarried. He must, at the time of his appointment, be registered under the Medical Acts in force in the United Kingdom. A candidate must complete the subjoined form of application and declaration and submit it to the Director-General, A.M.S., in sufficient time to permit of reference to the medical school in which the candidate completed his course as a medical student.

APPLICATION OF A CANDIDATE FOR A COMMISSION IN THE ROYAL ARMY MEDICAL CORPS.*

(*A Candidate will not be permitted to compete oftener than twice.*)

1. Name in full.
2. Address.
3. Date of birth.†
4. Nature and date of examination qualifying for registration.
5. Date of registration as a medical student.
6. Dates of passing medical examinations—First, Second, Final.
7. Qualifications. (Medical Registration Certificate, or, if not registered, Diplomas to be furnished.)
8. Academic and other distinctions.
9. Medical school or schools in which the candidate pursued his course as a medical student, and name or names of the deans or other responsible authorities.
10. Particulars of any commission or appointment held in the public services, including service in the officers training corps.
11. Date of examination at which the candidate proposes to present himself.

Declaration.

(N.B.—A mis-statement by the candidate will invalidate any subsequent appointment and cause forfeiture of all privileges for services rendered.)

I hereby declare upon my honour that the above statements are true to the best of my knowledge and belief and further:—

1. That I am a British subject of unmixed European blood.
2. That I am not, as far as I know, at present suffering from any mental or bodily infirmity, or physical imperfection or disability that is likely to preclude me from efficiently discharging the duties of an officer in any climate.
3. That I will fully reveal to the Medical Board, when physically examined, all circumstances within my knowledge that concern my health.
4. I also declare that my vision is good with either eye (with or without the aid of glasses as the case may be).

Signature .....
Date.....

* All communications to be addressed to the Secretary, War Office, Whitehall, S.W.

† A certificate of registration of birth to be furnished.

(N.B.—It is of great importance that the names given in the birth certificate should be correctly given on this form, and it is to be clearly understood that when they differ the names and date of birth given in the birth or baptismal certificate will be accepted for official record.)

The dean, or other responsible authority, of the candidate's school will be requested by the Director-General to render a confidential report as to his character, conduct, professional ability, and fitness to hold a commission in the corps. A candidate whose application is regarded as satisfactory will be directed to appear before the Director-General, Army Medical Service, a few days preceding the examination. The Director-General will decide if the candidate may be allowed to compete for a commission. If approved, he will then be examined as to his physical fitness by a board of medical officers detailed by the Director-General a few days preceding his examination. The following is the order of the examinations:—

1. A candidate for a commission in the Royal Army Medical Corps must be in good mental and bodily health and free from any physical defect likely to interfere with the efficient performance of military duty.

2. The attention of the board will be directed to the following points: (*a*) That the correlation of age, height, weight, and chest girth is not less than that which is given in the following table:—

Physical Equivalents.

Age.	Height without shoes.	Chest.	
		Girth when expanded.	Range of expansion.
	Inches.		
21 and upwards.	62½ and under 65	35 inches.	2 inches.
	65 ,, 68	35½ ,,	2 ,,
	68 ,, 70	36 ,,	2 ,,
	70 ,, 72	36½ ,,	2½ ,,
	72 and upwards.	37 ,,	2½ ,,

(*b*) Measurement of height. The candidate will be placed against the standard with his feet together and the weight thrown on the heels and not on the toes or outside of the feet. He will stand erect without rigidity and with the heels, calves, buttocks, and shoulders touching the standard; the chin will be depressed to bring the vertex of the head level under the horizontal bar and the height will be noted in parts of an inch to eighths.

(*c*) Measurement of chest. The candidate will be made to stand erect with his feet together and to raise his hands above his head. The tape will be carefully adjusted round the chest with its posterior upper edge touching the inferior angles of the shoulder blades and its anterior lower edge the upper part of the nipples. The arms will then be lowered to hang loosely by the side and care will be taken that the shoulders are not thrown upwards or backwards so as to displace the tape. The maximum expansion during deep inspiration will be carefully noted.

(*d*) Weight. The candidate will also be weighed and his weight recorded in the proceedings of the Board.

(*e*) The regulations regarding the examination of eyesight are as follows:—

Squint, or any morbid condition of the eyes or of the lids of either eye liable to the risk of aggravation or recurrence, will cause the rejection of the candidate.

The examination for determining the acuteness of vision includes two tests: one for distant, the other for near vision. The Army Test Types will be used for the test for distant vision, without glasses, except where otherwise stated below, at a distance of 20 feet; and Snellen's Optotypi for the test for near vision, without glasses, at any distance selected by the candidate. Each eye will be examined separately, and the lids must be kept wide open during the test. The candidate must be able to read the tests without hesitation in ordinary daylight.

A candidate possessing acuteness of vision, according to one of the standards herein laid down, will not be rejected on account of an error of refraction, provided that the error of refraction, in the following cases, does not exceed the limits mentioned, viz.: (*a*) in the case of *myopia*, that the error of refraction does not exceed 2·5 D; (*b*) that any correction for *astigmatism* does not exceed 2·5 D; and, in the case of myopic astigmatism, that the total error of refraction does not exceed 2·5 D.

Subject to the foregoing conditions, the standards of the minimum acuteness of vision with which a candidate will be accepted are as follows:—

Standard I.

Right eye.	*Left eye.*
Distant vision.—V = 6/6.	V = 6/6.
Near vision.—Reads 0, 6.	Reads 0, 6.

Standard II.

Better eye.	*Worse eye.*
Distant vision.—V = 6/6.	V, without glasses, = not below 6/60; and, after correction with glasses, = not below 6/24.
Near vision.—Reads 0, 6.	Reads 1.

Standard III.

Better eye.	*Worse eye.*
Distant vision. — V, without glasses, = not below 6/24; and, after correction with glasses, = not below 6/6.	V, without glasses, = not below 6/24; and, after correction with glasses, = not below 6/12.
Near vision.—Reads 0, 8.	Reads 1.

In Standard III., the standard for the test for distant vision, without glasses, for officers of the Special Reserve, will be not below 6/36.

Inability to distinguish the principal colours will not be regarded as a cause for rejection, but the fact will be noted in the report, and the candidate will be informed. The degree of acuteness of vision of all candidates for commissions (including preliminary examinations) will be entered in their reports in the following manner:—

Sufficient	Right eye...	V = ...	Reads .....
	Left eye ...	V = ...	Reads .....
Defective	Right eye...	V = ...	Reads .....
	Left eye ...	V = ...	Reads .....

No relaxation of the standard of vision will ever be allowed.

The following additional points will then be observed. (*f*) That his hearing is good. (*g*) That his speech is without impediment. (*h*) That his teeth are in good order. Loss or decay of ten teeth will be considered a disqualification. Decayed teeth if well filled will be considered as sound. Non-erupted wisdom teeth will not be counted as deficient. (*i*) That his chest is well formed and that his heart and lungs are sound. (*j*) That he is not ruptured. (*k*) That he does not suffer from varicocele or varicose veins in a severe degree. A candidate who has been successfully operated on will be accepted. A definition of severe varicocele may be obtained from the Director-General Army Medical Service, War Office, Whitehall, S.W. (*l*) That his limbs are well formed and developed. (*m*) That there is free and perfect motion of all the joints. (*n*) That his feet and toes are well formed. (*o*) That he does not suffer from any inveterate skin disease. (*p*) That he has no congenital malformation or defect. (*q*) That he does not bear traces of previous acute or chronic disease pointing to an impaired constitution. (*r*) If the candidate is not of pure European descent the fact should be recorded by the board. If a candidate be pronounced physically fit for service at home and abroad he will be eligible to present himself at the next entrance examination which will be held twice in the year, usually in January and July. A candidate will not be permitted to compete oftener than twice.

The Army Council reserves the right of rejecting any candidate who may show a deficiency in his general education.

An entrance fee of £1 is required from each candidate admitted to the examination.

Candidates who have been specially employed in consequence of a national emergency, either as an officer or in a position usually filled by an officer, will be allowed to reckon such service towards retired pay and gratuity, and if over the regulated limit of age at the date of commencement of the competitive examination will be permitted to deduct from their actual age any period of that service if such reduction will bring them within the age limit. The duration of service is to be reckoned from the date on which the candidate commenced such service, except in the case of candidates who have served

for two or more periods at short intervals. In such cases the total period of service to be considered in granting marks at the entrance examination will be specially determined.

Candidates who have served in the Officers Training Corps, and who are in possession of the certificates laid down in regulations, will be credited at the entrance examination with additional marks as follows: those having Certificate A will receive 1 per cent., and those having A and B 2 per cent. of the maximum marks allotted.

A candidate successful at the entrance examination will be appointed a Lieutenant on probation and will be required to pass through such courses of instruction as the Army Council may decide and, after passing the examinations in the subjects taught and satisfying the Director-General that he possesses the necessary skill, knowledge, and character for permanent appointment to the Royal Army Medical Corps, his commission as Lieutenant will be confirmed. The commission will bear the date of passing the entrance examination.

The precedence of Lieutenants among each other will be in order of merit as determined by the combined results of the entrance examination and the examinations undergone while on probation, except that the position on the list of a lieutenant on probation, seconded to hold a resident appointment in a recognised civil hospital shall be determined by the place he has gained at the entrance examination. A lieutenant cannot be so seconded for more than 12 months, and during this period he will not draw pay from Army funds, but his service will reckon towards promotion, increase of pay, gratuity, and pension. He will be required, at the conclusion of his hospital appointment, to attend the courses of instruction at the Royal Army Medical College and at Aldershot; but the subsequent examinations will be of a qualifying character and will not influence his position on the seniority list of the Corps.

Lieutenants when appointed on probation will receive instructions as to the provision of uniform.

EXAMINATIONS.

Subjects for the Entrance Examination.

Candidates will be examined by the examining board in medicine and surgery. The examination will be of a clinical and practical character, partly written and partly oral, marks being allotted under the following scheme.

	Maximum marks.
Medicine (written).	
A. Examination and report upon a medical case	125
B. Commentary upon a case in medicine	100
(Two periods of 45 minutes-total, one and a half hours—for A, and one and a half hours for B.)	
Medicine (oral).	
A. Clinical cases	100
B. Medical pathology	75
(Ten minutes to examine case and ten minutes *viva voce*—total, 20 minutes—for A; 30 minutes to examine specimens and ten minutes *viva voce* —total, 40 minutes—for B.)	
Surgery (written).	
A. Examination and report upon a surgical case	100
B. Commentary upon a case in surgery	125
(Two periods of 45 minutes—total, one and a half hours—for A, and one and a half hours for B.)	
Surgery (oral).	
A. Clinical surgery and pathology (including diseases of the eye)	75
B. Operative surgery and bandaging (including surgical instruments and appliances)	100
(Ten minutes to examine case and ten minutes *viva voce*—total, 20 minutes—for A, and about 30 minutes for B.)	
Total marks	800

The following headings are published as a guide to candidates in drawing up their reports on cases:—(*a*) A brief history of the case as given by the patient, including such points only (if any) in the family or personal history as have a distinct bearing upon the present illness or incapacity. (*b*) A detailed account of the subjective symptoms and physical signs elicited by the candidate's personal examination of the patient, noting the absence of any which might be expected to be present in a similar case. (*c*) Where there is any reasonable doubt in the mind of the candidate as to an exact diagnosis, he is to give the alternatives, with his reasons for making the selection. (*d*) A commentary upon the case as a whole, pointing out the symptoms which may be considered typical, and those which appear to be unusual or only accidental complications. (*e*) Suggestions as to treatment, both immediate and possibly necessary at a later date. (*f*) A forecast of the progress and probable termination of the case.

Similarly the commentary on the report of a case submitted to the candidate should discuss: (*a*) The family and personal history and other conditions preceding the development of the condition described. (*b*) The relative significance of the physical signs, symptoms, other indications of disease noted, and the general clinical aspects of the case. (*c*) The diagnosis, with reasons for selection of the most probable, when a positive diagnosis cannot be attained. (*d*) The treatment, dietetic, medicinal, operative, &c., including a criticism of the plan adopted, and alternative schemes of treatment in case of disagreement. (*e*) The morbid appearances and an account of the post-mortem examination (if any).

The examinations are held in London and occupy about four days.

The appointments announced for the competition are filled up from the list of qualified candidates arranged in the order of merit, as determined by the total number of marks each has obtained. Having gained a place in this entrance examination the successful candidates are ordered to proceed to the Royal Army Medical College, Millbank, S.W., for instruction in recruiting duties, at the termination of which they will undergo two months' instruction in Hygiene, Pathology, Tropical Medicine, Military Surgery, and Military Medical Administration, after which they are examined in these subjects. The maximum number of marks obtainable at this examination is 700. At the present time the professors at the Royal Army Medical College are Major E. M. Pilcher, D.S.O., F.R.C.S., in the department of military surgery; Major W. S. Harrison, M.B., in the department of tropical medicine; Lieutenant-Colonel Sir W. B. Leishman, M.B., F.R.S., in the department of pathology; and Lieutenant-Colonel C. H. Melville, M.B., in that of hygiene, Captain J. C. Kennedy and Major C. F. Wanhill being assistant professors. Colonel Erskine Risk, the commandant and director of studies, assisted by Brevet Lieutenant-Colonel A. P. Blenkinsop, instruct in hospital and corps administration, in the duties of officers on transports, and in the examination of recruits, and Major T. W. Gibbard lectures on Syphilology. The services of the following staff of clinical teachers have been secured to give courses of instruction to the classes made up of 50 captains that now undergo an annual course for promotion to the rank of major:—Medicine: Major G. N. Pitt, M.D., 2nd London General Hospital; and Captain J. Galloway, M.D., F.R.C.S., 4th London General Hospital. Surgery: W. H. Clayton-Greene, M.B., F.R.C.S.; and Captain H. S. Collier, F.R.C.S., 3rd London General Hospital. Dermatology: A. Whitfield, M.D. Midwifery and Gynæcology: G. F. Blacker, M.D., F.R.C.S. Ophthalmology: J. H. Parsons, M.B., F.R.C.S. Otology with Laryngology and Rhinology: H. Tilley, M.D., F.R.C.S. Specific Fevers: E. W. Goodall, M.D. Besides these lecturers an honorary consulting staff has been appointed by the War Office to Queen Alexandra's Military Hospital at Millbank. This staff comprises:—A. E. Barker, F.R.C.S.; Major Sir A. A. Bowlby, C.M.G., F.R.C.S., 1st London General Hospital; Surgeon-Major-General A. F. Bradshaw, C.B., K.H.P. (retired); J. M. Bruce, M.D., F.R.C.P.; Lieutenant-Colonel Sir J. K. Fowler, K.C.V.O., M.D., 3rd London General Hospital; Surgeon-Lieutenant-Colonel P. J. Freyer, M.D. Indian Medical Service (retired); W. S. A. Griffiths, M.D., F.R.C.P.; Lieutenant-Colonel G. H. Makins, C.B., F.R.C.S., 2nd London General Hospital; and Honorary Colonel Sir W. Osler, Bart, M.D., LL.D., F.R.S, South Middlesex Division, Royal Army Medical Corps. The course of hygiene has hitherto comprised the examinations of water and air, the general principles of diet with the quality and adulterations of food and beverages, the sanitary requirements of barracks, hospitals, and camps, the consideration of the clothing, duties, and exercises of the soldier, and the circumstances affecting his health, with the best means of preventing disease, both at home and under the conditions of foreign service, also with particular reference to active service in the field. The pathological course has up to the present time included bacteriology and demonstrations in microscopic diagnosis, preparations of vaccines, &c., special attention being given to modern methods of research in the causation of tropical disease. The surgical course consists of lectures and demonstrations in military surgery and X rays and lectures on errors of refraction from a military point of view. On completion of the above course Lieutenants on probation join the Royal Army Medical Corps School of Instruction at Aldershot for a two months' course in the technical duties of the corps, including a course of gymnasium, drill, and stretcher drill, and at the end of the course are examined in the subjects taught. The maximum number of marks obtainable at this examination will be 100. A Lieutenant on probation who fails to qualify in either of these examinations will be allowed a second trial, and, should he qualify, will be placed at the bottom of the list. Should he again fail in either examination his commission will not be confirmed. Illiteracy on the part of a candidate as evinced by inaccurate spelling, poor composition, or grammatical errors in the oral examination, at the entrance examination, or at the examinations undergone while on probation will be regarded as disqualifying for appointment.

EXAMINATIONS FOR PROMOTION IN THE ROYAL ARMY MEDICAL CORPS.

These examinations are intended to test the progress and proficiency of officers in those branches of knowledge which are essential to their continued efficiency.

Lieutenant before Promotion to Captain.—This examination may be taken at any time after completing 18 months' service and will be held in the military district in which the officer is serving. The subjects of this examination, which are detailed in the King's Regulations, are as follows: (1) squad, company, and corps drills and exercises; (2) (*a*) the terms of the Geneva Convention; (*b*) a general knowledge of the administration, organisation, and equipment of the

army in its relation to the Medical Services; (3) the duties of ward-masters and stewards in military hospitals, and the preparation of returns, accounts, and requisitions connected therewith; (4) duties of executive medical officers; and (5) military law.

Captains before Promotion to Major.—Captains will be examined under the following rules, and will be eligible for acceleration in their promotion to the rank of Major under Article 303 of the Pay Warrant. An officer who gains accelerated promotion will be placed for precedence after the last officer (whether subject to acceleration or not) promoted approximately 3, 6, 12, or 18 months before him.

This examination, which may be taken at any time after completing five years' service, will be held on the termination of a period of special study at such times and under such arrangements as the Director-General A.M.S. may determine. The examination will consist of written papers, essays, oral and practical examinations in the following subjects, which are detailed in the King's Regulations: (1) medicine; (2) surgery; (3) hygiene; (4) bacteriology and tropical disease; (5) one special subject from the subjoined list: (*a*) bacteriology, including the preparation of antitoxins; (*b*) dermatology, including venereal diseases; (*c*) midwifery and gynæcology; (*d*) operative surgery, advanced; (*e*) ophthalmology; (*f*) otology, including laryngology and rhinology; (*g*) State medicine; (6) military law.

Majors before Promotion to Lieutenant-Colonel.—This examination, which may be taken at any time after three years in the rank of Major, will be held in the military district in which the officer is serving at times which will be duly notified. The subjects of this examination, which are detailed in the King's Regulations, are as follows: 1. Army medical organisation in peace and war. 2. Sanitation of towns, camps, transports, and all places likely to be occupied by troops in peace and war; epidemiology, and the management of epidemics. 3. (*a*) Medical history of the more important campaigns and the lessons to be learnt therefrom; (*b*) a knowledge of the Army Medical Services of the more important Powers; and (*c*) the laws and customs of war, so far as they relate to the sick and wounded. 4. A tactical problem in field medical administration.

PAY, ADDITIONAL PAY, AND CHARGE PAY.

The following are the rates of pay, additional pay, and charge pay of the Army Medical Service and Royal Army Medical Corps:—

Pay.

Army Medical Service.	Inclusive of all allowances except field and travelling allowances (yearly).
At the War Office.	£
Director-General	2000
Deputy Director-General	1500
Assistant Director-General	850
Deputy Assistant Director-General	750
	Exclusive of allowances (daily).
At Other Stations.	£ s. d.
Surgeon-General	3 0 0
Colonel	2 5 0
Lieutenant-Colonel (promoted before Jan. 9th, 1907)	1 10 0
Lieutenant-Colonel (specially selected)	1 15 0
Major	1 3 6
After three years as such	1 6 0
After 20 years' total service, if considered qualified	1 10 0
Captain	0 15 6
After seven years' total full-pay service	0 17 0
After ten years' total full pay service	1 1 0
Lieutenant on probation and Lieutenant	0 14 0
Adjutant of the Royal Army Medical Corps (Territorial Force)	The pay of his rank.

A Captain of the Royal Army Medical Corps, holding the brevet rank of Major, shall receive pay at 2*s.* a day, in addition to the pay of his rank.

Additional Pay.

An officer not serving on the Headquarters Staff appointed a member of the Advisory Board, £150 a year. An officer under the rank of Lieutenant-Colonel holding an appointment as specialist, 2*s.* 6*d.* daily.

Charge Pay.

(*a*) An officer in charge of a general or other hospital, or of a division of a general hospital—

	Daily. s. d.
If in charge of at least 50 equipped beds	2 6
,, ,, 100 ,, ,,	5 0
,, ,, 200 ,, ,,	7 6
,, ,, 300 ,, ,,	10 0
(*b*) Senior medical officer, Royal Arsenal, not exceeding	10 0
(*c*) Officer in command of the Depôt, Royal Army Medical Corps	5 0
(*d*) The Senior officer of the Army Medical Service with an army in the field— A rate to be fixed according to the magnitude of the charge.	
(*e*) In a command abroad— The senior medical officer, if under the substantive rank of colonel, if the number of soldiers is 1500 or upwards	5 0

Reserve of Officers.

An officer of the Royal Army Medical Corps with at least three, but not more than six, years' service may be permitted to become an Army Reserve Officer for a period of seven years, and while so serving he shall receive a retaining fee of £25 a year. With the sanction of the Army Council such officer may be allowed to return to the active list, and if the period he has been in the Reserve of Officers amounts to at least one year, and not more than three years, he shall be allowed to reckon one-third of such period towards promotion, gratuity, and pension.

Seconded Officers.

A Lieutenant on probation who at the time of passing the examination for admission to the Royal Army Medical Corps holds, or is about to hold, a resident appointment in a recognised civil hospital may be seconded for the period not exceeding one year during which he holds the appointment. While seconded he shall not receive pay from army funds, but his service shall reckon towards promotion, increase of pay, gratuity, and pension.

PROMOTION.

No promotion of a medical officer shall be made without the approval of the Secretary of State.

An officer shall be eligible for promotion to the rank of Captain on the completion of three and a half years' service, and to the rank of Major on the completion of 12 years' service, provided that in each case he has previously qualified in such manner as may be prescribed by the Army Council.

Promotion to the rank of Lieutenant-Colonel to complete an establishment shall be made by selection from Majors who have qualified in such manner as may be prescribed by the Army Council.

If an officer has passed with distinction the examination qualifying for promotion to the rank of Major, the 12 years' service required to render him eligible for that rank may be reduced as follows:—

	Months.
If he obtained a "special certificate"	18
,, passed in the 1st Class	12
,, ,, ,, 2nd ,,	6
,, ,, ,, 3rd ,,	3

Promotion to the rank of Colonel to complete an establishment shall be made by selection from Lieutenant-Colonels. An officer promoted to the rank of Colonel shall, unless retired, be placed on half-pay on completing a period of four years' service in such rank. A Lieutenant-Colonel may also be promoted to the rank of Colonel if specially recommended for distinguished service in the field. Promotion to the rank of Surgeon-General shall be made by selection from Colonels. A Colonel may also be promoted to the rank of Surgeon-General for distinguished service in the field. An officer of the Royal Army Medical Corps is eligible for promotion to brevet rank. A Captain after at least 6 years' service, a Major or Lieutenant-Colonel, may be promoted to the next higher rank by brevet for distinguished service in the field or for meritorious or distinguished service of an exceptional nature other than in the field. If the officer dies before the date on which the notification of his promotion for distinguished service in the field appears in the *London Gazette* the promotion shall bear the date which it would have borne had the officer not died. Distinction in original investigation or research may, in the case of officers of the Royal Army Medical Corps, be regarded as "distinguished service of an exceptional nature other than in the field." An officer who may in the opinion of the Army Council have been prevented, in very special circumstances, from qualifying for promotion, or who, having failed to qualify, may have been debarred from further opportunity of qualifying, may be provisionally promoted. If, however, he fails to qualify on the first available opportunity his promotion shall be cancelled and he shall be retired from the service. An officer shall reckon towards his promotion any time, not exceeding one year, during which he may have been on half-pay on account of ill-health caused by military service; and also any time not exceeding two years during which he may have been on reduction. An officer while seconded shall continue to be eligible for selection for promotion as if he had remained on the establishment, and his service while seconded shall reckon towards such promotion.

RANK.

The Director-General of the Army Medical Service shall hold the substantive rank of Surgeon-General and shall rank in relation to combatant officers as a Lieutenant-General if recommended by the Army Council. All other Surgeon-Generals shall rank as Major-Generals in relation to combatant officers. Officers of the Army Medical Service above the rank of Colonel shall hold the substantive rank of Surgeon-General.

RETIREMENT.

(*a*) *Voluntary Retirement.*

An officer of the Army Medical Service will be permitted to retire in cases in which such retirement may be deemed expedient by the Army Council.

Scale of Retired Pay.

	Yearly. £
Director-General after 3 years' service in the appointment (with 30 years' service)	1125
Under 3 years' service as Director-General and after not less than 30 years' service	875
	Daily. £ s. d.
Surgeon-General	2 0 0
Colonel—	
Under 4 years' service as such, but with 30 years' total service	1 10 0
After 4 years' service as such	1 15 0
If not qualified as above	the rate for a lieutenant-colonel.
Lieutenant-Colonel—	
After 20 years' service	1 0 0
,, 25 ,,	1 2 6
,, 28 ,,	1 7 6
Major, after 20 years' service	1 0 0
	Gratuity. £
Major or Captain—	
After 5 years' service in the rank of captain	1000
,, 3 ,, ,, major	1800
,, 6 ,, ,, ,,	2500

Except in the case of a Colonel, or a Lieutenant-Colonel, an officer who, on voluntary retirement, has served for less than three years in

the rank from which he retires, shall be entitled only to the gratuity or retired pay assigned to the next lower rank.

(*b*) *Retirement on Account of Age or Limitation of Period of Service.*

The Director-General of the Army Medical Service shall, unless his service has been specially extended to complete 30 years' total service, retire on completion of the term of his appointment, and the retirement of other officers of the Army Medical Service shall be compulsory at the following ages: Surgeon-General, 60; Colonel, 57; and other officers, 55. A Major shall retire on completion of 25 years' service if he has been superseded for promotion; or, if he fails to qualify for promotion, on completion of 20 years' service.

It shall be competent to the Army Council to place a medical officer on the retired list after 30 years' service.

(*c*) *Retirement on Account of Medical Unfitness.*

An officer placed on the half-pay list on account of medical unfitness shall, if not previously retired, be retired from the Army at the expiration of five years from the date on which he was placed on the half-pay list, or, if reported by the regulated medical authority to be permanently unfit for duty, on the officer's application, at such earlier date as may be decided by the Army Council.

An officer, whether on full pay or half pay, who, to the satisfaction of the regulated medical authority has been pronounced insane, shall be retired from the Army.

The scale of retired pay on account of age or medical unfitness is the same as under voluntary retirement, except that the condition of three years' service in the rank is omitted.

Rates for Officers not qualified for Retired Pay or Gratuity on Voluntary Retirement.

If the unfitness was caused by military service retired pay equal to the half pay of his rank. If not so caused, provided the officer has at least 12 years' service, retired pay equal to the half pay of his rank for such period only, not exceeding five years from the date of the officer's retirement from the Army, after five years on half pay under Article 435, as the Army Council shall determine according to the merits of the case.

KING'S HONORARY PHYSICIANS AND HONORARY SURGEONS.

Six of the most meritorious officers of the Army Medical Service on the active list shall be named Honorary Physicians and six Honorary Surgeons. On appointment as Honorary Physician or Honorary Surgeon an officer under the rank of Colonel in the Army Medical Service may be promoted to the brevet rank of Colonel. A Lieutenant-Colonel appointed Honorary Physician or Honorary Surgeon shall receive pay at the rate laid down for a Colonel of the Royal Army Medical Corps when qualified for promotion to that rank. An officer shall relinquish the appointment of Honorary Physician or Honorary Surgeon on retirement.

MEDICAL OFFICERS OF THE REGIMENTS OF HOUSEHOLD TROOPS.

Commissions as surgeon-lieutenants in the Household Cavalry shall be given, on the nomination of the titular colonels of the regiments, to persons approved by the Army Council. The conditions governing pay and promotion are similar to those laid down for the Royal Army Medical Corps.

EXCHANGES AND TRANSFERS.

An officer of the Royal Army Medical Corps shall be permitted to exchange with another officer of such corps, or with a medical officer of the Household Cavalry, under such conditions and regulations as may from time to time be made.

Exchanges between officers of the Royal Army Medical Corps under the rank of Major and medical officers of the Indian Army, and transfers of such officers from either of the above services to the other, shall only be permitted subject to the approval of the Secretary of State for India in Council and on the following conditions: (1) That the officers have less than seven years' service; (2) that the senior officer exchanging takes the place of the junior on the list and shall not be promoted until the officer next above him has been promoted; (3) that the junior officer exchanging is placed for seniority next below all medical officers whose commissions have the same date as his own; and (4) that the officer transferred is placed for seniority below all medical officers holding the same rank at the time of his transfer and shall not be promoted until the officer next above him has been promoted.

An officer of the Royal Army Medical Corps who has exchanged or been transferred from the Indian Army shall reckon, subject to the above conditions his previous service with the said forces towards promotion, increase of pay, gratuity, and pension.

LEAVE OF ABSENCE.

Full pay during ordinary leave of absence for 61 days in each year at home stations and generally longer periods abroad may be granted to a medical officer provided that no additional expense is incurred thereby.

When the period of leave has been exhausted or exceeded in consequence of sickness no further pay during ordinary leave shall remain due.

SICK LEAVE.

An officer of the Army Medical Service may draw full pay for the undermentioned periods during sick leave granted on the recommendation of the regulated medical authority, provided there is reasonable probability that he will ultimately be fit to return to duty:—

1. In ordinary cases for a period not exceeding 12 months.
2. In very special cases, such as loss of health due to tropical service or to active operations, the period may be extended, but it shall not exceed 18 months in all.

When a medical officer is sick at his station, whether in hospital, quarters, or lodgings, his absence from duty on account of sickness, up to a period of 30 days, and if duly certified by a medical officer, shall not be included in the period of absence on leave to which the issue of pay is limited, provided the general officer commanding at the station considers that the circumstances of the case warrant such a concession. Any excess of such leave of absence on account of sickness at an officer's station beyond the period of 30 days shall be deducted from his ordinary leave.

SERVICE ON THE WEST COAST OF AFRICA.

An officer volunteering for, or ordered to, the West Coast of Africa shall receive double pay while actually serving on the coast, and for any time spent at Madeira or the Canary Islands on sick leave, or on ordinary leave not exceeding 61 days in a year.

A medical officer after 12 months' continuous service on the West Coast is entitled to full pay during leave at home for one day for every two days served on the coast.

Each year or portion of a year served on the West Coast of Africa by an officer of the Royal Army Medical Corps shall reckon double towards voluntary retirement or retired pay, provided that he has served 12 months on the coast. In ordinary cases the 12 months may be made up of two separate periods of not less than six months each; and if an officer leaves the coast on account of sickness he may reckon any period of service on the coast, however short, in order to make up the 12 months' coast service which is required to entitle him to count his service double. Except when the officer has been invalided, no period of less than six months' of service on the coast shall reckon double under this article, or count towards the required period of 12 months.

WIDOWS' PENSIONS.

Widows' pensions and compassionate allowances for children and other relatives of deceased officers are given under certain conditions specified in the Royal Warrant for Pay and Promotion. There is also an Army Medical Officers' Widows' and Orphans' Fund on mutual assurance principles.

PAY IN INDIA.

There has been an improvement of late years in the pay and conditions of service of army medical officers in India, as elsewhere. The pay and allowances (which are combined in India) of a lieutenant are 420 rupees per mensem; for captain's rank, the pay and allowances are from 475 rupees to 530 rupees after seven, and to 650 rupees after ten years' service. Majors receive 789 rupees on promotion and 826 rupees after 15 years' service. Lieutenant-Colonels, 1150 rupees. In addition, charge pay is given, ranging from 60 to 240 rupees according to the number of beds equipped in a hospital. There are also various specialist appointments, cantonment hospitals, &c., carrying extra pay, that are shared between the Royal Army Medical Corps and the Indian Medical Service. The value of the rupee is fixed at 1*s.* 4*d.*

INDIAN MEDICAL SERVICE.

The grades of officers in the Indian Medical Service are the same as those of the Army Medical Service and Royal Army Medical Corps. The Director-General will rank either as Major-General or Lieutenant-General as may be decided in each case by the Secretary of State for India in Council.

REGULATIONS FOR THE EXAMINATION OF CANDIDATES FOR ADMISSION TO THE INDIAN MEDICAL SERVICE.

Candidates must be natural born subjects of His Majesty, of European or East Indian descent, between 21 and 28 years of age at the date of the examination, of sound bodily health, and in the opinion of the Secretary of State for India in Council in all respects suitable to hold commissions in the Indian Medical Service. They may be married or unmarried. They must possess under the Medical Acts a qualification registrable in Great Britain and Ireland. No candidate will be permitted to compete more than three times. Examinations for admission to the service are held twice in the year, usually in January and July. Candidates for the January examination must be between 21 and 28 years of age on Feb. 1st, and those for the July examination must be between 21 and 28 on August 1st. The exact date of each examination and the number of appointments, together with the latest date at which applications will be received, will be notified in THE LANCET.

They must subscribe and send in to the Military Secretary, India Office, Westminster, *so as to reach that address by the date fixed in the advertisement of the examination*, a declaration according to the annexed form, which is procurable from the Military Secretary.

Declaration and Schedule of Qualifications to be Filled up by Candidates.

I, ..., a candidate for employment in His Majesty's Indian Medical Service, do hereby attest my readiness to engage for that service, and to proceed on duty immediately on being gazetted.

I declare that I labour under no mental or constitutional disease, nor any imperfection or disability that can interfere with the most efficient discharge of the duties of a medical officer.

I hereby declare upon my honour that the above statements are true to the best of my knowledge and belief.

I inclose, in accordance with Paragraph 4 of the Regulations, (*a*) proof of age; (*b*) two certificates of character; (*c*) certificate of having attended a course of ophthalmic instruction, showing that the course included instruction in errors of refraction; (*d*) evidence of a registrable qualification; (*e*) *in case of natives of India or others educated in that country only*, a certificate from the Director-General, Indian Medical Service.

Signature .....

Date ....., 19 .

1. Name in full.
2. Address. (*Any alteration to be notified to the Military Secretary, India Office, London, S.W.*)
3. Date of birth. (*This must be supported by a certificate or statutory declaration.* See *Paragraph 4 of the Regulations.*)
4. Profession or occupation of father, and whether, at the time of candidate's birth, his father was a British subject of European or East Indian descent.
5. Statement as to whether the candidate is married or single.
6. Colleges and Medical Schools at which the candidate has received his medical education.
7. Medical School in which the candidate completed his course as a medical student, and name of the Dean or other responsible authority.

8. Degrees of B.A. or M.A.; details as to any prizes, university honours, &c.
9. Registrable qualifications.
10. Date of examination at which the candidate proposes to present himself.
11. Date of any previous occasions on which the candidate may have presented himself for examination for admission to the Indian Medical Service, or other examination for the Public Services.
12. Particulars of any commission or appointment held in the Public Services.

The declaration must be accompanied by the following documents:—*a. Proof of age* either by Registrar-General's certificate, or, where such certificate is unattainable, by the candidate's own statutory declaration, form for which can be obtained at the India Office, supported, if required by the Secretary of State, by such evidence as he may consider satisfactory. A certificate of baptism which does not afford proof of age will be useless. In the case of natives of India it will be necessary for a candidate to obtain a certificate of age and nationality in the form laid down by the Government of India which is obtainable from the Director-General of the Indian Medical Service, Simla. *b.* A recommendation and certificate of moral character from two responsible persons—not members of his own family—to the effect that he is of regular and steady habits and likely in every respect to prove creditable to the service if admitted. *c.* A certificate of having attended a course of instruction for not less than three months at an ophthalmic hospital or the ophthalmic department of a general hospital, which course shall include instruction in the errors of refraction. *d.* Some evidence of having obtained a registrable qualification. *e.* Any European educated in India and every native of that country will be required to produce a certificate signed by the Director-General, Indian Medical Service, that he is a suitable person to hold a commission in the Indian Medical Service.

The Secretary of State for India reserves the right of deciding whether the candidate may be allowed to compete for a commission in His Majesty's Indian Medical Service.

The physical fitness of each candidate will be determined by a Board of Medical Officers who are required to certify that his vision is sufficiently good to enable him to pass the regulation tests (see under Army Medical Service). Every candidate must also be free from all organic disease and from constitutional weakness or other disability likely to unfit him for military service in India. The physical examination is otherwise in all respects the same as that detailed under Royal Army Medical Corps. Candidates who pass the physical examination will be required to pay a fee of £1 before being permitted to compete. No candidate will be permitted to compete more than three times. More detailed regulations as to the physical requirements can be obtained on application to the India Office.

Candidates for the Indian Medical Service may, if they like, undergo a preliminary examination by the Medical Board which meets at the India Office every Tuesday by applying to the Under Secretary of State, India Office, inclosing a fee of two guineas. They must pay their own travelling expenses. The decision must be understood, however, not to be final. It may be reversed in either direction by the Examining Medical Board immediately prior to the Professional Examination.

On proving possession of the foregoing qualifications the candidate will be examined by the Examining Board in the following subjects and the highest number of marks attainable will be distributed as follows:—

	Marks.
1. Medicine, including therapeutics...	1200
2. Surgery, including diseases of the eye	1200
3. Applied anatomy and physiology...	600
4. Pathology and bacteriology	900
5. Midwifery and diseases of women and children	600
6. Materia medica, pharmacology, and toxicology	600

N.B.—The examination in medicine and surgery will be in part practical and will include operations on the dead body, the application of surgical apparatus, and the examination of medical and surgical patients at the bedside. No syllabus is issued in the subjects of the examination, but it will be conducted so as to test the general knowledge of the candidate in all subjects. No candidate shall be considered eligible who shall not have obtained at least *one third* of the marks obtainable in each of the above subjects and *one half* of the aggregate marks for all the subjects.

For the clinical examinations each candidate should provide himself with notebook, pencil, stethoscope, and ophthalmoscope. In drawing up reports on cases the following points should be observed, viz.: (*a*) A brief history of the case as given by patient, including such points in the family or personal history as have a distinct bearing on patient's case. (*b*) A detailed account of the subjective symptoms and physical signs elicited by the candidate's personal examination of the patient, noting the absence of any which might be expected to be present in a similar case. (*c*) Where there is any reasonable doubt in the mind of the candidate as to the exact diagnosis he is to give the alternatives, with his reasons for making the selection. (*d*) A commentary upon the case as a whole, pointing out the symptoms which may be considered typical and those which appear to be unusual or only accidental complications. (*e*) Suggestions as to treatment, both immediate and possibly necessary at a later date. (*f*) A forecast of the progress and probable termination of the case.

After passing this examination the successful candidates will be granted about a month's leave and will then be required to attend two successive courses of two months each at the Royal Army Medical College, Millbank, and at Aldershot. The candidate's commission as a lieutenant will bear the date on which the result of the entrance examination is announced, but his rank will not be gazetted until he has passed the final examination, held at the conclusion of his period of instruction.

The course at the Royal Army Medical College will be in (1) hygiene, (2) military and tropical medicine, (3) military surgery, and (4) pathology of diseases and injuries incidental to military and tropical service.

The course at Aldershot will include instruction in (1) internal economy, (2) Indian military law, (3) hospital administration, (4) stretcher and ambulance drill, (5) equitation, and (6) map reading.

Lieutenants-on-probation will receive an allowance of 14*s.* per diem, and during the period of instruction they will be provided with quarters (where quarters are not provided they will obtain the usual allowances of a subaltern in lieu thereof), to cover all costs of maintenance, and they will be required to provide themselves with uniform; a detailed list of the uniform and articles required will be sent to each successful candidate.

A lieutenant-on-probation who is granted sick leave before the completion of his course of instruction and final admission to the service will receive pay at the rate of 10*s.* 6*d.* a day for the period of his sick leave.

Candidates will be required to conform to such rules of discipline as may from time to time be laid down.

At the conclusion of each course candidates will be required to pass an examination on the subjects taught, and in order to qualify each lieutenant on probation must obtain 50 per cent. of the total marks. If he fails to qualify in either of these examinations he will be liable to removal from the service, but if specially recommended he may be allowed to undergo the course or courses again under certain restrictions as to pay and position.

Officers appointed to the Indian Medical Service will be placed on one list, their position on it being determined by the combined results of the preliminary and final examinations. They will be liable for military employment in any part of India, but in view to future transfers to civil employment, they will stand posted to one of the following civil areas:—(1) Madras and Burma; (2) Bombay with Aden; (3) Upper Provinces—i.e., United Provinces, Punjab, and Central Provinces; and (4) Lower Provinces—i.e., Bengal, and Eastern Bengal and Assam. The allocation of officers to these areas of employment will be determined upon a consideration of all the circumstances, including, as far as possible, the candidate's own wishes. Officers transferred to civil employment, though ordinarily employed within the area to which they may have been assigned, will remain liable to employment elsewhere according to the exigencies of the service.

A lieutenant who, within a reasonable period before the date on which he would otherwise sail for India, furnishes proof of his election to a resident appointment at a recognised civil hospital,[2] may be seconded for a period not exceeding one year from the date on which he takes up such appointment, provided that he joins it within three months of passing his final examination and that he holds himself in readiness to sail for India within 14 days of the termination of the appointment. While seconded he will receive no pay from Indian funds, but his service towards promotion, increase of pay, and pension will reckon from the date borne on his commission. In special cases permission may be granted to lieutenants to delay their departure for India, in order to sit for some further medical examination. Lieutenants remaining in England under such circumstances will receive no pay for any period beyond two months from the date of termination of the course of instruction, unless the period elapsing before the day on which the majority of the lieutenants of the same seniority sail to India exceeds two months, in which case lieutenants allowed to remain in England will receive pay up to that day. In such cases pay will re-commence on the day of embarkation for India. All the provisions of this clause are subject to the general exigencies of the service. Before the commission of a lieutenant-on-probation is confirmed he must be registered under the Medical Acts in force at the time of his appointment. Candidates who have been specially employed in consequence of a national emergency, either as an officer, or in a position usually filled by an officer, will be allowed, under certain circumstances, to reckon such service towards pension.

Officers on appointment are, when possible, provided with passage to India by troop transport; when such accommodation is not available passage at the public expense is provided by steamer, or a passage allowance granted if preferred. Wives of married officers are entitled to passage by troop transport, if available. Any officer who may neglect or refuse to proceed to India under the orders of the Secretary of State for India within two months from the date of terminating his course of instruction, or within 14 days of the termination of his hospital appointment if the Secretary of State has permitted him to hold one, will be considered as having forfeited his commission unless special circumstances shall justify a departure from this regulation.

A course of instruction in sanitary methods, rules, and regulations as carried out in Indian cantonments has recently been instituted for young officers of the Indian Medical Service and the Royal Army Medical Corps on first arrival in the country. The nature of the diseases to be combated, the social and religious customs and prejudices of the various races, and the limited resources of money and material make large modifications from European methods necessary. Lieutenants of both services are now posted on arrival either to Rawal Pindi, Poona, Lucknow, or Bangalore for one month for this course, which is

[2] The following is a list of recognised Civil Hospitals.—England and Wales.—London: St. Bartholomew's Hospital, Charing Cross Hospital, Guy's Hospital, King's College Hospital, London Hospital, Middlesex Hospital, St. George's Hospital, St. Mary's Hospital, St. Thomas's Hospital, University College Hospital, and Westminster Hospital. Birmingham: General Hospital and Queen's Hospital. Bristol: Royal Infirmary and General Hospital. Cambridge: Addenbrooke's Hospital. Cardiff: Cardiff Infirmary. Leeds: General Infirmary. Liverpool: Royal Infirmary and Southern Infirmary Manchester: Royal Infirmary. Newcastle-on-Tyne: Royal Infirmary. Oxford: Radcliffe Infirmary. Sheffield: Royal Infirmary and Royal Hospital. Scotland.—Aberdeen: Royal Infirmary. Dundee: Royal Infirmary. Edinburgh: Royal Infirmary. Glasgow: Royal Infirmary and Western Infirmary. Ireland.—Belfast: Royal Victoria Hospital. Cork: North Infirmary and South Infirmary. Dublin: Adelaide Hospital, City of Dublin Hospital, Jervis Street Hospital, Mater Misericordiæ Hospital, Meath Hospital, Mercer's Hospital, Richmond, Whitworth, and Hardwicke Hospital, St. Vincent's Hospital, Sir Patrick Dun's Hospital, and Dr. Steevens' Hospital. Galway: The County Hospital and the Union Hospital.

carried out under the supervision of the senior medical officer and sanitary officer. The instructors are medical officers nominated by the principal medical officer, India, and demonstrations on various subjects are given by other officers, staff, engineer, and medical. The course consists of demonstrations and inspections in all parts of the lines of British and Indian troops, bazaars, Government dairies, bakeries, slaughter-houses, trade premises of dairymen, bakers, butchers, and aerated water manufacturers and dhobies' houses, market and water-supplies, methods of washing clothes, surface drainage, removal and disposal of sewage and refuse, antimalarial measures, disinfection, cantonment hospitals, control of venereal diseases, plague prevention, methods of hospital administration, &c. The officers under instruction thus have an opportunity of learning something of native customs and are encouraged to learn the vernacular, so as to be less dependent upon their subordinates when first put in responsible positions.

PROMOTION.

A Lieutenant is promoted to the rank of Captain on completing three years' full-pay service from the date of first commission, provided he passes an examination in military law and military medical organisation. Captains are promoted to the rank of Major *without examination* after 12 years' full-pay service; this promotion may be accelerated by six months in the case of officers who fulfil certain specified conditions. A Major is promoted to Lieutenant-Colonel *without examination* on completion of eight years' full-pay service in the rank of Major. All promotions to higher grades are given by selection for ability and merit. In case of distinguished service a medical officer may receive special promotion. The ages for compulsory retirement are 55 for Lieutenant-Colonel and Major, 60 for Surgeon-General and Colonel, and 62 for the Director-General.

LEAVE RULES.

Officers of the Indian Medical Service below the rank of Colonel may be granted: 1. Privilege leave under such regulations as may from time to time be in force. 2. Leave out of India for no longer period than one year, capable of extension to two years' absence from duty, on the following pay for officers in military employment (officers in civil employment are entitled to higher rates): After arrival in India, on first appointment, £250 a year; after the commencement of the tenth year's service for pension, £300 a year; after the commencement of the fifteenth year's service for pension, £450 a year; after the commencement of the twentieth year's service for pension, £600 a year; and after the commencement of the twenty-fifth year's service for pension, £700 a year. 3. Leave in India, but for the period of one year only, on full military pay and half the staff pay of appointment. No extension of leave involving absence from duty for more than two years, whether taken in or out of India, can be granted except on specially urgent grounds and without pay. An officer unable on account of the state of his health to return to duty within the maximum period of two years' absence, unless he is specially granted an extension of leave without pay, is placed on temporary half-pay or the retired list, as the circumstances of the case may require. An officer is also liable to be placed on half-pay or the retired list should his health require an undue amount of leave, whether in or out of India. Leave may be granted at any time, but solely at the discretion of the civil or military authorities in India under whom an officer may be serving. Officers of the Administrative grades may be granted leave not exceeding eight months, besides privilege leave, during their tenure of appointment. Extra leave (known as study leave) may be granted to officers desirous of pursuing special courses of study at the rate of one month's leave for each year's service up to 12 months in all. An officer on leave is required to join at once on being recalled to duty unless certified by a medical board as unfit to do so.

PAY AND ALLOWANCES.

The rate of pay drawn by Lieutenants of the Indian Medical Service previous to arrival in India is 14*s.* a day, but a Lieutenant (1) who has been permitted by the Secretary of State to hold a hospital appointment will receive no pay while holding it; (2) who is detained by illness in this country will be paid at the rate of £250 a year from the date on which he would otherwise have embarked until the date of embarkation, and at the rate of 14*s.* a day during the voyage to India.

Pay at the above rate is issued in this country up to the date of embarkation, and an advance of two months' pay at the same rate is also made prior to embarkation, which is adjusted in India.

The following are the monthly rates of Indian pay drawn by officers of the Indian Medical Service from the date of their arrival in India (N.B.—1 rupee = 1*s.* 4*d.*):—

Rank.	Unemployed pay.	Grade pay.	Staff pay.	In officiating medical charge of a regiment.	In permanent medical charge of a regiment.
	Rs.	Rs.	Rs.	Rs.	Rs.
Lieutenant	420	350	150	425	500
Captain	475	400	150	475	550
,, after 5 years' service ...	475	450	150	525	600
,, after 7 years' service ...	—	500	150	575	650
,, after 10 years' service ...	—	550	150	625	700
Major	—	650	150	725	800
,, after 3 years' service as Major	—	750	150	825	900
Lieutenant-Colonel	—	900	350	1075	1250
,, ,, after 25 years' service ...	—	900	400	1100	1300
,, ,, specially selected for increased pay	—	1000	400	1200	1400

NOTES.—(*a*) Unemployed pay is drawn by officers of less than seven years' service who are not holding officiating or substantive charge of native regiments *provided* they have passed the examination in Hindustani known as the "Lower Standard." Officers of more than seven years' service draw grade pay alone when unemployed. Staff pay is the pay of certain special appointments and is drawn in addition to grade pay.

(*b*) Horse allowance is granted to officers in charge of cavalry regiments at the rate of Rs. 90 a month to Lieutenant-Colonels and Majors, and Rs. 60 a month Captains and Lieutenants.

Exchange compensation.—Under present arrangements, officers of the Indian Medical Service who are not statutory natives of India receive exchange compensation allowance to compensate them for the fall of the value of the rupee. The allowance consists of an addition to their salaries (subject to certain limitations) equal to half the difference between their salaries converted at (1) 1*s.* 6*d.* the rupee, and (2) the standard Government rate, which has been fixed at 1*s.* 4*d.* the rupee until further notice.

No officer, however employed, can draw more than the grade pay of his rank until he has passed the "Lower Standard."

Officers holding the principal administrative appointments and substantive military charges of the Indian Medical Service receive the following consolidated salaries:—

	Rs. per mensem.
Colonel, 16 (some in civil employ) from	1800 to 2500
Surgeon-General, 1 @	2200
,, 2 @	2500
,, (the Director-General I.M.S.) 1 @	3000

Specialist pay at the rate of Rs. 60 a month is granted to officers below the rank of Lieutenant-Colonel who may be appointed to certain posts.

Except in the administrative grades and in certain special appointments officers are not debarred from taking private practice as long as it does not interfere with their proper duties.

POSTS IN CIVIL EMPLOY.

A large number of posts in civil employ are ordinarily filled up from officers of the Indian Medical Service. Officers are required to perform two years' regimental duty in India before they can be considered eligible for civil employment. The principal appointments, together with the salaries attached to each, are stated in the following table:—

Description of appointment.	Approximate number of appointments in each class.	Salary per mensem. When held by a Lieutenant-Colonel.	When held by a Major.	When held by a Captain.	When held by a Lieutenant.
		Rs.	Rs.	Rs.	Rs.
Inspectors-General of Civil Hospitals	6	2250-2500	—	—	—
Sanitary Commissioner with Government of India	1	2000-2500	—	—	—
Inspectors-General of Prisons	8	1500-2000	—		—
Principals of Medical Colleges	2	1650-1800	1200-1300	—	—
Professorial Appointments	23	1500-1650	1050-1150	800-950	750
Sanitary Commissioners ...	6	1500-1800	—	—	—
Deputy Sanitary Commissioners...	13	1450-1600	1000-1100	750-900	650
Bacteriological Appointments	5	1500-1600	1050-1150	700-900	650
Superintendents of Central Lunatic Asylums	6	1400-1550	1050-1150	700-900	650
Superintendents of First Class Central Jails	5	1400-1550	950-1050	700-850	650
Superintendents of Second Class Central Jails	5	1300-1450	850-950	600-750	550
Civil Surgeoncies (First Class)	37	1300-1450	850-950	600-750	550
Civil Surgeoncies (Second Class)	171	1200-1350	750-850	500-650	450
Probationary Chemical Examiner	1	—	—	600-750	550
Officers deputed to plague duty	—	1450	1000-1100	750-900	700

An allowance of Rs. 100 per mensem is also granted, in addition, to the chief plague medical officers in certain provinces.

There are also six Chemical Examiners with Rs. 800-1650 per mensem and a number of Port Health Officers with Rs. 750-1950 per mensem. Other appointments of Resident Surgeons and Physicians at hospitals, &c., are on salaries ranging from Rs. 700 to 1650 per mensem. There are also a certain number of appointments under the Political Department on salaries ranging from Rs. 450 to 1450 per mensem, exclusive of local allowances.

Qualified officers of the Medical Service are also eligible for appointments in the Assay and Mint Departments. The salaries of these appointments are from Rs. 600-2250 per mensem.

POSTS IN MILITARY EMPLOY.

Approximately half the highest administrative posts in military medical employ are allotted to the Indian Medical Service. These include the appointments of Deputy Principal Medical Officer of His Majesty's Forces in India and Secretary to the Principal Medical Officer of

His Majesty's Forces in India. Half the appointments of Principal Medical Officers are to Divisions and Brigades, the other half being filled by Royal Army Medical Corps Officers. In the junior ranks half the appointments to military staff surgeoncies, the medical charge of cantonment hospitals and Staff Officers for medical mobilisation stores in each of the nine divisions of the Army are allotted to the Indian Medical Service and the other half to the Royal Army Medical Corps. The appointments of Medical Storekeepers to Government, which supply the needs of the Civil and Military Departments, are reserved for the Indian Medical Service alone.

Tenure of Office in Administrative Grades.

The tenure of office of Surgeon-Generals and Colonels is limited to five years. Colonels, if not disqualified by age, are eligible either for employment for a second tour of duty in the same grade or for employment in the higher grade of Surgeon-General by promotion thereto.

Absence on leave in excess of eight months during a five years' tour of duty involves forfeiture of appointment.

Surgeon-Generals and Colonels, on vacating office at the expiration of the five years' tour of duty, are permitted to draw *in India* an unemployed salary of Rs. 1350 per mensem in the former, and Rs. 1000 in the latter case, for a period of six months from the date of their vacating office, after which they are placed while unemployed on the following scale of pay:—

—	Surgeon-General. Per diem.	Colonel. Per diem.
	£ s. d.	£ s. d.
After 30 years' service on full pay	2 5 0	1 14 0
,, 25 ,, ,, ,, ...	2 5 0	1 10 0
,, 20 ,, ,, ,, or on promotion, should this period of service not be completed...	2 0 0	1 8 0

A Surgeon-General or Colonel who has completed his term of service and has reverted to British pay may reside in Europe, at the same time qualifying for higher pension.

Retiring Pensions and Half-pay.

Officers of the Indian Medical Service will be allowed to retire on the following scale of pension on completion of the required periods of service:—

After 30 years' service for pension...	£700 per annum + £350 after three years' active employment in India as a Surgeon-General, or + £250 per annum after five years' active employment as a Colonel or £125 after three years as a Colonel. Eight months' absence on leave is allowed to count towards actual service in those grades.
,, 27½ ,, ,, ,,	£600 per annum.
,, 26 ,, ,, ,,	£500 ,,
,, 20 ,, ,, ,,	£400 ,,
,, 17 ,, ,, ,,	£300 ,,

Service for pension counts from date of first commission and includes all leave taken under the leave rules.

Time (not exceeding one year) passed on temporary half-pay reckons as service for promotion and pension, in the case of an officer placed on half-pay on account of medical unfitness caused by duty, military or civil.

Officers of the Indian Medical Service are liable after retirement on pension before completing 30 years' service to recall to military duty in case of any great emergency arising up to 55 years of age.

All officers of the rank of Lieutenant-Colonel and Major are placed on the retired list at the age of 55, and all Surgeons-General and Colonels at the age of 60, but the Director-General is allowed to serve until he has attained the age of 62 years. In any special case, where it would appear to be for the good of the Service that an officer should continue in employment, he may be so continued, subject in each case to the sanction of the Secretary of State for India in Council.

Officers placed on temporary or permanent half-pay are granted half-pay at the following rates.

—	Rates of Half-pay.* Per diem.	Per annum.
	£ s. d.	£ s. d.
Under 5 years' service	0 6 0	109 10 0
After 5 ,, ...	0 8 0	146 0 0
,, 10 ,, ...	0 10 0	182 10 0
,, 15 ,, ...	0 13 6	246 7 6
Lieutenant-Colonel, under 3 years' service as such	1 0 0	365 0 0
Lieutenant-Colonel, over 3 years' service as such	1 7 6	501 17 6

* Officers cannot retire *in India* on half-pay.

An officer of less than three years' service, although he may be transferred to the half-pay list under the general conditions of transfer, will not be granted any half-pay unless his unfitness has been caused by service.

Invalid Pensions.

An officer who has become incapacitated for further service in India on account of unfitness caused by duty may be granted an Invalid Pension on the following scale:—

	Per annum.
After 16 years' pension service	£272
,, 15 ,, ,, ,, ...	252
,, 14 ,, ,, ,, ...	232
,, 13 ,, ,, ,, ...	212
,, 12 ,, ,, ,, ...	192

Wound Pensions.

Officers are entitled to the same allowances on account of wounds received in action and injuries sustained through the performance of military duty as are granted to combatant officers of His Majesty's Indian Military Forces holding the corresponding military rank.

Family Pensions.

The claims to pension of widows and families of officers are treated under the provisions of such Royal Warrant regulating the grant of pensions to the widows and families of British officers as may be in force at the time being.

The widows and families of officers are also entitled to pensions under the Indian Service Family Pension Regulations, for the benefits of which all officers must, as a condition of their appointment, subscribe from the date of their arrival in India, except in the case of natives of India, for whom it is optional.

Honours and Rewards.

Officers of the Indian Medical Service are eligible for the military distinction of the Order of the Bath and for other Orders, British and Indian, and for good service pensions. Six of the most meritorious officers are named Honorary Physicians and six are named Honorary Surgeons to His Majesty. On appointment as Honorary Physician or Surgeon an officer below the rank of Colonel is promoted to that rank, remaining supernumerary until absorbed.

The Royal Army Medical Corps is at the present time, we believe, a fairly contented service, although for some time back there has been a feeling of uneasiness and uncertainty amongst all ranks, but more especially in the senior ranks, as to their future prospects by the adoption of a system of promotion by so-called selection. It is felt that the spirit of the Royal Warrant for promotion has been departed from, thereby causing a block in promotion affecting all ranks. We had reason to refer to this condition of affairs in an annotation on the appointment of the present Director-General (*vide* THE LANCET, April 2nd, 1910, p. 936). The limitation of the tenure of the colonel's appointments to four years has caused heartburnings in this grade, as after this period, unless promoted, men are now placed on half-pay. Again, the reduction of the cadre establishment of lieutenant-colonels has adversely affected a large number of majors who are well worthy of promotion to the next rank; and it is felt that the rules recently introduced allowing of accelerated promotion from the rank of captain to major have not worked as fairly as it was intended they should have. Dissatisfaction is also caused by the inconvenience caused to officers under 12 years' service having to remain in military hospitals on orderly duty as often as every fourth night for night duty and carry out their day work as well.

The improvements that have been introduced by Sir Alfred Keogh, K.C.B., the late Director-General, have, however, been so substantial, both as regards emolument and as affecting the professional and military status of medical officers, that it would be ungracious to refrain from acknowledging the generous spirit that has actuated the War Department authorities in their attitude to the medical service. We feel sure that the good results of this are being, and will continue to be, manifested in an improvement in the health and efficiency of the army at large.

In the Indian Medical Service the recent introduction of the increased pension (£600 per annum) after 27½ years service has been an important concession; there is still, however, a block in promotion, administrative rank, which used to come after 26 or 27 years', being now generally deferred until over 30 years' service; limitation of the period of service in administrative rank, as recently adopted in the Royal Army Medical Corps in the case of the colonel's grade, would probably be an improvement. The order issued that an officer of the Indian Medical Service must refer the question of his fees when above a certain low limit to the civil authority was most objectionable: it might necessitate the violation of professional secrecy and it is professionally degrading. Revised rules were promulgated in the early part of the present year (see THE LANCET, March 11th, 1911, page 682), which, if there is really necessity for any regulations at all in these matters, need not be objected to. The neglect of the rule that the office of principal medical officer to His Majesty's forces in India may be held by an officer of the Indian Medical Service is still felt to be a grievance. On the whole it can hardly be said that the Indian service at the present time offers the advantages over the Royal Army Medical Corps, either professional or pecuniary, that it formerly possessed. If the changes foreshadowed by the Secretary of State (see THE LANCET, May 29th, 1909, p. 1537, and July 10th, 1909, p. 91) be carried out, it seems to be inevitable that the status, prospects, and influence of the Indian Medical Service will be affected injuriously. The objections to these proposals are, however, we venture to think, so serious on the grounds of general policy that we

abstain from any criticism on their effect on the prospects of the Indian Medical Service; there is, indeed, no concrete proposal to criticise. It is, moreover, a dangerous thing to introduce a feeling of distrust and uncertainty into any public service; if the duties hitherto performed by the Indian Medical Service are in future to be shared with other medical men not of that service, then the privileges and emoluments of the Indian Medical Service will inevitably be diminished, with the natural result that men of the highest class will come forward in fewer numbers to compete for the service, and the service generally will deteriorate. Such a result would be disastrous.

PUBLIC HEALTH DIPLOMAS.

INSTRUCTION FOR DIPLOMAS IN STATE MEDICINE.

RESOLUTIONS, designed with a view of ensuring "the possession of a distinctively high proficiency, scientific and practical, in all the branches of study which concern the public health," have been adopted at various times by the General Medical Council from 1902 to 1910. The rules require that—"1. A period of not less than twelve months shall have elapsed between the attainment of a registrable qualification in Medicine, Surgery, and Midwifery and the admission of the candidate to any examination or any part thereof for a diploma in Sanitary Science, Public Health or State Medicine. 2. Every candidate shall produce evidence that after obtaining a registrable qualification he has during six months received practical instruction in a laboratory or laboratories, British or foreign, approved by the licensing body granting the diploma, in which chemistry, bacteriology, and the pathology of diseases of animals transmissible to man are taught. 3. Every candidate shall produce evidence that, after obtaining a registrable qualification, he has during six months (of which at least three months shall be distinct and separate from the period of laboratory instruction required under Rule 2) been diligently engaged in acquiring a practical knowledge of the duties, routine and special, of Public Health administration either under the supervision of: (*a*) in England and Wales, the medical officer of health of a county or of a single sanitary district having a population of not less than 50,000, or a medical officer of health devoting his whole time to Public Health work; or (*b*) in Scotland, a medical officer of health of a county or counties, or of one or more sanitary districts having a population of not less than 30,000; or (*c*) in Ireland, a medical superintendent officer of health of a district or districts having a population of not less than 30,000; or (*d*) in the British Dominions outside the United Kingdom, a medical officer of health of a sanitary district having a population of not less than 30,000, who himself holds a registrable Diploma in Public Health; or (*e*) a medical officer of health who is also a teacher in the Department of Public Health of a recognised Medical School; or (*f*) a sanitary staff officer of the Royal Army Medical Corps having charge of an Army Corps, District, Command, or Division, recognised for this purpose by the General Medical Council. (The certificate of an assistant medical officer of health of a county or of a single sanitary district having a population of not less than 50,000 may be accepted as evidence under Rule 3, provided the medical officer of health of the county or district in question permits the assistant officer to give the necessary instruction and to issue certificates. Provided that the period of six months may be reduced to a period of three months (which shall be distinct and separate from the period of laboratory instruction required under Rule 2), in the case of any candidate who produces evidence that after obtaining a registrable qualification he has during three months attended a course or courses of instruction in sanitary law, sanitary engineering, vital statistics, and other subjects bearing on Public Health Administration, given by a teacher or teachers in the Department of Public Health of a recognised medical school. A candidate who shall have produced evidence that he has himself held for a period of not less than three years an appointment as medical officer of health of a sanitary district within the British Dominions, and having a population of not less than 15,000, may be exempted from the requirement of Rule 3.) 4. Every candidate shall produce evidence that after having obtained a registrable qualification he has attended during three months the practice of a hospital for infectious diseases at which opportunities are afforded for the study of methods of administration. (Methods of administration shall include the methods of dealing with patients at their admission and discharge, as well as in the wards, and the medical superintendence of the hospital generally. In the case of a medical officer of the Royal Army Medical Corps a certificate from a principal medical officer under whom he has served, stating that he has during a period of at least three months been diligently engaged in acquiring a practical knowledge of hospital administration in relation to infectious diseases, may be accepted as evidence under Rule 4.) 5. The examination shall be conducted by examiners specially qualified; it shall have extended over not less than four days, one of which shall have been devoted to practical work in a laboratory, and one to practical examination in, and reporting on, subjects which fall within the special outdoor duties of a medical officer of health."

The regulations in question as to study may be procured at the office of the General Medical Council in London.

University of London.—State Medicine is one of the subjects which candidates for the M.D. degree may offer (Branch V.). Certificates must be produced showing that a course of practical instruction has been attended for the prescribed period, and that the course has included such chemical, microscopical, and meteorological work and exercises as more especially relate to sanitation. The attendance includes six months' practical instruction in a laboratory and six months' instruction in public health administration under the supervision of a medical officer of health, and three months' attendance on the practice of a hospital for infectious diseases. In connexion with this degree the various metropolitan medical schools hold regular classes under teachers of Public Health and Sanitary Science, such instruction being also used to obtain the various diplomas of other Universities and of those Royal Corporations which grant them.

University of Oxford.—An examination, conducted partly in writing, partly *vivâ voce*, and in each subject partly practical, is held in Michaelmas and Easter Terms in the following subjects:—General Hygiene, General Pathology (with special relation to Infectious Diseases), the Laws relating to Public Health, Sanitary Engineering, Vital Statistics. The examination is in two parts, which may be taken together or separately; but Part I. must be passed either before or at the same examination as Part II. The fee for admission to the examination is £5 for each part. Successful candidates are entitled to receive the Diploma in Public Health. Any person whose name is on the Medical Register is admissible as a candidate for this examination provided (1) a period of not less than twelve months shall have elapsed between the attainment of registrable qualification and the time when he presents himself for either part of the examination; (2) he produce evidence of having, after obtaining a registrable qualification, attended during three months the practice of a hospital for infectious diseases at which opportunities are afforded for the study of methods of administration; (3) he produce evidence of having, after obtaining a registrable qualification, attended during a period of six months on one or more courses, approved by the Syndicate, of practical laboratory instruction in Chemistry, Bacteriology, and the Pathology of those diseases of animals that are transmissible to man; and (4) he produce evidence of having, after obtaining a registrable qualification, for six months (of which at least three months shall be distinct and separate from the period of laboratory instruction) been associated day by day in the duty, routine and special, of public health administration under the supervision of: (*a*) in England and Wales either the medical officer of health of a county or of a single sanitary district having a population of not less than 50,000 or a medical officer of health devoting his whole time to public health work; or (*b*) in Scotland or Ireland the medical officer of health of a county or of one or more sanitary districts having a population of not less than 30,000; or (*c*) a medical officer of health who is a teacher in the department of public health of a recognised medical school; or (*d*) a sanitary staff officer of the Royal Army Medical Corps having charge of an army corps or district;

or (*e*) in the British dominions outside the United Kingdom a medical officer of health of a sanitary district having a population of not less than 30,000 who himself holds a registrable diploma in public health. A certificate of an assistant officer of health of a county or a large sanitary district may be accepted, provided the medical officer of health of a county or district consents to the assistant officer giving such instruction. Any candidate who shall produce evidence that he has himself held an appointment as medical officer of health under conditions not requiring the possession of a special sanitary diploma shall be exempt from this regulation. A candidate who produces evidence that he has himself held, for a period of not less than three years, an appointment as medical officer of health of a sanitary district within the British dominions and having a population of not less than 15,000 shall be exempt from the provision of paragraph (4). The provisions as to previous study shall not apply to medical practitioners registered, or entitled to be registered, on or before Jan. 1st, 1890.

The First Part of the examination will comprise (*a*) a written paper of three hours in Chemistry and Physics; (*b*) a three hours' practical and *viva voce* examination in Chemistry and Physics. The Written Examination: the subjects will be: Air (Examination, Recognition and Determination of Impurities); Water (Rainfall, Sources and Characters of Waters, Purification and Softening, Methods of Analysis, Distribution and Supply); Soils; Ventilation and Warming; Removal and Disposal of Sewage, House Refuse, Trade Refuse; Offensive Trades in their Chemical and Physical Aspects; Disinfectants; and the Examination of Foods by Chemical and Microscopical Methods. The Practical Examination: Candidates will be expected to exhibit a practical acquaintance with the ordinary methods of analysis and examination used in investigations concerning the subjects of the Written Examination.

The Second Part of the examination will consist of the following parts:—(*a*) Two written papers, each of three hours, dealing with General Hygiene (including Sanitary Engineering, Vital Statistics, and the Laws relating to Public Health); (*b*) a practical and *viva voce* examination in General Hygiene; (*c*) a written paper of three hours in Pathology and Bacteriology; and (*d*) a three hours' practical and *viva voce* examination in Pathology and Bacteriology. The subjects of these examinations will be as follows:—General Hygiene.—The Written Examination: The construction, drainage, heating, and ventilation of dwellings, schools, hospitals, and other similar buildings; the general sanitation of villages and towns; influences which exercise or threaten to exercise an injurious effect on health and physical development; the etiology, symptoms, and methods of prevention of infectious and other preventable disease; the effects of food, season, soil, and climate upon health and disease; dangerous and offensive trades; the inspection of food; the principles and methods of Vital Statistics; the laws, statutes, memoranda, &c., relating to Public Health. The Practical and *viva voce* Examination: Candidates will be required to show a practical knowledge of outdoor sanitary work. Pathology.—The Written Examination: The general pathology of infection by any organism (including a general knowledge of parasitology and helminthology), immunity, the principles of prophylactic and curative inoculations, serum therapeutics; the special pathological characters of the common human infections; the pathology of the diseases of animals transmissible to man; the conditions affecting the existence of infective agents outside the animal body; the pathology of diseases dependent on occupation. The Practical *viva voce* Examination: Candidates will be expected (*a*) to be able to demonstrate the existence of infective agents in pathological material; (*b*) to recognise cultures of the ordinary pathogenetic bacteria; (*c*) to exhibit a knowledge of the ordinary methods of bacteriological investigation, and of the special methods applicable to the examination of air, water, food, soil, and sewage; (*d*) to be familiar with the appearances presented by food which for bacteriological reasons is considered unfit for consumption.

Candidates in Part I. of the examination will be required to produce a certificate (1) of Laboratory Work in Chemistry as applied to Hygiene.

Candidates in Part II. will produce the following further certificates: (2) of a Practical Knowledge of the Duties, Routine and Special, of Public Health Administration; (3) of having had Practical Instruction in Bacteriology, and the Pathology of the Diseases of Animals transmissible to Man; and (4) of having attended the practice of a Hospital for Infectious Diseases at which opportunities are afforded for the study of the Methods of Administration. The courses of instruction in Chemistry applied to Hygiene and in Pathology and Bacteriology may be taken in the laboratories of any University in the United Kingdom, of any school of the University of London, of the Royal Army Medical College, of University College, Bristol, of any extramural school in Edinburgh, of Anderson's College, Glasgow, The Royal Institute of Public Health, and in any such other laboratory as may, in the case of any particular candidate, be approved of by the Regius Professor of Medicine. In the cases of certificates (2) and (4), the certificates shall be given in such form as shall satisfy the secretary to the Boards of Faculties that the candidate has conformed to the rules of the General Medical Council. The names of candidates must be sent to the Assistant Registrar of the University, Clarendon Building, Oxford, to whom applications for any further information should be addressed.

University of Cambridge.—Two examinations in so much State Medicine as is comprised in the functions of medical officers of health are held during the year in Cambridge. Each examination consists of two parts, Part I. beginning on Wednesday, April 5th, and Wednesday, Oct. 4th, respectively, and Part II. on the Monday following, April 10th and Oct. 9th respectively. Any person whose name is on the Medical Register is admissible as a candidate for this examination provided (1) a period of not less than twelve months shall have elapsed between the attainment of a registrable qualification in medicine, surgery, and midwifery, and the admission of the candidate to either part of the examination; (2) he produce evidence of having, after obtaining a registrable qualification, attended during three months the practice of a hospital for infectious diseases at which opportunities are afforded for the study of methods of administration, including therein the methods of dealing with patients at their admission and discharge as well as in the wards, and the medical superintendence of the hospital generally; (3) he produce evidence of having, after obtaining a registrable qualification, attended during a period of six months one or more courses, approved by the Syndicate, of practical laboratory instruction in Chemistry, Bacteriology, and the Pathology of those diseases of animals that are transmissible to man; and (4) he produce evidence of having, after obtaining a registrable qualification, during six months[1] (of which at least three months shall be distinct and separate from the period of laboratory instruction required under paragraph 3) been diligently engaged in acquiring a practical knowledge of the duties, routine and special, of public health administration under the supervision of: (*a*) in England and Wales either the medical officer of health of a county or of a single sanitary district having a population of not less than 50,000 or a medical officer of health devoting his whole time to public health work; or (*b*) in Scotland the medical officer of health of a county or counties or of one or more sanitary districts having a population of not less than 30,000; or (*c*) in Ireland the medical superintendent officer of health of a district or districts having a population of not less than 30 000; or (*d*) a medical officer of health who is also a teacher in the department of public health of a recognised medical school; or (*e*) a sanitary staff officer of the Royal Army Medical Corps having charge of an army corps district or command, recognised for this purpose by the General Medical Council[2]; or (*f*) in the British dominions outside the United Kingdom a medical officer of health of a sanitary district having a population of not less than 30,000 who himself holds a

[1] This period of six months may be reduced to a period of three months (which must be distinct and separate from the period of Laboratory Instruction required under paragraph 3) in the case of any candidate who produces evidence that, after obtaining a registrable qualification, he has during three months attended a course or courses of instruction in sanitary law, sanitary engineering, vital statistics, and other subjects bearing on Public Health Administration, given by a teacher or teachers in the Department of Public Health of a recognised Medical School.

[2] Districts recognised by the General Medical Council:—Aldershot, Salisbury Plain, Southern and South-Eastern, Western, Dublin and Belfast, Cork, Chatham and Woolwich, Home, Eastern, North-Eastern and North-Western, Scottish, Gibraltar Command, Western Command (late Bombay), Northern Command (late Punjab), Eastern Command (late Bengal), and Secunderabad and Burma Divisions (late Madras Command).

registrable diploma in public health. The certificate of an assistant officer of health of a county or of a large sanitary district having a population of not less than 50,000 may be accepted as evidence under paragraph 4, provided the medical officer of health of the county or district in question permits the assistant officer to give the necessary instruction and to issue certificates. A candidate who produces evidence that he has himself held, for a period of not less than three years, an appointment as medical officer of health of a sanitary district within the British dominions and having a population of not less than 15,000 shall be exempt from the provisions of paragraph (4). The provisions as to previous study (paragraphs 2, 3, and 4) shall not apply to medical practitioners registered, or entitled to be registered, on or before Jan. 1st, 1890.

Examinations in Tropical Medicine and Hygiene.—Two Examinations in Tropical Medicine and Hygiene are conducted yearly by the State Medicine Syndicate of the University of Cambridge. The examinations are held in Cambridge early in January and in the middle of August. Each examination will extend over four days.

Any person whose name is on the Medical Register is admissible as a candidate to the examination provided (I.) that a period of not less than 12 months have elapsed between his attainment of a registrable qualification and his admission to the examination; (II.) that he produce evidence, satisfactory to the Syndicate, that he has diligently studied Pathology (including parasitology and bacteriology) in relation to Tropical Diseases, Clinical Medicine, and Surgery at a Hospital for Tropical Diseases, and Hygiene and Methods of Sanitation applicable to Tropical Climates. As evidence of study and attainments a candidate may present to the Syndicate (1) any dissertation, memoir, or other record of work carried out by himself on a subject connected with Tropical Medicine or Hygiene; (2) any Certificate or Diploma in Public Health or Sanitary Science he may have obtained from a recognised Examining Body. Such evidence will be considered by the Syndicate in determining whether he is qualified for admission to the examination and by the examiners in determining whether, if admitted, he shall be included in the list of successful candidates.

The examination will be partly oral and partly practical, and will have reference to the nature, incidence, prevention, and treatment of the epidemic and other diseases prevalent in tropical countries. It will comprise the following subjects: 1. The methods of pathological and bacteriological investigation. The examination of the blood. The characters, diagnosis, and life-history of animal and vegetable parasites. The examination, chemical and microscopic, of poisonous or contaminated foods and waters. 2. The origin, pathology, propagation, distribution, prevention, symptoms, diagnosis, and treatment of the epidemic, endemic, and other diseases of tropical climates, including—malaria; blackwater fever; trypanosomiasis; relapsing fever; dengue; yellow fever; plague; tetanus; beri-beri; dysentery and hepatic abscess, cholera, enteric fever, Malta fever, and specific diarrhœal affections of the tropics; diseases due to cestode and other worms; filariasis; bilharzial disease; specific boils, sores, and other cutaneous affections; mycetoma; ophthalmic affections of the tropics; affections caused by poisonous plants and animals, and by poisoned weapons; sunstroke. 3. The general effects on health in the tropics of seasons and climate, soil, water, and food. Personal hygiene, acclimatisation. Principles of general hygiene, with special reference to food- and water-supplies, sites, dwellings, drainage, and the disposal of refuse. The sanitation of native quarters, camps, plantations, factories, hospitals, asylums, jails, pilgrim, and coolie ships. Principles and methods of disinfection.

Every candidate who passes the examination to the satisfaction of the examiners will receive from the University a diploma testifying to his knowledge and skill in tropical medicine and hygiene.

The fee for the examination is £9 9*s*., and all applications for information should be addressed to Professor G. H. F. Nuttall, F.R.S., 3, Cranmer-road, Cambridge.

The first part of the examination will have reference to the general principles of sanitary science and will comprise the following subjects. The elements of chemistry and physics: methods of chemical analysis and in particular the analysis of food, air, water, and sewage. The laws of heat and the elements of pneumatics, hydrostatics, and hydraulics in their application to warming, ventilation, water-supply, and drainage. The geological and other conditions determining the healthiness of sites for dwellings. Sources, storage, and purification of water-supply. The elements of meteorology in relation to health. The general principles and chemistry of sewage disposal. Disinfectants, their chemistry and use. The microscopical examination of foods and the detection of the commoner forms of contamination. The methods of bacteriological investigation and analysis. The bacteriology of air, water, food, and soil. The general pathology of infection and of the diseases of animals that are transmissible to man. The second part of the examination will have reference to State Medicine and to the applications of Pathology and Sanitary Science, and will comprise the following subjects. Laws and Statutes relating to Public Health.[3] The model by-laws of the Local Government Board. Sanitation of dwellings, schools, factories, and workshops, and of villages and towns. Inspection of slaughter-houses, cowsheds, &c. Inspection of meat and other articles of food. Principles of building construction in their application to dwellings, hospitals, and schools. The general principles and practice of sanitary engineering. General epidemiology, with special reference to the origin, pathology, symptoms, propagation, geographical distribution, and prevention of the epidemic, endemic, and other infective diseases both of temperate and of tropical climates. The methods applicable to the medical investigation of epidemics. Effects on health of overcrowding, vitiated air, impure water, polluted soils, and bad or insufficient food. Unwholesome trades and occupations and the diseases to which they give rise. Nuisances injurious or dangerous to health. The effects on health of season and climate. The principles and methods of vital statistics in relation to public health. (N.B.—The foregoing schedule is not to be understood as limiting the scope of the examination, which will include every branch of sanitary science. No candidate will be approved by the examiners who does not show a high proficiency in all the branches of study, scientific and practical, which bear upon the duties of medical officers of health.) The examinations in both parts will be oral and practical, as well as in writing. Candidates may present themselves for either part separately or for both together at their option; but the result of the examination in the case of any candidate will not be published until he has passed to the satisfaction of the examiners in both parts. Every candidate will be required to pay a fee of £6 6*s*. before admission or readmission to *either part* of the examination, but candidates who have presented themselves before the year 1896 will be readmitted to either part on payment of a fee of £5 5*s*. Every candidate who has passed both parts of the examination to the satisfaction of the examiners will receive a diploma testifying to his competent knowledge of what is required for the duties of a medical officer of health. Marks of distinction will be placed opposite the names of candidates who have specially distinguished themselves either in (1) the general principles of hygiene, (2) bacteriology, (3) chemistry in Part 1 of the examination, or (4) the second part of the examination. All applications for information respecting this examination and the courses of study should be addressed to J. E. Purvis, M.A., Assistant Secretary to the State Medicine Syndicate, the Chemical Laboratory, Pembroke-street, Cambridge. Candidates who desire to present themselves for the examination must send in their applications on forms supplied for the purpose and transmit them with the fees to Mr. J. W. Clark, Registrary, University of Cambridge, for the April examination on or before March 24th[4] and for the October examination on or before Sept. 22nd.[4] The prescribed certificate must be sent to the Registrary so as to reach him not later than 10 A.M. on March 30th and Oct. 1st respectively. Cheques should be crossed "Barclay and Co., Ltd." The fee for either part of the examination cannot be returned to any candidate who fails to present himself; but he will be entitled, without an additional fee, to be a candidate on one subsequent occasion. Candidates must before admission to either part of the examination produce evidence of having satisfied provisions (1), (2), and

[3] All candidates will be examined in the provisions of the English Statutes relating to public health, but any candidate will be given an opportunity of showing a special knowledge of other sanitary laws in operation within the British Empire, provided that, *when applying for admission to the examination, he give notice* of his desire and indicate the special law he proposes to offer.

[4] These dates vary slightly from year to year.

(3), and before admission to Part II. having satisfied provision (4), above mentioned. The following is a list of colleges and schools of medicine at which the courses of laboratory instruction have, for the purposes of this examination, been already approved by the State Medicine Syndicate: The University Laboratories, Cambridge; London Hospital Medical College; St. Bartholomew's Hospital Medical College; King's College, London; University College, London; the Royal Army Medical College, London; the Victoria University of Manchester; the University of Durham Medical School, Newcastle-on-Tyne; University of Birmingham; University of Liverpool; St. Mary's Hospital Medical College; Charing Cross Hospital College; Westminster Hospital Medical School; University College, Bristol; the University of Leeds; Guy's Hospital Medical School; St. Mungo's College, Glasgow; Edinburgh University; Middlesex Hospital Medical School; Royal Southern Hospital, Liverpool; Royal Colleges, Edinburgh; Surgeons' Hall, Edinburgh; Trinity College, Dublin; Queen's College, Belfast; St. Thomas's Hospital Medical School; University College, Cardiff; University of Sheffield; Medical School, Catholic University, Dublin; St. George's Hospital Medical School; University of Glasgow; University of Aberdeen; Anderson's College, Glasgow; the Royal Institute of Public Health; the Royal College of Surgeons in Ireland; the Government Bacteriological Laboratory, Hong-Kong; North-East London Post-Graduate College; and the Government Bacteriological Laboratory, Cairo.

University of Durham.—Sanitary Science is the special object of the degrees in Hygiene. Candidates for the degree of Bachelor of Hygiene (B.Hy.) must be at least twenty-two years of age, registered, and a graduate in Medicine of a recognised university, and at least twelve months shall have elapsed after the date when the candidates obtained their first registrable qualification in Medicine, Surgery, and Midwifery before presenting themselves for examination. They shall spend six months at Newcastle-upon-Tyne studying Comparative Pathology, Practical Bacteriology, Sanitary Chemistry, and Physics. They have to pass an examination in Sanitary Chemistry, Physics, Comparative Pathology, Sanitary Legislation, Vital Statistics, Nosology, Climatology, Meteorology, Distribution of Health and Disease, Sanitary Medicine and Practical Hygiene. The fee for the examination for the degree of B.Hy. is 10 guineas and for the degree £6 6*s*. The examination is divided into two parts and candidates may present themselves for either part or both together at their option. Candidates for the degree of Doctor of Hygiene (D.Hy.) must have acquired the degree of Bachelor of Hygiene, must for two years subsequently have been engaged in practice as a medical officer of health, and must write an essay upon some practical hygienic subject. The fee for the examination for the degree of D.Hy. is £5 and for the degree £6 6*s*. The regulations for education and examination for the Diploma in Public Health (D.P.H.) are the same as those for the degree of Bachelor of Hygiene, except that the candidate is not required to be a graduate in Medicine of a recognised University and the course of study need not be passed at Newcastle-upon-Tyne. The fee for the examination and Diploma in Public Health is 10 guineas.

Victoria University of Manchester.—An examination in Public Health is held twice yearly under the following regulations: The examination is in two parts and is written, oral, and practical. Candidates before entering for either part of the examination must have held for not less than twelve months a registrable qualification in Medicine, Surgery, and Midwifery, and must present satisfactory certificates of having attended courses of instruction in Public Health in the University, or in a college or medical school recognised for this purpose by the University; of having attended, after obtaining a registrable qualification, during at least six months, practical instruction in a laboratory approved by the University, the courses including Chemistry as applied to Public Health, Bacteriology, and the Pathology of those diseases of animals which are communicable from animals to man; of having, after obtaining a registrable qualification, attended for three months the clinical practice of an approved hospital for infectious diseases; of having, after obtaining a registrable qualification, practically studied the duties of outdoor sanitary work for not less than six months under the medical officer of health of a county or of a large urban district. Candidates may present themselves for Parts I. and II. separately or at the same time, provided that no candidate be admitted to Part II. unless he has already passed in Part I. No candidate's name will be published until he has satisfied the examiners in both parts of the examination. The fee for each part is £5 5*s*. and must be paid on or before July 1st in each year. For any subsequent examination in the same part the fee will be £3 3*s*. Every candidate who has passed both parts of the examination to the satisfaction of the examiners, and who is legally registered, will receive a Diploma in Public Health. The examinations will begin about the end of March and the middle of July in each year. Holders of the Diploma in Public Health are eligible for examination for the Certificates in School Hygiene and Factory Hygiene after attending the prescribed periods of study and hospital practice.

University of Birmingham.—The University grants a degree of B.Sc. in Public Health and also a Diploma in the same subject on the following conditions: Graduates in Medicine of this University may become candidates for the degree of Bachelor of Science in Public Health, by conforming to all the requirements laid down for candidates for the Diploma in Public Health, except that after graduating in Medicine all courses of study must be taken out in the University and they must, in addition, have attended a three months' course of Geology in the University. The following are the regulations for Diploma in Public Health (general conditions):—1. All candidates must be registered under the Medical Act. 2. The examinations will be held in the months of March and June and will consist of two parts. No candidate will be allowed to pass Part II. until he has passed Part I. 3. Candidates may enter for Parts I. and II. separately or at the same time. 4. The examination in each part will be written, oral, and practical. 5. Candidates intending to present themselves for either part of the examination must give notice in writing to the registrar of the University on the date prescribed in the calendar. 6. The fee for each part of the examination is £5. The conditions of admission to the examinations are identical with those approved by the General Medical Council.

Officers of the Royal Army Medical Corps who have studied Chemistry and Bacteriology at the Staff College and pursued the further course of study approved by the General Medical Council in December, 1902, will be admitted to the Examination for the Diploma in Public Health, whether they have previously been students of the Birmingham School or not.

University of Liverpool.—The University grants a Diploma in Public Health and every facility is afforded for training in Sanitary Science and State Medicine. The curriculum for the D.P.H. Examination demands (1) a six months' course of practical instruction in Sanitary Science; (2) a six months' course of laboratory instruction in Chemistry and Bacteriology; and (3) practical instruction in Infectious Diseases. Fees.—Chemistry, £5 5*s*; Bacteriology, £5 5*s*.; Practical Sanitation, £15; Infectious Diseases, £3 3*s*. The courses may be taken out at any time and students are allowed to work daily in the laboratories.

University of Leeds.—The University grants a Diploma in Public Health and every facility is afforded for training in Sanitary Science and State Medicine. The examination, which is held twice in each year—namely, in June and December—is in two parts, and is written, oral, and practical. Candidates, before entering for the first part of the examination, must have held for not less than 12 months a registrable qualification in Medicine, Surgery, and Midwifery and must present satisfactory certificates (1) of having attended an approved course of instruction in Public Health in the University, or in a college or medical school recognised for this purpose by the University; (2) of having attended, after obtaining a registrable qualification, during at least six months practical instruction in laboratories approved by the University, the courses including Chemistry as applied to Public Health, Bacteriology, and the Pathology of those diseases of animals which are communicable from animals to man; three of these months must be spent in the University in attendance on one of the practical courses. Candidates before entering the second part of the examination must present certificates (3) of having, after obtaining a registrable qualification, attended during not less than three months the clinical and administrative practice of a hospital for infectious diseases approved by the University; (4) of having, after obtaining a registrable

qualification, during six months (of which at least three months shall be distinct and separate from the period of laboratory instruction required under 2), been diligently engaged in acquiring a knowledge of the duties, routine and special, of Public Health administration under the supervision of (*a*) the medical officer of health of a county or of a single sanitary district having a population of not less than 50,000, or (*b*) a medical officer of health devoting his whole time to Public Health work, or (*c*) a medical officer of health who is also a teacher in the Department of Public Health of a recognised medical school, or (*d*) a sanitary staff officer of the Royal Army Medical Corps having charge of an Army Corps, district, or command recognised for the purpose by the General Medical Council, *or* of having attended during three months as required above, and during three months after obtaining a registrable qualification, having attended a course or courses of instruction, approved by the University, in subjects bearing on Public Health Administration. Candidates may present themselves for Parts I. and II. separately or at the same time, provided that no candidate be allowed to pass in Part II. unless he has already passed in Part I. No candidate's name will be published until he has satisfied the examiners in both parts of the examination. Fees—The fee for each part is £5 5*s*., and must be paid at least 14 days before the commencement of the examination. For any subsequent examination in the same part the fee will be £3 3*s*. Every candidate who has passed both parts of the examination and who is legally registered will receive a Diploma in Public Health. Medical practitioners registered or entitled to be registered on or before Jan. 1st, 1890, may be exempted from producing the above required certificates of study.

University of Sheffield.—This University grants a Diploma in Public Health and courses of instruction have been arranged for it. These qualify for the Cambridge University Diploma, for that given by the Conjoint Board of England, and for the degree of M.D. in State Medicine of the University of London.

University of Bristol.—Diploma in Public Health. Candidates must be at least 23 years of age, shall be fully registered medical practitioners of not less than 12 months' standing as such, and shall have passed the examination prescribed by regulation. The examination is divided into two parts. The subjects of the First Part are Chemistry as applied to Public Health and Pathology and Bacteriology. Candidates for the First Part shall, during six months after having obtained a registrable qualification, have received practical laboratory instruction in Hygienic Chemistry, in Bacteriology, and in the Pathology of the Diseases of Animals Transmissible to Man. The subjects of the Second Part are: Public Health and Epidemiology, Sanitary Law, Vital Statistics, and Sanitary Reporting. Candidates for the Second Part shall, during six months after having obtained a registrable qualification, have been diligently engaged in acquiring a practical knowledge of the duties, both routine and special, of public health administration under the supervision of certain persons specified by the General Medical Council, a list of which can be obtained from the prospectus.

University of Edinburgh.—Two degrees in Science in the Department of Public Health are conferred by the University of Edinburgh, viz., Bachelor of Science in Public Health and Doctor of Science in Public Health. Candidates for the degree of B.Sc. in Public Health must be graduates in Medicine of a University of the United Kingdom, or of some other University recognised for the purpose, and must pass two examinations, for the first of which they must, after graduation in Medicine, have worked for at least 20 hours per week during a period of not less than eight months, of which at least five consecutive months must be in the Public Health Laboratory of the University of Edinburgh and the remainder either there or in a laboratory recognised by that University; they must also have attended courses of instruction in Physics and Geology in some Scottish University. Candidates are not admitted to the Second Examination sooner than six months after having passed the First Examination, nor sooner than 18 months after having taken their degree in Medicine, and they must have attended two separate courses in Public Health in some University of the United Kingdom or in such medical school or Indian, Colonial, or Foreign University as may be approved for the purpose by Edinburgh University, each course consisting of 40 lectures at least; one of which courses shall deal with medicine and the other with engineering, each in its relation to public health. They must also give evidence that, subsequent to graduation in medicine, (1) they have during three months, which must be separate and distinct from the period of laboratory instruction, been diligently engaged in acquiring a practical knowledge of the duties, routine and special, of Public Health administration under the supervision of (*a*) a medical officer of health recognised for this purpose by the General Medical Council; (*b*) a sanitary staff officer of the Royal Army Medical Corps, having charge of an army corps, district, or command, recognised for this purpose by the General Medical Council; (2) that they have attended during three months the practice of a hospital for infectious diseases, at which opportunities are afforded for the study of methods of administration; and (3) that they have had three months' instruction in mensuration and drawing. The subjects of examination include Laboratory work, Physics, Geology, Medicine in its application to Public Health, Sanitation, Sanitary Law, and Vital Statistics. Graduates who have held the degree of B.Sc. in Public Health from the University of Edinburgh for a term of five years may offer themselves for the degree of D.Sc. in Public Health in that University. They must then present a Thesis and pass an examination in Public Health. The fees are £3 3*s*. for the First and £3 3*s*. for the Second B.Sc. Examinations, and £10 10*s*. for the degree of D.Sc.

University of Aberdeen.—The Diploma in Public Health (D.P.H.) is conferred only on graduates in Medicine of a University in the United Kingdom; and a period of not less than 12 months must elapse between medical graduation and entrance to the examination for the diploma. Every candidate must produce evidence of having attended, after graduation in Medicine, during a period of six months, practical instruction in Hygiene and Bacteriology in laboratories approved of by the University, together with having during six months (whereof three months must be distinct from the period of laboratory instruction) been diligently engaged in acquiring a practical knowledge of the duties, routine and special, of Public Health administration under the medical officer of health of a county or large urban district. He must have regularly attended for three months the practice of a hospital for infectious diseases at which opportunities are afforded for the study of methods of administration. He must also have obtained practical instruction in the drawing and interpretation of plans. Every candidate who is not a graduate in Medicine of this University must have attended a course of instruction in the University in one or more of the subjects embraced in the examination for the diploma. The diploma is conferred after an examination in Public Health held in March and July of each year. Candidates must send in their names, with the necessary fee, to the Secretary of the Medical Faculty a fortnight before the examination. The fee is £5 5*s*. The examination is conducted by specially qualified examiners appointed by the University. Candidates may enter for the whole examination at one period or they may enter for Part I. at one period and for Part II. at another and subsequent period.

University of Dublin (Trinity College).—The Diploma in Public Health is conferred, after examination, on the following conditions. The candidate must be a registered medical practitioner and have obtained a registrable qualification at least 12 months before the examination. The candidate must have completed (unless registered as a practitioner on or before Jan. 1st, 1890), subsequently to obtaining a registrable qualification, six months' practical instruction in a chemical and bacteriological laboratory or laboratories approved by the University, must have studied practically outdoor sanitary work for six months under an approved officer of health (at least three months of this period being distinct from the time spent in laboratory work), and must have spent three months in a fever hospital where opportunities are afforded for the study of methods of administration. The subjects of examination are:—Part I.: Chemistry, Bacteriology, Hygiene, Pathology (including methods of post-mortem examinations), Physics, and Meteorology. Part II.: Hygiene and Epidemiology, Vital Statistics, Public Health Law, and Sanitary Engineering and Reports.

National University of Ireland.—At this University there is a Diploma in Public Health and a B.Sc. in Public Health. The Diploma may be granted to matriculated students of the University who shall have completed approved courses

of study and shall have passed the prescribed examinations, provided that it shall not be granted except to a registered medical practitioner.

Candidates may present themselves for the examination after an interval of not less than 12 months from the time of obtaining a registrable qualification in Medicine, Midwifery, and Surgery. Every candidate when entering for the examination must produce a certificate that, after obtaining a registrable qualification, he has attended during a period of six months practical instruction in a laboratory, approved by the University, in the subjects of Chemistry, Bacteriology, and the Pathology of the diseases of animals transmissible to man. Every candidate must also produce evidence that, after obtaining a registrable qualification, he has during six months (of which at least three months shall be distinct and separate from the period of laboratory instruction mentioned above) been diligently engaged in acquiring a practical knowledge of the duties, routine and special, of Public Health Administration, under the supervision of:—(*a*) In England and Wales, the medical officer of health of a county or of a single sanitary district having a population of not less than 50,000, or a medical officer of health devoting his whole time to public work; or (*b*) in Scotland, a medical officer of a county or counties, or of one or more sanitary districts having a population of not less than 30,000; or (*c*) in Ireland, a medical superintendent officer of health of a district or districts having a population of not less than 30,000; or (*d*) a medical officer of health who is also a teacher in the department of public health of a recognised medical school; or (*e*) a sanitary staff officer of the Royal Army Medical Corps having charge of an army corps, district, or command, recognised for this purpose by the General Medical Council.[5] Every candidate must produce evidence that, after obtaining a registrable qualification, he has attended during three months the practice of a Hospital for Infectious Diseases at which opportunities are afforded for the study of methods of administration, which shall include the methods of dealing with patients at their admission and discharge, as well as in the wards, and the Medical Superintendence of the Hospital generally; and in the case of a Medical Officer of the Royal Army Medical Corps a certificate from a principal Medical Officer under whom he has served, stating that he has during a period of at least three months been diligently engaged in acquiring a practical knowledge of hospital administration in relation to Infectious Diseases.

The examination extends over not less than four days, one of which is devoted to practical work in a laboratory, and one to practical examination in, and reporting on, subjects which fall within the special out-door duties of a medical officer of health.[6] Candidates must answer questions in the following subjects: (1) Chemistry; (2) Meteorology and Climatology; (3) Sanitary Engineering and Architecture; (4) Bacteriology; and (5) Hygiene, Sanitary Law, and Vital Statistics. In connexion with this part of the examination candidates will be required to draw up a sanitary report upon the condition of dwelling-houses or other buildings selected for the purpose, and read plans, scales, sections, &c.

The examination consists of two parts, which may be passed separately or together. Part I. comprises the following subjects: Chemistry, Meteorology and Climatology, and Sanitary Engineering and Architecture. Part II. comprises the following subjects: Bacteriology, Hygiene, Sanitary Law, and Vital Statistics. The examination in each part will be oral and practical as well as written.

For the B.Sc. in Public Health, a candidate shall not be admitted unless he (*a*) shall have received the degrees of M.B., B.Ch., and B.A.O. at least one year previously; (*b*) shall have pursued an approved course of study in the Faculty of Medicine; and (*c*) shall have passed the prescribed examination. In addition to D.P.H. course the candidate will be required to take up (1) a Special Course of Pathology; (2) Bacteriology; and (3) Advanced Course in Hygiene. Each of these courses lasts three months.

University of Belfast.—A Diploma in Public Health is given by examination to every candidate, who must produce evidence that, after obtaining a registrable qualification, he has during six months received practical instruction in a laboratory or laboratories, British or foreign, approved by the Licensing Body granting the diplomas, in which Chemistry, Bacteriology, and the Pathology of the diseases of animals transmissible to man are taught.[7] He must also produce evidence that, after obtaining a registrable qualification, he has during six months (of which at least three months shall be distinct and separate from the period of laboratory instruction mentioned above) been diligently engaged in acquiring a practical knowledge of the duties, routine and special, of Public Health Administration, under the supervision of:—(*a*) In England and Wales, the medical officer of health of a county or of a single sanitary district having a population of not less than 50,000, or a medical officer of health devoting his whole time to public health work; or (*b*) in Scotland, a medical officer of a county or counties, or of one or more sanitary districts having a population of not less than 30,000; or (*c*) in Ireland, a medical superintendent officer of health of a district or districts having a population of not less than 30,000; or (*d*) in the British Dominions outside the United Kingdom, a medical officer of health of a sanitary district having a population of not less than 30,000, who himself holds a registrable Diploma in Public Health; or (*e*) a medical officer of health who is also a teacher in the department of public health of a recognised medical school; or (*f*) a sanitary staff officer of the Royal Army Medical Corps having charge of an army corps, district, or command, recognised for this purpose by the General Medical Council.[8]

After obtaining a registrable qualification every candidate must produce evidence that he has attended during three months the practice of a hospital for infectious diseases at which opportunities are afforded for the study of methods of administration.[9] The examination must have extended over not less than four days, one of which shall have been devoted to practical work in a laboratory, and one to practical examination in, and reporting on, subjects which fall within the special outdoor duties of a medical officer of health.

Examinations.—One examination will be held yearly and will consist of two parts. Candidates may present themselves for either part separately, or for both parts together at their option. The first part of the examination will have reference to the general principles of sanitary science, and will comprise the following subjects: Principles and methods of volumetric and gravimetric chemical analysis and their application to the analysis of air, water, milk, butter, beverages (alcoholic), foods, &c., ventilation, warming, water-supply, and drainage. Conditions determining the healthiness of sites for dwellings. Sources, storage, and purification of drinking water. Elements of meteorology and climatology. Building construction in relation more particularly to dwellings, hospitals, and schools. The disposal and purification of sewage and the

[5] The certificate of an assistant medical officer of health of a county or of a single sanitary district having a population of not less than 50,000 may be accepted as evidence of having received instruction in the practical duties and routine of a medical officer of health, provided the medical officer of health of the county or district in question permits the assistant officer to give the necessary instruction and to issue certificates. It is provided also that the period of six months may be reduced to a period of three months, which shall be distinct and separate from the period of laboratory instruction, in the case of any candidate who produces evidence that, after obtaining a registrable qualification, he has during three months attended a course or courses of instruction in Sanitary Law, Sanitary Engineering, Vital Statistics, and other subjects bearing on public health administration, given by a teacher or teachers in the department of public health of a recognised medical school

[6] The rules as to study shall not apply to medical practitioners registered, or entitled to be registered, on or before Jan. 1st, 1890.

[7] Provided that the period of six months may be reduced to a period of three months (which shall be distinct and separate from the period of laboratory instruction) in the case of any candidate who produces evidence that, after obtaining a registrable qualification, he has during three months attended a course or courses of instruction in sanitary law, sanitary engineering, vital statistics, and other subjects bearing on public health administration, given by a teacher or teachers in the department of public health of a recognised medical school.

[8] The certificate of an assistant medical officer of health of a county or of a single sanitary district having a population of not less than 50,000 may be accepted as evidence, provided the medical officer of health of the county or district in question permits the assistant officer to give the necessary instructions and to issue certificates. A candidate who shall have produced evidence that he has himself held for a period of not less than three years an appointment as medical officer of health of a sanitary district within the British dominions, and having a population of not less than 15,000, may be exempted from the requirements of these regulations

[9] Methods of administration shall include the methods of dealing with patients at their admission and discharge, as well as in the wards, and the medical superintendence of the hospital generally. In the case of a medical officer of the Royal Army Medical Corps a certificate from a principal medical officer under whom he has served, stating that he has during a period of at least three months been diligently engaged in acquiring a practical knowledge of hospital administration in relation to infectious diseases, may be accepted as evidence. These regulations as to study do not apply to medical practitioners registered or entitled to be registered on or before Jan. 1st, 1890.

disposal of refuse. The general principles of sanitary engineering. Disinfectants. Methods of bacteriological investigation and analysis. Pathology of infection and of the diseases of animals transmissible to man. The second part of the examination will have reference to State Medicine and to the applications of Pathology and Sanitary Science, and will comprise generally the following subjects:—Laws and statutes relating to public health. Model By-laws of the Local Government Board. Sanitation of dwellings, schools, factories and workshops; and of villages and towns. Inspection of slaughter-houses, cow-sheds, &c. Inspection of meat and other articles of food. General epidemiology, with special reference to the origin, pathology, symptoms, propagation, geographical distribution, and prevention of the epidemic, endemic, and other infective diseases, both of temperate and tropical climates. The methods applicable to the medical investigation of epidemics. Effects of overcrowding on health, also those of vitiated air, impure water, polluted soils, and of bad or insufficient food. Unwholesome trades and occupations and the resulting diseases. Nuisances injurious or dangerous to health. Relations of season and climate to health. The principles and methods of vital statistics in relation to public health. All candidates will be examined in the provisions of the statutes relating to public health in Ireland, but any candidate will be given an opportunity of showing a special knowledge of other sanitary laws in operation within the British Empire, provided that, when applying for admission to the examination, he give notice of his desire and indicate the special law he proposes to offer.

The examination in 1911 will begin on July 2nd. Candidates must lodge their names and pay the prescribed fees at the secretary's office on or before June 14th. The certificates of study required by the regulations must be produced before admission to the examination. The fee prescribed for each part of the examination is 1 guinea, and cannot be returned to any candidate who fails to present himself; but he will be entitled without an additional fee to be a candidate on one subsequent occasion.

Royal College of Physicians of London and the Royal College of Surgeons of England.—The following are the regulations for obtaining the Diploma in Public Health: Section 1: The examination consists of two parts. The fee for each part is £6 6*s*.[10] A candidate intending to present himself must give 14 days' written notice to the Secretary, at the Examination Hall, Victoria Embankment, W.C. A candidate registered under the Medical Act on or before Jan. 1st, 1890, will be admissible to Part I. of the examination on producing evidence of being at least 23 years of age, and to Part II. on producing evidence of being at least 24 years of age. A candidate registered under the Medical Act after Jan. 1st, 1890, will be admissible to examination in Part I. on producing evidence (1) of having been in possession of a registrable qualification in Medicine, Surgery, and Midwifery for at least 12 months; (2) of having attended, after obtaining such registrable qualification, practical instruction in a laboratory recognised by the Examining Board in England during a period of six months; and (3) of being at least 23 years of age. A candidate will be admitted to Part II. of the examination on producing evidence (1) of having been associated day by day in the duty, routine and special, of Public Health administration during six months (of which at least three months shall be distinct and separate from the period of laboratory instruction required under Par. 2 for Part I.) under the supervision of a medical officer of health who fulfils certain conditions which can be ascertained on application to the secretary[11]; (2) of having attended the clinical practice of a hospital for infectious diseases recognised by the Examining Board in England, after obtaining his registrable qualification in Medicine, Surgery, and Midwifery; and (3) of being at least 24 years of age.

[10] On and after July 1st, 1911, the fee for each part will be raised to £10 10*s*. for those candidates only who are not Diplomates of the Royal Colleges.

[11] Provided that the period of six months may be reduced to a period of three months (which shall be distinct and separate from the period of laboratory instruction required under Regulation 2) in the case of any candidate who produces evidence that after obtaining a registrable qualification, he has during three months attended a course or courses of instruction in sanitary law, sanitary engineering, vital statistics, and other subjects bearing on public health administration given by a teacher or teachers in the department of public health of a recognised medical school.

The Royal College of Physicians of Edinburgh, the Royal College of Surgeons of Edinburgh, the Royal Faculty of Physicians and Surgeons of Glasgow.—All candidates for the Diploma in Public Health must have been qualified for at least one year. Those qualified before 1890 do not require to produce evidence of attendance on any special courses. All other candidates must have attended, after qualifying, six months' practical instruction in a recognised laboratory or laboratories, and must have studied for six months the duties of outdoor sanitary work under the medical officer of health of a county or large urban district or a medical officer of health who is also a teacher of Sanitary Science in a Medical School, or a sanitary staff officer of the Royal Army Medical Corps having charge of an Army Corps District or command. There are two examinations, and candidates may enter for both at one period or for either separately. The First Examination includes (*a*) Laboratory Work (Chemistry and Bacteriology), (*b*) Physics and Meteorology; and the Second Examination embraces (*a*) Report on Premises visited, (*b*) Examination at Fever Hospital, (*c*) Examination at Public Abattoir, (*d*) Written and Oral Examinations on Epidemiology and Endemiology, (*e*) Vital Statistics and Sanitary Law, and (*f*) Practical Sanitation. The fee is 12 guineas for both examinations, or 6 guineas for either of them. A fee of 3 guineas is payable by rejected candidates for either examination. The examination is held twice yearly, in May and October. The published regulations provide detailed synopses of the subjects of examination. The Registrar for Edinburgh is Mr. James Robertson, solicitor, 54, George-square, and for Glasgow Mr. Alexander Duncan, LL.D., 242, St. Vincent-street.

Royal College of Physicians of Ireland and Royal College of Surgeons in Ireland.—Stated examinations for the Diploma in Public Health are held in the months of February, May, July, and November. A special examination for the diploma may, at the discretion of the Committee of Management (except during the months of August and September), be obtained on payment of £15 15*s*., in addition to the ordinary fees mentioned below, and on giving notice at least one fortnight before the date of the proposed examination. Every candidate for the Diploma in Public Health must be a registered medical practitioner. (Candidates registered or entitled to be registered prior to January, 1890, are exempt from the rules as to study.) He must subsequently to qualification (1) receive six months' laboratory instruction in Chemistry, Bacteriology, and the Diseases of Animals transmissible to man; and (2) during six months practically study outdoor sanitary work under a medical officer of health and shall as an additional requirement attend a hospital for infectious diseases. Candidates are examined on four days, commencing on the first Monday of February, May, and November. Each candidate must return his name to the secretary of the Committee of Management under the Conjoint Scheme two weeks before the examination, and lodge with him a testimonial of character from a Fellow of either of the Colleges, or of the Royal Colleges of Physicians or Surgeons of London or Edinburgh. The fee for the examination is £10 10*s*. The examination for the Diploma in Public Health comprises the following subjects:—Hygiene, Chemistry, Meteorology and Climatology, Engineering, Vital Statistics, Sanitary Law, and Bacteriology. For further particulars apply to Alfred Miller, Secretary, Committee of Management; Office, Royal College of Physicians, Dublin.

DENTAL SURGERY.

ANYONE who is on the Medical Register is entitled to practise as a dentist, although he cannot register as such without the special licence; but it is of eminent advantage to take the L.D.S., otherwise few dental appointments at general or special hospitals or dispensaries are available, and, what is still more important, the manual dexterity requisite for the successful practice of dentistry can only be gained by long and careful training; and, this having been attained, it is but little trouble to pass the special examinations. The subjects beyond those included in the general qualification are—Dental Anatomy and Physiology (Human and Comparative), one course;

a separate course of Dental Histology, including the preparation of microscopical sections; Dental Surgery, one course; a separate course of Practical Dental Surgery; a course of not less than five lectures on the Surgery of the Mouth; Dental Mechanics, one course; a course of Practical Dental Mechanics, including the manufacture and adjustment of six dentures and six crowns; Dental Metallurgy, one course; a course of Practical Dental Metallurgy; Practice of Dental Surgery at a recognised school, two years, and a certificate of having been engaged during a period of not less than two years in acquiring a knowledge of Dental Mechanics (this may be obtained by apprenticeship to a duly qualified dental practitioner or in the mechanical department of a recognised dental hospital). The Dental Schools in London are the Royal Dental Hospital of London, the National Dental Hospital, and Guy's Hospital Dental School. Most of the large provincial towns have now dental hospitals. A convenient arrangement by which the M.R.C.S., L.R.C.P., and L.D.S. can be taken is as follows:—The Preliminary Examination in General Education having been passed the student should commence his mechanical training at a dental school or with a qualified dentist and register as a dental and medical student. (This instruction, however, may be taken prior to the date of registration as a dental student.) During the mechanical tuition the student should receive instruction in Chemistry and Physics, together with Biology, and should pass the First Professional Examination for the Conjoint Diploma during his first year. He should then obtain instruction in Pharmacy and, having passed the examination, should complete his work for the First Professional Dental Examination and pass this at the end of his second year. On the completion of the mechanical training the student should join the general and dental hospitals and at the expiration of 18 months at the general hospital should pass the Second Examination for the Conjoint Diploma. The Final Examination for the L.D.S. can be taken at the end of two years from joining the hospital. The student during these two years will have been attending simultaneously both the general and dental hospitals. During the remainder of his time he should devote himself to Surgery, Medicine, Midwifery, &c., in which subjects he may be examined at the expiration of the required time from the passing of the Second Examination. When time is not a great object, a better course is to join only the general hospital at the completion of the mechanical tuition, and complete the Second Examination for the Conjoint Diploma and also his "Dressing" and "Clerking" appointments before commencing his surgical training at the Dental Hospital. The best course, however, is entirely to finish the curriculum for the M.R.C.S. and L.R.C.P. and then take the special Dental work. The regulations for the Dental Licence of the Royal Colleges of Ireland and Edinburgh and of the Faculty of Physicians and Surgeons of Glasgow are very similar to those of the English College. The L.D.S. can also be obtained alone.

The Registration of Dental Students is carried on at the Medical Council Office in London in the same manner as the existing registration of medical students, and subject to the same regulations as regards Preliminary Examinations. Candidates for a diploma in Dental Surgery must produce certificates of having been engaged during four years in professional studies and of having received two years' instruction in mechanical dentistry. The two years of instruction in mechanical dentistry, or any part of them, may be taken by the dental student either before or after his registration as a student, but no portion of such mechanical instruction will be counted as one of the four years of professional study unless taken after registration.

It is now necessary for anyone practising Dental Surgery in this country to be on the Register and no foreign qualifications are admitted.

The Royal College of Surgeons of England grants a diploma in Dental Surgery under the following regulations, which apply to all candidates who have registered as dental students after Jan. 1st, 1897. Candidates are required to pass three examinations: the Preliminary Science Examination, the First Professional Examination, and the Second Professional Examination. I. Preliminary Science Examination.—Before admission to this examination the candidate must produce a certificate of having received instruction (which may be taken prior to the date of registration as a dental student) at a recognised institution in Chemistry, Physics, and Practical Chemistry. The examination consists of these subjects and is identical with Part I. of the First Examination of the Examining Board in England. II. The First Professional Examination.—The candidate must produce the following certificates: 1. Of having been engaged during a period of not less than two years in acquiring a practical familiarity with the details of mechanical dentistry, under the instruction (which may be taken prior to registration as a dental student) of a competent practitioner or under the direction of the superintendent of the mechanical department of a recognised dental hospital. 2. Of registration as a dental student by the General Medical Council. 3. Of having attended at a recognised Dental Hospital and School (*a*) a course of Lectures on Dental Metallurgy; (*b*) a course of Practical Dental Metallurgy; (*c*) a course of Lectures on Dental Mechanics; and (*d*) a course of Practical Dental Mechanics, including the manufacture and adjustment of six dentures and six crowns. Candidates may present themselves for the First Professional Examination on production of the required certificates. The Examination consists of Part I. (Mechanical Dentistry) and Part II. (Dental Metallurgy), the examination in Dental Metallurgy being by written paper. The parts may be taken together or separately. III. The Second Professional Examination.—The candidate must produce the following certificates: 1. Of having been engaged during four years in the acquirement of professional knowledge subsequently to the date of registration as a dental student. 2. Of having attended at a recognised dental hospital and school (*a*) a course of Dental Anatomy and Physiology; (*b*) a separate course of Dental Histology, including the preparation of microscopical sections; (*c*) a course of Dental Surgery; (*d*) a separate course of Practical Dental Surgery; (*e*) a course of not less than five lectures on the Surgery of the Mouth, which lectures may be given at a dental hospital or at a recognised medical school; in the latter case they may form part of the course of lectures on Surgery; (*f*) a course of Dental Materia Medica; and (*g*) a course of Dental Bacteriology. 3. Of having attended at a recognised dental hospital or in the dental department of a recognised general hospital the practice of Dental Surgery during two years. 4. Of having attended at a recognised medical school (*a*) a course of lectures on Anatomy, (*b*) a course of lectures on Physiology, (*c*) a separate Practical Course of Physiology, (*d*) a course of lectures on Surgery, and (*e*) a course of lectures on Medicine. The lectures on Surgery and Medicine must be attended after the completion of the courses of lectures on Anatomy and Physiology. 5. Of having performed Dissections at a recognised medical school during not less than 12 months. 6. Of having attended at a recognised hospital the practice of Surgery and Clinical Lectures on Surgery for twelve months during the ordinary sessions. 7. Of being 21 years of age. The certificates of professional study will be required to show that students have attended the courses of professional study to the satisfaction of their teachers. All students joining the Dental Hospitals after Oct. 1st, 1909, will be required to attend a course of practical instruction in the anæsthetics in common use in the practice of Dental Surgery. Candidates may present themselves for the Second Professional Examination after the completion of four years' professional study from the date of registration as a dental student and after the lapse of not less than six months from the date of passing the First Professional Examination. The Second Professional Examination consists of: Part I., General Anatomy and Physiology, General Surgery and Pathology; Part II., Dental Anatomy and Physiology, Dental Pathology and Surgery, and Practical Dental Surgery. The written examination in Part I. comprises General Anatomy and Physiology, General Pathology and Surgery, and in Part II., Dental Anatomy and Physiology, and Dental Pathology and Surgery. At the Practical Examination candidates may be examined (*a*) on the treatment of Dental Caries and may be required to prepare and fill cavities or to do any other operation in Dental Surgery (candidates must provide their own instruments); (*b*) on the Treatment of the various irregularities of Children's Teeth. There is also an Oral Examination. Candidates may take the two parts of the examination together or separately. Candidates must pass Part I. before proceeding to Part II. If they fail in Part I. they are not allowed to proceed with Part II. Exemption from the Preliminary Science Examination is granted to candidates who have passed an Examination in Chemistry and Physics for a degree in Medicine at a

University in the United Kingdom, in India, or in a British colony. Exemption from Examination in Anatomy and Physiology is granted to candidates who have passed the Second Examination of the Examining Board in England or the corresponding Examination for any degree or qualification in medicine or surgery registrable under the Medical Act of 1886. Exemption from Examination in General Surgery and Pathology is granted to candidates who have passed the Examination in Surgery of the Examining Board in England or the corresponding Examinations of the Colleges and Universities above mentioned. The fee for the diploma is 20 guineas and is payable as follows:—Preliminary Science Examination, 3 guineas; First Professional Examination, 2 guineas; Second Professional Examination, 5 guineas; the balance to be paid on the completion of the Examinations. The Preliminary Science Examination is held in January, March, or April, July, and October in each year. The First and Second Professional Examinations are held in May and November in each year. Candidates must give 21 clear days' notice of their intention to present themselves for examination.

Royal College of Surgeons, Edinburgh.—For the Licence in Dental Surgery all candidates must pass a Preliminary Examination in General Knowledge and have their names inscribed in the Register of Dental Students of the General Medical Council. A copy of regulations giving a list of Preliminary Examinations recognised for obtaining this Licence, as well as of the subjects of the Professional Examinations, may be obtained from Mr. D. L. Eadie, Clerk to the Royal College of Surgeons, at 54, George-square, Edinburgh. Candidates must produce certificates of having, subsequently to the date of registration, been engaged for four years in professional studies and of three years' instruction in Mechanical Dentistry from a registered dental practitioner, except in the case of previously registered medical practitioners, when two years will be considered sufficient. Candidates must have attended the following curriculum: Anatomy, one course of six months; Practical Anatomy, twelve months; Chemistry, with Laboratory Instruction, one course of six months; Physics, with Laboratory Instruction, three months; Physiology, with Laboratory Instruction, one course of six months; Surgery, including Surgical Pathology, one course of six months; Medicine, including Medical Pathology, one course of six months; and attendance on the practice of a recognised general hospital, with Clinical Instruction on Surgery and Medicine, twelve months. These courses must have been attended at a University or in an established school of medicine or in a provincial school specially recognised by the College as qualifying for the diploma in Surgery. In addition to these courses candidates will be required to have attended in a recognised dental hospital, or with teachers recognised by the College, the following special courses of lectures and instruction: Dental Anatomy and Physiology (Human and Comparative) (not less than 24 lectures), with Practical Dental Histology, three months; Dental Surgery and Pathology (not less than 20 lectures), with the Materia Medica and Therapeutics applicable to Dental Surgery, three months; Dental Mechanics (not less than 12 lectures), Theoretical and Practical, with Dental Metallurgy, three months—one course each; two years' attendance at a dental hospital or the dental department of a general hospital recognised by the College. Practical instruction in Mechanical Dentistry from a registered Dentist, or in the Mechanical Department of a recognised dental hospital and school, as apprentices or otherwise, either before or after registration, for *three* years. Certificates of attendance on such of these courses as may be respectively required will entitle candidates to appear either for the First Dental Examination or for the First and Second Examinations for the Triple Qualification, as they may select, and subject to the existing regulations for each qualification. Candidates who have passed the First and Second Examinations for the Triple Qualification will be exempt from the First Dental Examination and will have the advantage of being admissible either to the Final Dental Examination or to the subsequent Examination for the Triple Qualification, or to both. But the First Dental Examination will not be held as equivalent to the First and Second Triple Examinations and will admit to the Final Dental Examination only. Candidates who are Licentiates of this College or who may be registered medical practitioners will be required to produce certificates of attendance on the special subjects only and will be examined in these only for the dental diploma. First Professional Examination: The candidate must have attended the required courses. The examination embraces (1) Chemistry and Physics; and (2) Anatomy and Physiology. The fee is £5 5*s*. for the complete examination and £3 3*s*. is payable for each division. In all cases of rejected candidates the fee for re-entry is £3 3*s*. Second Examination: The candidate must have attended the remaining courses of the curriculum, must produce certificates showing that he is 21 years of age, and must pay a fee of £10 10*s*., for re-entry £5 5*s*. The examination embraces (1) Surgery and Medicine; and (2) the special subjects of Dental Anatomy and Physiology, Dental Surgery and Pathology, Dental Materia Medica, Dental Mechanics and Dental Metallurgy, with a practical as well as the written and oral examinations in the subjects of Dental and Oral Surgery, Pathology, and Mechanics. The candidate will be tested in the Treatment of Dental Diseases, in Operative Dentistry, the Administration of Anæsthetics, Orthodontics, and in Prosthetic and Mechanical Dentistry. Candidates who claim exemption from the First Dental Examination on the ground of having passed the First and Second Triple Qualification Examinations or other recognised examinations will, before being admitted to the Second Dental Examination, be required to pay the total fee of £15 15*s*. payable for the dental diploma. Fees and schedules must be lodged not later than one week before the examination with Mr. D. L. Eadie, 54, George-square, Edinburgh, Clerk to the College.

Royal Faculty of Physicians and Surgeons of Glasgow.—The regulations as to certificates, curriculum, number, and subjects of examinations, fees, &c., are in effect similar to those of the Royal College of Surgeons of Edinburgh, but embrace Dental Bacteriology. Candidates can enter for the First Examination in three divisions, the first embracing Physics and Chemistry, the second Dental Metallurgy and Dental Mechanics, and the third Anatomy and Physiology. The examination in Dental Mechanics is practical; and there is at the Final Examination an examination in Practical Dentistry conducted in a dental hospital.

Royal College of Surgeons in Ireland.—Candidates for the Licence in Dental Surgery are required to pass two professional examinations, and to produce the following certificates before admission to the several examinations:—

First Dental Examination.—(A) Of having attended courses of instruction in the following subjects at an institution recognised for the purpose: (*a*) Theoretical Chemistry (six months); (*b*) Practical Chemistry, including Metallurgy (three months); (*c*) Physics (six months). The courses for these certificates need not be completed within one year, nor need they run concurrently; and they may be commenced or attended before the candidate registers as a medical or dental student. (B) 1. Of having passed a recognised Preliminary Examination in general education, and of having been registered as a medical or dental student by the General Medical Council. 2. Of having, subsequently to registration as a dental or medical student, attended courses of instruction in the following subjects at a recognised school of medicine: (*a*) Anatomy Lectures. (*b*) Dissections with Demonstrations (the candidates must dissect the head and neck three times) (12 months). (*c*) Physiology, including Dental Physiology. Lectures (six months). (*d*) Practical Physiology and Histology, including Dental Physiology and Histology, Human and Comparative (three months).

Final Dental Examination.—1. Of having been engaged during a period of two years in acquiring a practical familiarity with the details of Mechanical Dentistry under the instruction of a registered dentist, or under the direction of the superintendent of the Mechanical Department of a recognised Dental Hospital where the arrangements for teaching Mechanical Dentistry are satisfactory to the Council of the College. This instruction may be commenced or attended before the candidate registers as a medical or dental student. 2. Of having passed the First Dental Examination. 3. Of having attended, at institutions recognised by the College for the purpose, the following courses of instruction: (*a*) Dental Surgery and Pathology, Orthodontia, and the Materia Medica and Therapeutics applicable to Dental Surgery. Lectures. Two courses. (*b*) Dental Mechanics. Lectures. Two courses. (*c*) Dental Anatomy. Lectures. One course. (*d*) The practice of a Dental Hospital, or of the Dental Department of a General Hospital. Two years.

4. Of having attended Clinical instructions at a recognised General Hospital during the ordinary teaching sessions (nine months). 5. Of having been engaged during four years in the acquirement of professional knowledge subsequently to the date of registration as a medical or dental student. One year's *bonâ fide* apprenticeship with a registered dental practitioner, after being registered as a medical or dental student, may be counted as one of the four years of professional study. 6. Of being 21 years of age. All certificates of instruction and evidences of age and registration shall be submitted at least seven days before the commencement of the examination to the Registrar of the College.

In the First Dental Examination candidates will be examined in (A) Physics and Chemistry, including Practical Chemistry and Metallurgy. (B) Anatomy, Physiology, and Histology—General and Dental. All the subjects may be passed at the same time, or they may be passed in two groups, (A) and (B). Before presenting themselves for examination in either group, candidates must have attended the required courses of instruction in the subjects of the group for which they present themselves. The examination is partly written, partly *vivâ voce*, and partly practical.

In the Final Dental Examination candidates will be examined in General Pathology, Medicine, and Surgery; Dental Surgery, and Dental Pathology, with the Materia Medica and Therapeutics applicable to Dental Surgery; Dental Mechanics and Metallurgy; Orthodontia. Candidates must pass in all the subjects at one examination. The examination is partly written, partly *vivâ voce*, and partly practical, and includes the examination of patients and the performance of dental operations. Candidates are required to provide their own instruments and gold for filling. The First Dental Examination will commence on the first Mondays in the months of February, May, and November. The Final Dental Examination will commence on the second Mondays in the months of February, May, and November. The fee for the Diploma in Dental Surgery is 20 guineas, and is payable in the following manner, viz., First Dental Examination, Part (*a*), each admission, £3 3*s*.; Part (*b*), each admission, £4 4*s*.; Final, each admission, £5 5*s*.; amount payable before grant of Diploma, £8 8*s*.; total, £21. Fees for re-examination will not be allowed to count as part of the fee of £21 payable for the Diploma. Fees will not be refunded under any circumstances. Candidates must pay the fees for examinations from which they are exempted, unless when such exemptions have been granted in virtue of examinations passed before the Conjoint Board in Ireland.

University of Birmingham.—The teaching of Dentistry is undertaken by the University acting in association with the Birmingham Dental Hospital and the Birmingham Clinical Board, so that the students may fully qualify themselves for the Dental diploma (L.D.S.) of this and other universities and licensing bodies. There is a special and well-equipped Dental Museum and Laboratory. An Entrance Exhibition, value £37 10*s*., is awarded annually at the commencement of the winter session. The following are the regulations for Degrees in Dentistry:—1. The degrees conferred by the University are those of Bachelor and Master of Dental Surgery (B.D.S. and M.D.S.). 2. All candidates for these degrees must pass the same Matriculation Examination as that required from candidates for Medical Degrees. 3. The degree of Bachelor of Dental Surgery is not conferred upon any candidate who has not obtained a Licence in Dental Surgery. The candidate is not eligible for the degree until a period of 12 months has elapsed from the passing of his examination for the Licence in Dental Surgery. Of this period at least six months must be spent in the dental department of a general hospital approved by the University. 4. *A*. In addition to the Licence in Dental Surgery the candidate must produce evidence that he has attended the courses required by medical students of the University in the following subjects and passed the Examinations held in the same for Medical and Surgical Degrees: (*a*) Chemistry and Practical Chemistry, (*b*) Physics and Practical Physics, (*c*) Elementary Biology, (*d*) Anatomy and Practical Anatomy, and (*e*) Physiology and Practical Physiology. *B*. That he has attended the following courses and passed the class examinations in each of these subjects: (*f*) One Special Course of Lectures on Medicine, (*g*) One Special Course of Lectures on Surgery, and (*h*) Pathology and Bacteriology. *C*. That he has attended courses and passed the class examinations in: (*k*) Dental Histology and Patho-Histology, (*l*) Comparative Dental Anatomy, and (*m*) Dental Surgery and Prosthetic Dentistry. *D*. That he has received instruction in the Clinical Examination of living cases at the dental department of a general hospital for a period of not less than six months. 5. The Final Examination will deal with the subjects in Classes *C* and *D*. 6. On the expiration of 12 months from the date of passing the Examination for the Degree of Bachelor of Dental Surgery, the candidate will be eligible for that of Master of Dental Surgery. 7. For this degree candidates will be required to submit a thesis containing original work and investigations in some subject connected with Dentistry, which thesis shall be submitted to examiners to be nominated by the Dental Advisory Board. The degree will be awarded or withheld according to the report of these examiners.

University of Bristol.—Candidates for the degree of Bachelor of Dental Surgery must be not less than 21 years of age and shall have pursued the courses prescribed by University regulations during not less than five years, of which three shall have been passed in the University, and shall have been registered as dental students by the General Medical Council. All candidates for the degree of B.D.S. are required to satisfy the examiners in the several subjects of four examinations: the First Examination, the Second Examination, the Third Examination, and the Final Examination. The First Examination: The subjects are Chemistry, Physics, and Zoology, and the curriculum extends over one year. The Second Examination: The subjects are Dental Mechanics, Dental Metallurgy, and Dental Materia Medica, and the candidate shall produce evidence of having served for two years an approved pupilage in Dental Mechanics. The Third Examination: The subjects are Anatomy, Physiology and Histology, Dental Anatomy, and Dental Histology. The Final Examination: The subjects are Medicine and Surgery, Dental Surgery (including Prosthetics), Operative Dental Surgery, and Dental Bacteriology. Degree of Master of Dental Surgery: Candidates shall be Bachelors of the University, shall present a Dissertation on some subject of Dental Surgery to be approved by the Examiners, and pass an examination in Dental Surgery. Diploma in Dental Surgery: Candidates need not be undergraduates, but shall be registered dental students before being admitted to any professional examination; the curriculum extends over four years. A two years' pupilage in Mechanical Dentistry is required, and four examinations must be passed the subjects of which differ only from those of the B.D.S. in that Zoology is not required for the First Examination, and Medicine is not required for the Final Examination. Candidates who are already registered medical practitioners shall be further exempted from study and examination in Physics and Chemistry, Anatomy, Physiology and Histology, Medicine, and General Surgery.

University of Durham.—A Licence in Dental Surgery is granted. The conditions are as follows:—Every candidate for the Licence must pass the necessary examination required by the General Medical Council for registration as a dental student. There are four Examinations—viz., First, Second, Third, and Final. The subjects of the Examinations are:—*First:* (*a*) Chemistry; and (*b*) Physics. *Second:* (*a*) Dental Mechanics, Theoretical and Practical; (*b*) Dental Metallurgy; and (*c*) Dental Materia Medica. *Third:* (*a*) Anatomy; (*b*) Physiology and Histology; and (*c*) Dental Anatomy and Dental Histology. *Final:* (*a*) Surgery; (*b*) Dental Surgery, including Prosthetics and Orthodontia; (*c*) Operative Dental Surgery, Practical Examination; and (*d*) Dental Pathology and Bacteriology. A candidate before presenting himself for examination is required to furnish certificates of instruction in the following subjects, attended after registration as a dental student at recognised University Colleges, Medical or Dental Schools:—*First Examination:* Chemistry, lectures and practical work (nine months); and Physics, lectures and practical work (nine months). *Second Examination:* Dental Mechanics (not less than 20 lectures); Dental Metallurgy (not less than 12 lectures and 30 hours practical work); and Dental Materia Medica (not less than 12 lectures). *Third Examination:* Anatomy (six months); Dissections (12 months); Physiology (six months); Histology (three months); Dental Anatomy and Physiology (a course of not less than 20 lectures); and Dental Histology (not less than 12 lectures). *Final Examination:* Dental Hospital Practice (two years); General Hospital Practice (nine months); Medicine Lectures (six months); Surgery Lectures (six months); Dental

Surgery and Pathology (a course of not less than 20 lectures); Dental Bacteriology (not less than 12 lectures); Operative Dental Surgery (not less than 12 lectures); and Anæsthetics (a course of not less than one month).

Before admission to the Final Examination each candidate must furnish evidence (1) of having attained the age of 21 years, (2) of having undergone a three years' pupilage in Mechanical Dentistry with a registered dentist, and (3) of having been engaged in professional study for at least four years subsequent to registration as a dental student. He must also sign such declaration as the University may determine, binding himself not to advertise for professional purposes. The examinations will be held concurrently with the medical examinations, and the fees payable by candidates are as follows: First Examination, £2 10*s.*; Second Examination, £2 10*s.*; Third Examination, £3 10*s.*; Final Examination, £3 10*s.*; fee for Licence, £3; total, £15. For re-examination: First Examination, £1 10*s.*; Second Examination, £2; Third Examination, £2; Fourth Examination, £2. The practical examinations in dentistry will be conducted at the Newcastle Dental Hospital.

University of Leeds.—The degrees in Dental Surgery are Bachelor of Dental Surgery (B.Ch.D.) and Master of Dental Surgery (M.Ch.D.). All candidates for the degree of Bachelor of Dental Surgery shall be required to have passed the Matriculation examination, to have pursued thereafter approved courses of study for not less than five academic years, two of such years at least having been passed in the University subsequently to the date of passing Parts I. and II. of the first examination, and to have completed such period of pupilage or hospital attendance, or both, as may be prescribed by the regulations of the University. No candidate will be admitted to the degree who has not attained the age of 21 years on the day of graduation. All candidates are required to have passed the following examinations: the first examination, the second examination, and the final examination. Each examination will include practical work in the subjects offered. All candidates shall be required, before presenting themselves for examination, to furnish to the registrar certificates testifying that they have attended the prescribed courses of instruction in accordance with the regulations of the University in each of the subjects which they offer, and that they have fulfilled the other requirements of the ordinance and regulations in respect of such examination. Candidates for the diploma in Dental Surgery (L.D.S.) are required to present certificates showing that they have attained the age of 21 years, that they have attended courses of instruction approved by the University, extending over not less than four years, and that they have completed a pupilage of three years, two of such years at least having been taken before the First Professional examination. Candidates are required to satisfy the examiners in the several subjects of the following examinations: A preliminary examination in Arts; a preliminary examination in Science; the First Professional examination; and the Final examination. The classes in the Department of Dentistry will begin on Oct. 1st. The instruction in the Preliminary subjects of Chemistry, Physics, and Biology will be given at the University in College-road. The classes in the other subjects and the systematic courses in Dental subjects will be held in the School of Medicine of the University in Thoresby-place. The systematic instruction in the School of Dentistry will be given by the following:—Anatomy: Professor J. K. Jamieson. Physiology: Professor de B. Birch. Pathology: Professor A. S. Grünbaum. Medicine: Professor T. W. Griffith. Surgery: Professor R. L. Knaggs. Dental Surgery: Mr. A. G. G. Plumley. Operative Dental Surgery: Mr. T. S. Carter. Dental Anatomy and Physiology: Mr. A. Alan Forty. Dental Mechanics: Mr. C. Rippon. Dental Metallurgy: Mr. W. Lowson. Dental Materia Medica: Mr. J. H. Gough. The clinical instruction will be given in the Dental Department of the Leeds Public Dispensary, which is recognised by the University and by the Royal College of Surgeons. Applications for the prospectus should be made to the Dean of the Faculty of Medicine.

University of Liverpool (Liverpool Dental Hospital and School of Dental Surgery).—The University grants a diploma in Dental Surgery (L.D.S.) and degrees in Dental Surgery (B.D.S. and M.D.S.). The courses of systematic instruction are given in the University buildings, five minutes' walk from the Dental Hospital. The two institutions are now closely associated and the management of the curriculum is in the hands of the Board of Dental Studies. This school offers advantages to students which are not excelled anywhere for their practical nature. On Jan. 16th, 1909, the Earl of Derby laid the foundation stone of a new Dental Hospital in Pembroke-place, immediately opposite the University and Royal Infirmary, and covering a site of 672 square yards. The new Dental Hospital was opened in March, 1910, equipped in each department with every modern accessory. The ground floor contains a large waiting-hall, examination room, extraction and anæsthetic rooms, with special waiting and recovery rooms for each, staff room, and special room for nurses. A large lecture hall with library and museum, prosthetic room adjoining a lofty and well lighted laboratory divided into special rooms to accommodate over 30 pupils, and smaller laboratory for advanced students, plaster and smelting rooms, are situated on the first floor. The whole of the top floor (470 square yards) is devoted to conservation work, and lighted entirely from the north, and contains 50 pump operating chairs, each provided with water-flushed spittoons, brackets, and electric light. Provision is also made for the use of electric motors. Portions are reserved for porcelain inlay work, orthodontia, and the use of the demonstrator. The students' room, with cloak-room and lavatories, is placed in the mezzanine immediately below the conservation (filling) room, and provision is made in the basement for cycles. The whole of he building is heated by hot-water pipes and radiators, and specially ventilated and lighted throughout by electricity. The laboratory is in charge of a skilled dental mechanic under the supervision of the Warden, and students are able to undertake at the hospital the whole of their training in Mechanical Dentistry. The times of the lecture at the University are arranged to meet the convenience of students, thus allowing the maximum time for attendance upon Dental Hospital practice. The staff of the hospital includes 12 honorary Dental Surgeons, a Demonstrator, six Anæsthetists, two House Surgeons, and a Curator. Fees for two years' hospital practice, £21. Apprenticeship.—A limited number of apprentices are admitted annually. Fees for three years, £105. Further information may be had from the Warden, Mr. W. H. Gilmour. The various medical and dental lectures are given at the University of Liverpool. The Anatomical Department has been removed to a new building, comprising a spacious dissecting room and a museum which contains an excellent collection of skulls illustrative of human and comparative dental anatomy. Fees: The composition fees are as follows: Diploma course (L.D.S.): Composition fee £58 10*s.*, for diploma course of other licensing bodies £61 10*s.*, payable in two equal instalments, the first on entry, the second 12 months later. Two years' instruction in Mechanical Dentistry (pupilage) and two years' Dental Hospital Practice (combined) £100. Degree course (B.D.S.): £67 10*s.* for all lectures (including Chemistry, Physics, and Zoology) in three instalments. Two years' dental hospital, £21; general hospital practice, £10 10*s.*; three years' mechanical instruction (pupilage), £105.

University of Manchester.—In the University of Manchester the Dental Department forms an integral part of the Faculty of Medicine. This contains a series of laboratories, lecture rooms, and museums which will bear comparison with those of any other school in the kingdom, and the fullest opportunities for study are offered to students preparing for any of the professional examinations. Instruction adapted to the requirements of students preparing for the B.D.S. Degree and the Dental Diplomas of the University, the Royal College of Surgeons of England, and of other licensing bodies is given during the Winter and Summer sessions both at the University and at the Dental Hospital of Manchester in Oxford-street. The required general hospital practice is taken at the Manchester Royal Infirmary. Women students are admitted to the classes in the Dental Department and for them a separate laboratory for Practical Anatomy and common rooms are provided. The composition fee for candidates for the University degree of Bachelor of Dental Surgery is 60 guineas, payable in two equal instalments at the beginning of the first and third years of studentship. The composition fee for candidates for the University Diploma in Dentistry is 55 guineas, payable in two equal instalments at the beginning of the first and third years of studentship. The composition fee for candidates for the L.D.S. of England is 60 guineas, payable in two equal instalments at the beginning of the first and third years of studentship. Students who have already served their apprenticeship with a private

practitioner, and who propose to complete the final portion of their attendance at the University and at an approved dental hospital, will be required to pay the composition fee in two equal instalments at the commencement of the first and second years of studentship. The payment of any of the above composition fees will entitle the student to attend all the classes in the following list which are required for their respective examinations. The composition fee does not include the hospital fees, the examination fees, the fee for the conferment of the degree or the diploma, the registration fee, nor the fees for chemicals and chemical apparatus (£1 1*s*.).

National University of Ireland.—This University grants the degrees of Bachelor of Dental Surgery and a degree of Master of Dental Surgery. A student may not be admitted to the Degree of Bachelor of Dental Surgery unless a period of not less than four years shall have elapsed from the date of his matriculation, during which period he must have pursued an approved course of study of not less than nine terms. For the degree of Bachelor of Dental Surgery candidates must pass four examinations, the first two being the same as those for the first and second examination in Medicine. The subjects of the third examination are Dental and Practical Pathology, Dental Surgery, and Dental Medicine, the subjects of the fourth being Dental Surgery and Pathology, Dental Mechanics, Operative Dentistry, Orthodontia, and Dental Materia Medica. A candidate for the degree of B.D.S. must produce evidence of apprenticeship to a registered dentist for a period of two years. A portion of or the entire period may be served before commencing study for the degree of B.D.S., but no portion so taken prior to commencement of study shall count as part of the four years of Dental Study. The degree of Master of Dental Surgery will not be granted until three years after the B.D.S. has been obtained.

TEACHING INSTITUTIONS IN DENTISTRY.

LONDON.

Royal Dental Hospital of London and School of Dental Surgery, Leicester-square.—The school provides the special dental education required by the Royal College of Surgeons for the Licence in Dental Surgery. The general part of the curriculum may be taken at any general hospital. The hospital is open from 9 A.M. to 5 P.M., there being one staff for the morning and another for the afternoon of each day. Pupils are received for the mechanical training recognised by the curriculum. The demonstrators at the commencement of each session give a course of lectures on Operative Dental Surgery. The five house surgeoncies are held for six months each and are open to all qualified students. The lecturers, in addition to their lectures, give special demonstrations on the Microscopy of Dental Anatomy and Dental Surgery. The lecturer on Dental Mechanics also gives practical demonstrations in the mechanical laboratory. There are two Entrance Scholarships in Chemistry and Physics of the value of £50 and £25 respectively. One Entrance Scholarship in Dental Mechanics and Metallurgy value £25, open to pupils of the Hospital only. One Entrance Scholarship of £25 in Dental Mechanics, open to pupils of private practitioners. The Saunders Scholarship awarded to second year students. The Storer Bennett Research Scholarship for Scientific Research in any branch of Dental Surgery, value £50, is awarded triennially. The Alfred Woodhouse Scholarship of £35 and the Robert Woodhouse Prize of £10 for Practical Dental Surgery. Prizes and certificates are awarded by the lecturers for the best examinations in the subjects of their respective courses, at the end of the summer and winter sessions. Consulting Physician: Sir Richard Douglas Powell, Bart. Consulting Dental Surgeons: Mr. T. Arnold Rogers, Mr. Morton Smale, and Mr. C. S. Tomes, F.R.S. Dental Surgeons: Mr. J. F. Colyer, Mr. W. H. Dolamore, Mr. G. Hern, Mr. J. G. Turner, Mr. N. G. Bennett, Mr. D. P. Gabell, Mr. A. Hopewell Smith, and Mr. H. Austen. Assistant Dental Surgeons: Mr. R. McKay, Mr. W. W. James, and Mr. F. Coleman. Anæsthetists: Dr. Dudley Buxton, Dr. R. J. Probyn-Williams, and Mr. H. Hilliard. Demonstrators: Mr. A. T. Pitts, Mr. L. A. Harwood, Mr. R. M. Tickling, Mr. W. D. Southern, Mr. J. F. Gow, and Mr. G. J. Harborow. Lecturers:—Dental Anatomy and Physiology (Human and Comparative): Mr. A. Hopewell Smith. Dental Surgery and Pathology: Mr. J. G. Turner. Operative Dental Surgery: Mr. W. H. Dolamore. Dental Mechanics: Mr. D. P. Gabell. Metallurgy in its application to Dental Purposes: Mr. P. Ellis Richards. Dental Bacteriology: Mr. Howard Mummery. Dental Materia Medica: Mr. H. A. Austen. Chemistry: Mr. P. Ellis Richards. Physics: (vacant). Anæsthetics: Dr. Dudley Buxton. During the sessions the surgeons of the day will give demonstrations at stated hours. The house surgeons attend daily while the hospital is open. Fee for two years' hospital practice required by the curriculum, including lectures, £53 3*s*. in one payment, or £55 13*s*. in two yearly instalments. The curriculum requires two years to be passed at a General Hospital; the fee for this is about £60. Both hospitals can be attended simultaneously. For the lectures in Chemistry and Physics for the Preliminary Science Examination £10 10*s*. The fee for the instruction in Dental Mechanics and the two years' hospital practice required by the curriculum is £150 if paid in one instalment, or 150 guineas if paid in three equal instalments. The fee for tuition in Dental Mechanics is 50 guineas per annum; for one year's hospital practice £21. The Dean attends at the hospital every Thursday morning from 9.45 to 11 o'clock, or he can be seen at other times by appointment. Letters to be addressed—The Dean, 32, Leicester-square. The Winter Session opens on Oct. 3rd.

National Dental Hospital and College.—Corner of Great Portland and Devonshire-streets, W.—Consulting Surgeon: Sir Victor Horsley. Consulting Dental Surgeon: Mr. Sidney Spokes. Visiting Physician: Dr. James Maughan. Visiting Surgeon: Mr. E. W. Roughton. Dental Surgeons: Mr. K. W. Goadby, Mr. H. R. Pring, Mr. A. E. Relph, Mr. H. Creemer Cooper, Mr. H. W. Turner, and Mr. E. C. Sprawson. Assistant Dental Surgeons: Mr. F. St. J. Steadman and Mr. F. R. Smyth. Assistant Dental Surgeon for Radiology: Mr. C. A. Clark. Anæsthetists: Mr. H. P. Noble, Mr. C. J. Ogle, Mr. Vivian B. Orr, Dr. J. Maughan, Mr. P. H. Parsons, and Mr. R. E. Delbruck. Lecturers:—Dental Anatomy and Physiology: Dr. J. W. Pare, Tuesdays and Thursdays, 5 P.M., in October, November, and December. Dental Metallurgy: Mr. Hugh Candy, Tuesdays, 5 P.M., in January, February, and March, and May, June, and July. Dental Mechanics: Mr. H. W. Turner, Wednesdays, 5.30 P.M., in May, June, and July, and October, November, and December. Dental Materia Medica: Mr. F. R. Smyth, Tuesdays, 6 P.M., October, November, and December. Dental Surgery and Pathology: Mr. H. J. Relph, Thursdays, 5 P.M., during January, February, and March. Bacteriology of the Mouth: Mr. K. W. Goadby, Tuesdays, 4 P.M., during May, June, and July. Practical courses to comply with the R.C.S. curriculum are also held. The hospital is lighted throughout by electricity and warmed and ventilated by approved methods. Clinical Lectures and Demonstrations are given from time to time, and each student on entering passes through a preliminary course under a demonstrator. The stopping rooms have accommodation for 50 chairs. Dresserships in the extraction and stopping rooms are re-arranged every three months. Two Entrance Exhibitions, of the value of £40 and £20, are open for competition. Prizes are open for competition at the end of each course of lectures. Certificates of honour are also open in each class. The Rymer Medal for General Proficiency, value £5, is awarded annually to the most meritorious student; and the Ash Prize, value £3 3*s*., for a Thesis on a subject in Dental Surgery. Total fee for the Special Lectures and Hospital Practice required, 40 guineas. A composition fee covering the two years' mechanical pupilage and the two years' hospital practice required by the Royal College of Surgeons, £120. Single Courses: Dental Anatomy and Physiology, Dental Surgery and Pathology, Dental Mechanics, Dental Metallurgy, Bacteriology of the Mouth, Dental Materia Medica, Demonstration of Dental Mechanics, £5 5*s*. each. Hospital Practice to registered practitioners by special permission of Committee, 12 months, £15 15*s*. Information respecting the Hospital Practice and the College may be obtained from the Dean, Mr. Sidney Spokes, who attends at the Hospital, Great Portland-street, on Tuesday mornings.

Guy's Hospital.—The work of the Dental Department begins daily at 9 A.M. both in the extraction rooms and in the conservation room. *The Extraction Rooms:* A new Dental Out-patient Department has been provided. There

is ample accommodation for ordinary extractions and anæsthetic extractions, together with waiting- and retiring-rooms. Patients are admitted between 8.45 and 9.30 A.M., and are seen by the dental surgeon for the day, the dental house surgeon, the assistant dental house surgeon, and the dressers. Such patients as are suitable for conservative treatment are transferred to the conservation room, taking with them a chart to indicate the treatment required. *The Conservation Room:* This room is open from 9 A.M. till 5 P.M. It is now being reconstructed and when completed in October will afford accommodation for upwards of 100 dental chairs, with the necessary equipment of the most modern type, for the use of the Dressers, who, under the supervision of the Staff, perform the various operations of Dental Surgery. The members of the staff attend every morning and afternoon to give demonstrations and otherwise assist students in their work in the Conservation Room and Mechanical Laboratory. The *Probationers' Laboratory* is supervised by two of the staff demonstrators, and instruction is given in operative dentistry on a "mannikin" to students during their first three months of study. Pupils in Dental Mechanics are received, and a graded, systematic, and full course of instruction, extending over two years, is carried out. The control and supervision of the *Pupils' Laboratory* is in the hands of the following staff: The Demonstrator of Dental Mechanics, Two Staff Demonstrators of Prosthetic Dentistry, Two Skilled Mechanics and their Assistants. Dental students have the opportunity of attending at this hospital the whole course of instruction required by the examining board for the L.D.S. Eng., viz., two years' pupilage in dental mechanics, the special lectures and practice of the Dental Department and the general lectures and practice of the Medical School. The fees for these two courses may be paid separately or together, or they may be combined with the fees required to be paid for the course for a medical diploma. Students who enter for a medical as well as a dental diploma are allowed to pursue their study of Dentistry during any period of their medical course most convenient to themselves without further charge. Four Entrance Scholarships in Dental Mechanics of the value of £20 each are offered for competition annually, two in September and two in April, and prizes of the aggregate value of £47 are awarded for general proficiency and for skill in Practical Dentistry. A Dental Travelling Scholarship of the value of £100 is awarded every second year. The next award will be made in 1913. Dental students are eligible for admission to the Residential College and enjoy the privileges of students in the Medical School.

Staff.—Consulting Dental Surgeons: Mr. F. Newland-Pedley and Mr. W. A. Maggs. Dental Surgeons: Mr. Wynne Rouw, Mr. H. L. Pillin, Mr. M. F. Hopson, and Mr. J. B. Parfitt. Assistant Dental Surgeons: Mr. J. L. Payne, Mr. E. B. Dowsett, Mr. J. F. Pearce, and Mr. H. P. Aubrey. Demonstrators of Practical Dentistry: Mr. H. Chapman, Mr. H. C. Malleson, Mr. F. N. Doubleday, and Mr. C. A. Hodgson. Demonstrators of Prosthetic Dentistry: Mr. S. W. Charles and Mr. E. A. Tomes. Anæsthetists: Dr. H. F. Lancaster, Mr. C. J. Ogle, Mr. R. Davies-Colley, Dr. F. E. Shipway, Mr. H. M. Page, and Mr. T. B. Layton. Lecturers:—Dental Anatomy and Physiology: Mr. Hopson. Dental Surgery and Pathology: Mr. Wynne Rouw. Operative Dental Surgery: Mr. Parfitt. Dental Mechanics: Mr. Payne. Practical Dental Mechanics: Mr. Pillin. Dental Materia Medica: Dr. A. P. Beddard. Dental Bacteriology: Dr. Eyre. Dental Microscopy: Mr. Dowsett and Mr. Kennaway. Metallurgy: Dr. J. Wade. Practical Dental Metallurgy: Mr. Pearce. Curator of Dental Museum: Mr. Dowsett. Dean: Dr. Eason. Sub-Dean: Dr. Cameron.

London Hospital—This school is part of the London Hospital and Medical College. It provides a complete curriculum in all subjects for the L.D.S. Lecturers: Dental Surgery and Pathology:—J. Sim Wallace, M.D., D.Sc. Glasg., L.D.S. Eng. Operative Dental Surgery: George Northcroft, L.D.S. Eng., D.D.S. Mich. Dental Prosthesis: F. M. Farmer, L.D.S. Eng. Operative Dental Prosthesis: G. Paton Pollitt, L.D.S. Eng., D.D.S. Penna. Odonto-prosopic Orthopædics: Harold Chapman, L.D.S. Eng., D.D.S. Penna. Dental Histology: Evelyn Sprawson, M.R.C.S., L.R.C.P., L.D.S. Eng. Dental Anatomy: William Wright, M.B., D.Sc., F.R.C.S. Dental Bacteriology: William Bulloch, M.D. Dental Materia Medica: Otto Grünbaum, M.D., D.Sc., F.R.C.P. Dental Metallurgy (Theoretical and Practical): H. Candy, B.A., B.Sc. Instructor in Anæsthetics: R. J. Probyn Williams, M.D. Connected with the Medical College and Dental School are a Library, Athenæum, Clubs' Union, Athletic Ground, Dining Hall, and Students' Hostel. For prospectus and particulars apply to the Dean (William Wright, M.B., D.Sc., F.R.C.S.).

PROVINCIAL.

Devon and Exeter Dental Hospital, 24, Southernhay, West, Exeter.—Established 1880.—The hospital is open daily (Sundays excepted) and patients are admitted between the hours of 9 and 11 A.M. Students attending the practice of the hospital must consider themselves strictly under the control of the medical officers and must not undertake any operation without the consent of the dental surgeon for the day. Hon. treasurer, Mr. J. M. Ackland; secretary, Mr. W. Alfred Hooker.

SCOTLAND.

The Incorporated Edinburgh Dental Hospital and School.—The Edinburgh Dental Hospital and School is located in a spacious and well-equipped building at 31, Chambers-street and offers special advantages to dental students. The General Courses required for the Dental Diploma may be taken in the Medical School of the Royal Colleges of Physicians and Surgeons or in the University schools. The hospital attendance and clinical instruction are taken at the Royal Infirmary. The University, Medical Schools, and Royal Infirmary are within three minutes' walk of the Dental Hospital. The special courses are taken in the hospital. The Dental Hospital practice, extending over two years, affords a student ample opportunity for a full acquaintance with every branch of dentistry. The hospital admits a limited number of indentured pupils. They receive their instruction in Mechanical Dentistry concurrently with the general and special courses. A premium of 60 guineas is payable with each such pupil. The practice and lectures of the hospital are recognised by, and qualify for, all the Licensing Boards. For the special classes, both theoretical and practical, required by dental students the directors have secured the services of an efficient staff of dental officers and lecturers. There will also be a course of demonstrations in Mechanical Dentistry. Students will receive instruction in Practical Dental Mechanics under the mechanician. The cost of the hospital outfit of instruments is included in the Dental Hospital fee of £31 10*s.* The minimum cost of classes and Diploma for the whole course of dental instruction amounts to £90 7*s.* Those students who desire to take a Medical and Surgical Diploma in addition to the L.D.S. have in this school admirable facilities for so doing. The triple qualification of the Royal College of Physicians and Surgeons of Edinburgh and the Royal Faculty of Physicians and Surgeons of Glasgow is recommended. The minimum cost of the Professional Education Triple Qualification and Licence in Dental Surgery amounts to £169 7*s.* The mechanical department is large and airy and furnished with all modern tools and appliances. The winter session commences Oct. 2nd. The Museum is open to students for study. Further particulars can be obtained from the Dean, Mr. W. Guy.

Incorporated Glasgow Dental Hospital and School, 158, Renfrew-street and 15, Dalhousie-street, Garnethill, Glasgow.—The winter session will begin in October and the lectures will be delivered as follows. In Dental Mechanics on Tuesday and Thursday at 7 P.M., by Dr. Hugh McKay, and in Dental Metallurgy on Monday and Wednesday at 7, by Mr. W. Bruce Hepburn, L.D.S. Fee for each of the above courses of lectures, £3 3*s.* Lectures will also be delivered on the following subjects: Dental Surgery and Pathology, by Mr. J. Mason Noble; Dental Anatomy and Physiology, by Dr. W. Wallace; Dental Bacteriology, by Mr. J. F. Webster; Anæsthetics, by Dr. R. Home Henderson; Operative Technique, by Mr. Adam Cubie. The lectures and instruction at the Glasgow Dental Hospital and School are recognised by all the licensing bodies in the United Kingdom. The fees for two years' hospital practice are £15 15*s.* Intending students before commencing to attend the lectures or hospital practice must produce evidence of having passed the preliminary examination prescribed by the regulations of the General Medical Council for registration of dental students. The hospital is opened daily from 5 to 7 P.M. (Saturdays excepted). Students may only enrol during the months of April or October. Summer session begins in April. Winter session begins in October.

Glasgow Royal Infirmary (Dental Department).—Mr.

W. Taylor attends at the Royal Infirmary at 3.30 P.M. on Mondays, Wednesdays, and Fridays, and gives a course of instruction in Dental Surgery on these days. The following course in the curriculum can be taken at St. Mungo's College: Anatomy, six months; Practical Anatomy, nine months; Physiology, six months; Chemistry, six months; Practical Chemistry with Metallurgy, three months; Surgery, six months; Medicine, six months; Materia Medica. three months; Clinical Surgery, six months; Dental Surgery, six months, and attendance for two years on the dental department of the hospital. The attendance on the Dental Clinic is free to students of the hospital. The winter session opens Monday, Oct. 18th.

ANCILLARY SCIENTIFIC INSTITUTIONS.

IMPERIAL COLLEGE OF SCIENCE AND TECHNOLOGY, London (including as integral parts the ROYAL COLLEGE OF SCIENCES, the ROYAL SCHOOL OF MINES, and the CITY AND GUILDS COLLEGE).—Mechanics and Mathematics: Professor J. Perry, F.R.S., Dr. A. R. Willis, Mr. J. Harrison, M.I.M.E., and Mr. H. Klugh, B.A. Zoology: Professor A. Sedgwick, F.R.S. Botany: Professor J. B. Farmer, M.A., F.R.S., Plant Physiology and Pathology: Professor V. H. Blackman, M.A., Sc.D. Technology of Woods and Fibres): Professor Percy Groom, M.A., D.Sc. Chemistry: Professor Sir Edward Thorpe, F.R.S., Professor H. E. Armstrong, F.R.S., Dr. M. O. Forster, F.R.S., Dr. J. C. Philip, M.A., Ph.D., D.Sc., and Dr. G. T. Morgan, D.Sc., A.R.C.S. Physics: Professors H. L. Callendar, F.R.S., and the Honourable R. J. Strutt, F.R.S., Dr. W. Watson, F.R.S., and Mr. A. Fowler, F.R.S. Geology: Professor W. W. Watts, F.R.S., and Dr. Cullis. Metallurgy: Professor W. A. Carlyle, A.R.S.M., M.I.M.M. Mr. W. H. Merrett, A.R.S.M., F.I.C., M.I.M.M. Mining: Professor S. H. Cox, A.R.S.M., M.I.M.M. Mr. L. H. Cooke, A.R.S.M., M.I.M.M. Civil and Mechanical Engineering: Professor W. E. Dalby, M.A. Mr. A. G. Ashcroft, M.I.C.E. Electrical Engineering: Professor T. Mather, F.R.S. Mr. G. W. O. Howe, M.Sc. The College reopens on Wednesday, Oct. 4th, 1911. Communications should be addressed to the Secretary, Imperial College, South Kensington, S.W.

ELECTRICAL STANDARDIZING, TESTING, AND TRAINING INSTITUTION, Faraday House, 62–70, Southampton-row, W.C.—Principal, Alexander Russell, M.A. Cantab, D.Sc. Glasg., M.I.E.E. Instructor in Electrical Machine Design: F. T. Chapman, B.Sc., A.M.Inst.C.E. Instructor in Chemistry: Mr. J. Thomas, B.Sc. Lond. Instructor in Mechanical Engineering: Mr. Walter H. Bell, A.M.Inst.C.E. This institution, in addition to its ordinary course of training in electrical engineering, which occupies four years, also arranges for special instruction in all branches of electricity either by private tuition or by a specially arranged course at the College or at the works of the companies with which it is associated. There are Entrance Scholarships of the value of 150 and 100 guineas. Particulars may be obtained on application to the Secretary, Faraday House, Southampton-row, W.C. Session begins Sept. 25th.

SCHOOL OF THE PHARMACEUTICAL SOCIETY OF GREAT BRITAIN.—Chemistry and Physics: Professor Arthur W. Crossley, F.R.S. Botany: (vacant). Pharmaceutics: Professor Greenish. The session commences on Wednesday, Oct. 4th, on which day the inaugural address will be delivered. Medical students, or pupils intending to enter the medical profession, are admitted to the lectures and laboratory work in any or all the courses. Certificates of instruction in this school are received by the Conjoint Board of the Royal Colleges. Application for admission to the school, or for further information, may be made to the Dean, Professor Crossley, F.R.S., 17, Bloomsbury-square, London, W.C.

ROYAL SANITARY INSTITUTE (WITH WHICH IS INCORPORATED THE PARKES MUSEUM), 90, Buckingham Palace-road, S.W.—The objects of the Royal Sanitary Institute are to promote the advancement of sanitary science in all or any of its branches and to diffuse knowledge relating thereto. It was founded in 1876 and incorporated in 1888. Sessional meetings are held in London and in various provincial centres from time to time for the reading of papers and for discussions upon subjects connected with sanitary science, and lectures and demonstrations are arranged for sanitary officers; for army officers and professional men on food and meat inspection; for meat inspectors; for women health visitors and school nurses; and for school teachers. Examinations are held in London, and in provincial and colonial centres, and certificates of competency in sanitary knowledge are granted. The Parkes Museum, which is maintained by the institute, contains a great variety of the most approved forms of apparatus and appliances relating to health and domestic comfort. Professors and teachers of hygiene are allowed the use of the museum for demonstrations to their students on application to the committee. The museum is open daily free of charge from 9.30 A.M. to 5.30 P.M. and on Mondays to 8 P.M. There are also a large library of sanitary literature which contains, in addition to standard works on sanitary science, a collection of reports of medical officers of health over the whole country, and a reading room supplied with the principal sanitary periodicals, both home and foreign. The institute is under the patronage of the King, and the officers are: President, the Duke of Northumberland; chairman of council, Mr. H. Percy Boulnois, M.Inst.C.E.; treasurer, Colonel J. Lane Notter, R.A.M.C., M.A., M.D.; registrar, Mr. A. Wynter Blyth, M.R.C.S.; and secretary and director, Mr. E. White Wallis. The lecturers are Dr. C. Porter, Dr. J. A. Priestley, Dr. G. F. McCleary, Dr. A. Wellesley Harris, Dr. E. J. Steegmann, Dr. E. Petronell Manby, Professor H. R. Kenwood, M.B., Dr. C. J. Thomas, Dr. H. Meredith Richards, Colonel J. Lane Notter, R.A.M.C., Mr. J. Osborne Smith, F.R.I.B.A., Mr. W. C. Tyndale, M.Inst.C.E., Mr. J. E. Worth, M.Inst.C.E., Mr. J. Wright Clarke, Professor Henry Adams, M.Inst.C.E., Mr. C. Chambers Smith, Mr. Percy Griffiths, M.Inst.C.E., Mr. H. Percy Boulnois, M.Inst.C.E., Mr. Ainsworth Wilson, F.R.C.V.S., Mr. T. Dunlop Young, M.R.C.V.S., Mr. W. G. Barnes, M.R.C.V.S., Mr. W. Hunting, M.R.C.V.S., Dr. Eric C. Pritchard, Dr. A. Beresford Kingsford, Dr. Marian Hunter-Vaughan, and Miss E. Morris. For members the annual subscription is £2 2*s.* and for associates £1 1*s.*, but members and associates holding certain qualifications only pay half the ordinary rate of subscription.

THE ROYAL INSTITUTE OF PUBLIC HEALTH.—The Royal Institute of Public Health, 37, Russell-square, W.C., was founded in the year 1886 with the object of obtaining the registration of public health diplomas and the further statutory requirement that all medical officers of health should possess such a qualification. In 1905 the Fellows and members of the Institute, now numbering nearly 2000, decided to create a central public health institution in London and have erected bacteriological, serological, and chemical laboratories in which researches of a public-health character are undertaken for municipal and other authorities and for private medical practitioners and the necessary training for obtaining public health diplomas is provided, together with a library, lecture room, and common room. The Royal Institute of Public Health is recognised by the University of London as a public educational institution, and its course of instruction for the diploma by the universities and other examining bodies of the United Kingdom. The council appointed four medical practitioners yearly who possess a Diploma in Public Health as Assistant Demonstrators, and who are desirous of obtaining a more extended knowledge of laboratory work in connexion with the duties of a medical officer of health. The Royal Institute of Public Health is a recognised place of research in connexion with the Beit Memorial Fellowships for Medical Research. The Institute is under the patronage of His Majesty the King, and the Right Hon. the Earl Beauchamp, K.C.M.G., is President. The teaching staff consists of—the Principal, Professor William R. Smith, M.D., F.R.S.Ed.; demonstrators of chemistry, Ernest Garratt, M.Sc., and Alan Stewart, D.Sc.; demonstrators of bacteriology, Dr. L. Rajchman and Dr. A. Distaso. Occasional lectures are given by eminent sanitarians. The Harben lecturer for 1911 was Professor Dr. P. Uhlenhuth and the Harben lecturer for 1912 is Professor Simon Flexner, M.D. New York.

THE BRITISH MEDICAL MAN ABROAD.

THE conditions of medical practice have much altered in this country of late, as we have been able to point out in THE LANCET during the past decade. Professional incomes in many places have been lowered seriously by the unfair tactics of so-called medical aid societies, and the position of servant to which some of these associations would reduce their medical officer is one that liberally educated gentlemen do not welcome with enthusiasm. Improvement has taken place, but recent developments of legislation seem likely to increase the severe struggle ahead. Again, the expenses of living have gone up for medical men as they have for all the middle and upper middle

classes of this country, while more money is required to secure the necessary medical degrees and diplomas owing to the lengthy curriculum and the more expensive equipment. These facts account, though only partially, for the increased number of medical men who having obtained British medical qualifications desire to settle abroad. Other factors at work are the spirit of adventure, the feeling that in a new country there is more elbow-room and more chances of getting out of the ruck, and the increased facilities of transport. Newspapers and books galore nowadays make us familiar with life in other lands, while trains and steamers will take us all over the world in a short time and at a comparatively small expense. For this reason or that, the number of medical men who make inquiry from us as to their legal and professional position in a foreign country continues to increase, and in the following columns we attempt to give the information.

Speaking generally, our colonies make it easy for medical men from home to practise there, but the same is not the case on the continent, where there is an obvious tendency towards protection. But in the colonies there are not many openings for practise except for those who are willing to "rough" it and work hard. In Canada there are outlying districts where a good start might, perhaps, be obtained; but it must be remembered that Canada possesses advanced medical schools and is a sparsely populated country as yet. In Australia and New Zealand the prospect for the British practitioner is not greater than that which faces him in Great Britain. The medical profession is, in fact, crowded in all places at home and abroad where the circumstances of practice are favourable, and many practitioners who have gone out from the mother country have had to leave the colonies unsuccessful, or have been very hard pushed to make both ends meet. The graduates of the colonial universities every year tend to more than meet the usual vacancies. It used to be generally believed that, even where there was a large supply of general practitioners in the big colonial towns, there would still be good openings for men who have specialised in such branches of practice as the treatment of eye and ear diseases. This is partially true. There are openings of which good men can take advantage. But as a rule the openings in the colonies for newcomers are in country districts where the medical man, besides being proficient in every branch of the profession, must be ready to lead a hard life. It is desirable that every colonial practitioner, intending to start in a country district, should be of good physique and not only able to ride but able to take care of his horses.

There are, of course, certain colonial appointments made in this country, particulars of which will be found in our columns. These appointments are sometimes made with permission to practise privately, and sometimes this is not permitted. Candidates for the post should apply to the Colonial Office for information, and their chances of success will be much increased by having passed through one of the schools of tropical medicine. The duties of colonial medical officers involve medical charge of a district, including as a rule the charge of a hospital and a lunatic asylum. The medical officers also supervise the sanitation of their districts, and as a rule give gratuitous attendance to all Government officials.

The United States of America form a rich and well-populated country to which, as speaking our language, it is natural for the British medical man to desire to go. The regulations for practice in the various States differ much, but it will be found that wherever the social conditions are pleasant and the opportunities for emoluments good there will be plenty of competition. There is an enormous number of medical men in the United States, and the British medical man contemplating starting in medical practice there will be prudent to make full inquiry before deciding on the locality, while his chance of success will be increased by his having some good introductions.

FRANCE.

The law that regulates the conditions of the practice of medicine in France is that of Nov. 30th, 1892, passed by the Senate and the Chamber of Deputies and signed by Carnot, President, and Poincaré, the Minister of Public Instruction, at that date:—

> No one may practise medicine in France unless he holds a diploma of the doctorate of medicine given by the French Government after examinations duly passed in the State institution of higher medical education.

The fifth article of this law specifically refers to foreigners:—

> Physicians who have taken their degree abroad, of whatever nationality, can only practise in France on condition of having obtained in France the degree of doctor of medicine.

This article was modified by a special degree, signed in July, 1893, referring to certain concessions to be made to such foreigners:—

> Physicians with a foreign degree who desire the French degree of doctor of Medicine may obtain partial or complete dispensation of medical study and partial exemption from the examinations required. In no case will candidates be exempted from more than three examinations. Such exemption is accorded by the Minister of Public Instruction on the recommendation of the competent Faculty and the Committee of Public Education.

While this last quotation may be considered the actual state of the law in the formal sense of the word, further and much less liberal projects have since been considered by the legislative bodies and adopted in the form of *arrêt ministériel*, of *circulaire* issued by the Minister of Public Instruction, or of *décrêt* adopted by Parliament. Presumably too much advantage was taken of the generosity of the concessions of July, 1893, although it must be remembered that the exclusive policy since adopted is by no means aimed at English physicians, but rather against graduates of little-known universities the value of whose qualifications it is difficult to estimate. Be that as it may, in July, 1896, a certain number of exemptions were granted—among whom the writer was fortunate to find himself—and a circular was issued repealing—in substance—the concessions of 1893. No foreign qualifications were to be recognised as deserving of any dispensations, and physicians holding foreign degrees and desirous of practising medicine in France were obliged not only to matriculate as medical students, but also to produce evidence of having obtained the French diploma of Bachelor in Classical Education (Arts and Philosophy) and the certificate in physical, chemical, and natural science.

The refusal that for the last ten years has almost invariably met the request made by foreign physicians for the right to practise in France is based upon this *arrêt ministériel*. Such requests are answered in the formula—"Depuis 1896, époque à laquelle il y a eu une décision du Parlement, il n'est accordé aucune dispense aux étrangers désireux d'obtenir le diplôme d'etat: ils doivent tous produire le baccalauréat." The simplicity and clearness of this statement make translation unnecessary. This exclusive attitude was not, however, wholly maintained. While withdrawing nothing of the exclusiveness of 1896, the Minister could grant leave to foreigners to possess themselves of a formal academic medical degree which, while it entitled the possessor to call himself docteur en médecine de la Faculté de Paris (de Montpelier, Nancy, Bordeaux, Lille, Lyon, or Toulouse), gave him no right whatever to practise on French territory. To obtain this degree the postulant must formulate his request to the Minister on *papier timbré*, enclosing a copy of his birth certificate, his diplomas, and class certificates, formally translated. This honorary degree is readily obtained, and from English candidates it is probable that an appearance in so-called "final" subjects would alone be required.

Up to Dec. 29th, 1906, it was possible to transform the university or academic diploma into a Government degree by becoming a naturalised French subject. On account of the large number of young Russian girls who married in France and thereby became French and claimed the State diploma it has been decided to insist upon the possession by foreigners of the *license-ès-sciences* before this transformation can be granted. The fees for this degree amount to between £60 and £70.

The authority conferred on the Minister empowered him to exempt a certain number of students from the necessity of taking the diploma of bachelor, but this at last gave rise to such abuses that various associations both of medical men and of students protested against what they felt to be an injustice, as the proportion of exemptions was 20 per cent. in some of the faculties. A decree of May 12th, 1909, announced that no exemption would from that time be granted to any student. As, however, there was no desire to create obstacles for foreign students who come to Paris in continually increasing numbers, an official circular of June 2nd, 1909, stated that foreign students (but no others) might be granted exemption under the same circumstances as before, provided, that is to say, that their object is to

take merely the diploma of the university and not the State diploma, which alone gives the right to practise medicine in France.

ITALY.

Some years ago the British and American consuls at the great centres of Italian population and commerce combined to form an estimate of the money brought annually into the kingdom and spent within its borders by the English-speaking world. That estimate, an approximate one necessarily, which they carefully checked by every qualifying consideration conceivable, amounted to £20,000,000 sterling, about one-third of Italy's whole revenue at that time. Since then the yearly influx of English, and especially of American visitors, has greatly increased, so that were a similar calculation to be made now the estimate would doubtless be still larger. This is a fact of great importance from whatever side it is contemplated, and it implies a large and continuous demand for English-speaking practitioners. It is true that of late years an active agitation, having for its object the expulsion of all foreign practitioners from the country, has been carried on by a section of the medical profession in Italy, but the movement has proved only partly successful, the public at large being well aware of the injury which the adoption of such a measure would inflict upon its interests. The British medical men and their American *confrères* form a prominent reason for Italy continually to attract that portion of the travelling public from which she derives so much of her annual revenue.

The question of the foreign practitioner in Italy, which for so many years has agitated medical circles in this country, has now been settled in what appears to be a fair and satisfactory manner by the Bill which has lately been passed by the Chamber of Deputies. Approved a year ago by the Senate, this Bill, on account of the fall of the Giolitti Ministry, has only now reached the Lower House and been placed upon the statute book, under the title of "Sugli Ordini dei Sanitari." The object of the Bill as described by its promoter, Signor Giolitti, is the institution of organised bodies for the legal representation of the sanitary classes similar to those already existing for the members of the legal profession. There was at first some idea of uniting the medical profession with veterinary surgeons and pharmacists for this purpose, but this proposal had to be abandoned as, for obvious reasons, impracticable, and provision made for a separate organisation for each of the three categories.

Article 1 of the new law therefore provides for the institution of an "Ordine dei Sanitari" in each province of the kingdom for each of the three classes above mentioned. This will be accomplished by means of a register for each category, in which the names of all belonging to that category must be inscribed.

According to Article 2, the enjoyment of civil and political rights and the possession of a professional diploma granted by a recognised institution of the kingdom are the qualifications necessary for registration. To this rule there are certain exceptions. The first regards women with civil rights who have taken a professional diploma entitling them to practise and whom it would therefore be illogical to exclude merely because of their political disability. The same consideration holds good for foreigners who have civil rights and have taken a professional diploma in a competent institution of the kingdom. A third exception is made in favour of citizens and foreigners who have taken a professional diploma abroad. But in this case registration is permitted only to the possessors of foreign diplomas from universities in those states which grant reciprocal rights to diplomates of Italian universities. To obviate injustice being done to foreign practitioners settled in Italy under the old law, Article 10, however, authorises such persons to continue provisionally the exercise of their profession, but only amongst foreigners, and only on condition that for more than two years before the promulgation of the new law they have been enrolled on the list of tax-payers paying taxes on their professional income.

Article 3 makes inscription on the provincial register the *conditio sine quâ non* for the unrestricted exercise of the profession in the kingdom and in its colonies and protectorates, except in the case of sanitary officials connected with the public administration of the State, or of the provinces, or of the communes, and who do not engage in private practice. Such officials are only subject to the discipline of the "Ordine" in so far as may concern their private practice.

By Article 4 no one is permitted to inscribe contemporaneously in more than one provincial register, but his name may be transferred from one register to another under certain conditions.

Article 5 limits the registration fee to a maximum of 25 lire (£1).

Article 6 regulates the election of an executive council for each provincial "Ordine."

Article 7 defines the duties, functions, and disciplinary powers of these executive councils. *Inter alia* they are empowered when requested to intervene in disputes between members, or between a member and his client in regard to charges, fees, or other professional questions, to repress abuses, and to punish those guilty of unprofessional conduct.

Articles 8 and 9 refer to appeals from the "Ordini" and their councils and to various details of administration.

As will be seen, the position of foreign practitioners is considerably affected by the new law. Up to the present the possession of a diploma from any recognised foreign medical school has been sufficient to secure all the privileges the foreign practitioner wanted—namely, the right to practise amongst foreigners. Henceforward, only those whose respective countries grant reciprocity of medical practice to Italy will be admitted to exercise their profession there. As at the present moment Britain is the only foreign country which has conceded such reciprocity, British practitioners are the only ones whose foreign diplomas can gain them admission to the Italian register. The new law, therefore, affects the British practitioner in Italy favourably, since it gives him complete freedom to practise amongst Italians as well as amongst foreigners. Other foreign practitioners will be variously affected. None of them will be entitled to practise amongst Italians unless they possess an Italian diploma, but those already established and who have been enrolled for more than two years as contributories to the tax on professional incomes will, for the present at all events, be allowed to continue the exercise of their profession, although only amongst foreigners. Finally, all eligible foreign practitioners must become members of the new "Ordini," or associations of the provinces in which they practise, and consequently become subject to the discipline of these "Ordini." Altogether, the new regulations must be acknowledged to be equitable and just, even by those—and they are very few in number—on whom they fall most heavily. New arrivals, indeed, possessing diplomas of countries which do not grant reciprocity to Italy will be excluded henceforth from practice, but even to these it remains open to qualify themselves by taking an Italian degree, which is still obtainable under comparatively easy conditions.

As to the career Italy offers, it is in some respects better, in other respects worse, than it was some years ago. It is better inasmuch as Italian medicine and surgery have greatly improved of late years, and the foreign practitioner, particularly in those cities which are the seat of medical schools, is not in danger, as he used to be, of getting out of touch with the advance of the profession. Indeed, the British medical man may keep himself *au courant* with the latest accession to medical doctrine as conveniently in the Italian as in any other kingdom. By graduating at one or other of the many Italian schools he can obtain the *entrée* to the medical societies, the congresses (provincial and national), the hospitals, the class-rooms open to the native practitioners, and also become entitled to the reduced railway and steamboat fares conceded on occasion to all duly qualified Italians. Indeed, he is generally welcome to them on the ground of professional *fratellanza* (brotherhood), but the graduation above indicated gives him a right to what he would otherwise owe merely to courtesy. On the other hand, the career is less favourable than formerly on account of the large number of English-speaking competitors whom it now attracts and who comprise not only Englishmen and Americans, but Swiss, Germans, and other nationalities as well. Their harvest (generally limited to three or four months of the "season") entails immense, almost excessive, activity, compensating the comparative idleness of the months before and after it. Upon this short period of remunerative work the practitioner must therefore rely to carry him through the entire year, and with heavy expenses to meet for housekeeping, house rent, servants' wages, taxes, &c., it becomes a serious matter for him when

the "season," as it often happens, turns out a poor one. Nevertheless, for a well-qualified man with sufficient private means to tide him over the first years, and who is possessed of good social introductions, there are always openings where he can still find a profitable *clientèle*, although his possible income at any of the smaller health or pleasure resorts will necessarily be limited.

One word of warning in conclusion. Let anyone who is tempted to buy a practice in Italy proceed with even more caution than he would in negotiating in his own country. In the first place, the foreign population of nearly all Italian towns is largely a floating one, composed chiefly of people who remain for but a few weeks, often for only a few days in one resort, and many of whom never come back again. The vendor of a practice in a place of this sort will have many patients on his books whom he cannot possibly introduce in any way to his successor, and a good many others whom he may introduce but who will never return to the locality, or at best do so only at long intervals, and can therefore form no permanent or profitable part of his successor's *clientèle*. His hold upon the practice is, in fact, of a peculiarly personal kind, and cannot, in the nature of things, be easily transferred to another. Secondly, the purchaser himself must be a man fitted for this particular class of work, or he may discover too late that he cannot make it pay and that the capital which he has expended has been spent to no purpose. A similar remark is doubtless true with regard to all such transactions, but it applies with special force in the circumstances now under consideration, where the physician has to deal with patients of such varying types and diverse characteristics as are to be met with amongst the travelling public in an Italian health or pleasure resort. To achieve a full measure of success the foreign practitioner in Italy must not only be a man of good all-round attainments, conversant with all branches of his profession, but should be possessed of an unusual share of sympathy and tact, for the exercise of which he will have daily scope amongst patients on whom illness falls with peculiar sadness, alone, as they so often are, and helpless in a foreign land.

GERMANY.

Foreign diplomas are not legally recognised in Germany as entitling their owners to practise medicine, so that British medical men desiring to settle in that country have to attend all the classes and pass all the examinations. A young German before commencing the study of medicine must pass an *Abiturienten-Examen* requiring a knowledge of French, Latin, Greek, mathematics, history, and theology. Or the examination of a *Real-Gymnasium* or an *Oberrealschule* may be passed. In the latter event more stress is laid on modern languages, mathematics, and natural history, and English is required instead of Greek. Foreigners have, as a rule, to pass this examination, but if they have already passed a similar one in their own country they may be exempted from it by a special order to be obtained from the Minister of Public Instruction for each individual case. Medicine can only be studied at a university; the curriculum lasts five years, after the second of which the examination called the *Tentamen Physicum* must be passed; it includes anatomy, physiology, chemistry, physics, and natural history. After the end of the fifth year the student presents himself for the "State Examination," which is practical as well as theoretical, and includes medicine, surgery, obstetrics, gynæcology, pathology, materia medica, and hygiene. After passing the State examination the medical man, previously to obtaining his qualification, has to perform his practical year as clerk and dresser at a university clinic or a recognised hospital. If the medical man wishes to have the title of "doctor" he has to pass another examination, which is little more than a formality, but the degree of doctor without the State examination does not legally confer the right to practise. This title of doctor is granted by every German university to foreigners, but the conditions differ according to the university. Some universities demand a special course of study and others do not, and the intending candidate must in every case make inquiries of the authorities. The law does not allow qualified British practitioners any exceptional facilities in passing the examinations; the time of study may possibly be made a little less than five years for those who have already studied abroad, but a special order, very difficult to obtain, is always required for this purpose. A thorough knowledge of German is essential. The fees for lectures are at least £130 and the examination fees about £12. The fees for the degree of M.D. vary from £10 to £20, being highest at Berlin University, which is the degree that is most popular with alien medical men. There is sometimes no prohibition set against holders of British diplomas practising in Germany provided they do not make use of any professional titles resembling those of qualified German medical men. Medical men practising in this way must, however, understand that the law regards them as unqualified and that they have to comply with certain conditions which are rather vexing. A detailed description of these conditions may be found in THE LANCET, 1909, vol. ii., p. 183.

AUSTRIA-HUNGARY.

In order that foreigners may legally practise medicine in Austria it is necessary for them to become naturalised Austrian subjects, which necessitates five years' residence in the country. For such instances a new regulation is being drawn up, but it is not yet sanctioned. In special cases the Minister of the Interior, conjointly with the Minister of Education, may grant exemptions from that rule and may permit foreign holders of diplomas to practise in Austria if they comply with the other requirements. These are: The production of a so-called Maturitätszeugnis or certificate of having passed the final examination of the gymnasium, at which the candidate must show a satisfactory knowledge of Latin and Greek, as well as of German or one of the other languages spoken in the Austrian Empire, such as Polish, Bohemian, Italian, also of mathematics, history, natural history, chemistry, geography, and physics. If a British medical man or student has passed a similar examination in his own country he may apply for exemption, which is sometimes granted; he has to produce proof of his having passed such an examination, in the shape of a certificate, to be translated into German by a properly recognised translator. The medical curriculum lasts 11 semesters, or five and a half years. The holders of foreign diplomas may, however, obtain permission to pass their examinations at shorter intervals than are necessary for the students, so that from 18 months to two years may be reckoned as sufficient. After passing the first theoreticum, or first examination, which comprises biology, anatomy, physiology, and chemistry, and which, as a rule, is passed at the end of the fourth semester, the student is allowed to commence hospital work; at the end of the tenth semester he may present himself for the second theoreticum. This and all other examinations (altogether three in number) are both practical and theoretical and must be completed within eight days. Only one subject is taken each day. It comprises internal medicine, surgery, and pathology, whilst the third and last examination comprises gynæcology, obstetrics, hygiene, materia medica, and ophthalmology; pædiatrics, otology, dermatology, and laryngology are examined in alternately. This last examination the student is expected to pass not later than five years after the first, otherwise he has to present himself again for certain subjects of the first examination, especially anatomy. The fees for the three examinations are £15, and then comes the fee of £6 5*s*. for the degree of M.D., without which degree nobody is allowed to practise. The fees for the lectures are about £35 for the five years, and about £25 for special classes may be added, so that the entire cost of obtaining the degree of M.D. would be from £80 to £85. All the universities, of which there are seven in Austria and two in Hungary, confer the degree of M.D., and no distinction is made here as regards the place where the title has been gained, although the University of Vienna is most favoured because it offers the best opportunities for studying. In special cases the Minister of the Interior may allow a foreign qualification to be recognised as entitling its holder to practise, only a mere formal examination being required; such a special order is, however, very difficult to obtain. The examination are entirely oral and are conducted in various languages according to the locality—namely, German in Vienna, Innsbruck, Graz, and Salzburg; German and Bohemian in Prague; and Polish in Cracow and Lemberg. These seven universities are the only ones in Austria, and only they may grant degrees, as the medical schools are invariably integral parts of the universities. If a British medical man wishes to practise in one of the frontier spas or in Karlsbad he will have little difficulty in obtaining permission to do so if he applies for it, especially if he gives

an assurance that he will only attend his fellow-countrymen and only for the season. However, since last year greater obstacles have been placed in the way of foreign doctors wishing to practise in such places.

As regards Hungary, the medical curriculum is for practical purposes similar to that in Austria, and the foreigner, whether a holder of a diploma or a student who wishes to practise legally, must become a naturalised subject and must pass the three above-mentioned examinations in the Hungarian language. Applications for admission must be addressed to the Minister of Education, who decides upon the conditions of admission after consultation with the medical faculty of Budapest. Usually the applicant has to pass three medical examinations after having proved his qualification for admission by a Maturitätszeugnis, or testimonial of sufficient preliminary instruction in two classical languages, chemistry, arithmetic, geometry, and physics. The examination is allowed only in the Hungarian language. The total fees amount to 295 kronen (about £12), and the fee for "promotion"—i.e., for the M.D. degree—is similar to that in Austria. Besides the university in Budapest there is another university in Klausenburg (Hungarian "Koloszvar") for which the same rules hold good. Only these two universities may confer medical degrees in Hungary. In 1906 new regulations were drawn up which are now in the hands of the Minister, but they have not been ratified. In these rules the Professional Committee demands the passing of the second and third practical examinations from those who gained their diploma before 1901. Those who gained their diploma after that year are compelled to pass the second and third examinations, and in addition to pass one year in a hospital which is designated for that purpose. The subjects of the old second examination are as follows: clinical medicine, surgery, operative surgery, ophthalmology, obstetrics, and operative obstetrics. The old third practical examination embraces the following subjects: clinical medicine (theoretical), surgery (theoretical), forensic medicine, and public hygiene. The new third examination embraces the following subjects: clinical medicine, surgery, operative surgery, obstetrics and gynæcology, operative obstetrics, ophthalmology, operative ophthalmology, dermatology, pædiatrics, and psychology (from the latter three only one is compulsory, decided by lottery). The new second examination embraces pharmacology, general pathology, forensic medicine, public hygiene (all theoretical), and pathological anatomy (theoretical and practical). The Minister has the right to allow settling in Hungary without demand, the passing of these examinations, but it is questionable whether he will exercise this right.

Count Tános Zichy, Minister of Public Instruction, has added a new paragraph (this year) to the rules relating to practising medicine in Hungary by foreigners. According to the new paragraph the Hungarian Universities are empowered to give a licence to practise medicine with foreign qualifications if the universities themselves issue a medical diploma for the applicant. Every applicant has to prove his personal identity by the Consulate, and he has to certify that he has passed all the preliminary examinations (in the same subjects) which are required from the candidates studying in Hungarian Universities. The holder of a foreign qualification who desires to obtain permission to practise in Hungary must apply to the Professorial Board of the Budapest University, which Board instructs the applicant to pass the second and third practical examinations. After the candidate has passed these examinations the Board declares the candidate to be a suitable person for settling in the country, and this resolution is submitted to the University of Public Instruction for approval. The Ministerial approval is written on the back of the foreign diploma. The candidate must afterwards pass the ceremonies of the Hungarian University. Finally, the Board has resolved that an invitation of a foreign doctor to a Hungarian University chair is equal with the recognition of the validity of his foreign diploma. In special cases the Minister may grant a licence to foreign doctors to settle in Hungary.

DENMARK.

In Denmark only those who have passed the Danish Medical Examination are entitled to practise. In Iceland it suffices to have been examined at the Medical School in Reykjavik. The medical student before beginning his studies must present a diploma of *Examen artium*—an examination very similar to the German *Abiturienten-examen*. At the close of the first year he must pass an *Examen philosophicum*. The medical studies proper require from six to seven years. The foreign student will find one agreeable difference from what is customary in other countries—namely, that all University lectures and clinical courses are free, payment of class fees being unknown, but a few pounds are required for the examination. On passing the examination the young man becomes entitled to practise, and not a few commence at once. The majority, however, prolong their practical training by accepting an appointment as (salaried) junior house physician or house surgeon in one of the numerous hospitals of the country. The most highly valued appointments—namely, those at the Kommune hospital or at the State Hospital of Copenhagen—were, however, formerly in so great demand that not rarely four, five, or even more years elapsed before an aspirant could secure the coveted position, when he served for one or two years in the different departments of the hospital. This unreasonably long waiting time is now considerably reduced, as the Association of Junior Medical Men has arranged with the faculty and other authorities for the establishment of a larger number of appointments, which are to be officially considered as equivalent to the older appointments at the two hospitals.

The only academical degree for medical men known in Denmark is the degree of M.D. It is granted exclusively by the University of Copenhagen, and only to those who have submitted to the faculty an original investigation of undoubted scientific value, the consequence being that only a comparatively small number of Danish practitioners possess the degree in contradistinction to what is customary, for example, in Germany. In fact, the Danish degree of M.D. must be considered as equal to the German title of *Privatdocent* or the French tile of *professeur agrégé*, as it authorises its possessor to teach publicly in the university.

The only portion of Danish territory where a foreign medical man is permitted to make use of his diploma are the Danish islands in the West Indies, the Governor being empowered to grant such permissions; but he is not likely to do so except during epidemics or when other abnormal conditions obtain.

SCANDINAVIA.

As a general rule no one can legally practise medicine in Scandinavia without passing the examinations of the respective countries. Certain exceptions have, however, from time to time been made in favour of practitioners with foreign degrees who may wish to practise without passing the examinations of the country. An interesting account of the conditions of medical practice in Scandinavia and the evolution of medicine there will be found in THE LANCET for July 1st, 8th, and 22nd, pages 36, 114, and 244 respectively.

BELGIUM.

Application should first be made to M. le Ministre de l'Intérieur et de l'Agriculture in Brussels. The qualifications already possessed by a foreign practitioner are considered by a committee of the University which decides the nature and number of the examinations that must be passed by the applicant. A fee of about £4 is charged for each examination, and there is an annual fee which varies in different parts of the country.

NETHERLANDS.

A medical practitioner holding British qualifications cannot practise in the Netherlands without being also qualified in the Netherlands. For this purpose it is necessary to pass the medical examinations of one of the universities. The examinations are in the Dutch language.

SWITZERLAND.

Foreign practitioners must pass the first, third, and fourth State Examinations. These examinations are held in either French (at Lausanne and Geneva) or German (at Berne, Basle, and Zürich). In addition to the British five years' curriculum practitioners would require one or two years' additional study. The examination fees amount to about £9.

SPAIN.

To practise in Spain it is necessary for the holder of British qualifications to apply to the Royal Council of Public Instruction and Fine Arts and enclose the degees, diplomas, or similar credentials which he possesses, and request permission to appear before an examining body. The above documents must be translated by the Interpretation Bureau

of the Ministry of State and afterwards presented in the Ministry of Public Instruction, together with a petition to the Minister, clearly stating the applicant's requirements. We are informed that the examination which confers a licence to practise consists of three parts: 1. A written examination lasting two hours. 2. A *vivâ-voce* examination. 3. Clinical examination of a patient and a report upon his condition. The fee for the examination is 40 pesetas (£1 12*s.*). The fee for the diploma is 814.50 pesetas (£32). The length of time between the presentation of the documents to the Ministry of State and Public Instruction and the granting of the diploma is variable on account of the time occupied in the necessary legal formalities. The expenses of translation of the documents likewise vary with their length and the consequent work entailed to be done by the Bureau.

PORTUGAL.

Holders of foreign diplomas must apply for examination at the schools of Lisbon or Oporto or the Faculty of Coimbra. For the last examination the presentation of a *printed* dissertation is required.

GREECE.

In Greece the foreign qualification which entitles to practise legally is the possession of a degree or diploma from a recognised university or corporation of a state where practical examinations in Pharmacology, Surgery, Obstetrics, and Forensic Medicine are demanded, which means that registered British practitioners by supplying documentary proof to the medical secretary of the Ministry of the Interior in Athens can obtain the right to practise. All persons possessing no qualifications outside Greece have to submit to the practical examinations of which the doctors of medicine in the university are subject, but if ignorant of Greek examination can be taken in French, German, or Italian. There is no entrance fee, but there is an annual fee or tax dependent upon the amount of practice.

TURKEY.

Every foreign medical practitioner desirous of settling in Turkey for the purpose of practising his profession must undergo the ordeal of the so-called "colloquium." This is a sort of professional examination very easy in itself but a source of annoyance and vexation to Europeans by the dilatory propensities of Orientals and their habit of conducting business in an indolent and easy-going way. The "colloquium" itself takes about half a hour's time, whereas the preliminary steps and arrangements and the subsequent formalities necessary for the final obtainment of the medical permit lasts for weeks and even months. The "colloquium" must at the present time be passed either in French or Turkish without any interpreter, the choice of the language being left to the examinee. The possessor of a foreign diploma is tested, as a rule, in four subjects, and the testing consists in three or four questions in each subject, which the candidate has to answer orally. It has not yet happened that a European physician failed to pass the "colloquium." The fee for it used to be about £8. Two or three years ago it was raised to about £20. We are informed that this was done in order to increase the revenue of the rather inefficiently equipped Medical School at Haidar Pasha and to diminish the influx of the numerous medical men flocking to the Turkish metropolis from almost every country adjoining the Ottoman Empire. A far better means of effectively doing the latter would be to raise the rather low standard of the "colloquium." There are numbers of medical men in Constantinople and in other parts of Turkey whose qualification is doubtful. This is especially the case with regard to the so-called "surgical dentists." With the new *régime* of the free constitutional government new alterations and improvements will undoubtedly be introduced into the rules regulating the practice of foreign medical men. The Young Turkish Parliament has lately already touched upon some important medical questions, such as the service of non-Mussulman practitioners in the Ottoman army. We learn that strict measures will be taken against all those who do not possess necessary qualifications, that the standard of the medical curriculum will be raised, and that the manner of conducting the "colloquium," as well as its character, will be completely changed. Regenerated Turkey intends to organise everything in accordance with modern lines of European efficiency.

It was hoped that with the advent of the constitutional *régime* lady doctors, so very much needed in the Ottoman Empire, would also be admitted to the "colloquium" and have the right to practise. This hope has not been realised. A number of female practitioners, who went there especially from Russia, had to leave soon. They were told that no foreign lady would be admitted to any examination and that the right of practising in Turkey is strictly reserved to native women, who must be Ottoman subjects. They were also informed that the medical profession in the metropolis is overcrowded and that it would not be fair to increase foreign elements at the expense of the natives. A well-known lady doctor, Marie Siebold, who had lived in Constantinople during the old *régime* for about 20 years and who did excellent work very much appreciated by a large number of Turkish ladies in high circles of society, returned to the capital soon after the proclamation of the Constitution. She was well received by the harem ladies of the present Sultan and expected that she would be allowed to settle definitely in Constantinople this time. She was mistaken. The Sultan, with all his good intentions, is a mere figure-head, and although he was fond of Dr. Siebold he could do nothing for her. The medical authorities refused to acknowledge her and put in her way every possible difficulty. She left disgusted and is now doing excellent work in Cairo, where lady doctors seem to encounter no restrictions.

RUSSIA.

The law relating to foreign medical practitioners desirous of practising in Russia is contained in the two following paragraphs of the *Vratohebny Ustav* or medical statute:—Section 93 (*a*): No one, whether a Russian subject or a foreigner, who has not a diploma or certificate from a university or from an Army Medical Academy, has the right to follow any branch of medical or veterinary practice in Russia; (*b*) foreign medical practitioners who wish to practise medicine in Russia must, without exception, know the Russian language. Section 94: Of foreign practitioners who shall be invited or who may come to Russia the right to decide which of them shall be permitted to free practice here and under what conditions is in the hands of the Medical Council of the Ministry of the Interior: some shall be permitted only after the usual examinations and consequent granting to them of a learned degree; others more distinguished after an oral examination in the Medical Council; lastly, others who have made a name in the scientific world by their writings or unusually successful practice, or who have occupied professorial chairs or other important medical appointments in other countries, may be permitted to practise without any examination, solely on the decision of the Medical Council, confirmed by the Minister of the Interior, as to the worthiness of such practitioners.[1] Previous residence in the country before practice would not be necessary except in the case of the first group mentioned, who would have to pass through the usual five years' course of a Russian medical curriculum. As to the prospects of a British practitioner in Russia, the country and the smaller towns can present no attraction to an English medical man, even if the fees obtainable would support him, which they would not. In the two capitals, Moscow and St. Petersburg, the field is wider. Competition is, however, great, fees are as a rule small, and bad debts many. The frequency of bad debts results from the unwritten law by which medical men do not send in accounts, but leave the patient to pay what he considers a suitable amount.

EGYPT.

Any person in possession of a diploma from a recognised school of medicine is allowed to practise his profession in Egypt after having presented his diploma to the Director-General of the Sanitary Department at Cairo for verification and paid a small fee of 6 piastres. From a recent report of the department it appears that the influx of medical men into Egypt of late years has been very great, so that it is difficult to understand how some are able to gain a livelihood from their profession. The effective control of diplomas which emanate from so many different foreign schools must be at times somewhat difficult, as the Public Health Department has no means of identifying the person who presents the diploma as the person who underwent the examinations which entitled him to it—e.g., there is nothing to prevent a person who has come into possession of a diploma by fraudulent means personifying the legitimate owner of the diploma and obtaining a licence to practise.

[1] This Section dates from 1836; it was amended in 1842, 1845, and 1867.

It is true that in addition to the diploma a certificate of good conduct is necessary from the applicant's Consul before a licence to practise is granted, but in many cases the Consul finds himself in the same difficulty as the department with regard to ascertaining if the person in possession of the diploma is the rightful owner or not. We recommend any one of our readers who is attracted by the idea of medical practice in Egypt to obtain introductions to a resident in Egypt so that he may ascertain the chances of finding a remunerative opening and be provided with a witness to his identity. A knowledge of French or Italian and Arabic would be essential to any new-comer desirous of practising all the year round, for the tourist season only lasts from November to April.

JAPAN.

According to the regulations for medical licence, "persons holding either diplomas of foreign universities, or medical schools, or foreign licences for practising medicine may be granted licences for practising medicine in Japan, without being subject to the usual medical examination, upon producing such diplomas or licences obtained in foreign countries to the satisfaction of the home authorities." English medical practitioners will therefore have no difficulty in obtaining a licence in Japan. A local rate, which would be a small fee only, may have to be paid on opening a practice, but no charge is made for the right to practise. We have been informed that English practitioners in the foreign quarters of Japan are at some disadvantage for the reasons that the druggists, who are now nearly all Japanese, sell their drugs at a cheaper rate to native practitioners; and, moreover, living is cheaper for the native than for the foreigner. Foreign practitioners depend largely upon shipping and contract business work.

SOUTH AMERICA.

Argentine.—An examination which is held in the Spanish language must be passed. The fee for the examination is about £79, and there is an annual fee of about £8 15*s.*

Brazil.—Legally the consent of the Faculty of Medicine and Pharmacy must be obtained, but the law is somewhat lax. Certain small fees are demanded.

UNITED STATES OF AMERICA.

The laws regulating the practice of medicine in the various States and territories of the United States of America differ to a considerable extent in detail. In spirit, however, they are beginning to assume that uniformity which all medical reformers must desire for them. It has long been pointed out that one of the most open doors to abuse of medical practice in the United States was the fact that while in some States an excellent medical curriculum was required before admission to legal practice, in other States but little scientific training was exacted and freedom to practise was extended to dangerous forms of quackery. This position of affairs had its origin, of course, in the evolution of the United States, certain divisions of the country being in the forefront of civilisation, while others were, to say the least, in a rudimentary plight; but of late a great process of levelling-up has been witnessed. The progress of the United States is in no way better shown than in the fact that throughout its vast length and breadth there is now an attempt to secure for the people of the country adequate medical treatment based on scientific grounds. A *résumé* of the legal regulations for medical practice in the States and territories of the United States of America can be secured by sending 30 cents to the American Medical Association, 535, Dearborn-avenue, Chicago, Illinois. In this digest of the medical laws of the various States, which has been brought quite recently up to date, existing legislation is explained on broad grounds so far as it pertains to medical practice. If the information with regard to some particular State is anywhere scanty in detail it is always possible for the intending practitioner to communicate with the secretary or executive officer of the medical board at the capital of the State.

We must continue to warn the British medical man desiring to practise his profession in the United States of America that in all the more enviable centres he will find a vast number, almost a plethora, of medical men, the great proportion of whom have been thoroughly well educated and trained. He must remember also that in the more important States, generally speaking, although the remuneration may rule high, the expense of living is proportionate. He will understand that the less highly the State is developed the more easy will it be for him to obtain a footing, but the less pleasant in all probability will be his professional career. Examinations are now required of all applicants in all States.

(To be continued.)

POST-GRADUATE STUDY.

POST-GRADUATE study is divided into three main divisions —the general study of professional subjects (including the special study of some branch), the study of State medicine, and the study of tropical medicine. We have already described the provision made for instructing graduates in the last two divisions, mentioning the procedure necessary to obtain diplomas or certificates for proficiency in them. The following article shows the principal arrangements existing for general post-graduate instruction, and some little repetition has been necessary:—

LONDON.

The London Post-Graduate Association.—The London Post-Graduate Association is now so well known that it is hardly necessary to remind our readers that it is composed of the following hospitals and medical schools (general and special)—viz.: *General Hospitals:* Charing Cross, Guy's, King's College, St. George's, St. Mary's, St. Thomas's, University College, and Westminster. *Special Hospitals:* The Brompton Hospital for Consumption and Diseases of the Chest, the Hospital for Sick Children (Great Ormond-street), the London School of Tropical Medicine, the National Hospital for the Paralysed and Epileptic (Queen-square), the Royal London Ophthalmic Hospital, late Moorfields (City-road), St. Mark's Hospital for Diseases of the Rectum, and the Medical Graduates' College and Polyclinic. One ticket (the charge for which is 10 guineas for a three months' course, or 15 guineas for six months) admits the holder to the clinical instruction in the wards and out-patients' departments, the operations, necropsies, and other hospital practice of all the institutions mentioned above. For the purpose of enabling qualified medical men to keep up to date in their work we can heartily recommend the scheme offered by the London Post-Graduate Association, which thus places the best of all the hospital work in London at the disposal of its ticket-holders. The office of the association is now at 20, Hanover-square. Further particulars may be obtained by writing to the Secretary, the London Post-Graduate Association, 20, Hanover-square, London, W., or by personal application between the hours of 10.30 A.M. and 1 P.M. any week-day except Saturday.

Medical Graduates' College and Polyclinic.—This institution affords to medical practitioners special facilities for acquiring technical skill and for advancing their clinical and scientific knowledge. The building contains lecture- and consulting-rooms, a pathological and clinical laboratory, a Roentgen-ray room, an ophthalmoscope-room, a museum, a library, and reading- and waiting-rooms, &c. Cliniques are given on each working day of the week except Saturday at 4 P.M., and a lecture on medicine, surgery, or their special branches, is delivered daily except on Fridays and Saturdays, at 5.15 P.M. Practical laboratory instruction in the various branches of Clinical Pathology is also provided. Classes are also held in Otology, Laryngology, Rhinology, Ophthalmology, Radiography, Anatomy, Nervous Diseases, Microscopy, Urinary Analysis, Gynæcology, Practical Bacteriology, Sigmoidoscopy, Cystoscopy, Mental Diseases, Hygiene and Public Health, and Operative Surgery. Extra classes in any subject are formed to suit the convenience of practitioners unable to attend those already provided. Special tutorial classes are held for practitioners reading for the higher examinations. A monthly journal, the *Polyclinic*, recording the work done in the college, is issued free to subscribers and members. The annual subscription for medical practitioners of either sex is 1 guinea. Full information can be obtained from the Medical Superintendent at the College, 22, Chenies-street, Gower-street, W.C. The autumn session will commence on Monday, Sept. 11th.

The Hospitals of the Seamen's Society.—In connexion with these hospitals there are two post-graduate schools—viz.,

(*a*) the London School of Tropical Medicine; and (*b*) the London School of Clinical Medicine.

(*a*) *The London School of Tropical Medicine.*—The school buildings, laboratories, museum, library, &c., are within the grounds of the Branch Hospital, Royal Victoria and Albert Dock (Station, Connaught-road, Great Eastern Railway). Opportunities are afforded to students and others who may be desirous of studying diseases incidental to tropical climates before entering the service or going abroad. In the hospitals of the society are to be found cases of tropical diseases such as may be met with in actual practice in the tropics. There are three courses in the year, each lasting three months, beginning on Oct. 1st, Jan. 15th, and May 1st respectively. The laboratory, museum, library, &c., are open daily, and clinical instruction is given daily in the wards of the hospitals. The School Course is recognised by the University of Cambridge for its Diploma of Tropical Medicine and Hygiene. Classes are arranged for advanced Helminthology, Protozoology, and Entomology. The lecturers in the School are: Sir P. Manson, F.R.S., Dr. Andrew Duncan, Dr. C. W. Daniels, Dr. L. Westenra Sambon, Dr. J. M. H. Macleod, Professor R. Tanner Hewlett, Mr. James Cantlie, Mr. E. Treacher Collins, Dr. F. M. Sandwith, Mr. K. W. Goadby, and Professor W. J. R. Simpson. The Director is Mr. H. B. G. Newham. Certificates are granted after examination to those who complete a full course. Resident chambers are available for students who must be qualified or in the fifth year of their medical studies. Prizes: the Craggs prize of £50 and the Hon. Edward John Stanley Memorial Fund, £60, are awarded yearly.

(*b*) *The London School of Clinical Medicine* (for qualified practitioners only).—The lecture rooms, pathological laboratories (two), museum, and operative surgery class-rooms are in the *Dreadnought* Hospital at Greenwich, and the whole hospital of 250 beds with its out-patient departments is open to students from 10 A.M. till 5 P.M. Medical, Surgical, and Special Department In-patient Clinics are held upon every afternoon except Saturday by the senior members of the staff, and operations are performed daily, whilst out-patients in the Medical, Surgical, and Special Departments are demonstrated by the assistant physicians and assistant surgeons daily in the forenoon. Practical classes are arranged each session in the following subjects: The Practice of Medicine, the Practice of Surgery, Diseases of the Eye, Diseases of the Throat, Nose, and Ear, Diseases of the Skin, Diseases of the Nervous System, Operative Surgery, Clinical Pathology, Microscopy and Bacteriology, Mental Diseases, Radiography, Dental Surgery, the Administration of Anæsthetics, Hygiene and Public Health, Gynæcology, Surgical Diseases of Women, Surgical Diseases of Children, Medical Diseases of Women, Medical Diseases of Children, Applied Anatomy, and Midwifery. Three sessions of three months' duration are held in each year, beginning on Jan. 5th, April 15th, and Oct. 1st. Every variety of disease may be studied in the wards and out-patient rooms of the hospital, at the dispensaries, and at the affiliated hospitals. Male patients chiefly are received as in-patients by the Seamen's Hospital Society, but arrangements have been entered into with the Royal Waterloo Hospital for the reception of graduates who desire instruction in Diseases of Women and Children; with the Bethlem Royal Hospital for those who require tuition in Mental Diseases; and with the General Lying-in Hospital, York-road, for the prosecution of study in Midwifery. These hospitals are situated on the south side of the river, are directly linked to the *Dreadnought* by both railway and tramway, and are affiliated to the London School of Clinical Medicine. The certificates of the School are recognised by the Admiralty, the War Office, the India Office, the Conjoint Examining Board of the Colleges of Physicians and Surgeons, the Colonial Service, and the University of London (for the higher degrees). The supply of material affords exceptional facilities for practical instruction in Operative Surgery and in Pathology on the cadaver. The hospital also offers a wide field for the study of Venereal Diseases, and there is a special department with open-air wards for the treatment of Tuberculosis.

The teaching staff consists of: Sir Dyce Duckworth, Dr. Frederick Taylor, Sir John Rose Bradford, F.R.S., Professor R. Tanner Hewlett, Dr. Guthrie Rankin, Dr. S. Russell Wells, Sir William H. Bennett, Mr. William Turner, Mr. Lawrie H. McGavin, Mr. E. Rock Carling, Mr. L. Vernon Cargill, Sir Malcolm Morris, Mr. Richard Lake, Dr. Howard Pirie, Dr. Frederick Langmead, Dr. Gordon Holmes, Dr. Charles Singer, Mr. C. C. Choyce, Mr. H. Curtis, Mr. A. J. Walton, Mr. R. Bickerton, Dr. Wilfrid Fox, Mr. G. N. Biggs, Dr. Maynard Horne, Dr. Cecil Hughes, and Dr. R. E. Delbruck.

The extra-mural lecturers are: Dr. James Taylor, Dr. W. H. B. Stoddart, Professor W. J. R. Simpson, Mr. James Cantlie, Dr. William J. Gow, Dr. Herbert Williamson, Mr. Herbert S. Pendlebury, Mr. Ivor Back, Dr. Alexander Haig, Dr. R. O. Moon, Dr. Charles O. Hawthorne, Dr. Thomas D. Lister, and Dr. William R. Dakin.

The Syllabus and other particulars of the School can be obtained on application to Mr. C. C. Choyce, the Dean, Seamen's Hospital, Greenwich, S.E.

West London Post-Graduate College, West London Hospital.—The West London Post-Graduate College was started in 1895 and three years later its basis was enlarged by the provision for the post-graduates of lecture-, reading-, writing-, and class-rooms, &c., while owing to the continued growth of the college these were transferred in 1901 to a building especially constructed for the purpose. Over 2000 post-graduates have been enrolled since its establishment, the yearly entry being now about 220. The hospital, which contains 160 beds, is in the main Hammersmith-road, about three miles from Hyde Park Corner, and very accessible by omnibus, tram, or train. The physicians and surgeons (see p. 597) attend daily at 2.30 P.M. Post-graduates accompany the staff and the junior staff on their visits to the wards. Instruction is given in the out-patient department daily at 2.15 P.M. by the assistant physicians and assistant surgeons. The out-patient department has recently been enlarged, and there is ample accommodation for post-graduates to see and to examine the patients in all the special departments of the hospital. Clinical assistants are appointed from among the post-graduates to the Medical and Surgical out-patients and to the Special Departments. The fee for a clinical assistantship to non-members is £3 3*s.* for three months, which includes membership of the college on the days on which the clinical assistant attends. Practical classes, limited in number, for instruction in special subjects, as well as in medicine and surgery generally, are held as required. Operations are performed daily at 2 P.M. Post-graduates are allowed to stand close to the table and can see the operations perfectly. The surgeons often avail themselves of the assistance of post-graduates at operations. Instruction is given in the administration of anæsthetics by the anæsthetists on the operating days and post-graduates are allowed to administer anæsthetics under their superintendence. Post-mortem examinations are performed at 2 P.M., and demonstrations on recent pathological specimens are given on Mondays at 12 noon during each session in the pathological laboratory. Demonstrations are given each week on Practical Medicine on Thursdays at 12.15 P.M. Practical lectures and demonstrations are given each afternoon (except Saturdays), at 5 P.M., during the session. Included in this course are lectures by outside specialists on Mental Diseases and on Public Health, and in connexion with the former instruction is also given in certain asylums. The college is licensed for the teaching of operative surgery. The fee is £4 4*s.* each member in a class of four. The practice of the hospital is well adapted to the needs of medical officers of the Royal Navy and officers of the Royal Army Medical Corps, Indian Medical Service, and Colonial Service who have obtained leave for further professional study, and the certificate of attendance at the college during such leave is recognised by the Admiralty and other authorities. The college is recognised by the University of London for hospital practice before the M.D. degree and by the Royal College of Surgeons for the necessary work before the Fellowship examination. The pathological laboratory has recently been completely reorganised and placed in the hands of the pathologist, Dr. Bernstein, who attends there during the whole day and gives instruction in Bacteriology and Microscopy. A special class meets on three mornings a week from 10 to 1, and post-graduates joining the class can work in the laboratory at other times under the guidance of the pathologist. A class meets 12 times and commences at the beginning of each month. The fee for this class in bacteriology and microscopy is £5 5*s.* The fee for the hospital practice, including all ordinary demonstrations and lectures, is £1 1*s.* for one week, £3 3*s.* for one month, £6 6*s.* for three months,

£10 10s. for six months, £15 15s. for one year, and £30 for a life ticket; all fees to be paid in advance. A practitioner who cannot attend the whole course may attend any ten lectures or demonstrations during the session for a fee of £1 1s. A vacation class is held each year in August, the fee being £3 3s. for the course of one month, including hospital practice. The fee for a three months' course of instruction in the administration of anæsthetics, including a special class, is £3 3s., or without the class, £2 2s. A ticket for any of the above courses will be issued at any date. Arrangements can be made for gentlemen working for higher university examinations to be coached. The Winter Session will commence on Monday, Oct. 9th. All communications should be addressed to the Dean, Mr. L. A. Bidwell, Post-Graduate College, or to Mr. Donald Armour, Vice-Dean, West London Hospital, Hammersmith-road, W.

North-East London Post-Graduate College.—This post-graduate school is established in connexion with the Prince of Wales's General Hospital, Tottenham, N., which is recognised by the University of London as a place of post-graduate study for the M.D. and M.S. degrees and by the Admiralty and the India Office for purposes of study leave. Facilities are there afforded to qualified medical practitioners for taking part in the work of an active general hospital of 125 beds and for attending demonstrations in various branches of medicine, surgery, and gynæcology, with opportunities for clinical instruction in Diseases of the Eye, Ear, Throat, Nose, Skin, in Fevers, Psychological Medicine, the Administration of Anæsthetics, Radiography, and Dentistry. Cliniques, lectures, and demonstrations are given by members of the teaching staff in the lecture-room, in the wards, in the various out-patient departments, and in certain affiliated institutions. Operations are performed on every afternoon of the week except Saturday. Special limited classes are arranged in Modern Methods of the Study and Treatment of Diseases of the Lungs and Heart, Gynæcology, Diseases of the Throat, Nose, and Ear, Diagnosis of Diseases of the Nervous System, Ophthalmoscopy and Refraction, Diseases of the Skin, Abdominal Surgery, Radiography, Bacteriology (which is accepted by the University of Cambridge for its D.P.H. diploma), Clinical Pathology, Vaccine Therapy, and Medical Electricity. A Vacation Course will be held between Sept. 11th and 22nd. The fee for a three months' course of study, which may be begun at any time, in any single department, is 1 guinea. A fee of 3 guineas admits to the whole practice of the hospital for a similar term (one month 1 guinea), and a perpetual ticket for the practice of the hospital may be obtained on payment of a fee of 10 guineas. The fee for the Vacation Course is 2 guineas. Clinical assistants are appointed in the various departments. A certificate, signed by the staff, may be obtained at the end of three months' hospital attendance. A pathological museum and a pathological laboratory for original research are available. A reading- and a writing-room, containing a reference and lending library, is provided, and tea may be obtained. The hospital is connected with the Telephone Exchange (No. 23, Tottenham).

The lecturers are as follows:—In General Medicine: Dr. Percy Kidd, Dr. R. Murray Leslie, Dr. G. P. Chappel, Dr. A. J. Whiting, Dr. A. G. Auld, and Dr. T. R. Whipham. In General Surgery: Mr. Walter Edmunds, Mr. H. W. Carson, Mr. J. Howell Evans, and Mr. E. Gillespie. In Gynæcology: Dr. Arthur Giles. In Diseases of the Eye: Mr. R. Philip Brooks. In Diseases of the Ear, Throat, and Nose: Mr. H. D. Gillies. In Diseases of the Skin: Dr. G. Norman Meachen. In Fevers (at the North-Eastern Fever Hospital, St. Anne's-road): Dr. Frederic Thomson. In Psychological Medicine (at the Colney Hatch Asylum): Dr. S. J. Gilfillan. In Tropical Medicine: Mr. James Cantlie. In Radiography and Medical Electricity: Dr. A. Howard Pirie. In the Administration of Anæsthetics: Dr. Hadfield, Mr. Trewby, and Dr. Dunkley. In Vaccine Therapy and Bacteriology: Dr. G. G. Macdonald. In Clinical Pathology and Pathological Chemistry: Dr. Hunter Duncan.

The opening lecture of the Winter Session will be given at the hospital at 4.30 P.M. in the third week in October by Sir J. Crichton-Browne, Bart. Further information, with prospectus and syllabus of lectures and demonstrations, may be obtained from the Dean of the school, Dr. A. J. Whiting, at the Hospital, or at 142, Harley-street, London, W

PROVINCIAL.

Birmingham.—At the University of Birmingham special courses for post-graduates have not yet been instituted, except in the subject of Advanced Bacteriology (January to March) and Clinical Pathology and Bacteriology (April to June) and a course of Veterinary Pathology and Bacteriology for Veterinary Practitioners (October to December), but the various departments of the University are open to graduates who can attend any of the systematic courses on payment of a fee. Graduates may also work in the laboratories under the supervision of the professors for a small fee to cover the incidental expenses. Applications for information should be made to the Dean. At the General and Queen's Hospitals Clinical Demonstrations for practitioners are given by members of the staff twice a week during the autumn term. All classes at the University and hospitals are open to men and women.

Bristol.—Courses of post-graduate instruction adapted to the requirements of those proceeding to the M.D. degree of the Universities, each lasting about 12 weeks, will be held at the Bristol Royal Infirmary and General Hospital. The course will consist of: (*a*) clinical demonstrations on cases selected from the wards and from out-patients in medicine, obstetrics, dermatology, and laryngology; and (*b*) tutorial classes in medicine, obstetrics, pathology, laryngology, bacteriology, and dermatology. Classes in clinical medicine will be held twice a week—once at the Infirmary and once at the Hospital—by Dr. F. H. Edgeworth at the Infirmary and by Dr. J. Michell Clarke and Dr. J. O. Symes at the Hospital. Classes in obstetrics will be held once a week on alternate weeks at the Infirmary and Hospital by Dr. Walter C. Swayne and Mr. D. C. Rayner respectively. A class in pathology will be taken once a week by Professor Walker Hall. Six demonstrations on dermatology will be given by Dr. J. A. Nixon and Dr. W. K. Wills at the Infirmary and Hospital. Six demonstrations on laryngology will be given by Dr Watson-Williams at the Infirmary. A tutorial class in medicine will be held on one evening a week by Dr. G. Parker, Dr. Newman Neild, and Dr. J. R. Charles in rotation, and a similar class in obstetrics will be taken once a week by Dr. Walter Swayne and Mr. Rayner alternately. The fees are as follows:—For the whole course, £7 7s.; for classes in clinical medicine, pathology, laryngology, and bacteriology and tutorial class in medicine, £5 5s.; for classes in obstetrics, pathology, and bacteriology, £3 3s.; and for clinical medicine and obstetrics only, £3 3s. Applications to attend the classes should be made to the Dean of Medicine, University of Bristol.

Cambridge.—Long vacation courses are held at Cambridge during the month of July and the first three weeks in August. This year the course included lectures and demonstrations on general and special pathology by Professor G. Sims Woodhead and Mr. T. S. P. Strangeways, on bacteriology for medical students by Dr. Louis Cobbett, an advanced course on bacteriology for students of sanitary science by Dr. G. S. Graham Smith, a course in pharmacology by Professor J. B. Bradbury and Dr. W. E. Dixon. The pathological and pharmacological laboratories are open to advanced students and graduates. Applications for information should be made early in the year to Mr. E. E. Stubbing, Pathological Laboratory Museum, Downing-street, Cambridge.

Leeds.—The Anatomical, Physiological, and Pathological Laboratories at the University of Leeds are at the disposal of qualified medical men for research or for routine work at specially arranged fees, and though there is no definite post-graduate course at the General Infirmary the work of this large teaching institution is very freely accessible to qualified medical men at reduced fees.

Liverpool.—At the University of Liverpool the department of Bio-chemistry, under the superintendence of Professor Benjamin Moore, is devoted chiefly to post-graduate teaching and research work upon chemistry in relationship to biology and medicine. The laboratory possesses a main room designed specially for research students in bio-chemistry. In this room there is ample accommodation for ten workers, each with independent working space. Competent students desirous of undertaking research in problems of either physiological or pathological chemistry can be supplied with accommodation in the Johnston Laboratory. Every assistance is given to such students, either in working out suitable problems of their own choosing, or the professor is prepared to suggest problems to persons having a knowledge of

bio-chemistry and desirous of carrying on work in that subject. Applications should be addressed to the Johnston Professor of Bio-chemistry at the laboratory. A course of lectures and practical work in the laboratory is given each term in comparative bacteriology and parasitology for army and colonial veterinary surgeons and others. Instruction may be obtained at the Johnston Laboratory and also at the farm station of the Incorporated Institute of Comparative Pathology on the methods of manufacture and testing of the various curative and preventive vaccines and sera used in medical and veterinary practice. Seven of the rooms on the first floor of the Johnston Laboratories are utilised for the purpose of the Liverpool Cancer Research carried on by the aid of the Sutton Timmis Fund. In the department of tropical pathology, under the guidance of Sir Ronald Ross and Professor R. Newstead special courses of laboratory instruction in bacteriology, parasitology, morbid histology, pathology, and medical entomology are given in each term in the Johnston tropical Laboratory at the University, or at the associated laboratory at Runcorn. On Mondays, Wednesdays, and Fridays, at 4 P.M., during the summer, autumn, and Lent terms, Mr. D. Douglas Crawford delivers a course of lectures and demonstrations in surgical and applied anatomy which is intended to meet the requirements of students preparing for their final professional examinations. A practical course on the clinical examination of the blood, the staining and identification of pathogenic bacteria, and on the bacteriological diagnosis of certain diseases will be given on Tuesdays and Thursdays, at 4 P.M., during the summer term, by Associate Professor Ernest E. Glynn, provided a sufficient number signify their intention of attending. Post-graduate courses are also given in operative surgery, ophthalmology, surgical diseases of children, skin and throat diseases, by the several lecturers appointed for those special courses of instruction. All post-graduate classes at the University are open to persons of either sex.

Manchester.—The plan adopted a few years ago at the University of Manchester of having special courses of lectures on medicine and surgery for qualified medical men has since that time been considerably modified. Classes are now held and lectures given on various special subjects, as, e.g., diseases of the heart, diseases of the respiratory organs, of the kidney, and so on, and the same obtains as to surgical matters. These lectures are designed to meet the wants of senior students and practitioners. During the past summer post-graduate clinical demonstrations have been given twice a week at the infirmary by members of the staff, and it is expected that a series of demonstrations, will be arranged for next summer. Classes for senior students and post-graduates are also held at the Ancoats Hospital. There are good opportunities also for post-graduate study at the special hospitals for diseases of the eye, throat, ear, and skin, &c., but no special demonstrations are given. The Public Health Department, under the direction of Professor S. Delépine, is largely attended by medical men, as are also the lectures given in the University on Sanitary Chemistry by Dr. Gilbert J. Fowler and the Hygiene course by Dr. E. J. Sidebotham. Facilities are also given for the pursuit of research work in the public health laboratories, and in this department the dates of post-graduate courses in pathology and bacteriology are announced in the laboratory and in the medical journals. There is no difficulty in Manchester in the way of any practitioner who wants to have his recollections revived or his knowledge enlarged and brought up to the present standard in accomplishing his wish. Facilities for research and post-graduate work are offered to women on the same terms as men.

Newcastle-upon-Tyne.—At the University of Durham courses of instruction are given in chemical and physical laboratory work and lectures are delivered on comparative pathology and practical bacteriology for the Diploma in Public Health and the Degree of Bachelor in Hygiene. All courses are open to women students and graduates.

Sheffield.—At the University of Sheffield post-graduate courses are held annually. The subjects vary from time to time and include medical and surgical anatomy, physiology of digestion and nutrition, pathology of the blood, clinical bacteriology, surgery, ophthalmic surgery, operative surgery, diseases of the nose, and diseases of the ear.

SCOTLAND.

Aberdeen.—Although there is no special provision at Aberdeen for post-graduate study such as exists in London, still there are some facilities for doing work of this nature at the University. There are fully equipped laboratories in anatomy, anthropometry, bacteriology, botany, chemistry, pharmacology, physics, physiology, public health, and zoology. Graduates or others desiring to engage in special study or research may be admitted by the Senatus to prosecute such study or research in any of the laboratories in accordance with certain provisions. Research students are exempted from payment of laboratory fees, but are required to matriculate each year, paying the ordinary matriculation fee (£1 1*s.* for winter and summer; 10*s.* 6*d.* for summer). Forms of application for admission as research students may be had from the Secretary of the Senatus. The fees are £3 3*s.* for six hours per week in winter or nine hours per week in summer, 10*s.* 6*d.* and 7*s.* being charged for every extra hour per week in winter and summer respectively. The fee for the Public Health Laboratory for six months is £6 6*s.*, and for the Bacteriological Laboratory for three months is £4 4*s.*, £3 3*s.* and £1 11*s.* 6*d.* being respectively charged for a half course or any less time. At the Royal Lunatic Asylum, accommodating above 700 patients (fees, £2 2*s.* for three months), arrangements are made for extra teaching in the higher departments of medical psychology and cerebral pathology for graduates who desire it or wish to obtain the certificate of the Medico-Psychological Association of Great Britain and Ireland. Clinical work may be done at the following places:—(General Hospital): Aberdeen Royal Infirmary (accommodating 200 patients; perpetual ticket £6, or first year £3 10*s.* and second year £3, thereafter free); Sick Children's Hospital (75 patients; first year £2 2*s.*, then £1 1*s.*); City (Fever) Hospital (100 beds; £1 1*s.* for three months); General Dispensary and Lying-in and Vaccine Institution (10,000 out-patients per annum; a fee of £3 3*s.* for the general practice of the Institution, a fee of £1 1*s.* for the certificate of Vaccination, and a fee of £3 3*s.* for the Maternity Practice); and Ophthalmic Institution (16,000 patients per annum, fee £1 1*s.*). During the summer session (April to June) special classes, each costing £2 2*s.*, are held at the Royal Infirmary, the subjects being Diseases of the Skin, Medical Electricity, Dental Surgery, Anæsthetics, Ophthalmology, and Gynæcology. Lectures on Diseases of the Ear and Throat are given at the Dispensary. All these facilities for post-graduate study are open to medical practitioners generally.

Edinburgh.—Post-graduate teaching now occupies a recognised place in the Edinburgh School, the arrangements connected therewith being entrusted to a committee consisting of representatives appointed by the Faculty of Medicine of the University and the Royal Colleges. Exceptional facilities for post-graduate instruction are afforded during the summer vacation. Three courses are held at this time—viz., a course on Internal Medicine during August and both a Surgical and General Course during September. (*a*) The course on Internal Medicine, which will extend for four weeks, will comprise classes upon medical anatomy (10 hours), the clinical examination of the blood (15 hours), clinical bacteriology (15 hours), the examination of the heart (29 hours), the examination of the nervous system (20 hours), the examination of urine and digestive products (20 hours), and the examination of sick children (10 hours), in addition to a series of 40 specially arranged clinics dealing with diseases of the heart, lungs, blood and ductless glands, nervous system, stomach and kidneys, abdomen, and general diseases. The entries for this course will be limited to 25, and the fee will be 10 guineas. (*b*) The Surgical Course will include classes upon surgical anatomy (20 hours), surgical pathology (20 hours), and operative surgery upon the cadaver (30 hours), in addition to specially arranged daily clinics. The entries for the Surgical Course will be limited to 25, and the fee will be 10 guineas. (*c*) The General Course, subdivided into two independent fortnights, will also continue for four weeks. Among the subjects included in this course are medical anatomy, the medical and surgical affections of children, the medical inspection of school children, lectures upon infant feeding, demonstrations upon the pathology of the eye, clinics on medicine, surgery, infectious diseases, neurology, venereal diseases, diseases of the eye, demonstrations on morbid anatomy, &c. The fee for the course will be 5 guineas, or 3 guineas for either fortnight. In addition to the subjects above mentioned the following classes, the attendance upon which is necessarily limited, are open to graduates who have

entered for the General and Surgical Course upon payment of an additional fee of 1 guinea in each instance: bacteriology, diseases of the blood, diseases of the ear, nose, and throat, ophthalmoscopy, errors of refraction, gynæcology, histological methods employed in medical diagnosis, and X ray and electrical work. Further special lectures have been arranged for dealing with the progress of medicine in its various departments during the past ten years. These lectures are open to local practitioners as well as to graduates attending the September courses. Accommodation may be obtained during September at one of the residences of the University Hall. Information regarding other accommodation may be obtained from the Secretary. The committee of the University Union has decided to open the building during September, and gentlemen attending the course are eligible for temporary membership for one month on payment of a fee of 10*s*. The Union, which adjoins the University buildings, contains a good medical library, reading-rooms, dining hall, smoking-room, billiard-room, &c. Copies of the syllabus of both the August and September courses may be obtained from the Secretary, Faculty Office, University New Buildings, Edinburgh. The course of instruction is open to graduates of either sex.

Glasgow.—At Glasgow the possibilities for post-graduate work are considerable, and in almost every department graduates, both male and female, have opportunities for acquiring more special knowledge or carrying on original work. In pathology, courses in Practical Bacteriology and Pathological Histology for graduates will be commenced in the pathological department of the Western Infirmary about the middle of October. The courses will extend over eight weeks, each class meeting thrice weekly. The fee for either course is £3 3*s*., and for both courses £5 5*s*. In the Pathological Institute there is a limited number of rooms specially fitted up for research work, and arrangements can be made for graduates who are desirous of engaging in work of this nature. Those interested in embryology may take out the practical course, or if they desire to do special work may obtain the use of a table in the embryology laboratory with such guidance and help as the lecturer can give. The University also has the right of nomination to a table in the laboratory of the Marine Biological Station at Millport. This station is happily circumstanced as regards the richness and variety of the fauna, which can readily be obtained and kept alive in the tank rooms under approximately natural conditions. It thus offers facilities for various kinds of biological study and particularly for physiological and pharmacological work on the marine invertebrates. Further information regarding the station can be got from the honorary secretary, Mr. Geo. Middleton, 83, Bath-street, Glasgow. Post-graduate instruction in public health laboratory work is given in the University laboratory during both winter and summer sessions, and opportunities are offered under prescribed conditions for original research work. As regards physiology and materia medica, every facility is afforded to those wishing to engage in original research work. During the winter months classes in physiological chemistry and physiological psychology will be conducted by the University lecturers in these subjects. At Anderson's College Medical School the Public Health Laboratory course, conducted by Dr. Carstairs Douglas, is open to all qualified medical practitioners (including women), and is recognised for the Diploma in Public Health by the University of Cambridge, the Scottish Conjoint Board, and the Irish Colleges. The laboratory is fully equipped and the complete course in Chemistry, Bacteriology, and Microscopy is carried out. It is supplemented when desired by a three months' course of lectures on Sanitation, Vital Statistics, and Sanitary Law, attendance on which enables candidates to dispense with three months of the outdoor Public Health work. The course will commence about the middle of October. As regards Operative Surgery, graduates desirous of taking out a course in this subject can obtain the necessary facilities by arrangement with the Dean of Anderson's College. The new Maternity Hospital gives exceptional scope for post-graduate work. There are 110 beds and a large outdoor department. Gynæcological wards were opened last winter and are now available for teaching purposes. The fees for post-graduate work are £3 3*s*. for a month, £6 6*s*. for three months, and £10 10*s*. for six months. There is also a residence in the hospital grounds for 15 men, and available both for graduates and students, board and lodging being charged at £1 7*s*. 6*d*. per week. Post-graduate classes are conducted at the Royal Infirmary during the autumn months. The different courses are as follows:—1. Clinical Medicine: Dr. T. K. Monro, at 4.30 P.M. on Thursdays, Sept. 7th, 14th, 21st, and 28th; Dr. J. M. Cowan, at 4 P.M. on Tuesdays, Sept. 12th, 19th, and 26th; and Dr. J. B. Mackenzie Anderson, at 4 P.M. on Mondays, Sept. 4th, 11th, 18th, and 25th. 2. Clinical Surgery: Dr. J. H. Pringle, at 11 A.M. on Monday, Wednesday, and Friday, Sept. 6th, 8th, and 11th; and Dr. John Patrick, at 9.15 A.M. daily during September. 3. Hæmatology: Dr. Walter K. Hunter, at 4 P.M. on Wednesdays, Sept. 6th, 13th, 20th, 27th, and Oct. 4th. 4. Surgical Diseases of the Urinary Organs: Dr. David Newman, at 3 P.M. on Wednesdays, Sept. 6th, 13th, 20th, and 27th. 5. Clinical Examination of the Urine: Dr. John Henderson, at 10 A.M. on Mondays and Thursdays, Sept. 4th, 7th, 11th, 14th, 18th, and 21st. 6. Clinical Gynæcology: Dr. G. Balfour Marshall, at 9 A.M. on Thursdays, Sept. 7th, 14th, 21st, and 28th. 7. Diseases of Throat, Nose, and Œsophagus (A): Dr. John Macintyre, at 4 P.M. on Tuesdays and Fridays, Sept. 5th, 8th, 12th, 15th, 19th, and 22nd. 8. Diseases of the Ear: Dr. J. Kerr Love, at 4 P.M. on Wednesdays, Sept. 6th, 13th, 20th, and 27th. 9. Diseases of the Eye: Dr. A. Maitland Ramsay, at 2 P.M. on Mondays, Wednesdays, and Thursdays, and at 8 P.M. on Tuesdays and Fridays during September. 10. Diseases of the Skin: Dr. Alex. Morton, at 11 A.M. on Mondays and Wednesdays, Sept. 6th, 11th, 13th, 18th, and 20th. 11. Diseases of the Throat and Nose (B): Dr. Robert Fullerton, at 10 A.M. on Tuesdays and Fridays, during September. 12. Asthma and Related Nasal and Pulmonary Conditions: Dr. James Adam, at 4 P.M. on Thursdays, Sept. 7th, 14th, 21st, and 28th. 13. Venereal Diseases: Dr. A. N. Macgregor, at 3 P.M. on Mondays, Sept. 4th, 11th, 18th, and 25th. 14. Surgical Diagnosis: Mr. Donald Duff, at 4 P.M. on Fridays, Sept. 1st, 8th, 15th, 22nd, and 29th. 15. Electro-therapeutics: Mr. James R. Riddell, at 9.30 A.M. on Tuesdays and Fridays, Sept. 5th, 8th, 12th, 15th, 19th, 22nd, 26th, and 29th. 16. Vaccine Therapy and Opsonic Technique: Mr. J. A. Campbell, at 2 P.M. daily, from Sept. 18th to 22nd. 17. Immunity: Dr. E. T. Fraser, at 2 P.M. daily from Sept. 11th to 15th. 18. Anæsthetics: Dr. John Donald, at 3 P.M. on Fridays, Sept. 8th, 15th, 22nd, and 29th. The fee for attendance at each of the above classes is £1 1*s*.; for any three of them, £2 2*s*. 19. Gynæcology: Dr. A. G. Banks, at 10 A.M. on Tuesdays, Thursdays, and Saturdays during September. Fee for course, £2 2*s*. 20. Operative Surgery: Mr. Henry Rutherfurd and Mr. James Battersby, at 12 noon daily, beginning Sept. 4th; fee, £3 3*s*. 21. Bacteriology: Mr. David M'Crorie, five days a week for three months, beginning Oct. 10th; fee, £3 3*s*.

IRELAND.

Belfast.—At the Queen's University of Belfast a course in Clinical Pathology, consisting chiefly in practical instruction, has been given hitherto during the summer session, and, should a sufficient number desire to attend, a post-graduate course of practical work in the application of methods of chemical physiology to clinical investigation is also held open to practitioners. A course in Clinical Pathology or Bacteriology is given to medical practitioners, and members of this class have an opportunity of seeing the methods employed in the various investigations carried out in this department for the public health committee of the Belfast corporation in connexion with water-supply, sewage disposal, meat- and milk-supply, and the diagnosis of cases of infectious diseases. Subject to the number of students presenting themselves, arrangements are made for the necessary practical instruction (1) in the chemical laboratories; (2) in the pathological and bacteriological laboratories; and (3) for outdoor sanitary work under the medical officer of health of Belfast. These courses have been approved by the Privy Council in connexion with the degree of M.D. in State Medicine in the University of London. The certificates of these courses are also accepted for the Diploma in Public Health granted by the Queen's University of Belfast, the University of Cambridge, and the various licensing bodies. Post-graduate courses are open to practitioners of both sexes.

Post-Graduate Research Fund.—Grants from this fund may be obtained by graduates in medicine of the University of Belfast of not more than three years' standing. Such research grants are available for graduates who desire to

prosecute original research or clinical study in some department of medicine. Applicants must give such evidence of capacity for the work which they desire to prosecute as shall appear satisfactory to the Faculty of Medicine. The holders of such grants must furnish reports of their work either during the prosecution of, or at the close of, their studies. Further information regarding these research grants may be obtained from the Secretary of the University, to whom all applications must be forwarded.

It is proposed to give opportunities for advanced clinical work to graduates at the Royal Victoria Hospital, Belfast. The clinical rooms will afford excellent facilities for carrying on such work. For further information and particulars application should be made to Dr. R. J. Johnstone, honorary secretary, medical staff, 17, University-square, Belfast, or at the hospital.

Cork.—At University College a post-graduate course has been held hitherto for the Diploma in Public Health, including Chemistry, by Professor A. E. Dixon; Public Health, by Mr. D. Donovan, public health officer of the city of Cork; and Bacteriology, by Professor A. E. Moore. Other professors and lecturers would also give post-graduate courses if requested to do so. No post-graduate courses have up to the present been held at the hospitals. All the College and hospital courses are open to men and women students.

Dublin.—Trinity College and the Royal College of Surgeons each make arrangements for a course of post-graduate instruction in the year. The course arranged by Trinity College is held in September–October and occupies three weeks. Instruction is usually given in the following 11 subjects: Medicine, Surgery, Gynæcology, Diseases of Eye, Diseases of Throat, Nose, and Ear, Diseases of Skin, Pathology, Anatomy, Physiology, X Ray Work, and Cystoscopy. One or two teachers deal with each subject, and a detailed syllabus is published beforehand, care being taken to choose matters of particular interest at the time. The courses in pathology, anatomy, and physiology are designed with special bearings on clinical problems. The classes are held in the School of Physic, Trinity College, and in Sir Patrick Dun's, the Adelaide, the Royal City of Dublin, the Rotunda, and the Royal Victoria Eye and Ear Hospitals. Arrangements are made by which a limited number of members of the class can reside in College rooms and dine on commons, at an inclusive cost of £1 1*s.* per week. The composite fee for the entire course is £5 5*s.* The autumn course for 1911 will begin on Sept. 25th and end on Oct. 14th. Full particulars can be obtained from the honorary secretary, 27, Lower Fitzwilliam-street, Dublin.

The post-graduate courses arranged under the auspices of the President and Council of the Royal College of Surgeons in Ireland have hitherto proved a most gratifying success. The object of these courses is to render available the whole of the clinical material in the city for the post-graduate student, so that he may see as much as possible during the brief time at his disposal. With this object in view the ten general hospitals of the city are included (Richmond, Jervis-street, Adelaide, St. Vincent's, Dr. Steevens', Mater Misericordiæ, Meath, Mercer's, Royal City of Dublin, and Sir Patrick Dun's), and also the various hospitals which are devoted to "specialties." The opportunities afforded are shown by a glance at the list of special subjects and the institutions where they are respectively cultivated: Skin, Adelaide Hospital; Eye and Ear, Royal Victoria Eye and Ear Hospital; Throat and Nose, Mater Misericordiæ Hospital and Sir Patrick Dun's Hospital; Gynæcology, Rotunda Hospital, Coombe Hospital, and National Maternity Hospital; X Ray and Light Therapeutics, Meath Hospital and Sir Patrick Dun's Hospital; Pathology and Bacteriology, Richmond, Whitworth, and Hardwicke Hospitals, Mater Misericordiæ Hospital, Meath Hospital, and School of Surgery, Royal College of Surgeons; Diseases of Children, Orthopædic Hospital, Temple-street Hospital, and Harcourt-street Hospital; Lunacy, Richmond District Lunatic Asylum; Anæsthetics, Dental Hospital; Cadaver Operations, Professors at Schools of Surgery, R.C.S.I.; Anatomy, Professor of Anatomy, R.C.S.I.; Sanitary Science, Professor of Hygiene, R.C.S.I. The course for 1911 will begin on Monday, Sept. 18th, and will terminate on Oct. 10th following. Fee for course, inclusive of all, £5 5*s.* Full details regarding the course can be obtained from, and all applications are to be addressed to, the Professor of Anatomy, Royal College of Surgeons in Ireland. A list of addresses of apartments and hotels, which have agreed to modified rates for pupils while passing through the course, can be obtained by application at the Royal College of Surgeons.

In addition to the special courses detailed above, arrangements can be made at the various laboratories and hospitals for individual post-graduate work. In particular the practice of the maternity hospitals, the Rotunda, the Coombe, and the National Lying-in, is made much use of by graduates from all parts of the world.

All courses are open to women practitioners on the same terms as to men.

THE TRAINING OF CADETS IN THE MEDICAL UNIT OF THE CAMBRIDGE UNIVERSITY OFFICERS' TRAINING CORPS.

BY H. BUCKLEY RODERICK, M.A., M.D. CANTAB.,
UNIVERSITY DEMONSTRATOR OF SURGERY; OFFICER COMMANDING MEDICAL UNIT, C.U.O.T.C.

THE medical unit of the Cambridge University Officers' Training Corps has been established three years, and the scheme of training of the cadets, which at first, of necessity, was of an experimental nature, has now taken definite shape and resolved itself into:—(A) Individual instruction, consisting (1) of lectures and demonstrations, and (2) of drills; and (B) the exercising of the medical unit as a whole in the field.

A. *Individual Instruction.*

1. *Lectures and demonstrations.*—Owing to the multifarious lectures and demonstrations which the medical student is compelled to attend in the course of his ordinary studies there is little time or inclination left for much instruction of this nature. It has, therefore, been found sufficient to confine this branch of the training to one lecture a week. During the Michaelmas term a course of lectures and demonstrations is given in first aid, dressing and healing of wounds, antiseptic principles, preparation of a patient, instruments, &c., for operation, and the application of triangular and roller bandages. The Lent term is devoted to lectures on military hygiene and sanitation and the general organisation of the Army and of Field Medical Units and the work of Field Medical Units in the field. Owing to the nearness of the triposes and M.B. Examinations no lectures are given during the Easter term.

2. *Drills.*—During the Michaelmas and Lent terms squad, company, and stretcher drills are held every week at times to suit the convenience of cadets. During the Easter term the work is confined to early morning (7 A.M.) parades twice a week. The annual inspection of the corps takes place in the Easter term and necessitates some practice in ceremonial drill. Otherwise nothing more is attempted during the Easter term.

B. *The Exercising of the Medical Unit as a Whole in the Field.*

This has resolved itself into the holding of two field days a term—i.e., Michaelmas and Lent. In one a small scheme is worked out in detail, whilst in the other an extensive scheme is worked out in skeleton. In the former the unit takes the field as a section of a field ambulance and falling in with the general scheme of the corps the tent division establishes a dressing station on a suitable site near the scene of operations, subsequently converting it into a tent division company, pitching the operating tent, bell tents, and bivouacs, and constructing trench kitchens, latrines, incinerators, and slop sinks. The bearer division search for, and attend to, the "wounded," on whom "tallies" are fixed stating the nature of the wound, and convey them on stretchers to the ambulance wagons at the wagon rendezvous and thence back to the dressing station. The cadets are thus made acquainted with the detailed work of a section of a field ambulance, which they, in fact, represent.

On the second field day in each term a more extensive scheme is attempted, and the unit is made to represent in skeleton perhaps three field ambulances (i.e., the medical establishment of a division) depending on the nature of the scheme. On these occasions the cadets parade with bicycles at the medical schools which represents the headquarters of the "administrative medical officer." Here they are informed of the "general idea" of the day's battle and receive their special orders and instructions before proceeding to their respective localities. On these days

Colonel James, C.B., R A.M.C., of the War Office staff, and one or more other officers of experience act as umpires, and every member of the unit represents an officer with responsible duties to perform. On the completion of the operations the members of the unit reassemble at the medical schools, where each cadet makes his report, which is criticised by the umpires.

To illustrate the work done on these occasions a cadet is commanded to proceed to the scene of action and choose a site for a dressing station; he is instructed to take advantage of existing buildings for the harbouring of the wounded, to calculate the number of patients each building would hold, and to report as to the suitability of such buildings for the purpose. The accessibility to main roads and railway lines, and in the case of the latter the existence or not, and the capacity, of sidings for the loading of ambulance trains, are to be reported upon, and the cadet is to estimate the quantity and ascertain the quality of the water-supplies and the available food-supply in the district in the shape of cattle and sheep, fowls, milk, eggs, corn, &c. He is also instructed to note the number of sacks and hurdles, and to estimate the quantity of straw available for the extemporising of stretchers and bedding, and the number of farm wagons, carts, and horses obtainable to supplement or relieve the ambulances for the conveyance of the wounded to the clearing hospital. He has also to calculate the number of wagons required to convey the estimated wounded under his charge and the probable time that would be taken in evacuating all his wounded.

From the experience gained in two such field days the cadet should be able to grasp both the detailed work of a section of a field ambulance and also the means employed in collecting, providing for, and evacuating a large number of casualties from an extensive field of battle to the clearing hospital.

The time at the disposal of the medical undergraduate to give to "soldiering" is very little after he has satisfied the requirements of his college tutor and college clubs, so that unless the work of the unit can be made interesting enough to form one of his recreations it is difficult to persuade him, on purely patriotic motives, that it is one of his duties to join the corps. It is therefore very satisfactory to be able to state that the medical unit is rapidly gaining in popularity, and that its members are drawn from the best all-round men in the colleges.

Thus the cadet, during the first years of his medical education, has the opportunity, by way of a recreation one may say, of gaining a practical insight into the detail of first aid in all its branches, into the technique of minor surgery, into the hygienic problems that arise in ordinary simple life, and into many other subjects not included in the medical curriculum. He is not likely to have such opportunities later in his career, as his time is indeed more than fully occupied.

It would seem that this simple training not only teaches the student how an organised body of men is managed and cared for, but it instils into him the rudiments of a business training and business methods, together with an orderly and methodical way of dealing with problems of organisation which is invaluable to, but only too rarely found in, the average medical man. It also materially helps him to obtain a wider outlook of his own future and a broader view of the objects of his studies in the earlier period of his career.

INSTRUCTION IN HOSPITAL ADMINISTRATION.—The Metropolitan Asylums Board has instituted a three months' course of lectures and demonstrations in hospital administration at the North-Western Hospital and at the Grove Hospital, Tooting. At the North-Western Hospital the lectures will commence on Monday, Oct. 9th, and will be continued on successive Mondays (3 P.M.) and Thursdays (11 A.M.). At the Grove Hospital the lectures will commence on Wednesday, Oct. 4th, and will be continued on successive Saturdays (11 A M.) and Wednesdays (3 P.M.). The fee for the course is £3 3*s*. In the case of each hospital the lectures and demonstrations on the two days in any one week will be identical. Students can attend on the day that best suits them, and they can join the class at any time provided they complete their attendance during the term beginning in January, 1912. The fee must be paid in advance to the clerk of the Metropolitan Asylums Board, Embankment, London, E.C.

Annotations.

"Ne quid nimis."

THE POSTPONEMENT OF THE INTERNATIONAL CONGRESS ON TUBERCULOSIS.

THE Organising Committee of the Seventh International Congress on Tuberculosis has issued a circular stating that the postponement of this Congress from September, 1911, to April, 1912, was desired by many foreign committees, and is generally approved. The circular goes on to say that, according to the last number of *La Tubercolosi*, the official organ of the Congress, it appears that from June last the scientific and general organisation or preparation for the Congress was "in the best conditions." Nearly all the reports had arrived and many papers had been received and announced, says the circular, adding, "the postponement, however, will help to definitively coördinate the contributions from all nations, and ensure the most widespread coöperation of all the civilised world in the great scientific and humanitarian meeting to be held in Rome in April, 1912." It must be confessed that this is an unsatisfactory document. Had the committee plainly stated that the danger of cholera was such that it was thought on all accounts, and notwithstanding the great inconvenience that must ensue, more prudent to postpone the Congress, it is doubtful if a murmur would have arisen, and certainly on all sides the sincerest sympathy would have been expressed. As for reports and papers, a large number are always sent too late; and this does not in the least matter, for they are generally far too numerous to be read or discussed. Postponing the Congress, with all the counter orders this entails, has gravely complicated matters, and such an act seems justifiable only in the face of so grave an affair as the probable spread to Rome of the actual cholera epidemic. But little thought seems to have been given to those coming from far distant regions—Australasia, for instance—who, in order to arrive in time, must actually have started before the postponement was announced. But over and above this individual hardship the committee must have known that in September, 1912, the Fifteenth International Congress of Hygiene and Demography meets at Washington. There are no two congresses more closely allied. Those who attend the parent Congress of Hygiene also endeavour to assist at the Congress on Tuberculosis. The same sanitary reformers meet at these two congresses and their intercourse becomes more intimate and more useful. But how many will be able to afford the money and the time to go to Italy next spring and to the United States in the autumn of next year? Instead of being 12 months apart the congresses will be only six months apart, and this must be mutually injurious. If there is real danger of cholera of course these grave inconveniences cannot be helped; but if, as is suggested in the circular, it is merely to allow a committee more time to sort a few papers, then the postponement has been, we think, injudicious. This occurrence is a good illustration of the necessity for a permanent international committee in respect of all these congresses. At the meeting of the International Association of the Medical Press in Budapest two years ago it was maintained that such a committee should take in hand the organisation, not merely of medical congresses, but of congresses of the allied sciences. The object was to unify where possible and to prevent overlapping or clashing. Such a committee would have kept well before the organisers of the congress at Rome the fact that the congress at Washington was to follow shortly afterwards. If an international committee, having in view the interests of all the other congresses, had given its

consent to the postponement of the congress of Rome, then, however regrettable such a course might be, it would have been felt that what was done was done for the best. As it is, great hardship has already been inflicted on individuals, and the interests of two congresses have been endangered by being brought into opposition.

THE VALUE OF SKIAGRAMS IN FRACTURES AND DISLOCATIONS.

FROM time to time cases occur in which disputes arise as to whether a fracture had resulted from an injury, and not seldom these cases come before courts of law in suits for compensation for injury or for malpraxis. In cases such as these the value of a skiagram taken soon after the receipt of the injury will go far to settle the question as to what lesion was present. The skiagram must be carefully taken and must be correctly interpreted. An important case was decided at the Nottingham county court recently, when an unsuccessful action for compensation was brought against Dr. A. Campbell of Radcliffe. Nearly a year ago a boy fell and hurt his right arm, and it was found that a dislocation of the ulna had occurred, and that it recurred after being replaced. There was some conflict of testimony as to the diagnosis first made, but there was no difference of opinion as to the fact that Dr. Campbell mentioned a dislocation on the third day. The parents appeared to doubt the need for the arm being moved during the making of a diagnosis, not seeing the impossibility of making a clinical diagnosis without movement. It is not improbable, if the information supplied in the report of the case in the *Nottingham Daily Express* is exact, that the coronoid process of the ulna was broken, so allowing recurrence of the dislocation. In a case such as this much of the misunderstanding would have been avoided had a skiagram been taken when the patient was first seen or soon afterwards, so that the diagnosis could have been confirmed. Dislocations and fractures in the neighbourhood of the elbow are often exceedingly puzzling to the most experienced surgeons, and the importance of the evidence afforded by a skiagram both for diagnosis and as a permanent record of the condition at the time should not be overlooked. There are fractures which yield no signs to ordinary clinical methods of diagnosis, and only the introduction of the X rays has enabled us to determine their presence. Therefore on all accounts surgeons should become more ready to take advantage of the information supplied by X rays. It is not sufficient to use a screen, for this, as a rule, affords less assistance in diagnosis and constitutes no record.

PARLIAMENT adjourned on Tuesday, August 22nd, until the end of October. It will then take up the further consideration of the National Insurance Bill among other measures which it has been found impossible to pass within the limits of an ordinary session.

WE understand that the committee for the removal of King's College Hospital to South London has received a cheque for £10,000 from an anonymous donor in aid of the fund.

WE regret to announce the death of Dr. George Fielding Blandford, the well-known alienist, which occurred on Friday last at his residence, "Woodlands," Camden Park, Tunbridge Wells.

BY an obvious error in our obituary notice of Dr. Gee last week Dr. Charles Hilton Fagge was described as an obstetrician. The allusion was, of course, to Dr. Gee's contemporary, the famous physician.

Correspondence.

"Audi alteram partem."

THE BACTERIOLOGY OF THE TOOTH-BRUSH.

To the Editor of THE LANCET.

SIR,—My attention has been drawn to the paper by Mr. Herbert Smale and Dr. D. W. Carmalt Jones read in the Section of Odontology at the recent meeting of the British Medical Association and published in THE LANCET of August 5th, p. 380, on a subject which happens recently to have been engaging my special attention—viz., the bacteriology of the tooth-brush. The conclusions at which I have arrived differ so essentially from those arrived at by the authors of the paper in question that I trust you will allow me the opportunity of making them public.

I see in the paper no reference to the condition of the mouth itself, and it may therefore be news to the authors that on waking in the morning I have found the mouth itself to contain about 3000 million bacteria capable of being removed by a fivefold rinsing with 25 c.c. of water each time. After ordinary washing of the teeth with a hard tooth-brush about one-fourth the number could still be rinsed away. After using, on another occasion of course, euthymol tooth paste, 120 millions only were left. Even the smallest of these numbers is so enormously in excess of the number which could be left on any ordinary tooth-brush, especially after becoming dry, as is usually the case, that the stress laid upon the latter as a lethal instrument is calculated rather to raise a smile than to inspire fear. If, in addition, the toothbrush has been used with a really germicidal tooth-paste or tooth-wash, containing soap as one of its ingredients, I must ask leave to doubt whether the point raised is worth considering at all.

In view of Martindale's well-known work upon the essential oils as germicides, it is not surprising to find that the paste referred to has an actual phenol coefficient of 0·3—i.e., that it is equal to 30 per cent. phenol in germicidal power—so that the authors' remark as to the inefficiency of tooth-pastes, at least, in destroying germs is by no means borne out by my experience.

Not desiring to further particularise, I refrain from enlarging on the results which I have obtained, but the tendency of the paper, as printed, is so unnecessarily pessimistic that I felt bound to give something on the experimental side to set against it.

I am, Sir, yours faithfully,

EDWARD C. BOUSFIELD, D.P.H. Camb. & Lond.,
Bacteriologist for the Metropolitan Boroughs of Camberwell and Hackney.

Denmark-hill, London, S.E., August 20th, 1911.

ENDEMIC TETANY IN THE GILGIT VALLEY.

To the Editor of THE LANCET.

SIR,—In my article on the above subject, which appeared in THE LANCET of June 10th, p. 1575, the passages, "The disease is a common one in India," and, "In India tetany is a disease of women," should read as follows: "The disease is a common one in Gilgit," and, "In Gilgit tetany is a disease of women."

I am Sir, yours faithfully,

Gilgit, Kashmir, July 24th, 1911. ROBERT MCCARRISON.

TATTOOING *v.* VACCINATION.

To the Editor of THE LANCET.

SIR,—May I inquire, as a layman interested in the public health, whether it is an accepted medical opinion that tattooing will act as a protection against small-pox, and if so what may be the scientific explanation, and upon what evidence the opinion may be founded. As personally I had never heard of such a thing until recently, I may perhaps say that I was speaking to a workman who had his sleeves

rolled up and noticed that his arms were very heavily tattooed. They were so covered with dragons and decorated patterns of an Oriental type that very little skin could be seen, and I asked him where they were done. He told me that he had been tattooed in Burma when serving in some regiment, I forget which, and in reply to questions which I omit, added that the pain and inconvenience had not been serious, or not serious enough to interfere greatly with his military duties; that the colonel of his battalion had encouraged, and almost ordered, men and officers to be done; that a man who chose to "have a pair of Burmese drawers put on him" (i.e., to be closely tattooed over those portions of the body and legs that a pair of drawers would cover) was allowed eighteen days of light duty to enable him to submit and recover. When I asked the reason of this he said that "the doctor" said that tattooing was as good as vaccination as tattooed people never took small-pox, at least when the tattooing was more or less recent.

The tattooing in his case seemed to be of the ordinary kind executed with Indian ink, and perhaps if there is anything unusual or not generally known in what I have described the surgeon in question, whom I understood to be an Irishman, may notice my letter and will be able to give the explanation. This, of course, may be that my ex-soldier friend had an inventive mind, but I think he spoke in perfect seriousness; and, again, the whole thing may be so well known as to be of no general interest. To suggest that public vaccinators should learn design at South Kensington and offer to cover the children of reluctant parents with conventional sunflowers and coats-of-arms or moral precepts according to their rank and condition as an alternative to vaccinating them seems to savour of frivolity.

I am, Sir, yours faithfully,

August 21st, 1911. E. A. A.

*** The notion that tattooing is protective against small-pox is, of course, absurd.—ED. L.

Medical News.

PHARMACEUTICAL EDUCATION AND EXAMINATION.—In order to qualify as a pharmacist in Great Britain it is necessary to be 21 years of age, to have passed an approved preliminary examination, to have been for three years practically engaged in the translation and dispensing of prescriptions, and to have passed the minor examination of the Pharmaceutical Society. The subjects which must be included in the approved preliminary examination are English, Latin, a modern foreign language, arithmetic, algebra, and Euclid. No certificate can be accepted unless it has been granted for the whole of these subjects. To become eligible to enter for the minor examination the candidate must be registered as an "apprentice or student," and such registration may be secured through the Registrar of the Pharmaceutical Society, 17, Bloomsbury-square, London, W.C., to whom a certificate of the preliminary examination must be sent. The subjects of the minor examination are botany, chemistry and physics, practical chemistry, materia medica, pharmacy, practical pharmacy and dispensing, and prescription reading. The fee for the examination is 10 guineas, but a candidate who has attended and failed to pass may re-enter for the examination on payment of a reduced fee of 3 guineas. Persons who pass this examination are registered as chemists and druggists. The advanced or major examination entitles those who pass it to registration as "pharmaceutical chemists." The subjects of the examination are botany, chemistry and physics, practical chemistry, and materia medica, and the entrance fee is 3 guineas.

UNIVERSITY OF GLASGOW AND WESTERN INFIRMARY MEDICAL HOSTELS.—The committee in charge of these hostels, consisting of Principal Sir Donald Macalister, Lady Macalister, Professor R. Muir, Dr. D. J. Mackintosh, Dr. and Mrs. Crawford Renton, and Mr. J. W. Gourlay, desire to make public acknowledgment to the donors who contributed £1000 towards defraying the expenses. Two hostels in telephonic communication with the Western Infirmary have been opened, and both have been full from the outset, as the students attending the infirmary realise the great value of the facilities for securing extra clinical instruction in urgent medical or surgical cases. These are the first hostels for medical students adjacent to, and in direct telephonic communication with, an infirmary to be opened in Scotland. The charge for board and lodging is one guinea per week, and, so far, this has sufficed to make the hostels self-supporting, which is what the committee have aimed at. As the success of the experiment is now demonstrated, the committee look forward to opening a permanent residency, capable of accommodating 25 students. For the initial expenses of adapting and furnishing a suitable house, they are inviting contributions from the public, which may be sent to Mr. John W. Gourlay, 124, St. Vincent-street, Glasgow, or to any member of the committee.

Births, Marriages, and Deaths.

BIRTHS.

TURTLE.—On August 18th, at 18, Cambridge-terrace, Hyde Park, the wife of Godfrey de Bec Turtle, M.D., M.R.C.P., of a son.

MARRIAGES.

HONEYBOURNE—SANDILAND.—On August 16th, at St. Peter's, De Beauvoir-square, by the Rev. A. J. Parsons, M.A., cousin to the bridegroom, assisted by the Rev. H. Fuller, M.A., H. Cecil Honeybourne, M.A., younger son of J. C. Honeybourne, M.A., head master of Guildford Grammar School, to Daisy, younger daughter of A. H. Sandiland, L.R.C.P.Lond., of Oakley House, Southgate-road, N.

DEATHS.

BEADLES.—On August 19th, at Dover, Arthur Beadles, M.R.C.S. Eng., L.S.A., late of Forest Hill, S.E., son of the late John Nathaniel Beadles, M.R.C.S. Eng., of Broadway, Worcestershire, aged 72.

COUTTS.—On August 21st, suddenly, at 29, Surrey-street, Norwich, D. K. Coutts, F.R.C.S.

JEAFFRESON.—On August 17th, at Framlingham, George Edwards Jeaffreson, J.P., M.R.C.S., L.S.A., aged 76, son of the late Wm. Jeaffreson, F.R.C.S., of Framlingham.

Notes, Short Comments, and Answers to Correspondents.

THE POPLAR AND STEPNEY SICK ASYLUM.

IT has been announced that "a girl who belongs to a poor family" has given the sum of £50 to the nurses of the Poplar and Stepney Sick Asylum in recognition of the attention and care bestowed by them on her brother who was an inmate of the institution. The gift would have been a generous one even from a well-to-do person; under the limitations of conditions as stated above it deserves to be classed with the munificent donations made at rare intervals by the wealthy to the public treasury of the service of the healing art in its various branches. The gift, it is understood, will be used to establish a library for the nursing staff, each volume of which will have placed in it an extract from the letter of thanks accompanying the gift. The donor in this act has honoured not only the nurses and herself, but the class to which she belongs.

H. J. T. will find no other parties to the contract upon which he desires to enter.

M.D.—The honorary secretary of the Continental Anglo-American Medical Society is Dr. Charles G. Jarvis, 81, Boulevard Malesherbes, Paris (8e).

OUR CURRENT NUMBER

Being almost exclusively devoted to information especially interesting to Students we are necessarily compelled to defer the publication of communications on other important subjects.

We tender our best thanks to those gentlemen who have at considerable personal trouble kindly supplied us with the returns and prospectuses upon which the information given in this Students' Number of THE LANCET ***relative to the various medical examining bodies, hospitals, and medical schools of the United Kingdom is based. We regret that in some cases, however, owing to proofs having been either not returned at all or too late, certain inaccuracies may be found.***

TO ADVERTISERS.

Owing to the pressure on our advertisement columns this week some announcements have unavoidably been held over.

Communications, Letters, &c., have been received from—

A.—Messrs. G. Allen and Co., Lond.; Annoyed; Automobile Association, Lond.; A South of England Man; Messrs. Arnold and Sons, Lond.; Messrs. J. W. Arrowsmith, Bristol.

B.—Messrs. T. B. Browne, Lond.; Bristol General Hospital, Secretary of; Mr. K. S. Basu, Pindighâll, India; Mr. W. G. Burcombe, Lincoln; Messrs. C. Barker and Sons Lond.; Birkenhead and Wirral Children's Hospital, Hon. Secretary of; Messrs. Chas. Birchall, Liverpool; Messrs. R. and J. Beck, Lond.; Mrs. Bulstrode, Lond.; Dr. W. H. Bryce, Edinburgh; Mr. W. Balgarnie, Penzance; Mr. E. C. Bousfield, Lond.; Miss Mary Brady, Rock Island, Illinois; Mr. Walter F. H. Blandford, Tunbridge Wells; Board of Trade, Lond., Secretary to; Mr. R. Stanmore Bishop, Manchester; Messrs. Baillière, Tindall, and Cox, Lond.

C.—Canterbury Borough Asylum, Clerk to the; C. R. G.; C. B. S.; Carlisle Dispensary, Hon. Secretary of; County Asylum, Prestwich, Medical Superintendent of; Messrs. J. and A. Churchill, Lond.; Mr. H. C. Collins, Lond.; Dr. I. D. Chapmell, Worthing; Mr. R. Cobb, Leytonstone; Mr. R. F. Conolly, Wimbledon; Mr. George Culver, Lond.

An Address

ON

SPINAL CURVATURES AND THEIR TREATMENT BY PHYSICAL EXERCISES.

Delivered before the Windsor and District Medical Society at the Guild Hall, Windsor,

BY RICHARD TIMBERG, M.R.C.S. ENG., L.R.C.P. LOND., G.D. STOCKHOLM,

MEDICAL OFFICER IN CHARGE OF THE PHYSICAL EXERCISE AND MASSAGE DEPARTMENT AT ST. THOMAS'S HOSPITAL, LONDON.

MR. PRESIDENT AND GENTLEMEN,—When asked to read a paper before the society I acceded with great readiness and much pleasure, suggesting at once some subject in connexion with spinal curvatures. The exact title which I have now chosen indicates (as you might have expected) that I will deal with the question principally from the point of view of its treatment by exercises and allied measures.

GENERAL PATHOLOGY.

[Before entering upon the treatment of spinal curvature Mr. Timberg cleared the ground by describing its general pathology. Spinal curvatures, he said, were classified according to etiology or according to the particular direction of the curves; from the former point of view two subdivisions were given: (*a*) due to primary affection of bone; (*b*) due to some fault in the muscular and ligamentous structures. Amongst osseous affections rickets and caries were considered, other rarer causes merely referred to; spondylitis was dealt with as an affection intermediate between the osseous and ligamentous. Turning attention to the second main group of curvatures, those where the primary cause is to be found in the muscular and ligamentous structures, he recognised three different factors that influence the shape of the spine and which might tend to produce abnormal curves in it. They are, firstly, the support upon which the spinal column rests; secondly, the distribution of the weight which it has to carry; and thirdly, one-sided muscular action upon it. After a few remarks on the normal shape of the spine, on the occurrence of the four physiological curves in the antero-posterior direction—any physiological lateral curve being denied—and on the various directions and degrees of the pathological curves, the lecturer proceeded to trace the mechanism of how the various curvatures are produced by these three factors:—]

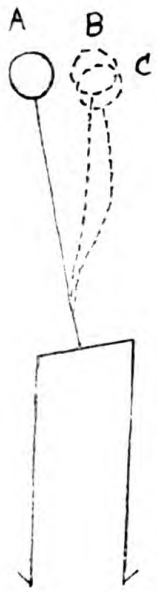
With regard to the first, the support upon which the spinal column rests, this might, in the first instance, be said to be the pelvis; and there may be simply developmental inequalities in the two sides of the pelvis which reflect upon the position and shape of the spine; but a much more usual occurrence is that the pelvis itself is tilted by an inequality in the length of the legs from whatever cause: error of development, disease, or accident.

Supposing, for instance, the left leg to be shorter and the pelvis thus tilted towards this side (Fig. 1), the spinal column, too, would naturally point towards the left side, if it maintained its normal right angle to the intertrochanteric axis. Such a position would, however, entail by far too great a muscular exertion, and therefore the body is soon brought into balance by a contraction of the muscles on the right side of the spine. A large convex lumbar curve is in this way produced; and if it stops at this well and good. It is Nature's way of making up for any accidental shortening of a leg, for instance, by a fractured femur; and a difference of up to an inch can be made up for in this way without any detrimental effects to a normally strong and muscular subject. In weak and undeveloped individuals, on the other hand, the correction is likely to be carried too far, so that the body will be brought over to the right side, and a compensatory cervico-dorsal curve with the convexity to the right will then be induced to counteract this loss of balance.

The obvious way of treating these so-called statical curvatures is gradually to raise the sole of the boot under the shorter leg or to make up for any inequality of the pelvis by a slanting seat until the tilting of the pelvis is corrected. The curves of the spine already produced can then generally be easily dealt with by special exercises, about which further later on.

Antero-posterior curves can also be caused by a similar faulty position of the pelvis. A tilting forward will, for instance, occur in a case of congenital dislocation of the hip-joints, or it may be caused merely by deficient strength of the extensors in the hip-joints, the hamstring and glutei muscles, in bringing the pelvis into balance. Any such tilting forwards of the pelvis will of necessity lead to lordosis, and a compensatory kyphosis is likely to follow. On the other hand, the physiological antero-convex curve in the lumbar region can be reduced or obliterated by a kyphosis continued down into this region if the pelvis is tilted to any degree backwards. As we know, there is in our natural upright position a constant tendency to hyper-extension in the hip-joints, which, however, is normally resisted by the Y-shaped ligament on the anterior aspect of the joint, any continuous muscular exertion thus being saved. Should

FIG. 1.



Diagrammatic representation of the occurrence of a statical curvature from shortness of left leg. A, Position of spinal column as it would appear if its relation to the intertrochanteric axis were maintained. B, Spinal column brought into balance by muscular action, with consequent left convex lumbar curve. C, This action carried too far and the balance again restored by a compensatory right convex thoracic curve.

now any yielding occur of this ligament, a tilting more or less backwards would take place and a lumbar kyphosis made possible.

The second of the mentioned causes of spinal curvature—i.e., "the unequal distribution of the weight which the spine has to carry"—is best illustrated by a case of torticollis. A long-standing condition of this kind is sure to bring about a curve of the cervical spine, and the process of secondary curves will occur here too, although in an opposite direction from above downwards. Other instances of the same nature is after amputation of one of the upper extremities, or when any external weight of any kind is habitually carried on one side.

Still, in both these instances our third factor is at work as well: "that of unilateral muscular action on the spinal column." Let us try to analyse how a preponderant use of one hand and arm will affect the spine. It is, of course, the right hand that is more often used in this way, and for its efficient working the scapula of the same side need to be fixed. This is secured by the action of the muscles connecting this bone with the trunk, the most important of them being pectoralis minor, serratus magnus, levator anguli, scapulæ, the rhomboids, and trapezius. These muscles require in their turn a firm origin from the spinal column,

which is obtained by a contraction of the spinal muscles of the opposite side; and if now at the same time the right arm is raised, which it generally would be, and perhaps supporting some weight in addition to its own, the upper part of the spine would naturally be leaning over to the left side. A frequent repetition of such a position will soon make it permanent, a primary dorsal curve, with its convexity to the right, thus being formed.

At first it is merely a lateral deviation, but an added rotation of the interested vertebræ will soon convert it to a more or less fixed scoliosis. This rotation of the spine seems to form something of a mystery to some learned men, but to my mind it is a simple and easily comprehensible result of the muscular action upon the vertebræ, although I do not know that I have ever seen any statement to this effect. The muscles passing between neighbouring vertebræ (and still more when their fibres skip two or three vertebræ before becoming attached) will naturally tend to take the shortest course between their origin and insertion, and thus, instead of following the arch of the curve, they will try to occupy the position of a string to a bow. As this tendency of the muscles obviously acts strongest on the spinous processes, these will thus come to approach the middle line, and the bodies of the vertebræ, on the other hand, be twisted towards the convexity of the curve. This applies to any part of the spinal column, but it is most noticeable in the thoracic region, as the ribs are there taking part in the deformity, becoming much more prominent on the convex side at the back and correspondingly depressed in front. A costal hump is thus formed, not to be confused with the angular hunchback after Pott's disease. In fact, the whole shape of the thorax is altered, the costal angle becoming much more acute on the convex side and obtuse on the concave. (Fig. 2.)

FIG. 2.

Diagrammatic representation of a transverse section of the thorax in a case of right convex curve. Note spinous processes of vertebræ directed towards the middle line and prominence of ribs posteriorly on the convex side, with abnormal acuteness of the costal angle.

The organs of the thoracic and upper abdominal cavity cannot fail to be influenced by such a deformity of the chest; and if we to this add that the ribs on the convex side become spread apart, whereas on the concave side they become crowded together so that intercostal pains are often produced by the pressure, and the ribs even made to atrophy, we can then, I say, realise what a serious condition a spinal curvature actually might become when affecting the thoracic region. A lumbar curve is in itself not quite so detrimental, but there is always the risk of its continuing down into the sacrum and deforming the pelvis, thus in females leading to serious consequences with regard to possible future pregnancy and parturition.

In diagnosing a case of scoliosis it is therefore not sufficient merely to take notice of the line of spinous processes. These tend, as I said, to approach the middle line, and might, therefore, often make the curvature appear less than it really is. One point of greater diagnostic importance is the shape of the space between the outline of the trunk and the arm on either side. In a right convex dorsal curve the right arm would thus hang close to the body in the upper part and away from it lower down. (Fig. 3.) If the same single C-shaped curve were continuous through the whole of the back this effect would be still more marked, as the hip of the left side would then be rendered prominent. (Fig. 4.) The left scapula would in either of these two cases be lowered.

The relative level of the scapulæ and hips respectively thus form another point of great diagnostic significance. In cases where a secondary curve has occurred in the lumbar region, making the other hip (the right side) prominent, the appearance of the arm spaces is again altered. (Fig. 5.) In our present example it becomes triangular on the right side and crescentic on the left. I speak advisedly of prominence of the hip and not of a raised hip, as the one *may* occur without the other. In most cases it is, however, raised as well, and this point is best settled by noticing the level of the two anterior superior spines.

To ascertain whether any rotation of the spinal column is present, the best way is to let the patient bend forward and

FIG. 3.

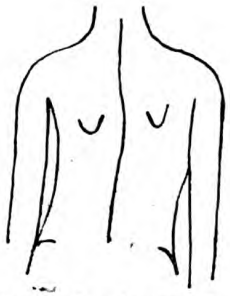


Diagram of a right convex thoracic curve. Note the different shape of the space between the arm and the outline of the body in either side, also the lowering of the left scapula.

then to notice against a dark background the outline of his back at different levels. Any prominence in either side of the middle line will then easily be detected. In our last instance such prominences would naturally be likely to be found on the right side in the thoracic region, and on the

FIG. 4.

A right convex curve continuous throughout the spine. Note arm spaces, lowering of left scapula, and raising of left hip.

left side in the lumbar, and it is quite conceivable that a third compensatory curve might have occurred in the cervico-dorsal region, also accompanied by a rotation. (Fig. 5.)

FIG. 5.

Right convex thoracic and left convex lumbar curve. Note arm spaces, lowering of the left scapula and prominence of the right hip, also the backward protrusion at each convexity due to the rotation of the spinal column.

Turning now our attention to the question of treatment of spinal curvatures, there are, of course, admittedly many useful agencies in addition to physical exercises, such as

general constitutional treatment with good food, fresh air, and other tonics, rest, change of occupation, artificial supports, baths, electricity, massage, &c. Still, for the great majority of cases exercises are indicated often in combination with one or more of the above-mentioned other methods of treatment. The ideal aim is obviously to correct the curve so as to restore the spine to its normal shape; and this is very often possible by means of suitable exercises. These should be directed towards increasing the power of those muscles, or rather groups of muscles, that are weakened—i.e., on the convex side of any curve—and towards again stretching and restoring to normal length the muscles on the concave side, which are over-active and contracted. At the same time endeavours should be made to correct or over-correct the existing curves by applying pressure upon their highest convexities, and by choosing such positions as will enable the law of gravity to aid the muscular action in this direction. Any constant or frequently repeated position or movement that can be discovered causing the curvature should naturally be avoided.

With regard to the prognosis, this is obviously better the earlier a curvature is discovered and can come under treatment. The simple lateral deviation is generally easily amenable to treatment; and a curve in the second degree of severity—i.e., a true scoliosis, but not yet fixed—is, in favourable circumstances, capable of perfect recovery. Still, even in the numerous cases where the ideal of a cure cannot be reached by any known means, judicious exercises can do much good in effecting more or less improvement, or, at least, preventing the deformity from getting worse, increasing the patient's strength and power of carrying what is left of his deformity, relieving pain (as well as muscular aching and feeling of fatigue, as the pain caused by pressure), rendering the spine more moveable and at the same time the chest, thus lessening the detrimental consequences to the patient's general health. These benefits are very considerable, and one has to be content if these can be attained. In unfavourable cases it is often necessary to adopt some form of spinal jacket in addition to exercises.

A forcible correction, under anæsthetic, of any fixed curvature is, on the other hand, strongly to be condemned. You remember perhaps that such a course was advocated a few years ago by the French surgeon Calot. He used excessive pressure on the curve, while four assistants held the patient by one arm and leg each. Without counting the immediate danger of such a proceeding, the possible advantages to the patient were very doubtful, for a weak and wobbly spine is but a poor substitute for a strong and firm back, even if possessing an angular curve.

TREATMENT BY EXERCISES.

In giving examples of the actual exercises employed I will classify them according to the particular form of curvature for which they are suitable, and within each such group I will place first those exercises that are simple enough to be done, after some tuition, by the patients themselves without any expert aid. In order to avoid too much repetition it will be best to start with a list of exercises that lend themselves for any form of curvature.

One object to be kept in view in the treatment of all kinds of spinal curvatures is the improvement of the shape and mobility of the chest, and for this purpose breathing exercises should always be introduced. In order to make them at the same time corrective of the existing curves, or at least to avoid any risk of the curves being accentuated by the movements, it is a wise precaution to let the patient perform them while lying flat on the back or standing with the whole of his back supported against the door-post.

Exercise No. 1.[1]

(*a*) *Lying* (flat on the back with the arms and the palms of the hands pressed to the sides). *Lifting both arms* forwards and upwards, while breathing in, and bringing them back again outwards and downwards to the sides while breathing out (six to eight times, slowly, in time with deep breathing).

(*b*) *Standing* (with the back from head to heels against some support, such as the door-post; the arms pressed to the sides). *Lifting both arms* outwards and upwards while breathing in, and lowering them outwards and downwards while breathing out (six to eight times, slowly, in time with deep breathing).

Another simple form of exercise that opens up the chest, strengthens the inspiratory muscles, and tends to straighten the spine by active muscular effort is arm bendings and stretchings, and the way in which these movements can most safely be done is the following:—

Exercise No. 2.

Standing (with the arms by the sides). (*a*) *Bending both forearms* up, so that the fingers slightly bent touch the outer part of the shoulders, and from that position *extending both arms outwards* (the palms turned down), then bringing them into the bent position, and from there down to the sides again (two to six times; each movement quickly, but stopping in the different positions). (*b*) *Same exercise*, but extending the arms *upwards*.

Hanging exercises have a still more marked effect on the inspiratory muscles and on the chest, and the mere weight of the body will here help to straighten the spine. These positions can be made more strongly corrective of any special curve by applying manual pressure to the height of its convexity; but it has then to be remembered (with regard to the lateral curvatures) that the pressure should be applied in the right direction, from behind forwards, as well as from the side, so as to meet the rotation of the spine as well as the lateral deviation. There is otherwise a great risk of increasing the already abnormally acute angle of the ribs on the convex side. (Compare Fig. 2.)

For our present purpose the most suitable hanging exercise is—

Exercise No. 3.

Hanging (from a bar, trapeze, or similar support, with the hands kept as far apart as the width between the shoulders). *Parting and closing the legs* with the knees kept straight (two to six times; repeat the whole exercise two or three times).

The leg parting and closing is added not only to serve as a measure of time for the hanging but also in order to make the patient relax his over-acting spinal muscles, so as to let the weight of the lower part of the body more fully extend the spine.

FIG. 6.

"Suspension." (For this and the other photographs illustrating this paper I beg to acknowledge my indebtedness to Mr. W. M. Lupton of St. Thomas's Hospital.)

Exercise No. 4.

Standing (with the back resting against a door-post, the arms hanging perfectly loose by the sides, the feet parted and placed some few inches forward from the post). *Bending the body* forwards and downwards with the head and arms drooping down; then *raising it up* gradually, so that each vertebra of the spine in turn from below upwards may, if possible, touch the door-post (two to four times; repeat twice).

[1] This and several other of the exercises described below will also be found in the author's book on "Home Exercises for Spinal Curvatures."

This exercise will bring the spinal muscles into more active use, and will increase the mobility between the various vertebræ. It will thus tend to straighten slighter degrees of lateral curvatures. When properly performed its principal effect is, however, to correct antero-posterior curves; lordosis is corrected by the hamstring and glutei muscles being made to tilt the pelvis backwards, the lumbar spinous

FIG. 7.

Self correction with belt.

processes thus being brought to touch the support; and kyphosis is corrected by the straightening of the upper part of the spine. In this latter part of the movement care has, however, to be taken that the lordosis is not allowed to recur.

Exercise No. 5.

Lying (flat on the face with the arms and the palms pressed to the sides). *Raising the upper part of the body* a short distance only, but with the shoulders well drawn back (two to four times).

A stronger muscular exertion than in the previous exercise is here obtained, acting in the same manner, corrective of slighter degrees of lateral curves. This requires careful watching in cases of antero-posterior curves in order that the effort may be localised in the proper part of the back—i.e., the scapular region. There is otherwise a great risk of a lordosis being increased or produced instead of a kyphosis being corrected.

Exercise No. 6.

Sitting (astride a chair with the hands bent up to the shoulders, the elbows kept close to the sides and the forearms brought well outwards). *Twisting of the body* from side to side (two to six times each side).

Twisting of the body executed in the position just described or (to get a stronger effect, although less easy of control) in the standing position with feet parted and arms extended outwards, is of value in order to increase the mobility of the spinal column, and at the same time of the chest, thus facilitating free respiration.

Exercise No. 7.

"*Suspension*" by means of a halter supporting the patient's chin and neck. (Fig. 6.)

This is a sort of glorified hanging exercise (compare Exercise No. 3). The method is to attach the halter, by means of a rope and pulleys, to a fixed point above the patient, and then to let him take hold of the running end of the rope above his head, and by means of this hoist himself up as high as he can when standing on tiptoe. If there is a marked difference in the level of the scapulæ the hand of the side where the scapula is lower must always be made to grip higher up on the rope. The patient should now try, without paying out the rope, to lower his heels again towards the ground as far as possible. A marked straightening of the spine will then generally be noticed. It is an important point to let the patient pull the rope himself, not only because of the correction thus obtained in the shoulder level, but also because there is in this way no fear of accidental hanging or anything approaching to it. For he must obviously either bear his weight on his toes or support it on his arms, and any undue strain on the neck is thus effectually prevented.

Exercise No. 8.

The specially devised belt depicted in Fig. 7 affords one useful way of helping a patient to correct his curvatures by his own muscular efforts with the aid of his arms. The belt is fastened round the patient's body between the iliac crests and the trochanters, with straps passing diagonally across from back to front above the iliac crests, and from this belt two handles are suspended, one on each side, which the patient is made to grasp. He is then directed to walk forwards and backwards on tiptoe, holding himself as erect as possible. Frequent supervision is, however, necessary to prevent faulty positions such as undue raising of the shoulders.

In dealing with individual curvatures we will first consider those in the antero-posterior direction.

Exercise No. 9.

The most important movement for a faulty carriage of the head (stooping or poking the chin) is *bending the head* slowly backwards and raising it up again by drawing in the chin (four to eight times). The

FIG. 8.

Postural correction of lordosis and active muscular correction of kyphosis.

effect might be increased by someone offering resistance to the movement by a hand placed behind the neck. In either case it is essential that the movement takes place not merely between the atlas and occiput but throughout the whole of the cervical spine.

In a case of kyphosis continuous throughout the whole of the back, Exercise No. 5 might with advantage be modified by raising the body as far as the individual is able. When kyphosis coexists with a lordosis such positions and movements must be chosen as do not increase one curve while

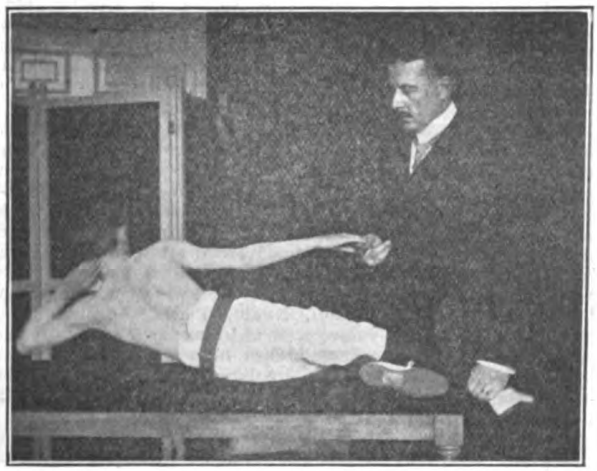
correcting the other. One exercise that meets these requirements is—

Exercise No. 10.

Sitting (facing a wall, some 2 to 3 feet distant from it, with the arms extended upwards). *Leaning the body* forwards from the hip-joints, with the spine kept straight, until the hands touch the wall at the highest possible point (four to eight times).

The principal exertion is here localised to the scapular muscles, and the exercise is thus corrective of kyphosis,

FIG. 9.



Active correction of right convex curve.

while the leaning forward on a low seat prevents lordosis from occurring. (Fig. 8.)

Exercise No. 11.

Lying (flat on the back, with the arms extended upwards and the hands grasping some support). *Drawing up both knees* and then bringing the legs down to the original position again (four to eight times). To increase the effort the same movement might be arranged in a hanging position.

Here, on the other hand, the kyphosis might be said to be mechanically prevented by the position, while the lordosis is more actively corrected.

With regard to lateral curvatures more difficulties present themselves, and it is here that expert help becomes a necessity in all but the very slightest cases. (In describing the exercises for lateral curvatures we will consistently suppose the thoracic curve to be right convex and the lumbar curve to be left convex. For the opposite condition right and left should naturally be reversed.) A unilateral C-shaped curve can be met by the following two exercises:—

Exercise No. 12.

Sitting (astride a chair with the left hand behind the neck and the right arm hanging down by the side). *Bending the body* to the right side and raising it to the upright position again (six to ten times).

Exercise No. 13.

Lying (on the left side with the left hand behind the neck and the right arm extended along its own side of the body). *Raising the upper part* of the body straight towards the right side (three to six times).

The action of Exercise No. 13 will be easily understood from Fig. 9. The different position of the two arms helps to counteract the inequality in the level of the shoulders, and the position of the body entails a powerful contraction of the muscles of the convex side.

Exercise No. 14.

Sitting (with the feet parted and firmly resting on the floor, the body leaning forwards from the hip-joint). *Extending the left arm* upwards (three to six times; repeat the whole exercise three times).

The active correction of the inequality between the scapulæ is still more marked in this movement, and it is best done with the help of someone who, standing in front of the patient, can steady his body by placing one hand on the convexity of his curve, and at the same time with the other hand offer some resistance to the extension upwards of the left arm.

A lumbar curve (with the convexity to the left) is efficiently treated by one of the two following exercises:

Exercise No. 15.

Hanging (from a bar), *bringing both legs* over to the left side, and keeping them there for a few seconds (three to six times; repeat twice).

Exercise No. 16.

Standing (with the left foot two foot-lengths in front of the other; the left side resting against the edge of a table or similar support, placed at the level between the iliac crest and the trochanter). *Bending the body* over to the left side (six to twelve times).

The next exercise provides one very effective way of passively correcting a lumbar curve.

Exercise No. 17.

Lying (flat on his face), while his legs are grasped and brought over to the left side by the operator, who at the same time by his other (left) hand placed on the height of the convexity steadies the patient's body and localises the movement to the desired part of the spine (Fig. 10).

This performance enables the operator at the same time to give any desired amount of torsion to the pelvis, thus, so to say, "untwisting" the rotation of the spine which may accompany the lumbar curve. In cases of double S-shaped curvature this exercise can be used for the lower curve, if precaution is taken that the bending over to the side is actually produced at the right situation; and for the thoracic curve a corresponding reduction can be obtained by securing the lower part of the body and passively bringing the upper part over to the right side.

Exercise No. 18.

Sitting on the buttock and thigh of the side where the hip is *lowered* (the left). *Extending the other* (right leg) backwards as far as possible. *Leaning the body forwards* in line with the hind leg. *Extending the arm* of the side where the scapula is lowered (left) upwards in line with the body, and the *other arm* (right) downwards and backwards. (Maintain this position 15–50 seconds; repeat three or four times.)

Careful instruction is needed for the patient to occupy this position properly (Fig. 11), but it is then admirably adapted to counteract all the various malpositions of a double curve. By the position of the legs the relative level of the two hip crests is reversed, and a lumbar curve temporarily over-corrected; by leaning the body forward all the spinal muscles are called

FIG. 10.

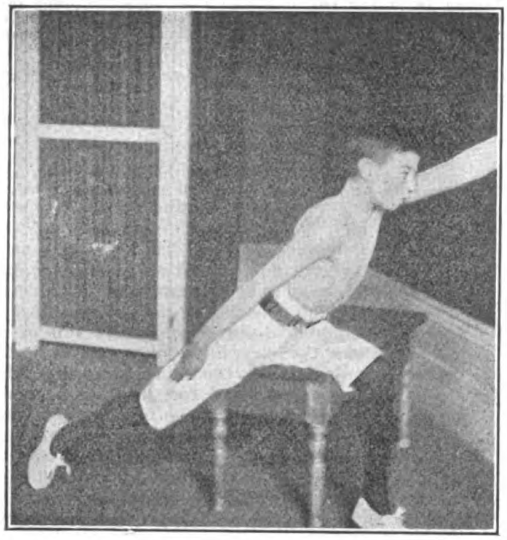
Passive reduction of a lumbar curve.

into activity to maintain the position; and by the position of the two arms the difference in the level of the scapulæ tends to be counteracted and the thoracic curve to be corrected. Positions of this kind form the essential feature in Professor Klapp's so-called *crawling method* of treating spinal curvatures.

In conclusion, I will describe one method of dealing more directly with the rotations of the spinal column, which are

always the most difficult part of a curvature to influence. For this purpose I employ an indiarubber band (3 ft. 6 in. long

FIG. 11.

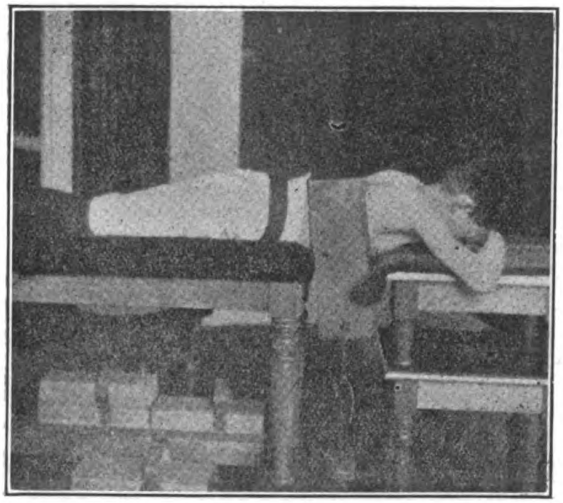


Corrective position for double lateral curvature (right convex thoracic and left convex lumbar).

by 5 in. broad and ¼ in. thick), which is used in the following manner (Fig. 12).

Two tables are placed 8 to 10 inches apart, and the patient is made to lie prone across them, so that the part of the back to be dealt with is spanning the gap between the two tables. The indiarubber band is now applied to the bare skin in this section of the back over the convexity of the curve with its end close to the spinous processes. It is then wrapped round the body, its free end hanging down on the convex side, thus overlapping and retaining in position the first part of the

FIG. 12.



Application of indiarubber band to correct rotation of the spine.

band. A suitable weight (3 to 12 lb.) is now suspended from this free end, and a powerful torsion of the required part of the body is thus obtained. The position should be kept up for some 5 to 15 minutes.

The above does not, of course, claim to be a complete list of the exercises and positions used in the treatment of spinal curvatures. Only a few typical examples have been given.

OMNOPON: A POTENT ADJUVANT TO LOCAL ANÆSTHESIA.

BY H. M. W. GRAY, M.B. ABERD., F.R.C.S. EDIN.,
SURGEON AND LECTURER ON CLINICAL SURGERY, ROYAL INFIRMARY, ABERDEEN; SURGEON TO THE ROYAL HOSPITAL FOR SICK CHILDREN, ABERDEEN.

OMNOPON (as it is called in this country) or pantopon (the name used on the continent of Europe) was introduced by Professor Sahli[1] of Berne, in conjunction with the late Dr. Schärges, as a medical sedative. It is sold in liquid, powder, or tabloid form, but is almost universally used in the liquid condition. It is made up in various strengths and combinations by the Hoffmann-La Roche Chemical Company, and sent out in sterile ampoules of usually 1 c.c. capacity. It is a watery solution containing nearly 90 per cent. of the soluble alkaloids of opium in chloride form. It is faintly acid in reaction, but not sufficiently so to be irritating when injected into the tissues. Opium itself contains 14 to 15 per cent. of its total alkaloids, so that 1 gramme of omnopon is equal to 5 or 6 grammes of opium. Sahli gave the name pantopon from the Greek $\pi\alpha\nu$ = all, and $\acute{o}\pi\acute{o}\varsigma$ = juice. There are about 20 alkaloids in the preparation, and they are present in the same relative proportion as in opium. It has been widely used in medical practice, e.g., by Sahli, Ewald,[2] Pertik,[3] Innsbruch,[4] and Haymann.[5] They have used it in cardio-vascular disorders as a sedative because it has been found to have no depressing effect on the circulation; in diabetes insipidus, in which it produced improvement in the general condition with marked reduction of the quantity of urine excreted; in laryngeal and pulmonary tuberculosis, and in tumour of the lung, where it gave much better and more lasting results than morphia as a sedative, hypnotic and antidiarrhœic. In mental cases it was found to be a good sedative, and in fact it is used in many clinics instead of and in preference to morphia. In gynæcological and obstetrical practice it has been used with gratifying results by Gräfenberg,[6] Johannsen,[7] and Heimann.[8] It has been found that there was no lengthening of the labour on account of weakening of the pains and all the children were born alive. (Gräfenberg,[6] number of cases not given.)

A great deal of experimental work has been done with the drug in practically all continental countries. The most important deductions from such experiments (Bergien,[9] Rodari,[10] Loewy,[11] Wertheimer-Raffalovich,[12] Rodolico,[13] and others) show that the circulation of the blood is absolutely unaltered by therapeutic doses; in fact, Rodolico found that the heart acted more strongly, while the pulse became slower and fuller. The respiratory centre is less influenced by omnopon than by morphia, as regards volume and rate of respiration, and also that the effect passes off more quickly than that of morphia. The narcotic, sleep-producing effect is very marked, and usually appears without any previous stage of excitement. It has been found further that the gastric secretions are increased, but later the motility of the stomach and intestines is reduced (Rodari), this being accompanied by ischæmia of these parts.

The good qualities of the drug were soon appreciated by surgeons in Berne and elsewhere (Brustlein[14] and von Brunn[15]) on the continent, who began and have continued its use, coupled with scopolamine, as an aid in the administration of inhalation anæsthetics, in the same way as the

morphine-scopolamine combination is used. The drugs are used also by some as a post-operative sedative. In the hands of these men omnopon-scopolamine has supplanted morphine-scopolamine, with admittedly definite advantage to both surgeon and patient. Mr. C. L. Leipoldt, of the German Hospital at Dalston, has drawn attention to its use in this manner in an article published in THE LANCET.[16] His article is, I think, the first on the subject in the English language.

With increase of experience in its use, one is led to speak of it more and more enthusiastically. I do not intend to say much of it with regard to its use along with ether, but rather to give my experiences and opinion of it when used in combination with the injection of the field of operation with a local anæsthetic. I may say, however, that the amount of inhalation anæsthetic necessary is usually only one-sixth or one-fourth of what is necessary in ordinary circumstances. Strangely enough, in two of my cases, for no apparent reason, the amount of ether used to produce and maintain complete narcosis was considerably in excess of that ordinarily required. In both these cases omnopon alone was used. The sedative effects of the drug are apparent usually for hours after the operation is over and bad after-effects are negligible.

I have to thank Dr. William Anderson, my private assistant, for bringing omnopon under my notice, when he returned from Germany in the beginning of this year. He had seen it used in the clinic of Professor Perthes, in Tübingen, where it is administered along with injection of a local anæsthetic (novocaine). I procured samples of the drug at once in order to test it and took an early opportunity of visiting my friend Perthes in Tübingen, in order to see his work. Professor von Brunn, first assistant in the surgical clinic there, gave me many particulars as to their experience with it. My own experience extends now to its use in over 300 cases since March, and I feel that I can therefore speak with a good deal of knowledge of its effects. In order to have as accurate data as possible Dr. Anderson and I compiled a table of observations which were carefully kept in 70 cases. I thank many of our local medical men, especially Dr. J. Robertson (assistant anæsthetist at the Aberdeen Royal Infirmary), Dr. W. G. Thomson (my house surgeon), and Dr. Anderson for supervising these observations. I shall give details of my methods of procedure and the deductions made from the observations referred to above.

Dose.—I have used almost invariably, for adult males and females alike, intramuscular injections of solution containing 2/3 grain (0·04 grm.) of omnopon with 1/150 grain (0·0004 grm.) of scopolamine. The use of the scopolamine with either morphia or pantopon is justified by Bürgi's[17] observation that when two narcotics are injected simultaneously, or one shortly after the other, the effect is more potent than when a quantity of one, equal in strength to the combination, is injected alone. This holds good apparently only when the narcotics used are chemically related to different substances in the organism, or, in other words, when they have different cell receptors. In this way, simultaneously, different reactions are obtained. I used at first omnopon (0·04 grm.) alone in my hospital cases, while in my private cases I used scopolamine also. The private cases were uniformly more strikingly successful than the hospital ones, so that now all of them receive the mixture. Sickness was much more frequent when omnopon alone was given and in some cases it was particularly distressing. It was rarely observed when the mixture was used—so that I feel fairly certain that the scopolamine with omnopon acts as a preventive of sickness, more certainly than it does when used along with morphine. There is, in my opinion, no safety in attempting to regulate the dose in adults in proportion to the body-weight, age, or development of the patient. The dose used by me acted lightly in one patient, whereas in another of approximately the same weight and apparently in the same state of health and mental condition it acted most satisfactorily. The dose mentioned appears to me to be a safe one for any adult case. I do not think it is safe to give a larger one right off because of possible idiosyncrasy. Far rather have resort to a small quantity of inhalation anæsthetic if necessary, to produce surgical anæsthesia, or give a repeat dose of, say, half or quarter of the original dose 15 to 30 minutes before the beginning of the operation if the patient is not satisfactorily narcotised. The latter procedure has been resorted to in many cases with excellent result. One must remember another of Bürgi's observations in this connexion: that the same amount of such medicament given in two or more doses, one shortly after the other, acts more strongly than when the whole is given in one dose. In weakly or toxæmic individuals it may be well to give a rather smaller dose.

I have not used the combination in children below the age of 13, but with juveniles just above this age the effect has been quite satisfactory. A small amount of ether has usually been given in order to ensure quietness because such young patients are apt to show less control if they *should* be aroused by painful sensations. For such cases usually half the adult dose has been given. From my observations in such young patients I am inclined to agree with Leipoldt that it will have a very beneficial effect "in mitigating the effects of a prolonged operation in a child, as regards shock—and these advantages outweigh the possible, but more or less theoretical, dangers. Wiki[18] has recently shown that children bear morphia injections remarkably well, especially in cases of profound collapse from pain, and it is just in this class of case that it seems advisable to use omnopon on account of its sedative effect." It seems more advisable to make the injections into the muscles than "hypodermically," both on account of greater rapidity of absorption and less likelihood of local irritation. Von Brunn recommends limiting the circulation by applying tourniquets to two or more limbs near the trunk. He claims to produce "sleep" more quickly and to get more certain effects and at the same time to have, in case of too severe effects, a supply of "unpoisoned" blood which, when the tourniquets are removed, will nullify the excessive dose. He warns against the use of chloroform. Brustlein does not approve of this method. He has had three rather alarming experiences during its use. I have not used von Brunn's method.

Local anæsthetic used.—The patient's skin is prepared in the usual way before the injection of omnopon-scopolamine is made. While being brought to the operating table the face is covered with a towel. In order to prevent the patient seeing what is being done either a towel is kept on the face or a screen is fixed on the table to hide the field of operation. The skin is then finally wiped, first with mercuric biniodide in spirit (1–500), and then with Harrington's solution. I infiltrate the skin where the incision is to be made and the deeper parts of its neighbourhood, and, at the same time, in certain cases try to "block" the sensory nerves supplying the area of operation with solution of novocain and adrenalin. The adrenalin is used because the omnopon seems to cause increased vascularity in the superficial tissues. The adrenalin may, of course, help the omnopon in its effect on the cardio-vascular system. The strength of the novocain is ¼–½ per cent. in saline solution. According to the vascularity of the part concerned, ½–1 drachm of adrenalin chloride (1–1000) solution is added to each 100 c.c.

Messrs. Down Bros., Limited, have made for me an all-metal syringe, fitted for any size of Schimmel's needles and with special detachable points (which facilitates filling), and capable of holding 40 c.c. I use No. 15 (small) and No. 0 (large) Schimmel's needles. The ordinary syringes are too small for handy use when large areas have to be anæsthetised. It is, of course, perfectly easy to anæsthetise the immediate area of incision or dissection, but when intra-abdominal manipulations have to be carried out the anæsthetising of the parietal peritoneal tissue is a matter of considerable difficulty if the omnopon has not taken good effect. In several such cases I have, by using gauze-packs wrung out of novocain solution, been able to finish operations satisfactorily with but little complaint from the patient. As one gets more practice in the injection of the local anæsthetic, the results with regard to the anæsthetising of the parietal tissues are increasingly satisfactory.

In operations on the perineum or lower extremities, and in intravesical operations, such as enucleation of the prostate, I find much help in many cases from the injection, extradural, into the sacral canal of ¼ per cent. novocain solution, 20–40 c.c., according to the size of the patient. (Stoeckel's method.[19, 20]) This "blocks" the sacral nerves

before they emerge from the sacral canal. I had previous to my using omnopon-scopolamine a large experience in the use of local anæsthetics, and I feel that the simultaneous use of omnopon-scopolamine enhances the success of such anæsthetics by nearly 50 per cent.

In the operations in my wards of the Aberdeen Royal Infirmary during the past few weeks an inhalation anæsthetic is used in but 20 per cent. of cases. Emergency cases are excluded from the calculation because they are operated on usually immediately after admission to hospital.

Effects before operation.—Patients are prepared as for inhalation anæsthesia. The injection of omnopon-scopolamine is made deeply into the muscles (usually of the buttock) and patients very seldom make any complaint of local irritation. In my cases I have found it best to have the injection made 1¼–1½ hours before operation. The patients begin to get drowsy usually in a very few minutes and should be encouraged to go to sleep by being left alone in a darkened room free from noise or disturbance of any sort. Certain patients should not be told beforehand that possibly they will not get any inhalation anæsthetic; there should be no special fuss made about the method, otherwise they are apt to become excited, apprehensive, and resistant to the action of the drugs, and are almost certain to require some inhalation anæsthetic in order to quieten them during the actual operation. Such patients allow usually the injection of the local anæsthetic to be made, but when they appreciate that the operation is in progress they begin to complain. That such complaints are merely "mental" is fairly well shown by such facts, for example, as that only three drachms of ether (open method) were necessary to keep an excitable girl quiet during the operation for bilateral inguinal herniæ, or that in a complete operation for cancer of the breast, lasting one and a half hours, only 1½ oz. of ether were used.

In people over 50 the drugs act especially well. The older the patient the better the effect. This fact, in my opinion, makes this method of anæsthesia so valuable. It acts best in just that class of case in which one is anxious about the effects of an inhalation anæsthetic. Such patients usually go to sleep during the hour before the operation, or at any rate rest quietly, and are quite free from that apprehension which in some cases is so distressing. This advantage is, of course, evident when other narcotics are used, but with these there is sometimes considerable excitement during the early stages. Only in cases where omnopon was used alone has there been any sickness during this preliminary period. The pulse and respiration, which may previously have been raised in rate owing to excitement, become slower and of quite natural volume or depth. In only one case (gastrectomy in a woman of 56), where a double dose had been given by mistake, was there any anxiety caused by interference with respiration. The pulse kept good (about 90) all the time, but at the beginning of the operation the respirations were only 3 per minute, although they were quite deep when they occurred. The patient could not be roused to speak. The colour kept perfectly natural all the time. No novocaine was used in this case. The respirations were practically normal at the end of the operation, although they became slower again (8–10 per minute) for an hour after the operation. I may say here that clinically I have verified the experimental findings on the respiration and circulation previously referred to. It has always impressed me that a deep narcosis from omnopon gives rise to infinitely less anxiety than a similar narcosis from morphia. While in several cases the breathing has become slowed to 8 or 10 per minute, yet the general condition, colour, and pulse kept so good that one felt quite easy in mind. In no case has cyanosis been noted.

Some patients remark when roused on a feeling of thirst, even at this stage. Even in a perfectly satisfactory case the patient can practically always be roused to speak, to raise their limbs, pelvis, or abdomen, to take deep breaths, and so on, when they are placed on the operating table. They frequently take notice of the process of disinfection of the skin and more frequently of the early stages of anæsthetising the wound area, but have usually settled down again by the time that operation sheets, towels, &c., are fixed in position.

Effects during operation.—For obvious reasons the patient's arms, unless to be operated on, are fixed alongside the trunk by wrist-straps attached to a belt which runs round the table. Another belt, round the table and lower thighs, prevents the patient from flexing the knees. Usually no objection is made to being fixed up in this way. During a severe operation in a satisfactory case the general condition of the patient leaves little to be desired. This is especially remarkable in old patients in such serious operation as gastrectomy, colectomy, or gall-stone cases, where the operator and anæsthetist have frequently, under ordinary conditions, so much anxiety. This is just the sort of case in which one wishes to avoid inhalation anæsthetic. There is no necessity for haste on account of the effects of the anæsthetic. There is practically never any shock. (I have seen shock in only one case, a very difficult abdomino-perineal excision of the rectum, in which ether had to be given freely—10 ounces.) Respiration remains unaffected unless when organs are pulled upon vigorously or when exploration of the abdominal cavity is made, when the extreme sensitiveness of the parietal subperitoneal tissue appears. The pulse is unaffected unless under similar circumstances, when merely occasional increased frequency is the only result. In some cases the blood pressure has fallen to the extent of 10–15 mm. Hg, estimated by Martin's modification of the Riva Rocci manometer. In one case of subtotal gastrectomy, entailing removal as well of 15 inches of the transverse colon, part of the mesocolon, and stripping of the parietal peritoneal tissues off the pancreas, &c., separation of numerous old inflammatory adhesions, and so on, which occupied about three and a half hours, there was no evidence of shock, the pulse at the end of the operation being 90, regular, and of good volume.

The patients are usually able to assist the operator in more ways than one. For example, as already indicated, the taking of deep breaths may help the delivery of stomach, gall-bladder, or pelvic tumour from the wound. In some cases, during the performance of a laparotomy for other conditions, the patient has acquiesced in the decision with regard to the removal of the appendix, and so on. The fact that they can hear what is going on is urged at the time by some patients very persistently as a reason why they should get ether or chloroform. Such patients are usually easily quietened by receiving a few drachms of ether, and they then frequently remain quiet till the end of even a long operation, although they may become conscious again and even talk. In two cases intermittent complaints of a feeling of intense restlessness were made, which were overcome only after much encouragement by conversation. The loosening and holding of a hand by an attendant also seemed to relieve these attacks. One case was that of the combined gastrectomy, colectomy, &c., above referred to, in which the restlessness occurred during the last half-hour of the operation, and the other was a case of difficult thyroidectomy lasting 45 minutes. On both occasions the day was extremely warm and close, and the atmosphere in the theatre was irksome to all in it. Neither of the patients remember about the restlessness, and it is a curious fact that although a patient may talk perfectly rationally about many subjects, they frequently have no recollection of doing so, or, indeed, of the operation. This want of memory might create difficulties legally in a possible claim for damages on account of the permitted removal of a diseased organ not previously diagnosed. Sweating has been noted only occasionally. Thirst has been frequent and I have never hesitated to give a small quantity of water to drink, or, in gastric cases, merely to wash out the mouth. In patients who afterwards have no recollection of pain, or, indeed, of the operation, there has sometimes been a good deal of moaning or muttering during traction of organs or section of nerves—e.g., in breast operations—but there has rarely been noticed any deterioration of the pulse as in inhalation anæsthesia when such moaning is provoked. The pupils are generally slightly contracted, but in practically all cases have reacted, usually sluggishly, to light. The conjunctival and corneal reflexes have never been found to be abolished. In fully narcotised patients muscular relaxation has been more satisfactory than when ether is used alone. In only one case where ether was not used have I had any difficulty in replacing bowel in the abdomen. I think that this was due chiefly to inefficient preparation, among other things in the matter of diet, of the patient previous to operation.

I have been disappointed in two cases with the inefficient

action of the omnopon-scopolamine. In both of these cases the patients were strongly-built healthy men, but in spite of that, from my experience, I expected that the narcotic would have a good effect. The local anæsthetic had also very little effect. They were both "tipplers." The occurrence of failure is perhaps fortunate in that if the method were successful in every case critics might well say that the effect was too perfect, that the writer's enthusiasm for a new procedure had carried him too far.

Effects after operation.—The patients seem occasionally to feel the application of a firm binder or bandage as much as any part of the operation. This has the effect of reassuring onlookers who may be timid concerning the method of anæsthesia. The average case is conscious enough to appreciate that the operation is finished, and in many cases to express thanks, which sentiment, in these Socialistic days, is increasingly rarely given voice to by hospital patients when they are in full possession of their faculties! Only on very few occasions have patients been in a condition to be allowed to walk back to bed. They stagger and feel giddy as if intoxicated by alcohol.

Practically all cases, except those of moveable kidney, loin abscess, spinal or thigh lesions, are placed at once in the reclining position. The patients usually go to sleep at once, after being settled in bed, and sleep for a considerable period, even so long as six hours. In those who do not sleep, pain is not complained of for several hours. This is of considerable advantage in cases of operation on the upper abdomen, in which, when inhalation anæsthetics alone have been used, the pain of the wound, after consciousness has been regained, prevents the patients properly inflating the lungs. In cases with heart or lungs below par this early respiratory difficulty may lay the foundation of more serious trouble which becomes pronounced in the course of a day or two, such as hypostatic congestion, pneumonia, or massive lobar collapse. The fact that occasionally respiration is slowed during the first hour or two after omnopon-scopolamine anæsthesia is possibly a drawback in this connexion, and for this reason such patients as require it are roused up every half-hour or so and made to take a few deep breaths so as to fill out the lungs thoroughly. There have been strikingly fewer cases of chest trouble in the omnopon series than in a similar number of cases in which inhalation anæsthesia was used alone.

There is apparently no reason why a second dose of omnopon-scopolamine should not be given, if necessary, to subdue post-operative pain. By giving half the original dose —i.e., 1/3 grain (0·02 grm.) omnopon and 1/300 grain (0·0002 grm.) scopolamine—we can secure for the patient a restful, painless night, and the impression is given that the immediate and after effects are preferable to those of morphia, in that the rest is more natural and the heavy nauseated feeling which morphia often gives next morning is absent. In some cases in which morphia has had but little effect, omnopon has acted promptly and efficiently.

Gastro-intestinal system.—I have already referred to the occasional presence of distressing sickness and vomiting after omnopon has been used alone. It has never persisted more than from 24 to 36 hours. When scopolamine was given along with the omnopon, sickness has been present either before, during, or after the operation in only four cases, less than 2 per cent. In three of these cases it was found that morphia produced the same result, in probably worse degree. In one case relief was procured after 2 drachms of a solution (1–100) of potassium permanganate had been given by the mouth. The patient vomited at least part of this about 15 minutes later, but was not again sick.

Thirst is the most distressing post-operative symptom and is most marked in patients who have been well under the influence of the omnopon-scopolamine, owing probably to their having slept with the mouth open. It is doubtful if this thirst is any greater than what occurs after inhalation anæsthesia. Plain water is given in small quantities to relieve thirst, except in gastric cases. In no case has thirst been complained of after 24 hours. The giving or withholding of scopolamine did not seem to have any effect on this symptom.

The appetite remains unimpared in most cases which are not complicated with sickness. Several patients have asked for and received solid food immediately after operation, while, on the other hand, in a very few cases the appetite has been rather poor for the first day.

There has been no evidence of unfavourable action of the drug upon intestinal peristalsis. Flatus has been passed within 24 hours even in cases of operation upon the colon, such as ileocolostomy or colectomy. This fact is of great benefit to patients, as except on very rare occasions there is no tympanites with its accompanying colicky pains. Movement of the bowels has been secured on the second or third day with the usual aperients more easily than in cases where ether alone was used. In this respect, also, omnopon compares very favourably with morphia, as when the latter is used, either before or after operation, a subsequent paralytic condition of the bowel is a frequent, persistent, and distressing result.

Circulatory system.—Pulse. At the end of operation the pulse is usually slightly accelerated, but as soon as the patient is settled in bed the rate and rhythm return to the normal. After six to eight hours there is usually a rise of from 10 to 20 beats per minute, but gradually a return to normal rate occurs within 24–36 hours. This temporary rise is most marked in nervous patients or in those who have been subjected to severe operations. As has been stated, the blood pressure shows during or at the end of operation a fall of from 5 to 15 mm. Hg, but by the end of the first day it has risen again to normal. In no case has any dilatation of the heart been observed, and as far as can be made out by the usual methods of percussion and auscultation the cardiac muscle remains uninjured by the drugs even in cases with evidence of old endocarditis. In one such case operation (gastro-enterostomy) had been decided against by two different surgeons in different parts of the country.

Respiratory system.—In well-narcotised patients the respiration is slow but regular and deep during the first few hours. No stertor has been observed. As soon as the patient is fully awake, however, there is a rapid rise in rate to the normal, which is maintained although the patient may again fall asleep. The colour of the face remains good. As the effect of the omnopon passes off the face becomes paler. Chest complications have been exceptionally few in number. Acute lobar pneumonia occurred in one patient, aged 65, who was suffering from well-marked secondary anæmia due to hæmorrhage from duodenal ulcer. (Hæmoglobin before operation was 52 per cent., red blood corpuscles 2,300,000.) The patient became rapidly very ill and died on the fourth day after operation, and although massive collapse of the lung was suggested the consultant physician was of opinion that such did not exist. Post-mortem examination was not performed.

Omnopon-scopolamine is especially valuable in phthisical cases, as it obviously does away with the disadvantages of inhalation anæsthesia.

Urinary system.—In severe abdominal operations the quantity of urine during the first 24 hours shows a marked reduction, while in other cases the reduction is less. In many practically no reduction in amount is noticed. In one case of subtotal gastrectomy with colectomy only 10 oz. of urine were passed during the first day, a reduction of 25 oz., but in cases where the operation *per se* does not interfere with metabolism the reduction amounts to from 10 to 15 oz., so that again there is little difference from inhalation anæsthesia. During the second day there is an increased excretion in most cases, and the amount passed before operation is equalled during the third day. In no instance has albuminuria or glycosuria appeared during convalescence. The specific gravity is usually raised on an average from about 1020 before to about 1028 after operation, the rise being usually in inverse proportion to the quantity passed. The quantity of urea passed daily has been estimated in a few cases before operation and during the first three days thereafter. The number of cases estimated, however, has been too small to draw definite conclusions, but aided by the rough method of estimation of the urea from the specific gravity, we may infer that the effect of omnopon-scopolamine on healthy kidneys is of little importance from a practical point of view. The effect of this narcotic on the function of the kidney seems to compare favourably with that of an inhalation anæsthetic. In old people, especially where the quantity on the day following operation has been much decreased, a few doses of such a simple diuretic as spirit of nitrous ether have speedily had a beneficent effect.

Nervous system.—The mental acumen of the patient

remains dulled in some cases for a short time (8–10 hours) after operation, but thereafter this condition rapidly passes completely away. There has been no headache, restlessness, or giddiness complained of even by nervous patients during convalescence. All superficial reflexes are sluggish but normal again by the day after operation. Muscular paralysis, hyperæsthesia, or anæsthesia of any description has never been noted. Two cases have been transferred to the lunatic asylum, but as there had been mental derangement in both cases some time previous to operation it is unfair to ascribe any causative influence to the omnopon, especially as it is found to be of such value in psychiatric cases (Haymann). One case, gastro-enterostomy for pyloric stenosis, had twice previously been in the asylum, and had two brothers who had also been confined there. The other case was one of trephining for depressed fracture which had been caused eight years before operation. The continuous headache and worry were so annoying to the patient that he had stated before operation several times that "he did not feel quite sure of himself in that he might do himself harm." He improved vastly, was much brighter in every way, had no headaches, and was dismissed three weeks after operation. On the day after dismissal from hospital he was found wandering in the street, had apparently "suicidal mania," and was taken to the asylum.

The healing of the operation wounds is not delayed in the slightest degree by the use of the local anæsthetic.

There has been one case of shock—an abdomino-perineal excision of the rectum above referred to. There has been one post-operative collapse from internal hæmorrhage due to slipping of a ligature on the ovarian vessels. It has been suggested that the omnopon might obscure symptoms of internal hæmorrhage, but as a good colour and pulse are characteristic of omnopon-scopolamine narcotisation it is unlikely that any real difficulty will ever occur. The restlessness of severe hæmorrhage is, however, likely to be absent.

Deaths Occurring after Operation in which Omnopon or Omnopon-scopolamine has been Used Alone or in Conjunction with Other Anæsthetics.

There were but seven deaths in the series of 300 cases.

1. Male, aged 65. Duodenal ulcer, with secondary anæmia (Hb. 52 per cent., R.B.C. 2,300,000). Death on fourth day from acute lobar pneumonia of 18 hours' duration.
2. Female, aged 54. Extensive carcinoma of stomach. Gastrectomy. Death on fifth day from pulmonary embolism.
3. Male, aged 67. Comminuted fracture of upper end of femur. Plated. Death 17 hours later from fat embolism. Ether used.
4. Male, aged 65. Hypertrophy of prostate with septic urine. Prostatectomy in two stages. Death on eighth day after second operation from double suppurative pyelonephritis.
5. Male, aged 62. Acute intestinal obstruction from band, three days' duration. Death four hours later (½ dose omnopon only, plus ether).
6. Female, aged 59. Carcinoma recti. Abdomino-perineal excision. Death from shock six hours after operation. Ether used.
7. Negro male, aged 40. Double renal and perirenal abscesses. Death three weeks after operation from marasmus. (The patient refused food, having, as he said, made up his mind to die.)

It will thus be seen that in no case could the cause of death be ascribed justifiably to the effects of the omnopon-scopolamine.

Treatment of Cases in which Excessive Action of the Drug Occurs.

The usual stimulating remedies may be used, but probably most good will be got from the intravenous infusion of saline solution in which one or two grains of potassium or sodium permanganate are dissolved. Atropine has apparently little effect. The possible benefit obtained in cases of persistent sickness from the administration of potassium permanganate by the mouth has already been referred to.

It will be noted that none of the cases in the following table are trivial ones, which would ordinarily require such a small amount of ether, especially when given on a mask by the open method. Many of the remaining cases, not included in the foregoing lists, were difficult pelvic cases, operations on joints or bones, &c., or occurred at the beginning of the series when the administration of the omnopon-scopolamine or local anæsthetic was not so efficient. It is readily appreciated that this method of narcotisation alleviates, in a very great measure, the anxieties of anæsthetists.

Synopsis of Cases requiring no Ether.

Appendicectomy (both acute and interval cases)	22
Appendicostomy	1
Cartilage (excision of semilunar of knee)	2
Cholecystectomy or cholecystostomy (2 with choledochotomy)	5
Colectomy	3
Cystotomy (suprapubic)	7
Exploratory laparotomy (inoperable cancer)	3
Fractures (plating and nailing)	8
Gastrectomy (subtotal, 2 with colectomy)	6
Gastro-enterostomy (1 with gastroplasty for hour-glass stomach)	14
Hæmorrhoids (Whitehead's operation)	6
Hallux valgus	1
Hernia	12
Hysterectomy (supravaginal for large myoma)	2
Hysteropexy	3
Ileosigmoidostomy	4
Intestinal obstruction (one with resection of bowel)	2
Ligamentum patellæ, suture of	1
Mammary tumours (four complete operations for cancer)	8
Nephropexy (one double)	5
Nephrotomy (double)	1
Ovarian tumours	3
Penis, complete removal of	1
Perineal operations	8
Prostatectomy	4
Recurrent growth (carc. mammæ) in axilla	1
Sarcoma of leg (extensive removal)	1
Skin-grafting (extensive)	6
Thyroidectomy	2
Trephining	1
Varicose veins (four double)	6
Total	149

Cases requiring under 3 Fluid Ounces of Ether (Open Method).

Appendicectomy (acute and chronic)	13
Cartilage (excision of internal semilunar of knee)	1
Cholecystectomy or cholecystostomy	3
Excision of joints (knee-tarsus)	2
Fracture (plating)	2
Gastro-enterostomy	2
Hernia (double)	1
Hysteropexy	3
Intestinal obstruction (one with resection of bowel)	3
Mammary tumour	1
Nephropexy	1
Ovarian tumours	4
Perineorrhaphy	1
Sarcoma of neck (excision)	2
Varicose veins	3
Total	42

Conclusions.

1. That omnopon-scopolamine used in the dose and manner recommended is apparently a perfectly safe narcotic.
2. That it increases enormously the field of application of local anæsthetics,
3. That it is especially advantageous when used in conjunction with local anæsthetics in extensive operations in old patients.
4. That the innate objection of many patients to being conscious during the performance of extensive operations does not constitute, according to experience, a justifiable contra-indication to the method.
5. That there are no bad sequelæ which can be reasonably ascribed to the use of the drugs in the method described, even in cases where lesions of heart or lungs have been a serious objection to the use of an inhalation anæsthetic. The writer has not had sufficient experience of operations in renal lesions to enable him to draw satisfactory conclusions.
6. That with increasing experience in the dosage of the omnopon-scopolamine combination, the results, especially in younger adults, are increasingly satisfactory.

Since writing the above I have had increasingly satisfactory experience with over 150 more cases. The improved results have been due mainly to improvement in dosage for middle-aged patients. A repeat half dose has frequently been necessary, and some have got even a further quarter or half dose at the commencement of the operation. In some old patients half or three-quarters of the ordinary dose has

been ample—in fact, in one or two the effect has lasted for 12 to 16 hours. This is apt to happen apparently in enfeebled, wasted, "wizened" patients, especially if they give a previous history of "knuckling under" to minor maladies. I should, therefore, like to give a note of warning that the narcotisation is not in all cases the extraordinarily simple matter which onlookers are apt to suppose. Experience only will enable us to estimate when such doses are really required, and therefore in beginning the use of the drug we should far rather incur imperfect results and have resort to ether than run unnecessary risk with omnopon alone. We must constantly keep in mind that the full effect of the drug is produced slowly and that repeat doses within a short period have a more potent effect than might be supposed. It is almost impossible to convey on paper the indications for repeat doses, or rather for the withholding of repeat doses. Some patients look drowsy or may be sound asleep when this judgment has to be given, yet wake up directly the operation is begun. The rate of respiration, the general condition and the temperament of the patients, the apparent lethargy produced, and other minor conditions have all to be taken into consideration. It is well, therefore, in order to have good results, for the operator to decide previously what the initial dose is to be and to have some reliable person on the spot to decide half an hour before operation whether a second dose is necessary.

In satisfactory cases, the condition of the patient before, during, and after operation is so ideal that I think it well worth while to take trouble to master the details which will procure equal results in all cases.

Aberdeen.

BREAST-FEEDING: THE VALUE OF THE TEST-FEED.[1]

BY ERIC C. PRITCHARD, M.A., M.D. OXON., M.R.C.P. LOND.,
SENIOR ASSISTANT PHYSICIAN, QUEEN'S HOSPITAL FOR CHILDREN, HACKNEY-ROAD, N.E.; PHYSICIAN TO OUT-PATIENTS, CITY OF LONDON HOSPITAL FOR DISEASES OF THE CHEST; AND HONORARY PHYSICIAN FOR INFANT CONSULTATIONS, ST. MARYLEBONE GENERAL DISPENSARY;

HUGH RONALD CARTER, M.D. BRUX., M.R.C.S. ENG., L.R.C.P. LOND.,
HONORARY PHYSICIAN FOR INFANT CONSULTATIONS, NORTH KENSINGTON;

AND

W. O. PITT, M.D. CANTAB.,
ASSISTANT MEDICAL OFFICER, THE PARK HOSPITAL FOR CHILDREN, HITHER GREEN; LATE VISITING MEDICAL OFFICER, ST. MARYLEBONE WORKHOUSE.

BY a "test-feed" we mean an estimation of the amount of breast-milk obtained by the nursling at a single feeding. The estimation is made by weighing the infant before and after feeding on scales sufficiently accurate to record differences of one drachm avoirdupois. This test has been applied to most of the breast-fed babies who have attended the infant consultations at the St. Marylebone General Dispensary during a period of 6½ years, to infants who have attended the Kensington Infant Consultations during a period of 4½ years, to a certain number of sick infants who have attended at the Queen's Hospital for Children during the last 2½ years, and to a considerable number of infants born in the lying-in wards of the Marylebone Workhouse during the last 2 years. We have thus, in the aggregate, a large number of estimations of the amount of breast-milk obtained by nurslings during the whole of the first year. These estimations, in the cases of the Marylebone General Dispensary and the Kensington Infant Consultations have been taken under our personal supervision, while the Marylebone Workhouse and Queen's Hospital cases were weighed by trained and experienced nurses.

It is unfortunate that we have been unable to find analogous observations made in this country with which to compare our figures. To prove how little the method is understood in this country we may mention that when we embarked on these researches, in spite of the most careful inquiry, we could find no scales which could be used for this purpose, and we were compelled to order special weighing machines to carry out the work. It is needless to say that spring-scales, or ordinary baby scales, are quite useless for the purpose of accurate weighings. Heretofore, all our knowledge with respect to the amount of breast-milk consumed by the nursling has been derived from observations made in France, Germany, and Austria, where racial and social conditions are somewhat different from our own.

Our results are so widely different from those obtained by Heubner, Feer,[2] Camerer,[3] Peter,[4] Beuthner,[5] Hachner,[6] and others on the Continent that we might have hesitated to publish our several results had they not shown such singular agreement in the more important details. Comparing these foreign results with ours, it would appear that nursing mothers who live under good hygienic conditions in maternity institutions such as those in which these continental observations were made, supply much larger amounts of milk than do the class of women in this country who live at home and attend our out-patient clinics.

Our observations, which for the most part have been made at varying times of the day at our respective clinics, possibly are not so accurate as many of those made abroad in which the amount of every feed was definitely measured. In our investigations we have, in each case, ensured the lapse of an interval of from two and a half to three hours between the time the infant was last put to the breast and the time of the "test-feed." We have estimated the total supply in the 24 hours by multiplying the amount of milk obtained at one "test-feed" by the total number of feeds taken in the 24 hours. Thiemich[7] asserts that this does not give an accurate estimation of the amount in the 24 hours. It is somewhat difficult to prove or disprove the truth of this statement in the case of out-patients, for it is practically impossible to estimate all the domiciliary feedings Although the test feeds were made in Marylebone sometimes at 10.30 A.M. and sometimes at 3 P.M., in Kensington at 3 P.M., and at the Queen's Hospital at 9 30 A.M., our several estimates for the total amount for the 24 hours agree so closely that it is difficult to believe there is any substantial inaccuracy in our method. In private cases we have noted one feed differs but little from another when the feedings are by the clock, and not at irregular intervals. We here append the results of a few private cases in which every feeding was carefully estimated.

TABLE I.—*Cases in Private Practice. Test Feeds Conducted for each Meal during 24 Hours for Three Days in 5 Cases. Average for Three Days in Each Case.*

Age and weight of infant.	Time of feeding.								
	5 A.M.	7 A.M.	9 A.M.	11 A.M.	1 P.M.	3 P.M.	6.45 P.M.	8.45 P.M.	10.45 P.M.
	oz.	oz.	oz.	oz.	oz.	oz.	oz.	oz.	oz.
Case 1.—17 days, 9 lb. 7 oz. ...	5	3	3¼	3¼	3	3¼	3¼	3	3
,, 2.—1 month, 9 lb.	4	2	2½	2	2	2	2½	3	2
,, 3.—2 months, 10 lb. ...	3½	2	2½	2	2½	2	2¼	2½	2
,, 4.—4 months, 10 lb. 6 oz.	5	—	3	—	2½	—	3½	—	3
,, 5.—2 months, 11 lb. ...	5	3	3¼	2	2½	3	3½	2½	3

It will be noted that the variations in the amount of milk consumed are comparatively slight, except in the case of the early morning feed; this feeding, owing to the prolonged rest over-night, is invariably the largest in the 24 hours. On the other hand, some of the figures which we have collected from the literature appear to bear out Thiemich's statement. For instance, certain of Feer's cases show considerable variations, and, again, variations to a lesser degree are to be noted in Peter's cases. We do not know, however, in these instances whether the intervals were strictly regulated by the clock. We ourselves have always attached the greatest importance to regularity in the times of feedings, and have spared no trouble to secure complete regularity in the meal-times of the infants who have attended our consultations.

Most of our estimations have been made between the third week and the sixth month. During the first two weeks of

[1] A paper read before the Society of Infant Consultations on July 13th, 1911.

[3] Zeitschrift für Biologie, Band xiv., 1878.
[4] Archiv für Kinderheilkunde, Band xxx., xxxiv., 1902.
[5] Ibid., Band lvi., 1902.
[6] Jahrbuch für Kinderheilkunde, 1880–1881.
[7] Lehrbuch für Kinderheilkunde, E. Feer, p. 40, 1911.

life infants are seldom brought to our consultations, and after the sixth month we frequently employ supplementary feedings, which naturally deprive the single test-feed of statistical value.

To add to the completeness of our figures the early hiatus between the first and twenty-first day of life has been filled in by a very carefully conducted series of "test-feeds" which have been carried out in the maternity wards of the Marylebone Workhouse. These figures can, in a sense, be compared to those of foreign observers, as they refer exclusively to nursing mothers who have been kept under observation in an institution where the dietetic and hygienic conditions were carefully regulated. Our figures for this group are based on 61 cases, and the total number of test-feeds taken was 9435. For the sake of comparison we inscribe in parallel columns similar averages worked out by Feer and Camerer; as their figures are based on six cases only they have not the same statistical value as our own.

TABLE II.—*Average Amount of Milk Consumed by Nurslings during the First Ten Days of Life in 24 Hours.*

Day of life.	1st.	2nd	3rd.	4th.	5th.	6th.	7th.	8th.	9th.	10th.
	oz.	oz.	oz.	oz.	oz.	oz.	oz.	oz.	oz.	oz.
Our cases (61)	½	4⅛	4⅛	6½	6	7¼	8	7	8	8½
Feer's cases (6)	0	½	5¾	11¼	15	16½	20	18½	21	20
Camerer's cases (6) ...	¾	2½	6	11½	12½	13	16	16½	16	15¾

We are unable to explain why our figures, taken as a whole, are so much lower than those given by Feer or Camerer; nor can we explain the anomaly that on the second day of life our cases obtained more milk than did those in the parallel series.

In Table III. we give more detailed figures of the amount

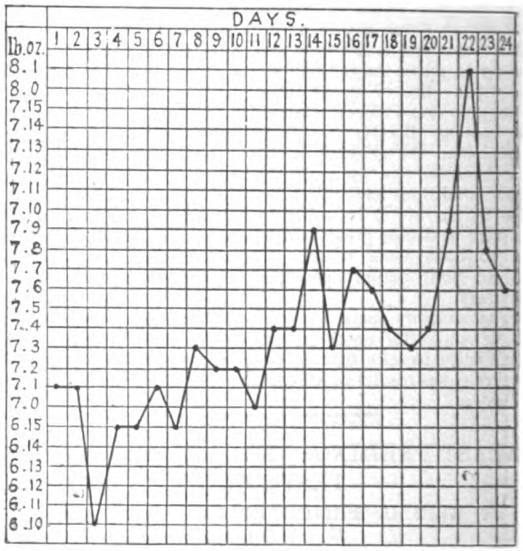
of milk obtained on successive days by the infants in our series, of the number of feeds given in the 24 hours, and of the weight of the infants from day to day, from which the average daily gain or loss can be calculated.

It will be noticed that the gains or losses registered from day to day show somewhat marked deviations from the standard which is generally regarded as normal; nevertheless, the curves, taken as a whole, conform to the usual type—that is to say, at the end of the first week the infants have regained the initial loss, and present approximately the same weight as at birth, and during each of the following weeks they show a gain of about half a pound. In other words, the infants in our series, in spite of the fact that their average intake of food is well below the accepted standards, increase in weight at about the same rate as infants who are estimated by other observers to take a very much larger quantity of milk. This is shown by the accompanying curve:—

FIG. 1.—*Curve showing Variations in Weight during First 10 Days of Life. Average Weight of 61 Breast-fed Infants.*



The average test-feed from the tenth day onwards has been estimated in the cases of a large number of infants of varying ages who have attended at our clinics in Marylebone and Kensington. The mothers of these infants lived at home without any disciplinary control. For the most part, the infants sent to the Marylebone Consultations were either ill, mismanaged, or weaklings from hereditary or congenital causes, while of those sent to the Kensington Consultations the majority were mismanaged, a few were ill, but some were fine, healthy infants.

For the sake of comparison, we give the test-feeds of a number of babies who were brought to the Queen's Hospital for Children, either because they were wasting or because they presented other symptoms of disease.

TABLE IV.—*Showing the Average Amount of Milk Consumed at a Test-feed During the Various Ages up to Nine Months According to Different Observers.*

	Weeks.			Months.							
Age	2	3	4	2	3	4	5	6	7	8	9
	oz.	oz.	oz.	oz.	oz.	oz.	oz.	oz.	oz.	oz.	oz.
Marylebone figures	1·87	1·62	1·95	2·04	2·26	2·23	3·0	2·81	3·08	2·67	—
Kensington figures	—	1·75	1·85	1·8	2·0	2·15	2·5	2·67	2·72	2·9	3
Queen's Hospital figures	—	1·0	1·47	2·0	1·84	1·35	2·18	3·0	2·08	—	—
Peter's figures ...	2·4	2·7	2·87	5·42	—	—	—	—	—	—	—
Camerer's figures ...	2½	3½	3½	3½	4½	3½	—	—	—	—	—
Beuthner's figures	2	2¼	2⅔	3¼	4½	4½	5	—	—	—	—
Feer's figures	2·5	2·8	3·5	4·0	4·5	4·8	4·8	—	—	—	—
Hachner's figures ...	2½	2½	3	5½	5½	5½	5½	5½	7	—	—

Unfortunately, we have been able to find only a few figures by foreign observers with which to compare our results, since most of their estimates are worked out for the 24 hours and not for the individual feeds. In the following table we give in parallel columns our figures for the 24 hours and also those published by Camerer, Feer, Beuthner, Peter, and Hachner:—

TABLE V.—*Showing the Average Amount of Milk Consumed in the 24 Hours.*

	Weeks.			Months.						
Age	2	3	4	2	3	4	5	6	7	8
	oz.	oz.	oz.	oz.	oz.	oz.	oz.	oz.	oz.	oz.
Marylebone figures...	18·8	14·77	13·46	16·38	16·02	15·85	13	18·25	20·66	12
Kensington figures	—	16·5	14·5	20	14·5	13·2	17·2	21·5	15·4	26·2

Feer's cases	2	2	2	2	2	2	2	2	2	—

* Camerer's figures, according to Feer, were based on 97 cases, but we have not been able to ascertain the number for the various ages.

Table VII. on the following page shows in parallel columns the average weights and the average increase in weight per week of the infants referred to in the above tables.

With respect to the figures in Table VII. there will be found a most remarkable similarity in the Marylebone and Kensington cases; the figures from the Queen's Hospital, as would naturally be expected in the case of sick infants, are altogether on a lower plane. Camerer's figures are uniformly higher—that is to say, his infants, who are well cared for in institutions, and whose mothers are regularly and judiciously fed, show a larger weekly increment in weight, which is almost, if not entirely, parallel with the larger amount of breast milk consumed.

Our experience with the test-feed in Marylebone and Kensington has proved to us that no reliance can be placed on the quantity of milk consumed as a criterion of the progress or nutrition to be expected in the infant. Many babies make the most remarkable progress on exceedingly small quantities of milk, while others, whose daily allowances appear to be ample, show various symptoms of malnutrition. Our general impression for a long time has been that, on the whole, the infants who obtain the smaller amounts give less trouble and make better progress than those obtaining the larger quantities. We, therefore, decided to arrange our cases into three groups according to the amount of milk consumed daily and ascertain whether any inferences could be drawn from the evidence thus afforded:—Group 1: Those obtaining less than 10 ounces of milk in the 24 hours; Group 2: those obtaining from 10 to 20 ounces; and Group 3: those obtaining over 20 ounces.

TABLE VIII.

1.—*Cases in which Less than 10 oz. of Milk were Consumed during the 24 hours.*

Queen's Hospital	17	11½	9 12	6·6	1·4

2. *Cases in which between 10 and 20 oz. of Milk were Consumed during 24 hours.*

Marylebone... ...	82	9⅝	10 6	14·0	4·66
Kensington... ...	50	13	10 5	13·0	3·74
Queen's Hospital	47	10	10 0	14·5	2·1

3.—*Cases in which more than 20 oz. were Consumed during 24 hours.*

Marylebone... ...	49	9⅞	10 9	25·5	3·17
Kensington... ...	25	16	13 1	27·0	2·81
Queen's Hospital	13	11½	12 12	23·5	1·9

The similarity between the Marylebone and Kensington cases is most striking. The Queen's Hospital figures are hardly comparable, for they represent the test feeds obtained in the case of infants all of whom were ill, but even this series of cases would not have differed so greatly from the first series had it not been that among the infants obtaining less than 10 oz. of milk in the 24 hours there were two or three very severe cases of illness presenting heavy losses in weight during the week.

In both the Marylebone and Kensington series the infants who for the time being were obtaining less than 10 oz. of milk in the 24 hours showed a larger weekly increment in weight (4·38 oz. and 4·8 oz.) respectively than those infants who were obtaining larger amounts. Those infants who were obtaining over 20 oz. per week showed in both of our series the smallest weekly gains in weight.

It would appear that those infants who are brought up in institutions and receive a larger amount of breast milk increase in weight more rapidly than those who attend our infant consultations as out-patients; on the other hand, among this latter class of infants it would appear that those who receive larger quantities of milk, instead of putting on more weight per week put on a smaller amount.

If our observations are reliable it is not easy to offer an explanation of this paradoxical evidence. It may be that on an average the milk which is secreted in large amount is inferior in quality, and in this connexion it must be remembered that chemical analysis only affords a very crude estimate of quality. Analysis may show the relative

percentage of proteids, fats, and sugars, but it cannot, as yet, afford a differential estimation of constituent proteid bodies, nor does it indicate whether or no they possess toxic properties. On the other hand, it must be remembered that institutional infants live under superior hygienic conditions than do the poor class of infants who attend our consultations; *ceteris paribus* the better the hygienic conditions and the more active the vital processes the greater is the demand for food. Want of air, sunlight, and all the natural stimuli for active metabolism reduce the vitality of our out-patient infants to such a debased level that it is conceivable that an allowance of food which would be physiologically appropriate for the institutional infants may be relatively excessive for the needs of our class of out-patient infant; and overfeeding, as is now well understood, leads sooner or later to malnutrition and loss of weight.

We do not claim that our figures can be regarded as criteria of the amounts of breast milk obtained by infants exposed to different and better conditions; indeed, we know from our experience of private cases that the amount of milk consumed by the latter is often very much larger. The largest individual test-feed recorded at the Marylebone Consultations is just over 5 oz., and at Kensington it is 6 oz., whereas in private cases 6, 7, or even 8 oz. are by no means uncommon measurements for individual test-feeds. We are, however, quite agreed that it is impossible to conduct breast-feeding on accurate or scientific lines without the control of an occasional "test-feed."

The test-feed is the most valuable aid to the diagnosis of the ailments of breast-fed infants which we possess. It is mere guesswork to attempt to treat cases of this kind unless we know how much milk the infant is receiving.

Infants are often brought to our clinics who have been treated by drugs for constipation when the sole cause of the condition is starvation. Again, infants are often given supplementary feeds of cow's milk in amounts of 4 or 5 oz. (we have known as much as 9 oz.), when the test-feed proves that the amount they obtain from the breast is about 1 oz., sometimes less; under such conditions it is hardly surprising that cow's milk is found to disagree. As an aid to diagnosis and for accurately adjusting the amount of food given in supplementary feedings, or at the time of weaning, the test-feed soon becomes absolutely indispensable to those who have had experience of its advantges.

It is hoped that the publication of these results will stimulate others to pursue similar lines of inquiry in order that our figures may be critically examined.

On the whole, breast-feeding is conducted more carelessly than artificial feeding, and our experiences of the methods pursued at many maternity institutions suggest that this statement is true in their case also. The results of breast-feeding are often so extremely bad that recourse is taken to artificial feeding, and the latter is often unjustly blamed for subsequent failures which more reasonably can be referred to initial mistakes in breast-feeding.

The best results we obtain both in Marylebone and in Kensington are undoubtedly those cases in which combined feeding is employed after the third month of life. In all these cases the amount of artificial food supplied is regulated by the evidence afforded by the "test-feed," and the subsequent physiological reactions of the infant.

PACHON'S SPHYGMO-OSCILLOMETER

AND ITS USE IN THE DETERMINATION OF BLOOD PRESSURE, WITH NOTES ON THE THEORY OF OSCILLATIONS.

BY J. F. HALLS DALLY, M.A., M.D. CANTAB., M.R.C.P. LOND.,

ASSISTANT PHYSICIAN TO THE NATIONAL HOSPITAL FOR DISEASES OF THE HEART, SOHO SQUARE; PHYSICIAN TO THE ST. MARYLEBONE GENERAL DISPENSARY.

FOR general purposes sphygmomanometric methods conveniently may be divided into two main groups: (1) those which are based upon estimation of the pulse wave below the level of the point of compression; and (2) those which are based upon estimation of movements or oscillations of the arterial wall at the level of compression.

Of the first group, perhaps the most widely used in this country is one of the modifications of the Riva-Rocci sphygmomanometer. In practice, however, such an instrument registers only the maximal or systolic arterial pressure, and it is only in experienced hands, and even then with considerable difficulty, that the minimal or diastolic pressure can be determined with any approach to accuracy. It is therefore impossible to obtain a complete blood pressure record.

With reference to the second group, for information other than that regarding the systolic pressure, we must turn to instruments which are based on the "method of oscillations." This method was first evolved by Marey,[1] who showed that if a vessel, instead of being compressed upon one surface only, was placed in a fluid medium to which pressure could gradually be applied, it was clear that by raising the pressure of the surrounding medium, a point was reached at which the internal pressure could be overcome with resultant collapse of the arterial wall. The closure of the vessel indicated the moment at which the surrounding pressure, as measured by the manometer, exceeded the intra-arterial pressure. If instead of an artery a segment of a limb was enclosed within an inelastic reservoir filled with fluid, the oscillations set up in the fluid were found to vary in amplitude with the pressure. Hence Marey endeavoured to find that pressure which was requisite to produce the largest oscillations, believing that at this moment the completely relaxed arterial walls floated freely, and that an effect was produced similar to that which would occur were the blood pressure applied directly to the manometer.

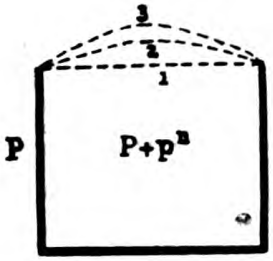
Founded on this method of oscillations many instruments

have been devised, including those of Hill and Barnard, Erlanger, von Recklinghausen, Vaquez, Pal, and Amblard, but although a great advance has been made in such instruments yet all of them have the grave disadvantage of working at inconstant pressure.

In considering instruments which register both systolic and diastolic pressures, reference must be made to the auscultatory method, which was discovered in 1905 by Korotkow,[2] and which has since been studied extensively by various workers—in particular, Krylow, Fischer, Schrumpf, Zabel, Winterhalder, and more recently in England by Oliver. But this method, although affording information as to the systolic and diastolic pressures, has the obvious disadvantages which are inseparable from any auscultatory method, and cannot be compared as a practical one with the oscillatory method as exemplified in Pachon's instrument.

Let us now consider what takes place in an ordinary aneroid apparatus, such as that of Hill and Barnard or Amblard, which may diagrammatically be represented in Fig. 1. When the instrument is at rest the pressure within

FIG. 1.



and without will be the atmospheric pressure P and the wall of the aneroid chamber will not be distended, as at (1). If now the internal pressure be raised so that the capsule assumes the position (2), the internal pressure will then be equal to the sum of the atmospheric pressure P, together with the given additional pressure p. Suppose the pressure be still further raised to p^n, the wall of the aneroid will assume the position (3), the internal pressure being $P + p^n$, whilst the external pressure remains P, the amount of distension being represented by the formula $(P + p^n) - P$.

by the invention of the sphygmo-oscillometer of Pachon,[3 4 5] which works at constant pressure throughout the whole period of investigation. I do not propose here to enter into a detailed description of the construction of this apparatus, since this has already been given.[6] Briefly, however, it may be said that Dr. Pachon has enclosed an aneroid capsule of aluminium within an air-tight and rigid metallic box. (Fig. 2.) This capsule is connected directly with an armlet, and by a three-way passage with the interior of the outer metallic box. The pressure within this system is indicated

FIG. 2.

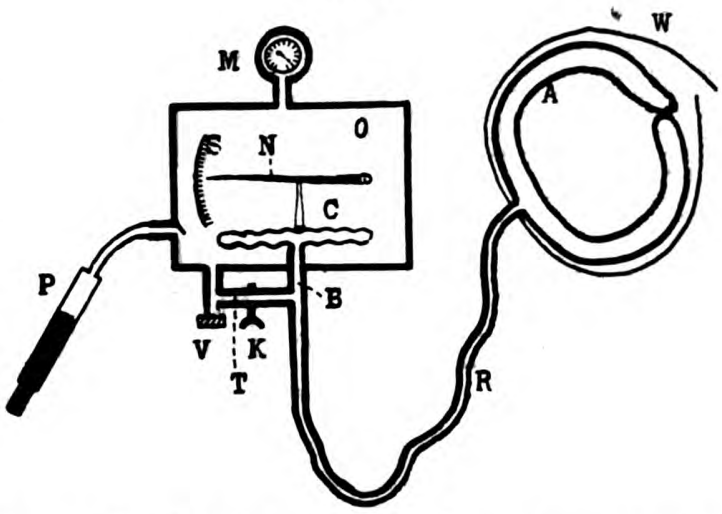


Diagram in section of the sphygmo-oscillometer of Pachon. P, pump; M, manometer; O, outer metallic box; C, capsule; N, registering needle, which is drawn too coarsely, and should taper to a fine point at the left extremity and be quite horizontal; S, oscillometer scale; V, escape valve; T, B, R, three-way channel; K, separator key; A, indiarubber armlet; W, outer inelastic webbing.

on the dial of a small manometer. The inner capsule can be cut off from communication with the external chamber by means of a separator key, and thus allows pulsations set up in the armlet to be transmitted directly to the interior of the aneroid chamber. Fig. 3 represents purely diagrammatically this instrument, (a) being the capsule and (b) being the outer box.

Just as in Fig. 1, the pressure throughout the whole apparatus at rest will be the atmospheric pressure P, but if the pressure is raised to p^n, on each side of the aneroid capsule the pressure will now be $P + p^n$, the external

FIG. 3.

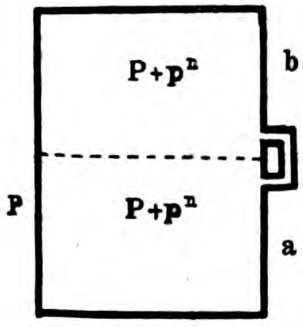

FIG. 4.

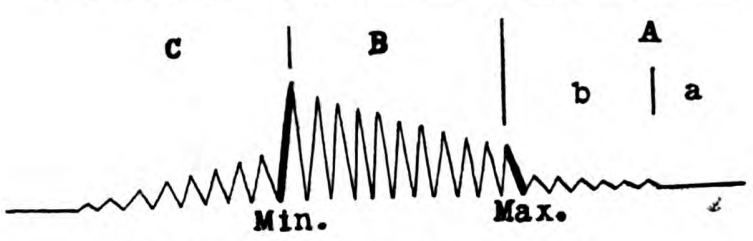


The reading in this diagram, as in Fig. 5, is from right to left.

If the capsule be in the position (2) any communicated movement due to alterations in internal pressure set up by variations in the blood pressure must of necessity be superadded, therefore the movement of the capsule will be limited and the greater p becomes the less will be the movement of the capsule. Hence it follows that an instrument of this type works at inconstant pressure, and with increasingly high grades of blood pressure its sensitiveness diminishes.

Recently, however, these difficulties have been overcome

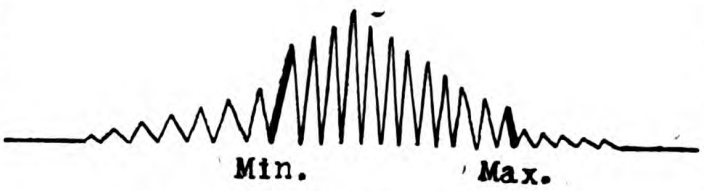
atmospheric pressure, of course, still remaining P. No displacement of the walls of the capsule therefore can take place, except that which is caused by variations in pressure transmitted to the armlet by the blood pressure. As Dr. Pachon says, the instrument is always extremely sensitive and works with constant maximal sensitiveness.

We may now consider the series of events which occurs when the method of oscillations is used. When the pressure is raised considerably above the maximal blood pressure (Fig. 4) we find a Phase A where the needle either shows:

(a) no oscillations; or (b) oscillations, equal and of small magnitude or of a negligible increase: these are perhaps better termed fibrillations. As the pressure is lowered, a point (Max., Fig. 4) is reached at which a sudden and definite increase in the size of the oscillation occurs. This point indicates the maximum or systolic blood pressure. There is then a gradual increase in the size of the oscillations (Phase B) until a point is reached at which they have attained their greatest amplitude. This point registers the minimum or diastolic pressure (Min., Fig. 4). Below this a sudden decrease takes place in the size of the oscillations which gradually disappear (Phase C).

The above represents a curve which is typical; nevertheless, variations may occur, an example of which is given in Fig. 5. Such variations are most manifest, as one would expect, when instruments working at inconstant pressure are employed, and at times there may be considerable difficulty in determining the exact point of the systolic and diastolic pressures. With Pachon's sphygmo-oscillometer, on the other hand, the greater length of oscillation due to the fact that the instrument works at constant pressure renders it extremely sensitive, and therefore enables changes in the size of the oscillations to be perceived with ease.

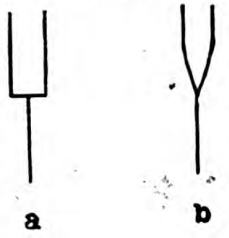
FIG. 5.



This reading, as in Fig. 4, is from right to left.

To understand the above diagram let us investigate the changes which take place in an artery under compression. The systolic pressure is that pressure which is necessary completely to close an artery and to stop all circulation below. In theory, therefore, supramaximal oscillations should not exist, and, were the lumen of the artery suddenly and cleanly obliterated, as in Fig. 6a, this indeed would be the case. In practice, however, it will be found that not infrequently a funnel-shaped depression of the artery (Fig. 6b) is produced at the upper border of the armlet. Shocks due to the blood stream acting on this funnel-shaped depression are transmitted to the registering needle, and so cause small indefinite oscillations, but no separation of the arterial wall takes place. As the pressure is decreased, at the level of the systolic blood pressure the arterial walls separate to a very slight extent and for a very short time with a resultant sudden and definite increase in the length of the oscillations. With further lowering of the pressure the arterial walls separate and remain apart for gradually increasing intervals. Hence the oscillations will become larger. At the level of the diastolic pressure—i.e., when the external pressure just equalises the internal blood pressure—the oscillations will theoretically be greatest. At this point the arterial wall supports an equal pressure alike on its inside and its outside, and, floating freely, is in a condition of equilibrium. Below this level the oscillations diminish in proportion as the external pressure progressively becomes less than the internal pressure until at length they fade away entirely.

FIG. 6.



It will now readily be understood how difficulty arises in accurately estimating such degrees of variation with an ordinary manometer working at inconstant pressure, whose capsule already is in a state of positive distension. With the sphygmo-oscillometer, on the other hand, *by reason of the constant pressure which is maintained throughout, the oscillations are reproduced in their entirety.* At times the zone of supramaximal fibrillations is well marked, but rarely is there difficulty in distinguishing the definite increase in size which denotes the systolic pressure. Further, since the oscillations are reproduced to the best mechanical advantage, not only may the various characteristics of the pulse—e.g., arrhythmia, &c.—be studied most easily, but its amplitude may be recorded in terms of divisions of the oscillometer scale.

In conclusion, I propose to give a few typical examples of the figures which may be obtained by the use of the sphygmo-oscillometer. Neither systolic nor diastolic pressure alone affords that complete blood pressure record which is given when the systolic pressure, the amplitude of the pulse, and the diastolic pressure are noted simultaneously. Take, for example, a systolic pressure of 130 mm. as estimated by Pachon's instrument. This alone might indicate that we were in the presence of a case of mitral stenosis, pulmonary tuberculosis, or various asthenic states, &c. If to this, however, we add the diastolic pressure and the pulse-amplitude and obtain a formula such as 130– 0, 5– 80, we gain information of value. Put into words, this formula means that the systolic pressure is 130 mm., the amplitude of the pulse is half a division on the oscillometer scale, and the diastolic pressure is 80 mm. Such a formula is characteristic of mitral stenosis, where we have a low systolic pressure combined with a small pulse, and a diastolic pressure which is relatively high. Let us take another example. A systolic blood pressure of 250 may indicate aortic disease, arteriosclerosis, chronic interstitial nephritis, &c., but if we obtain a formula 250–7–50, we realise at once that we are dealing with a case of aortic regurgitation. Moreover, we know that these figures are evidence of pure aortic regurgitation, since when the regurgitation is combined with stenosis the diastolic pressure will be raised to a degree varying with the amount of stenosis.

This preliminary communication is intended merely as a brief outline of the "theory of oscillations," and of the salient points of an instrument which accurately records these oscillations. In a further paper I hope to publish some of the results which I have obtained from a large number of clinical determinations of blood pressure with Pachon's sphygmo-oscillometer.

My thanks are due to Dr. Kenneth Eckenstein, assistant pathologist to the National Hospital for Diseases of the Heart, for his kind assistance in taking readings with this instrument.

Lower Seymour-street, W.

THE SEWERAGE OF FALMOUTH.—The Local Government Board has granted permission to the Falmouth town council to borrow £3875 for a sewerage scheme and the construction of a new road.

UNIVERSITY OF LONDON.—The London Inter-Collegiate Scholarships Board announces that combined examinations in anatomy and physiology and in arts and preliminary scientific subjects will be held on Tuesday, Sept. 19th, for medical entrance scholarships and exhibitions of an aggregate total value of over £1700, and tenable at University College, King's College, and in the medical schools of Westminster Hospital, St. George's Hospital, London School of Medicine for Women, University College Hospital, and King's College Hospital. Full particulars and entry forms may be obtained from the Deans of the respective medical schools, or from the secretary of the board, Mr. Alfred E. G. Attoe, University of London, University College.

FULMINATING APPENDICITIS: PRESENCE OF LIVER DULNESS: LIGATURE-TEMPERATURE.

BY F. W. FORBES-ROSS, M.D. EDIN., F.R.C.S. ENG.,
AND
QUINTIN CHALMERS, M.D. GLASG.

THE following case of acute general peritonitis, due to the sudden onset of gangrenous appendicitis, and rescued by prompt surgical aid, is deemed worthy of record, especially because it presented a classical train of symptoms so typical of the condition, with the exception of the presence of liver dulness. We also consider that the ligatures and sutures in the wall of the bowel and on the stump of the appendix should be regarded as a cause of the post-operative febrile condition, so often seen for a limited period following the operation for removal of the appendix in septic cases.

The patient, a male aged 34 years, an American from Boston, was seen by Dr. Quintin Chalmers at 9 A.M. on Oct. 19th, 1910, when he complained of a dull aching and stabbing pain over the region of the appendix. On examination the parts were tender, and some impairment of resonance was apparent, as well as slight unilateral rigidity of the abdominal parietes. The temperature was 99·6° F., and the pulse about 100. The tongue was more or less normal and moist. Rest in bed was advised, and an expectant attitude decided upon. At or about 3 P.M. (temperature 101·4° and pulse 110) the patient complained of an increase of pain, which continued until after 6 P.M., when he described himself as suddenly becoming easier. When he was seen by Mr. Forbes-Ross in consultation at 10 o'clock the same night, the patient expressed himself as feeling much better and fairly easy, but added that the pain he went through between 4 and 6 P.M. "would serve him as a memory for a lifetime." The fact was elicited that he had had three previous attacks of mild appendicitis before at intervals of about 18 months.

The physical condition was as follows. The abdominal parietes were absolutely rigid and retracted, and absolutely immobile during respiration. There was no marked tenderness over McBurney's spot, but resonance and an ill-defined tenderness (slight) over the whole abdomen, otherwise there was a sense of stomach-ache referred to the umbilicus, but nothing to compare with the pain between 4 and 6 P.M. The temperature at 10 P.M. was 102·4°, and the pulse was 124 and apparently rising in frequency. There was no absence of liver dulness. The tongue was moist and not by any means typical of the so-called "abdominal tongue." The patient was lying on his back with his legs drawn up, but had no anxious facies or sunken countenance—in fact, quite the reverse.

The diagnosis of acute general peritonitis in its initial stage was made, and immediate operation was advised as the only hope of survival of the existing attack. Naturally the patient, who expressed himself as being fairly free from the previous pain and feeling better, was decidedly opposed to operative interference, as was also his wife, but on earnest pressure ultimately consented, and at 11.30 the same night Dr. P. H. Parsons administered an anæsthetic and Mr. Forbes-Ross, assisted by Dr. Chalmers, opened the abdomen over the appendix by skin incision and separation of the muscular fibres. The abdomen contained a large quantity of white, thin, milk-like pus, which welled up through the wound from amongst the coils of the small intestine. There was little or no attempt by nature to seal off the diseased area. The cæcum was drawn out of the abdomen and the appendix sought for, but the only evidence of its existence was a greenish-grey patch with a hole of the size of a sixpence in what was apparently the cæcal wall itself. On careful examination, however, it was found that the appendix was infolded along its entire length by the cæcal wall, so that it appeared to be absent. The appendix required to be literally dug out of the wall of the cæcum. The only guide to its existence was the apparent perforation of the bowel. We believe that this tucking-away, parallel to its long axis, of the appendix in the bowel wall by adhesions, will account for the numerous instances in which appendicular abscesses (the result of chronic appendicular trouble or previous attacks) are opened, and no appendix can be discovered. The appendix is often described as "sloughed away" when really it is infolded in the wall of the bowel on its long axis. Having been shelled out from the bowel wall the appendix was ligatured close to the cæcum and invaginated by a purse-string suture and the meso-appendix stitched over the line of union. The abdomen was very gently dried by swabs inserted into the pelvis, and as little as possible beyond the removal of the appendix was attempted purposely—certainly no attempt at irrigation whatever. A large drainage-tube containing tape-gauze was inserted through the wound down into Douglas's pouch and the abdominal wound closed round the tube. The patient was returned to bed at 12 midnight and was made to sit bolt upright in bed. The next morning the pulse was 94 and the temperature 100·2°; the patient had slept fitfully and complained of thirst, but was doing well. On the second morning after the operation the case had almost ceased to present any point of interest other than the temperature, which was fluctuating between 99° and 100·6°. It was, however, confidently anticipated that on the ninth day after the operation the temperature would begin to approximate to the normal. The prediction was fulfilled. Experience seems to show that in these cases, where an abscess exists at the time of operation, and where the appendix is removed and the stump buried in the bowel wall, it requires about nine days for the ligatures and sutures to work through into the bowel and free themselves.

The removed appendix was about 7 to 8 inches long, as thick as the forefinger, and presented a complete stricture at its proximal end; hence the presence of liver dulness. In the distal portion beyond the stricture was a perfect specimen of a Boston baked bean, with intact cortical covering and two cotyledons and plumule. It was fæcally mummified. It was, of course, the cause of the previous attacks and the present gangrenous perforation of the appendix. The patient made an uninterrupted recovery and returned to his duties exactly one month from the date of the attack. At the present time (August, 1911) the wound is firm and sound and the man in robust health.

AN UNUSUAL CASE OF INTUSSUSCEPTION.

BY DOUGLAS WOOD, M.B., CH.B. ABERD.,
HOUSE SURGEON TO THE EVELINA HOSPITAL FOR SICK CHILDREN, LONDON.

THE patient, a girl just 2 years of age, was admitted to the Evelina Hospital for Sick Children on July 4th, 1910, under the care of Mr. H. S. Clogg. Her illness commenced suddenly a fortnight previous to admission. The initial symptoms were vomiting and the passage of blood and mucus per anum. Pain was said not to be a marked feature at the onset. The vomiting persisted periodically for a week, and blood was passed by the bowel for four or five days. Constipation was absolute throughout the illness, so that for a whole fortnight no fæcal matter was voided. During the fortnight she apparently had frequent attacks of intestinal colic, but for the greater part of the time she lay in bed in a listless condition, until towards the end when pain became more frequent and more severe, and she then became restless. She took fluid nourishment well after the vomiting had ceased. The abdomen was noticed to swell progressively, particularly towards the end of the fortnight. Several enemata were given, and these were either retained or returned in part without force. There was never any fæcal material in the washings, but occasionally some blood and mucus.

In view of these facts the condition of the child on admission was remarkably good. She was well nourished and of a good colour. Her eyes were clear though rather sunken, and the mouth was drawn down at the corners. She kept up almost constantly a cry, which was more of a whine than a pain-cry, which one might have expected in the circumstances. She assumed the knee-chest position in bed and strongly resented being disturbed. The tongue was dry and clean; pulse 120 and fairly good, and temperature 99·6° F. The abdomen was uniformly and considerably distended. Peristalsis was not observed. Rigidity was

absent, and the abdomen was free from tenderness. There was too much distension to allow of any swelling to be palpated. The rectal examination was negative.

There could be little doubt that the child was suffering from an intussusception and an operation was straightway performed. On opening the abdomen through a right paramedian incision it was impossible to prevent the prolapse of many coils of greatly distended bowel. An intussusception was easily delivered through the wound. It had travelled to the left iliac fossa. As is usual, the larger part was easily reduced, but the force employed in attempting the reduction of the last 6 inches or so was too great and the intussuscipiens gave way, the intussusceptum escaping through the rent. It was now seen that the intussusception commenced about 18 inches above the ileo-colic valve. About 12 inches of the small gut, including the intussusception, were resected, and an end-to-end anastomosis rapidly made. The child's condition was critical, and as the suturing had to be rapidly carried out in œdematous bowel the junction was almost certainly imperfect. For this reason, and also on account of the great intestinal distension, the bowel was drained on the proximal side of the junction by a Paul's tube. The abdominal wall was closed save in the lower part where the drainage was established.

There was marked shock from the operation, but the patient responded very well to subcutaneous saline infusion and ether hypodermically. Forty-eight hours after the operation there was a free flow from the fistula, and on the third day practically all the intestinal distension had disappeared. The child was now taking food well. On the fifth day the condition permitted of the second operation. During this subcutaneous saline infusion was continuously administered. The abdominal wound was freely suppurating, and it was impossible to exclude this source of infection from the peritoneal cavity. The wound was completely opened and the bowel bearing the tube drawn to the surface. On separating the adhesions around the previously anastomosed bowel the latter almost entirely gave away, the sutures tearing out on the slightest manipulation. The gut on the proximal side was still very œdematous, and some few inches of it, together with the site of the former anastomosis, were resected almost to the ileo-colic junction. The ends of the bowel were ligatured and invaginated with a purse-string suture. The ileum was laterally anastomosed to the cæcum. The ileum used for the anastomosis proved to be œdematous, contrary to expectation. The abdominal wall was sutured in a single layer on account of the child's condition and a drain inserted into the peritoneal cavity.

The shock following the operation was very great, and vigorous measures were necessary to combat it. The following day the condition was much improved and the bowels opened naturally. This improvement was maintained for four days. and then suddenly vomiting and marked collapse set in. The abdomen became distended, and the picture was one of acute intestinal obstruction in an already exhausted child. Food by the mouth was stopped, champagne freely administered, with saline infusions and ether and strychnine hypodermically. For the following two days the condition was critical and any operative interference was impossible. Two small stools were passed and the discharge from the wound had a distinctly fæcal odour. In a day or two it was obvious that a fæcal fistula had formed, and with this the symptoms of obstruction became relieved. It would appear most likely that the fistulous opening was at the site of the anastomosis, and presumably, from the after-history of the case, the obstruction was caused by adhesions at this site.

From this time onwards to the beginning of August the child rapidly and progressively lost weight and became extremely emaciated. The dressings were always soaked with intestinal contents. The fistula, however, showed some signs of closing, and an attempt was made to seal the opening over with guttapercha tissue and strapping. This was successful, and prevented any further escape of intestinal contents. The fistula was practically closed by the end of the first week in August. Following the closure of the fistula the child rapidly improved, and now at the beginning of September is well nourished and apparently in good health. The bowels are regular in action and of normal consistency. The wound is healed, and at present there is no suspicion of any hernia, which is remarkable considering the condition of the abdominal wound at one time.

There are some features in the case worthy of comment. One was struck principally with the extraordinary vitality of the child. She seemed to have considerable resisting powers to infection of the peritoneum, as this was freely exposed to infection at the second operation when the wound in the abdominal wall was purulent. The child had suffered from complete obstruction for a fortnight before coming into the surgeon's hands, she underwent two grave operations involving resection of some length of bowel within a period of five days, she had acute intestinal obstruction a few days after the second operation, and a fæcal fistula, through which all the intestinal contents escaped, for three weeks. The case serves to show that a child of this age can *exist* with a fæcal fistula for three weeks, and that any attempt at suturing the œdematous bowel is hopeless. Bearing these two facts in mind, should a similar case present itself, to quote Mr. Clogg, the correct treatment would be to resect the bowel and tie a tube in each end, and later to restore the continuity. In dealing with children the way is surprising in which they will sometimes successfully fight conditions which seem to be hopeless, and the above case which I have ventured to record is a striking example of such.

It may be incidentally remarked that the cause of the irreducibility of the intussusception was entirely the swelling of the intussusceptum, and not due to adhesions, which are always stated to be a potent cause. Mr. Clogg tells me that in all cases of irreducible intussusceptions which he has seen this has always been the case, and that he has never seen any adhesions between the intussuscipiens and the intussusceptum which would prevent reduction.

I am indebted to Mr. Clogg for permission to publish the notes of this case.

A DERMOID CYST OF THE TESTICLE.

BY ERNEST E. HUGHES, M.B., CH.B. VICT.,
SENIOR RESIDENT MEDICAL OFFICER, BARNES CONVALESCENT HOSPITAL, CHEADLE.

THE following case occurred at the Manchester Royal Infirmary, and my thanks are due to Mr. E. D. Telford for permission to publish it.

History.—A man, aged 35 years, a clerk by occupation, married, but no children, was admitted complaining of a swelling of the right testicle. He gave a history of some injury to the right testicle in childhood, and stated that the swelling had been present as long as he could remember. It had gradually increased in size. Some eight years ago he suffered from phthisis and has a cough at the present time. There was no history of venereal disease.

Condition on admission.—The scrotum showed the presence of a swelling on the right side suggestive of a uniformly enlarged testicle. Length, 3 inches; width, 2 inches. The skin of the scrotum was normal and freely moveable over the testicle, which was heavy, somewhat elastic, surface irregular, but not distinctly nodular. The vas and cord appeared normal. There was no translucency. A diagnosis of fibro-cystic disease of the testicle was made, and orchidectomy was performed by the inguinal route, the cord being divided at the internal abdominal ring. The patient made an excellent recovery.

Macroscopical appearance.—The appearance of the parts on removal was that of a very large testicle lying wholly within the tunica vaginalis. On opening the latter, no fluid escaped and no adhesions were found. The surface of the swelling was smooth, but showed a shallow groove running obliquely round the upper pole from above downwards and backwards and mapping off a portion 1 inch long by ½ inch broad. The epididymis was of normal size and therefore out of proportion to the size of the tumour. No hydatids of Morgagni were seen, but a well-marked vas aberrans of Haller was found on dissection of the epididymis. A vertical incision was made through the tumour along its posterior margin. The cut surface showed a complete tunica albuginea somewhat thickened, enclosing two distinct portions. An upper, solid, crescentic part marked off by the shallow groove mentioned from a lower, larger portion—the dermoid cyst. At first sight the upper solid portion appeared to be normal testicle, but this was disproved at a later stage. It was somewhat yellowish in colour and on critical examination showed numerous small cysts filled with a clear, colourless, colloid or mucoid material. The dermoid cyst was more or

less loculated and was separated from the upper solid portion by a fibrous layer which formed part of the cyst wall. The contents of the cyst consisted of the usual whitish sebaceous material with long, black, curly hairs and irregular flakes of bony consistence.

Microscopical examination.—Sections were cut and examined of the following:—(1) Vas deferens; (2) epididymis; (3) solid crescentic body; (4) wall of the dermoid cyst; and (5) contents of the dermoid cyst.

1. The vas deferens appeared normal. Its lumen was patent, but the walls were perhaps rather thicker than usual.

2. The epididymis. This section was planned to go through the epididymis at its junction with the two parts of the tumour. It showed a normal appearance of the canal of the epididymis with a condition as described below of the tumour.

3. The solid crescentic body. This section at once showed the complete absence of testicular structure. There was a thick fibrous capsule—the tunica albuginea—surrounding a loose fibrous stroma in which were numerous cysts, irregular in size and shape, lined by one or more layers of cells, and filled with a substance staining feebly with hæmatoxylin. Not a trace of a seminiferous tubule was seen.

4. The wall of the dermoid cyst. This showed a laminated fibrous appearance, lined internally by true skin in places, by stratified epithelial cells in others.

5. Contents of the cyst. (*a*) A piece of the putty-like sebaceous material was examined. It showed the presence of true skin, consisting of several layers of squamous cells lying on a rete Malpighii. The papillæ were very rudimentary. Numerous large sebaceous glands and many sweat glands were seen, but no hair follicles. (*b*) An attempt was made to show the structure of the hard, bone-like content. The section showed the appearance described of the cyst wall, with, in addition, some smooth muscle fibres and a small area of dense tissue, but no bone and no cartilage.

Remarks.—Testicular teratomata are of very uncommon occurrence, and very few cases are on record. They are always unilateral.

In cases reported by Verneuil,[1] Bland-Sutton,[2] D'Arcy Power,[3] Jackson Clarke,[4] and recently by Barrington,[5] where a side on which the lesion has occurred has been mentioned, that side has always been the right. A left-sided testicular dermoid has yet to be recorded, but a case reported by Bilton Pollard[6] in which a dermoid cyst was situated outside the tunica vaginalis and adherent to the left testicle, is hardly to be reckoned as a true testicular dermoid. Another feature which appears to be commonly associated with testicular dermoids is the presence of small cysts filled with a material variously described as gelatinous, mucoid, or colloid. What the exact significance of these cysts is one can hardly say. They may represent a degenerative condition of the testicular body, partial in some cases, complete in others (as the above), where no trace of testicular substance can be found.

THE ROYAL DENTAL HOSPITAL AND LONDON SCHOOL OF DENTAL SURGERY.—A series of post-graduate lectures will be given during the months of October and November, 1911, on Tuesdays, at 6 P.M. The lectures announced are as follows:—Oct. 17th, Heredity in Teeth and Jaws (Mr. J. G. Turner); Oct. 24th, Some Hospital Cases (Mr. W. H. Dolamore); Oct. 31st, The Relative Effect of Metal and Vulcanite on the Tissues of the Mouth (Mr. G. H. Berwick); Nov. 7th, The Relationship of Periodontal Disease to General Health (Mr. J. F. Colyer); and Nov. 14th, A Review of the History of Dental Caries, and the Present Position of the Question (Mr. J. H. Mummery). Further information will be supplied by the secretary of the hospital. Past and present students of the hospital and internal students of the University of London will be admitted to the lectures free.

Clinical Notes:

MEDICAL, SURGICAL, OBSTETRICAL, AND THERAPEUTICAL.

NOTES ON TWO SOMEWHAT UNUSUAL ABDOMINAL CONDITIONS IN CHILDREN.

BY VERNON H. STARR, M.B., B.S. LOND.,
LATE HOUSE SURGEON TO THE ROYAL DEVON AND EXETER HOSPITAL.

THESE two cases being, I believe, somewhat uncommon I thought a short note of them might be interesting. Both cases were under the care of Mr. C. E. W. Bell, surgeon to the Royal Devon and Exeter Hospital, to whom I am indebted for permission to publish them.

CASE 1. *Acute intussusception caused by a Meckel's diverticulum.*—The patient, a girl, aged 6 years, was taken ill in the afternoon of Sept. 26th, 1910, with pain in the stomach; no particular notice was taken of it. She vomited that night and looked pale. On the 27th she was in great pain and the vomiting continued. There was also marked tenesmus but no result; on one occasion only it is said she passed blood and mucus. A glycerine injection gave no result. She was seen by a medical man in the evening, and later at night she was removed to hospital.

The child, who came from an orphan home, was not very robust in appearance. On admission the temperature was normal and pulse 120. She complained of pain to the right of the umbilicus. The abdomen was generally soft and resonant, slight rigidity could be made out over the right rectus, but no definite lump could be felt. Rectal examination showed that the rectum was empty and ballooned; at the tip of one's finger a mass could be felt on the right side like a thickened appendix. Fotus were applied. There was no vomiting during the rest of the night, but she was very restless and the tenesmus continued. Early in the morning—i.e., of the 28th—she was in much pain and the abdomen was more rigid. Also now a definite sausage-shaped tumour could be felt, extending from the right of the umbilicus to the anterior superior spine and curling upwards towards the hepatic flexure.

An operation was performed and lasted one and a half hours. The mass was soon delivered through the wound, and at first looked like a volvulus. A mass could be felt in the cæcum, but the appearance was not that of an ordinary intussusception. After careful and considerable manipulation, owing partly to the tightness of the constriction and the poor condition of the bowel in some places, the intussusception was reduced. It was then found that it had been caused by an invagination of a Meckel's diverticulum, which had carried both limbs of the bowel through the ileo-cæcal valve, thus forming a U-shaped intussusceptum. The diverticulum was situated about two feet from the ileo-cæcal valve; it was two inches long, and in its congested state as thick as a finger. No resection was performed and the wound was closed rapidly. The patient was very collapsed, and in spite of saline infusion did not really rally, dying at 9.30 the same night.

CASE 2. *Strangulated hernia in a child aged 5 months.*—The patient, a male, was admitted on August 25th, 1910, suffering from a swelling in the left inguinal region. The child was otherwise quite normal and healthy. He had been breast-fed. No rupture had been noticed at birth, but when between two and three months old the child cried a good deal, and on one occasion could not pass urine. The medical attendant found a hernia down and replaced it. It had been down for five hours. On August 24th, at about 5 P.M., the mother again noticed a swelling in the left inguinal region and the child seemed in great pain. He also had retention of urine. Taxis was tried unsuccessfully by the local medical man. Fotus were applied but did not give relief. Fæcal vomiting began at 1 P.M. on the 25th. The bowels had not been opened since the evening of the 22nd.

On admission at 2 P.M. the child's temperature was 101·4° F. and the pulse 128. A hard, tender swelling was present in the left inguinal region. An operation was performed at 2.30 P.M. A very thin sac was found, in which was a coil of small intestine in a very congested condition.

The opening at the internal ring was very small. Herniotomy was performed and the pillars were sewn up. The child had a normal action the same evening. There was no vomiting and he made a good recovery, being discharged on Sept. 9th.

Church Mission Hospital, Peshawar, N.W. India.

EVAGINATION OF MECKEL'S DIVERTICULUM.

BY J. W. THOMSON, M.A., M.B., C.M. ABERD.,
ASSISTANT SURGEON, GENERAL HOSPITAL, WAKEFIELD.

MECKEL'S diverticulum, the remains of the omphalomesenteric or vitelline duct which connects the yolk sac to the convexity of the U-shaped primitive intestine, should have disappeared by the sixth month of fœtal life. It springs from the ileum about 100 cm. in adults and 30 cm. in newborn children above the ileo-cæcal junction, but it may be found as high as the duodenum or jejunum, or even in the cæcum or colon, according to which limb of the primitive intestine undergoes development. Kelly describes four types of Meckel's diverticulum. In the first the canal is short; there is a broad fissure at the umbilicus through which fæcal matter is discharged. The distal part of the ileum is insufficiently developed and the anus is constricted or occluded. In the second type the umbilical opening is smaller, the canal is longer, and there is no constriction or occlusion of the anus, and fæces pass in the normal way. This type may be produced at birth if the diverticulum still extends into the cord and becomes tied off with it. The case described below was originally an example of this variety. In the third type the distal portion of the vitelline duct has become obliterated, forming a fibrous cord, the filum terminale or terminal ligament. The fourth type is the variety of Meckel's diverticulum usually met with.

Meckel's diverticulum is the cause of intestinal obstruction in 5 or 6 per cent. of such cases in the ileo-cæcal region, and numerous are the ways in which it may bring about this condition, varying with the stage at which the obliterative process has been arrested. The obstruction may depend on the vagaries of attachment of the terminal ligament or the formation—knot or otherwise—which it may assume when unattached. The part it plays in intussusception is well known, while as a result of inflammation of the diverticulum paralytic ileus may be caused, or stenosis of the intestine may occur from adhesions, or from the pressure of an abscess. Ileus from evagination, partial or complete, of Meckel's diverticulum must be a very rare occurrence.

The patient was a baby, 13 months old, and was admitted to hospital on Jan. 7th, 1910. After separation of the cord an opening was noticed at the umbilicus from which, if the child had diarrhœa, fæcal matter was passed, but from which there was a constant slight discharge of a sticky, watery fluid. There was always a pouting of the mucous membrane when the child cried or otherwise strained, the degree of prolapse varying with the straining effort. Some hours previous to admission the child was straining and the diverticulum was completely everted. The everted diverticulum presented rather a puzzling appearance. At first sight it looked like a knuckle of deeply congested distended intestine about two inches long lying on the abdominal wall. On closer inspection it was noted that an aperture existed at the distal end and that the outer covering was of mucous membrane. The child could retain nothing. The abdomen was large, but not much distended, and I think the possibility exists that gas might find an outlet through the diverticulum. Reduction at this stage was out of the question and operation afforded the only hope of recovery. Following therefore somewhat the umbilical method of Mayo, a circular incision through the skin round the diverticulum was made and the abdomen opened. The everted diverticulum, lined internally with serous membrane, with its contained loop of afferent and efferent intestine was lifted out, clamps were applied, the intestine was divided, and end-to-end anastomosis performed. The child's condition rapidly improved, and it was fed from the bottle from time to time and seemed to be making favourable progress, but died suddenly ten hours afterwards in a convulsion.

With regard to the treatment of this rare condition it appears to me that, if the case is seen early and the child is in poor condition, reduction might succeed with or without an anæsthetic, aided, perhaps, by incision of the umbilical opening, recurrence being prevented by an appropriate dressing supported by strapping or an umbilical truss. Operation might then be resorted to under more favourable circumstances. Failing reduction, or as an alternative method, the diverticulum might be excised and the possibility considered of suturing the aperture in the intestine. As the structure of the diverticulum is similar to that of the intestine, part of the former might be used to close the opening or to strengthen the line of suture. Another method that the surgeon might be compelled to adopt would be to remove the diverticulum and suture temporarily the aperture in the intestine to the umbilical opening. If the child were in good condition the operation performed in the above case would seem to be eminently satisfactory.

Wakefield.

Reviews and Notices of Books.

A Clinical Atlas of Sectional and Topographical Anatomy. By RICHARD J. A. BERRY, M.D. Edin., M.D. Melb., F.R.C.S. Edin., F.R.S. Edin., Professor of Anatomy in the University of Melbourne. With 60 plates in colours. London and Edinburgh: William Green and Sons. 1911. Price 42*s.* net.

BOTH author and publisher are to be congratulated on the production of this volume, for the Clinical Atlas is a very attractively got up publication upon which a great deal of care has been lavished by all concerned in its making.

It is to the wealth of material available at the University of Melbourne that Professor Berry owes his opportunities for carrying out a large number of carefully planned sections of formalin-hardened and frozen bodies. He has been fortunate in his opportunities and wise in the use he has made of them. Great efforts have been made to ensure the accuracy of the reproductions of the actual sections, and to this end photography has been employed. We may miss, perhaps, the delicate detail of the beautiful plates of Braune and of Symington, but at least we are compensated by the knowledge that no craftsman's personal factor has been introduced, and that what we study in the plates is the actual condition in the body under observation. The methods employed are thoroughly up-to-date, and a band-saw driven by electricity has replaced the more laborious contrivances used by former workers in the field of sectional anatomy. In these details of technique Professor Berry's work marks a great advance upon that of his forerunners; but the innovation which most distinguishes this atlas is the cutting of the sections in planes recognised by the clinician, rather than in some arbitrary series of lines which have no meaning in the ordinary examination of the living body. The planes advocated by Dr. Christopher Addison have been chosen by the author, in order that the clinician may study the sectional anatomy of the body along lines whose surface markings are familiar to him. Sections taken between these well-recognised planes are indicated by their distance in centimetres from the planes. To assist the student in locating in the actual body the structures which he studies in the sections, the cadaver has been photographed while still intact with the plane of each individual section marked clearly upon it. It is therefore only necessary to turn to these plates to see exactly where the slice under examination came from, and so to build up a reconstruction of the organs as they lie beneath the surface of the body. Two such reconstructions are given by the author, and others could readily be made from the plates.

For the study of cranial topography the head has been cut in the transverse plane into ten slices at measured intervals

below the vertex. The fact that the head of an Australian native was used for section adds an interest—but perhaps hardly a corresponding measure of clinical utility—to these plates. The trunk has been cut both in transverse and sagittal planes, and a series of dissections of regions of special clinical interest is also added. A very complete atlas is therefore produced, and by a uniform reduction of its plates it has been brought within the limits of a volume which is easily handled. Braune's work possessed the merit that all its plates were of life-size, and that actual measurements could be made from them, and his atlas was therefore of an uncomfortably large size. Professor Berry has sacrificed the advantages of life-sized reproduction, but he has made his book an easily manageable one. A bibliography of sectional anatomy is given, and in it we rather miss the mention of the beautiful work on the sectional anatomy of the child done by Professor Symington. Since the subjects used by Professor Berry are all adult—and, indeed, mostly rather aged—the two works may be considered as the complements of each other.

The work is certain to appeal to clinicians, and there is no doubt that the plates can be relied on as actual representations of the position of the organs in the sections of the subjects selected for examination.

Les Nouvelles Mycoses: Exascoses (ex-Blastomycoses), Oïdiomycoses, Sporotrichoses, Botrytimycose, Oosporoses, Hémisporose. Par MM. DE BEURMANN, Médecin de l'Hôpital Saint-Louis à Paris, et GOUGEROT, Professeur Agrégé à la Faculté de Médecine de Paris. Paris: Masson et Cie. Pp. 165. Price, paper, 2.50 francs; boards, 3 francs.

THIS little work is one of the volumes of the Encyclopédie Scientifique des Aide-Mémoire, and its inclusion in this series indicates that the subject is not considered to be of merely academic interest. These mycotic infections can be regarded no longer as pathological curiosities, but have assumed an important place in medicine; this point is emphasised by Professor Landouzy in the introduction. That comparatively little interest has been taken in the subject in this country is probably due to the fact that, though very widely spread, they are either rare or have escaped observation in England, and no reports of English cases of blastomycotic or sporotrichic infection are mentioned in this book. Their practical importance lies in the fact that all these fungi can produce granulomata, and the diseases caused by them are liable to be mistaken for tuberculous or syphilitic infections, with unfortunate results in treatment and prognosis. As the authors point out, the distinctions formerly drawn between bacterial and mycotic infections do not hold good. These fungi, like the bacteria, act by means of their toxins, and produce humoral reactions leading to the appearance of agglutinins, precipitins, opsonins, and bodies capable of fixing complement. Immunity has been produced and patients give skin and other reactions when inoculated with killed and disintegrated cultures.

The title shows the range of infections dealt with. As is natural, the longest and most important section of the book is occupied by a consideration of sporotrichosis. The authors have especially studied these infections, both clinically and experimentally, and to them we owe the discovery of the sporothrix Beurmanni and the most useful methods of diagnosis. These latter consist in culture in the cold on Sabouraud's medium, employing Gougerot's artifice (*coulée de pus sur le verre sec*) of inoculating the tubes by allowing the pus to flow over the dry glass instead of over the surface of the medium, and the use of sporo-agglutination according to the method of Widal and Abrami. Questions of nomenclature and classification are also considered, but not at the expense of more important practical matters. There are a few illustrations.

The book is a masterly little treatise which should prove of service to the practitioner.

Thérapeutique Usuelle du Praticien. By ALBERT ROBIN, Professor of Clinical Therapeutics at the Faculty of Medicine, Paris. Second Series. Paris: Vigot Frères. 1911. Pp. 551. Price 8 francs.

IN our review of the first volume of this series (THE LANCET, March 18th, 1911, p. 746) we explained the plan which Dr. Robin had adopted in order to render the work interesting and practical—namely, that he selects certain morbid conditions that yield more or less readily to systematic treatment, and examines at length the general considerations which should determine the therapeutic measures to be used, and then he explains in detail how these measures should be applied. In the present volume diseases of varied natures are discussed. The first five sections are devoted to a consideration of the treatment of typhoid fever, and numerous hints are given as to the regulation of the diet and the management of complications.

The therapeutics of acute articular rheumatism, of polyarthritis deformans, and of acute and subacute gout are also fully described. Throughout the book Dr. Robin adduces numerous typical cases on which to found his remarks; this lends it a practical aspect, which adds to the interest and usefulness of the manual. Amongst other diseases the treatment of which is detailed, are diabetes, pneumonia, acute œdema of the lungs, bronchitis, and paralysis agitans.

Dr. Robin writes in a pleasant manner and one easy to follow. The directions as to the use of drugs or of other therapeutic methods are given fully and plainly, so that as a work of reference this series will prove of value in actual practice. The only drawback is that the diseases are not arranged in systems, so that unless a general index be subsequently published it will be difficult to ascertain in which volume to look for the required information.

What to Eat and Why. By G. CARROLL SMITH, M.D. London and Philadelphia: W. B. Saunders Company. 1911. Pp. 310. Price 12*s.* net.

THE author states in his preface that he has not attempted to cover the whole subject of dietetics, but has aimed to describe for the medical student, and particularly for the busy practitioner, the fundamental elements of food, and the principles underlying its use, both in health and disease; so that the country practitioner may not be under the necessity of sending his patient to be dieted by a city specialist. The chief questions propounded for settlement are: (1) How much protein should be given; and (2) what should be the proportion of fats and carbohydrates. After an introductory chapter on the uses of food, the conditions of obesity and emaciation are discussed; the chief pathological conditions are then considered in order, and appropriate dietaries recommended. Referring to Chittenden's researches, the author advises his readers to stick to the Voit standard of 100 to 120 grammes protein daily, "until stronger evidence of a better is produced"; for sufficient time has not yet elapsed for clinicians to prove or disprove Chittenden's results. Dr. Smith has not found that protein, taken in the usual moderate amounts, does any harm to the system, so long as digestion and elimination are satisfactory; but he believes that intestinal disturbances do often result from over-taxing the digestion with carbohydrates.

We are surprised to find the author referring to "the quite prevalent habit of wine-drinking among young

ladies"; he condemns the practice, which, however, is not common in this country and is growing less common, while, surely, it is very rare in the United States. Again, with regard to the active business man subject to stress and strain, which cannot always be treated by rest and sleep, Dr. Smith says (p. 35) that the stimulus of food, coffee, and tea is insufficient to meet the exhaustion that often results: "Alcohol seems to opportunely and satisfactorily afford the necessary prop," and to be less harmful than giving up the struggle, which often means great financial loss and perhaps ruin. We fear that this opinion may be taken to imply more than the author really means, and we regret that it should be so unguardedly expressed. On the following page it is stated that for persons in health under 30 alcohol is unnecessary and to be avoided; its occasional use in middle life is advisable, under medical direction. This is reasonable enough, but is hardly consistent with the advice just quoted.

There is considerable originality of thought and of expression in this work, which is obviously the outcome of large experience. Everyone may not agree with the author, but his utterances are suggestive and are attractively set forth. It is unfortunate that there are a large number of misprints. "Discrasia" may be designedly phonetic, but "kal" on p. 212, presumably an abbreviation for "calories," can hardly be accepted. On p. 26, line 8, "percentage" of protein, &c., is written where "weight in grammes" is what is intended to be stated.

Diagnostik der Nervenkrankheiten. Von Dr. L. E. BREGMAN, Oberarzt am jüdischen Krankenhaus in Warschau. With 193 illustrations. Berlin: S. Karger. 1911. Pp. 535. Price, paper, M.12; bound, M.13.60.

THE symptomatology of nervous disease has become so rich, and methods of examination so many and complex, that the general practitioner is unable to keep himself abreast of the advances in neurology in many instances. A volume such as the one under review, which has been compiled from the point of view of the practising physician, cannot fail to be of considerable utility. He comes into contact with nervous cases the diagnosis of which is often by no means easy or straightforward; but with this book to guide him he will be able to appreciate the meaning of symptoms and to reach an adequate diagnosis on which to base his treatment. Dr. Bregman has written in great detail from the standpoint of symptomatology; motor and sensory changes, paralyses and involuntary movements, disturbances of the reflexes and of the special senses, aphasia, apraxia, vaso-motor, and other systemic alterations, are all handled with conspicuous ability and lucidity. Most of the illustrations are well reproduced and there is an excellent index. The book can be cordially recommended to the student and practitioner, for it combines conciseness of description with a wide range over the vast field of neurological symptoms and signs.

Die Erkrankungen des Herzbeutels und ihre Behandlung. (*Diseases of the Pericardium and their Treatment.*) Von Dr. FRANZ SINNHUBER, Königsberg i. Pr. With 18 figures in the text. Berlin: August Hirschwald. 1911. Pp. 114. Price 3 marks.

DISEASES of the pericardium are, as a rule, dismissed with somewhat scant reference except in the larger text-books on medicine. They are of considerable importance clinically, and their successful diagnosis and treatment require careful discrimination and sound judgment.

Dr. Sinnhuber supplies in the present monograph a useful study of the various affections of the pericardium. He lays special stress upon considerations of treatment, and he gives useful and detailed directions in regard to paracentesis in large effusions. The operations of pericardiotomy and of cardiolysis are also carefully considered, and an analysis is given of the recorded instances of cardiolysis carried out in cases of pericardial adhesion. The physical signs of adhesive mediastino-pericarditis are considered in detail, and an extra-diastolic sound described by Brauer is mentioned as occurring in this condition. A useful bibliography is given at the end of the monograph.

The Modern Treatment of Alcoholism and Drug Narcotism. By C. A. MCBRIDE, M.D. Tor., L.R.C.P. & S. Edin. London: Rebman, Limited. 1910. Pp. 376. Price 6s. net.

Dr. McBride, in the first chapter of his work on "The Modern Treatment of Alcoholism," takes occasion to inform his readers that "there is still a deplorable number of physicians in this country who stoutly refuse to believe inebriety to be a disease and as firmly refuse to credit its curability." This passage sufficiently indicates the author's standpoint; he regards inebriety as a specific disease for which it is reasonable and expedient to seek out a specific remedy. The adoption of such a view is attended by a somewhat peculiar difficulty; the author has not only to justify the claims of the particular line of treatment which he advocates, but he has also to demonstrate to a more or less sceptical public the existence of the disease for which this treatment is designed. And this is by no means an easy task, nor is it probable that the advance in our scientific knowledge of the subject will diminish its difficulties; for the more we learn about the inebriety of which Dr. McBride treats, the more we are likely to recognise that we are dealing with a particular manifestation of a general instability of brain, and not with a definite morbid entity. Dr. McBride has not perhaps sufficiently recognised the need of this preliminary proof of the theory of inebriety which he holds; he has been content to affirm the theory with conviction and to point to the practical results which he has obtained as an *a posteriori* evidence of its validity.

Proceeding on the assumption that inebriety is to be cured by some drug capable of counteracting the organic craving which he postulates as the origin of the disease, Dr. McBride claims to have found this specific in a method of treatment of which the main element is the administration by hypodermic injection of gradually increasing doses of strychnine and atropine. It is claimed for this method that "it cures inebriety" within six weeks, and this without interfering with the patient's liberty; that "it absolutely destroys the craving for alcohol" so that "it never returns of its own accord"; it even produces a revulsion against alcohol in any form. It will be seen that Dr. McBride rates his method of treatment very highly, and it is therefore to be regretted that he has not given more numerous and more detailed records of his cases, which is the more imperative inasmuch as the same method has failed to give such favourable results when it has been tried by other observers. This conflict of testimony may lead to some doubt as to whether Dr. McBride's results may not have been due chiefly to the suggestive influence of the enthusiastic physician. And this doubt will certainly be strengthened when the reader learns that the virtues of the treatment operate only with patients who wish to be cured. The class of inebriates whom the author describes as "voluntary drinkers," and who, he says, "get drunk from mere vice," are not influenced by the strychnine and atropine treatment, though it is not explained why these drugs should not be capable of producing in an individual of this sort the same organic aversion to alcohol which they are alleged to produce in the victims of the specific drink

craving. On the whole, therefore, while the author's confidence in his method is very admirable in a critical and incredulous age, it is doubtful whether he is likely to communicate his enthusiasm to his readers.

LIBRARY TABLE.

A Handbook of the Tsetse Flies (Genus Glossina). By E. E. AUSTEN. With 10 coloured plates. Printed by order of the Trustees of the British Museum, London. 1911. Pp. 110. Price 5*s.* 6*d.*—This timely and useful handbook is an extension of an earlier handbook written by the same author and also published by the Trustees of the British Museum. Mr. Austen, of the department of zoology at the British Museum, is a well-known authority upon insects, and thus brings to the consideration of these flies the prestige of an expert. His main object has been to define accurately the 14 species into which the genus as at present known is divisible; but the usefulness of the manual is greatly increased by notes upon the mode of life of the biting flies and by precise records of habitat. As is well known, the pressing interest of this small genus of diptera is due to the deadly tsetse fly, deadly not because of its bite but by reason of the carriage of disease to man along with that bite. In this country we have a member of a genus allied to glossina—viz, stomoxys—whose bite is well enough known and which is often regarded as an ordinary housefly that has taken to a more predatory life. It has, of course, nothing whatever to do with the common housefly, but is a relative of the purely Arabo-African glossina, though it is not a disease-carrier. The two genera, however, though much alike, can be distinguished, as the author indicates, by a sketch showing the position of the wings during rest. It is very important to have readily accessible a trustworthy means of identifying the various species of tsetse flies, for it is by no means all of them which are concerned in the transmission of sleeping sickness and other trypanosomiases. The excellent coloured plates, combined, of course, with the written details of structure given under the heads of the various species, should render identification easy.

Maladies des Nerfs. By BERNARD CUNEO, Professor agrégé in the Faculty of Medicine; Surgeon to the Hospitals of Paris. Volume X. of the *Nouveau Traité de Chirurgie.* Published under the direction of A. LE DENTU and PIERRE DELBET. With 50 figures. Paris: Baillière et Fils. 1911. Pp. 174. Price, paper, 4 francs; bound, 5 50 francs.—This fasciculus of the "Nouveau Traité de Chirurgie" is concerned with the diseases of nerves—traumatic, inflammatory, neoplastic, and so on. The physiology of nerve degeneration and regeneration is described in detail, and the treatment of nerve wounds is well handled. This is true, not merely as regards the surgical technique of nerve anastomosis, but also for the various trophic, vaso-motor, and secretory complications of nerve lesions. Traumatic neuritis is the subject of one of the best chapters in the work. Plexiform neuroma and Recklinghausen's disease and other neoplastic conditions are discussed. Many of the illustrations have been especially drawn for the book, and have the merit, therefore, of freshness and up-to-dateness. There are useful references to the literature. The book maintains the high level of scholarship that we associate with the Parisian school of medicine.

On the Production of Pure Milk: An Account of the Methods Employed at the Infants' Hospital Farm. By RALPH VINCENT, M.D. Durh., M.R.C.P. Lond., Senior Physician and Director of the Research Laboratory, the Infants Hospital, London. London: P. S. King and Son. 1911. Pp. 22. Price 6*d.* net.—This lecture contains a description of the farm at which all the milk used at the Infants' Hospital is produced. It gives also a series of pictures of the buildings and dairy apparatus, refrigerator, power separator, and air-wall churn. The herd consists exclusively of Dairy Shorthorns, because they are said to be steady milk-yielders and their milk of the best kind for infant feeding; also they make good meat when no longer of use for milk production; and there is no difficulty in replenishing the herd, as there would be with fancy cattle. Jersey, Guernsey, and Alderney cows are excluded as unsuitable for infant feeding, their milk containing large fat globules. To the objection that such a plant sounds very like costly milk Dr. Vincent replies that the milk costs the hospital loss than 3*d.* a quart. The lecture forms interesting reading.

Camping for Boys. By J. H. WHITEHOUSE, M.P., Honorary Secretary to the National League of Workers with Boys, and Warden of the Secondary Schoolboys' Camp. London: P. S. King and Son. 1911. Pp. 72. Price 1*s.* net.—This little book tells the story of the camp founded a few years ago to organise the holidays of boys attending the grammar schools and secondary schools of the country. The camp was intended to exercise a vitalising influence on the minds and characters of the campers, to correct some of the limitations of life, to develop and draw out the best and bravest in them, and to bring a fuller spirit of chivalry to the lads within it. Chapter I. tells the story of the Secondary Schoolboys' Camp. Chapter II. describes its educational work in history and geology, architecture, collecting, kite-making, nature-study, first-aid and life-saving, literature, music, and civic teaching. Chapter III. deals with camp excursions, and Chapter IV. with camp games and sports. Chapter V. describes a typical day in camp. Chapter VI. deals with camp craft, and describes the pitching and care of camps. Alfred Noyes's "Song of England" is reprinted, and there is a good list of books bearing on the various subjects of interest in camp life. The book is freely illustrated. All concerned with camp and outdoor life for boys will find it of interest.

Low's Handbook to the Charities of London, 1911. London: Charles H. Sell. Pp. 248. Price 1*s.*—This well-known book is now in its seventy-sixth year of publication. More than 12,000 charitable institutions are arranged in alphabetical order, and brief details are given of the objects of the institutions, their date of formation, income and expenditure, the names of the treasurers and the secretaries, and so forth. There is also a classified table of contents. It is pointed out in the preface that the year 1910 was an unfortunate one for charities, the majority of which have had to record a decrease in income, while it is, of course, obvious that those conditions which restrict the incomes of charities cause an increase in the claims made upon them.

Maternity Primer. By A. H. F. BARBOUR, M.D. Edin., LL.D., Physician to the Edinburgh Royal Maternity Hospital. Edinburgh: William Green and Son. 1911. Pp. 165. Price 1*s.* net.—This little book consists of notes that were originally printed for the use of nurses commencing their maternity training, on which account the language used is, as far as possible, familiar rather than technical, and the information intended to be conveyed, instead of being baldly stated, is developed by a process of constructive reasoning or explanation. The book can be commended to the novitiate nurse, and even to the medical student beginning his midwifery; for to him it will serve, if properly used, as the bird's eye view presented by a low power, so to speak, before he begins to examine the intimate detail through the higher power of scientific text-books. It does not stop short with

the confinement, but has some useful remarks on the hygiene of the baby.

Ueber abnorme Lage der Männlichen Keimdrüsen mit besonderer Berücksichtigung des Kryptorchismus. (On Abnormal Positions of the Testis, with Especial Reference to Cryptorchism) Von Dr. med. H. VON FOTH. Leipzig: Otto Wigand. 1910. Pp. 89. Price M.2 40.—In this work we find a general account of the misplacements of the testis and a classification of its abnormal sites. The treatment to be employed is discussed, and the author gives the details of five cases in which he had operated for misplaced testes, in several of which a hernia was also present. A bibliography with 252 references is a valuable addition.

Cat's Cradles from Many Lands. By KATHLEEN HADDON. London: Longmans, Green, and Co. 1911. Pp. 95. Price 2*s.* 6*d.* net.—Until comparatively recent years very little was known about the pastime which, in this country, has received the name of cat's cradles, although the amusement to be derived from making patterns and shapes in string is well known to people in almost all parts of the globe. There now exists a very good bibliography of the subject, but there is still much to learn about these string figures of interest to anthropologists and ethnologists. In "Cat's Cradles from Many Lands" Miss Haddon describes some 50 figures, and has adopted the system of nomenclature invented by Dr. W. H. R. Rivers and her father, Dr. A. C. Haddon. By the aid of this system and the clear illustrations there should be little if any difficulty in reproducing the figures shown, though it sometimes requires a considerable stretch of the imagination to see in them the forms indicated by the names. It has been suggested that the making of these figures might form a useful pastime for invalids, while it is possible that the amusement might prove of service in breaking the tedium of a long railway journey. In the education of the memory and of the tactile sense cat's cradles might also find a place in the kindergarten, and the clever teacher could improve the occasion by giving useful knowledge to the pupils concerning the peoples of other lands.

JOURNALS AND MAGAZINES.

Journal of Anatomy and Physiology. Conducted by Sir WILLIAM TURNER, K.C.B., Professor ALEX. MACALISTER, Professor ARTHUR THOMSON, Professor ARTHUR KEITH, and Professor ARTHUR ROBINSON. Vol. XLV. Third series, Vol. VI., Part. IV. July, 1911. London: Charles Griffin and Co. Annual subscription 21*s.* post free.—The present number is mostly devoted to subjects of embryological interest, for no less than eight of the 12 papers comprised in the issue are concerned with developmental problems. For the most part the papers deal with reconstruction models of embryos, human and otherwise, and five of them are concerned with the study of the head region. Dr. J. W. Jenkinson contributes a paper on the Development of the Ear-bones in the Mouse, and briefly his findings are that the stapes is derived from the dorsal median portion of the hyoid arch, while the incus and malleus are formed in the upper part of the blastema of the mandibular arch. Dr Jenkinson has used very early stages to determine the precise development of the ossicles, and in this way it is possible he has succeeded in setting at rest this most debated point of vertebrate morphology. His paper possesses the advantage that, in addition to being illustrated by excellent figures of the wax model as a whole, it contains clear diagrammatic drawings of the more important members of the series of sections from which it was reconstructed. Again, after a clear statement of the detailed investigation of the sections and the models, the author provides a summary of his conclusions and a comparison of them with those of other workers. It might seem almost unnecessary to allude to these as special virtues, but a perusal of this present number of the *Journal of Anatomy and Physiology* reveals the fact that these very essential details of a paper are in common—and growing—danger of complete neglect. Two papers, contributed by members of Birmingham University, represent contributions towards the developmental history of the ferret. The Birmingham school has devoted a great deal of research towards reconstructing the early stages of the ferret embryo, and as the papers published here are preliminary to further investigations, we may reasonably hope to have the whole of the developmental history of one animal thoroughly worked out. Dr. Thomas Yeates contributes a paper entitled "Studies in the Embryology of the Ferret." The paper, which is an excellently illustrated one, describes the details of a reconstruction of an early embryo cut *in utero*, and many important points concerning the early connexion of the embryo to the uterus are discussed. The mass of detail does not admit of easy summary—indeed, the author himself has not attempted it. Miss Marion Radford contributes the second paper, and she deals with the cranial region of a somewhat older embryo. The features of the brain and pharynx as they are displayed in two models are detailed and discussed. Many points of interest arise in the description, but again they are not summarised. Mr. J. E. S. Frazer deals with the human embryo, and describes the development of the septum of the nose and the maxillary structures in a paper entitled "A Preliminary Communication on the Formation of the Nasal Cavities." Mr. Frazer claims a larger share for the maxillary processes in the formation of the early mouth cavity than is generally admitted, for he has determined that they form the side walls and roof of the cavity as far forward as the olfactory pit, a finding well in accord with the nerve distribution. Many other revisions of the present teaching are introduced into this preliminary contribution. Professor Alexander Meek contributes an important paper on the Morphogenesis of the Head of the Crocodile. From the reconstruction of the heads of crocodile embryos Professor Meek has made a very complete study of the development of the cranial region. The paper is a long one, but is ably summarised, and many of the conclusions arrived at point more clearly to the origin of certain mammalian structures, such as the maxillary and sphenoidal sinuses and the ethmoturbinal region. The results are of obvious importance, and would appear to furnish a new link in the chain of evidence available in the study of mammalian descent. Professor Edward Fawcett continues his studies of the ossification of the human cranium by contributing a paper on the Development of the Human Maxilla, Vomer, and Paraseptal Cartilages. On the whole, the work of Professor Fawcett goes to simplify the teaching of the development of these complicated bones. In pronouncing the maxilla as a membrane bone derived from a single centre, the author confirms the statement made over 50 years ago by Professor Humphry, and thus gives fresh evidence of the remarkably accurate insight of this painstaking anatomist. Concerning the premaxilla but little information is given, the subject being reserved for fuller treatment in a future paper. For the vomer Professor Fawcett finds two centres uniformly present in man—a condition which, though contrary to the assertions of many anatomists, is in harmony with the phylogeny of the bone. A lengthy account of the paraseptal cartilages concludes this exhaustive contribution to the development of the cranium. Mr. Douglas G. Reid continues his Studies of the Intestine and Peritoneum in the Human Fœtus, and Dr. J. Cameron contributes a note on a Venous Anomaly. A paper of a more unusual nature is that of Mr. E. S. Mawe

upon Types of Nuchal Hair and a Possible Theory of the Prediction of Sex. The foundation of this paper is the ancient Japanese belief—and indeed the belief is spread far wider than Japan—that the sex of the next child may be predicted from a study of the arrangement of the hair on the back of the neck of the last child. Mr. Mawe has made some 300 observations, and as a result has determined ten types of nuchal hair patterns, and argued the expectation of sex to be drawn from them. Criticism is easy; but better than criticism will be an extension of the series of observations and the adoption of a strict scientific basis for all the data accumulated. One of those unnoticed points in osteology, of which so many have been discovered recently and so many more remain, has provided the subject of Dr. S. E. Whitnall's paper on a Tubercle on the Malar Bone, and on the Lateral Attachments of the Tarsal Plates. The tubercle, which is on the outer side of the orbital margin, was found to be present in 95 per cent. of 2000 skulls examined, and its importance as a point of attachment for various structures connected with the globe of the eye is amply demonstrated by the author. Another such point, but one previously noted by Dr. W. L. H. Duckworth, is dwelt on by Professor Thomas Dwight in his paper on Irregular Ossifications in the Space between the Transverse Process and the Rib at the Junction of the Neck and Thorax. Professor Robert Thomson describes two brains showing complete unilateral interruption of the fissure of Rolando. Some notes on various anatomical subjects complete the number.

Edinburgh Medical Journal.—Dr. George Williamson contributes to the August number of this magazine some notes on the Workmen's Compensation Act, illustrative of medico-legal points which may arise under this statute. Mr. William Guy, Dr. Alexander Goodall, and Dr. H. S. Reid publish a second instalment of their observations on blood pressure during the administration of anæsthetics, this part dealing with pulse frequency, and also setting forth the conclusions which the authors have reached. They are inclined to attribute such pressor effect as is observed to partial asphyxia, while they note that ethyl chloride causes a disturbance of circulation which may be dangerous. Dr. D. Fraser Harris points out that in the recently published textbook of physiology by Professor Luciani the credit for the discovery of the circulation of the blood is given to Cæsalpinus instead of to Harvey; and a clinical note by Mr. David Wallace calls attention to the possible coexistence of vesical tumour with enlargement of the prostate, and to the necessity for careful examination in cases of the latter affection.

The Medical Chronicle.—In the August number Mr. J. Howson Ray writes on the Surgical Affections of the Hip-joint in Infancy and Childhood, dealing chiefly with tuberculous disease, congenital dislocation (so-called), and conditions of coxa vara and valga. He speaks favourably of the results of Lorenz's method and gives details of his own operative procedure. Dr. R. T. Williamson records a case of Cerebral Tumour affecting the basal ganglia on the left side and both temporo-sphenoidal lobes, and accompanied by flaccid paralysis and changes in the posterior nerve-root fibres.

Dublin Journal of Medical Science.—In the August issue of this journal is published a thesis by Dr. William H. L. MacCarthy on the Early Diagnosis of General Paralysis. The author shows the close simulation of this disease by some forms of alcoholism and enumerates the various laboratory methods available for aid in diagnosis. The use of atropine as a preventive of pulmonary complications following the administration of ether is recommended by Dr. Ernest A. W. Henley, this drug apparently checking the secretion of mucus from the trachea and bronchi. The Clinical Report of the Rotunda Hospital, by Dr. E. Hastings Tweedy and Dr. R. J. Rowlette, is concluded in this issue.

Reports and Analytical Records FROM THE LANCET LABORATORY.

HALAKONES.

(FRANK A. ROGERS, 327, OXFORD-STREET, LONDON, W.)

HALAKONES seem to us to be very useful for bringing a medicament into contact with the nasal, laryngeal, or bronchial passages; they consist of small conical plugs composed of stiffened gauze. They are easily introduced and retained in the nostril. Amongst the medicaments with which the halakone is charged are menthol, guaiacol, eucalyptus, terebene, and sal alembroth, but perhaps one of the most useful, on account of the good results which it gives in nasal catarrh, is coryfin, which is menthol ethyl glycolate. Its action is more lasting than menthol. The halakone also is calculated to remove organisms from the air intake when inspiration is confined to the nasal passage. Another application of moment is the halakone as a filter of the dust from the air of the dusty road for motorists and cyclists.

CEREGEN FOOD.

(JOHN BELL, HILLS, AND LUCAS, LIMITED, OXFORD WORKS, TOWER BRIDGE-ROAD, LONDON, S.E.)

A decided dietetic advantage of ceregen food is that it contains, according to our analysis, a requisite amount of assimilable protein. There are present also ferments which, when the instructions for preparing the food are carefully followed, serve to help the work of digestion. In our experiments we found that if the food be mixed into a paste with water, and then diluted and kept at body heat for an hour or so, the filtered liquid shows a considerable proportion of soluble protein according to the bromine test. Fat is also present in suitable quantity. In short, the food contains all the elements necessary for complete nutrition. Our analysis gave the following results: moisture, 8·10 per cent.; mineral matter, 5·70 per cent.; protein, 23·81 per cent.; fat, 3·44 per cent.; carbohydrates by difference, 58·95 per cent.; phosphates were present in abundance. The food is pleasant besides nutritious, while its cost is moderate.

MALT EXTRACT WITH IRON IODIDE.

(A. WANDER, LIMITED, 1 AND 3, LEONARD-STREET, CITY-ROAD, LONDON, E.C.)

Malt extract appears to be a good vehicle for administering the useful, but unstable, salt iodide of iron. The malt tends to keep the iron definitely in the ferrous state, while the iodine does not set up iodism when so administered. We had no difficulty in detecting both iron and iodine, and the former was present, as stated, in the ferrous condition unoxidised. Clinical evidence shows some good results of the use of the mixture in tuberculosis and it has also been used in anæmia and rheumatic affections.

JAMESON'S IRISH WHISKY.

(JOHN JAMESON AND SON, LIMITED, BOW-STREET DISTILLERY, DUBLIN.)

It is rarely that we find Irish whisky anything else but an all malt pot-still spirit, and the brand under examination is typical of a thoroughly matured soft-flavoured Irish whisky. We have evidence also of its being a standard product

inasmuch as the analysis of a sample obtained independently on the market gave results which accorded exactly with those given by samples submitted to us direct from the distillery. This is a matter of some importance when the medical practitioner considers it advisable to recommend this kind of stimulant to the patient. The peculiar flavour of Irish whisky is well known, and it is due to the method of manufacture. It is prepared from a mixture of malted barley with unmalted grain, and the malt is not dried over peat. The flavour in the young spirit is unpleasant, and therefore when an Irish whisky is palatable it is a guarantee that it has been matured. Below we give the analyses of two samples of whisky from the above distillery, one obtained upon the market and the other direct from the distillers: 1. Distiller's sample—alcohol by volume, 48·21 per cent.; extractives, 0·07 per cent.; acidity reckoned as acetic acid, 0·012 per cent. The secondary products were as follows, given in parts per 100,000 parts of alcohol present: aldehydes, 20·00; furfural, 8·30 per cent.; and higher alcohols, 208·00. Market sample—alcohol by volume, 47·67 per cent.; extractives, 0 07 per cent.; acidity reckoned as acetic acid, 0·018 per cent. The secondary products in parts per 100,000 parts of alcohol present were as follows: aldehydes, 20·00; furfural, 8·30; and higher alcohols, 208·00. There will thus be seen a very close agreement between the figures of analysis of the samples. The whisky has all the physical signs of maturity; it is peculiarly soft and smooth to the palate, free from acidity and from harsh flavours.

FIREPROOF CLOTH.

(E. H. SELLERS AND SONS, SCARR MILLS, LOCKWOOD, HUDDERSFIELD.)

We have been asked to submit a sample of this cloth to the same fire tests as those described in our report on flannelettes which appeared in THE LANCET, July 15th, 1911. The material came through the ordeal quite satisfactorily and behaved much like ordinary flannel when ignited. The well-known disagreeable smell evolved when animal matters are burned was given off—the smell of burnt feathers. The material is safe, and when it does burn it burns quietly, and the flame is easily extinguished. There is none of the nap or fluff upon it which causes the flame to spread with disastrous rapidity over flannelette. The material gave no ash on ignition, so that it is not fireproofed with fixed mineral salts. The cloth looks like canvas, but is cool, smooth, and silky to the touch. We understand that it has not been used for clothing so far, but there is a suggestion that it might be so used with certain advantages.

HOME-MADE MARMALADE.

(CHARLES SIBLEY, HIGH STREET, REDBOURN, HERTS.)

There is very little calling for remark in regard to this preserve except that it is evidently made with care and from pure materials. Analysis shows a good state of concentration, the moisture amounting to 23·32 per cent. There were no artificial stiffening substances present. The total sugar amounted to 74·08 per cent. We believe marmalade to be a very suitable addition to the first meal of the day, as undoubtedly it is an agreeable bitter and stomachic.

DENTAL PREPARATIONS.

(THE STRAND CHEMICAL CO., 22, ELY-PLACE, HOLBORN, LONDON, E.C.)

These preparations act satisfactorily for the purpose of keeping the oral cavities and crevices clean. The tooth-powder has for its basis magnesium peroxide which yields nascent oxygen and a residue of antacid magnesia. It is a pleasant and effective powder to use. The aseptic denture cleanser is similarly useful for keeping the dental plate scientifically clean; it has burnishing properties and does not scratch. Formizin Waldo is an agreeable concentrated mouth-wash containing well-known antiseptic deodorant and soothing agents. It leaves a pleasant sense of cleanliness in the mouth. We have confirmed by analysis the presence of several constituents which substantiate the claims made in regard to its suitability for keeping the mouth in a cleanly state.

ME-MALTO WINE.

(H. G. KINGHAM AND COMPANY, 96, HIGH-STREET, DORKING, SURREY.)

We agree in regard to the claim made in favour of this preparation that it is purely and simply a combination of genuine port (Alto Douro) with Liebig's beef extract and malt extract. Our analysis gave the following results: alcohol, by volume, 21·79 per cent.; extractives, 15·42 per cent.; mineral matter, 0·33 per cent.; and protein, calculated upon 0·07 per cent. of nitrogen, 0·44 per cent. The presence of nutritive protein was shown by the bromine test. The mineral matter consisted chiefly of phosphates. This analysis compares favourably with that of a sample obtained independently, the results being as follows: alcohol, by volume, 23·10 per cent.; extractives, 14·46 per cent.; and mineral matter, 0·30 per cent. This second sample again showed protein. Both samples possessed the real flavour of a genuine port with a suggestion of meat and malt extract. The physician will know what cases he considers such a preparation may be suitable for.

(1) MILK FOOD; AND (2) HEALTH DIET.

(JOSIAH R. NEAVE AND CO., FORDINGBRIDGE, HAMPSHIRE.)

1. "Milk food" is entitled to the description, inasmuch as it has a composition closely resembling that of dried human milk. Our analysis gave the following results: moisture, 4·80 per cent.; mineral matter, 3 50 per cent.; milk sugar, 42·55 per cent.; protein, 22·75 per cent.; and fat, 26·40 per cent. The food is thus well balanced from the dietetic point of view, containing all classes of reparative material. 2. The "health diet" differs from the previous food, in that it contains in addition to protein and fat and milk sugar, a proportion of starch. Analysis gave the following results: moisture, 4·10 per cent.; mineral matter, 2·90 per cent.; protein, 22·93 per cent.; fat, 19·40 per cent.; milk sugar, 21·18 per cent.; and starch, 29·49 per cent. The former food is adapted for infant and the latter for invalid requirements.

VIN DE GRAVES.

(HATCH, MANSFIELD, AND CO., 47, PALL MALL, LONDON, W.)

This is a typical clean non-acid wine from the Graves district; it contains a minimum of alcohol as will be seen from the following analysis: alcohol, by volume, 11·61 per cent.; total extractives, 2·20 per cent.; mineral matter, 0·19 per cent.; volatile acidity, reckoned as acetic acid, 0·21 per cent.; fixed acidity, reckoned as tartaric acid, 0·52 per cent.; and sugar, 0·46 per cent. There is a minimum again of sugar and acid. The wine, which was in sound condition when it reached us, possesses an agreeably delicate flavour. As is the case with most genuine sauternes, it contains traces of sulphur dioxide due to the burning of a little sulphur in the cask. As long as this treatment is not excessive good is more likely to result than harm by its adoption.

LITERARY INTELLIGENCE.—Mr. Albert Carless has passed for the press the eighth edition of the "Manual of Surgery," by himself and the late Mr. William Rose, which Messrs. Baillière, Tindall, and Cox announce for immediate publication. The new edition will include numerous coloured plates, in the preparation of which Mr. Carless has been assisted by Dr. W. d'Este Emery. Many of the older illustrations have been redrawn, and the entire work has been revised. A second edition of the English translation of Professor Dieulafoy's "Manuel de Pathologie Interne" is announced by the same firm.

ROYAL INSTITUTE OF PUBLIC HEALTH: ANNUAL CONGRESS.

(FROM A SPECIAL CORRESPONDENT.)

THE annual Congress of the Royal Institute of Public Health was held in Dublin from August 15th to 21st, under the presidency of Her Excellency the Countess of Aberdeen. On two previous occasions—in 1892 and 1898—the institute had met in Dublin, under the presidency of Sir Charles Cameron. The work of the Congress on the present occasion was divided into eight sections—viz., Preventive Medicine, Chemistry and Bacteriology, Child Study and Eugenics, Comparative Pathology and Veterinary Hygiene, Engineering and Architecture, Housing of the Working Classes and Town Planning, Municipal and Parliamentary, and Vital Statistics. There were, in addition, conferences of medical officers of health and port sanitary officers, and of sanitary inspectors. The meetings were all held in Trinity College, the rooms being kindly lent by the Provost and senior Fellows.

The Housing Question.

Out of the large number of subjects discussed two attracted special attention—the housing question and school hygiene. As there was a special section to deal with the housing question one would have expected to find the discussions on the subject confined to that section, but there was, however, constant overlapping, and the same subject was discussed before small audiences in two, three, or four sections. Three sectional Presidents chose the housing problem in Dublin as the subject of their presidential addresses, and a paper on the same subject was read in at least one other section.

A paper by Dr. J. WRIGHT MASON of Hull, entitled "The Housing Problem in Industrial Centres and the New Housing Acts," was perhaps the most important contribution in the Housing Section. He compared the rates of mortality in cottage dwellings with those in large blocks and argued strongly in favour of the cottage system as preferable in every way.

Sir LAMBERT ORMSBY recounted the history of a successful experiment on a small scale in Dublin for the housing of the very poor.

Mr. C. J. MCCARTHY, the city architect of Dublin, showed the magnitude of the problem which has to be faced in Dublin. The Dublin Artisans' Dwellings Company had erected 3600 well-planned dwellings, while the corporation had provided 1330 dwellings. Nevertheless, it would be understood that while they had still some 21,000 families occupying single-room tenements the housing problem was very far indeed from having been solved. As to the direction in which a solution might be found, he thought that instead of attempting to provide working-class dwellings on the outskirts of the city and bringing the people in to their work they would have to acquire and clear large central slum areas. Portion of these would, he hoped, be converted into open spaces, playing grounds, and gardens, and on the other portions would be erected dwellings suitable to the requirements of the working population. They must abandon the idea that any really great and comprehensive reform of the housing of the people could be made remunerative in the ordinary sense of the word. The chief return for which they must look would be found in the improved health of the city and the increased efficiency of the workers.

School Hygiene.

On the subject of school hygiene the most important contribution was that of Mr. W. J. M. STARKIE, the Resident Commissioner of National Education in Ireland. He dealt with the question of dental inspection of school children in Ireland. He learned from the teachers that practically all the older children were as regards their teeth in a desperate condition. With regard to school buildings he said that there were hundreds of school buildings which for sheer horror could not be equalled in any part of Europe. He referred to photographs of two in Donegal and said in his opinion children would be far better off if they remained at home without education than cooped up in such huts for four or five hours a day. If many of the schoolhouses were permitted to be hotbeds of disease it seemed hopeless to expect the State to make any provision for the care of the teeth. And yet he ventured to say that the health of the young should be the first interest of the public.

Mr. GEORGE FLETCHER, of the Department of Agriculture and Technical Instruction, urged the necessity of medical inspection of school children in Ireland. The medical inspection of schools—which should be accompanied by an anthropometric survey—was a pressing need. From a national standpoint, however, it was not at bottom a question of expenditure, but a question of bookkeeping. It was better to pay for the prevention of an evil than for its cure. The State, rightly or wrongly, had made itself responsible for the school education of its youth. Much of the money expended on education was wasted owing to the physical unfitness of the scholars. This could in a large measure be remedied by medical inspection, and the vigour of the nation improved at the same time. The question was not one for educational administrators alone. It was a matter in which the education of public opinion and the cultivation of a "hygienic conscience" were prime essentials.

Dr. E. MAGENNIS read a paper on "Visual Impediments to Learning," and Surgeon-Colonel D. E. FLINN and others pressed for the establishment of day industrial schools.

Water Supplies.

Dr. A. C. HOUSTON (of the Metropolitan Water Board) discussed various problems concerned with water-supplies. He spoke of the process by which stored water purified itself from bacterial contamination, and thought storage more important than filtration. He suggested that they had been over-estimating the dangerous qualities of unfiltered water as a constant factor, and under-estimating the necessity of shutting the door against the possibility of accident, and also placing an altogether delusive value on the effect of sand-filtration alone. He believed that in the future they would consider it unnecessary still further to perfect filtration processes when dealing with "stored" waters, that they would have less dread of the evil qualities of unfiltered water as a constant menace, and that the main endeavour would be to guard against the possibility of accident, either before, during, or subsequent to, the filtration process, and so to deal with unfiltered water—e.g., by storage—as practically to nullify the effects of any sudden gross specific infection.

Other Papers.—Social Events.

Dr. E. J. MCWEENEY read a paper dealing with the Rôle of Carriers in the Propagation of Disease, and another on Meat Poisoning.

In the section of Vital Statistics two papers of special interest were read, one, by Sir W. J. THOMPSON, Registrar-General, President of the section, on Vital Statistics of Ireland from 1864 to the Present, and the other by Mr. D. A. CHART, on Public Health of Ireland from 1801 to 1911. Sir William Thompson showed that the death-rate from practically all the principal epidemic diseases had steadily fallen. The tuberculosis rate had altered little until within the past few years, when there was a slight fall. Influenza and cancer showed an upward tendency. In a general summary he stated that (1) emigration had enormously decreased; (2) the birth-rate, notwithstanding emigration and a decreasing population, had remained almost stationary; (3) the marriage rate had increased of late years; (4) the death-rate, after many fluctuations, was decreasing. Moreover, (*a*) the number of inhabited houses in Ireland had increased; (*b*) the number of houses being built had also increased; (*c*) the number of families had increased; (*d*) the number of uninhabited houses had decreased.

In addition to the sectional meetings there were, of course, many pleasant social events. There was all the more time for these as the sections adjourned each day at lunch-time. The afternoons and evenings were spent in garden parties, receptions, dinners, and visits to places of interest.

Faults in the organisation of the Congress gave rise to a good deal of grumbling. The overlapping of the work of the sections, already mentioned, robbed many of the discussions of their interest and influence. The official "Programme and Guide" gave no help to a member wishing to know where and when a particular paper was to be read. Except in one section, that of Comparative Pathology, no time-table was issued. A member therefore had to take his chance of finding something of interest going on in whatever section he happened to visit. In future meetings the time given to the Congress might well be shortened, the number of sections might be diminished, and their working hours lengthened.

New Inventions.

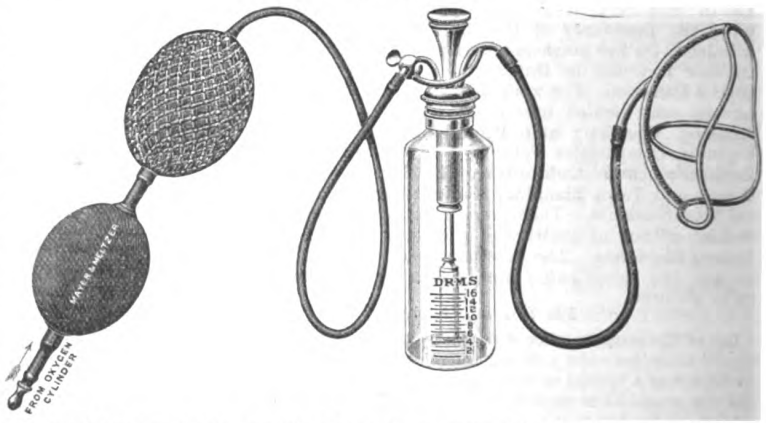
AN OXYGEN-DRIVEN CHLOROFORM INHALER.

THIS apparatus (Fig. 1), on the principle of the Junker chloroform inhaler, is designed to simplify the simultaneous administration of oxygen and chloroform. A short cannula (Fig. 2) at the extremity of the bellows system plugs into the tube leading from the oxygen cylinder. The bellows consists of two bulbs, each of the capacity of 100 c.c.; the first bulb is provided with an inlet valve The chloroform chamber is fitted with oxygen inlet and chloroform vapour outlet tubes (Figs. 3 and 4). These tubes are connected outside the chamber by a short-circuit tube controlled by a simple tap. By closing this tap the current of oxygen no longer passes through the chloroform in the chamber, but is delivered through the short circuit directly to the face-piece free from chloroform vapour.

To use the inhaler the cannula is plugged into the oxygen cylinder tubing and a feeble current is allowed to enter the chloroform chamber. The current required to maintain anæsthesia corresponds to between 0·5–1·0 litre per minute. The current passing is measured by compressing the bulb, allowing it to fill, compressing again, and noting how often per minute the bulb is filled. As the capacity of the bulb is 100 c.c. five fillings per minute correspond to a current of 0·5 litre, ten fillings to a current of 1·0 litre, and so on. The average patient requires a current of 0·75 litre per minute (7–8 fillings). At any moment the chloroform vapour may be instantaneously cut off and pure oxygen supplied to the patient by turning the short-circuit tap. The percentage of chloroform in the mixture delivered is very low; about 3·5 c.c. (1 drachm) of chloroform is volatilised every quarter of an hour with the average 0·75 litre oxygen current. It has not been found necessary to interpose an oxygen reservoir bag in the system—there is already a triple expansion series—viz., two bulbs and the chloroform chamber—and no appreciable chilling of the oxygen-chloroform mixture occurs. In default of oxygen the apparatus may be used as an ordinary air-bellows inhaler by disconnecting the cannula from the oxygen cylinder tubing.

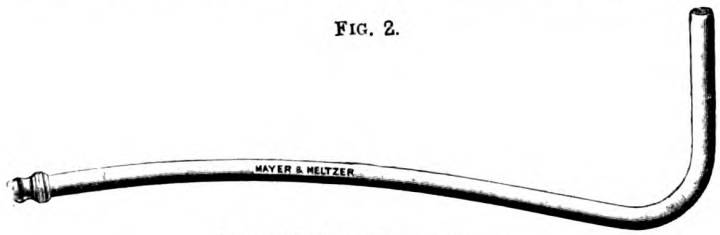
The apparatus is carefully constructed by Messrs. Mayer and Meltzer, 71, Great Portland-street, W.

FIG. 1.



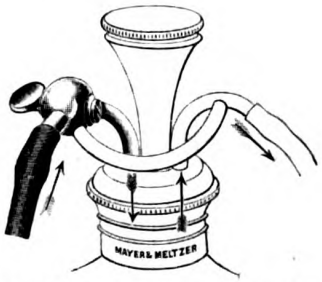
Oxygen-chloroform inhaler, consisting of a bellows system free at one end for attachment to the oxygen cylinder, and attached to the chloroform bottle, from which an outlet tube leads to the face mask. The inlet and outlet tubes can be short-circuited by a curved connecting tube, which is opened and closed by a stopcock.

FIG. 2.



The cannula for mouth administration.

FIG. 3.



The attachment to the chloroform bottle, showing the stopcock open, so that the stream of oxygen passes down the tube into the chloroform bottle, whence the emerging stream to the face-mask consists of oxygen plus chloroform.

FIG. 4.

The same as Fig. 3, but with the stopcock closed, showing how the oxygen stream, instead of passing through the chloroform bottle, goes directly through the short-circuit tube to the face-mask, thus delivering pure oxygen without the admixture of chloroform.

R. M. ROWE, M.A., M.D., Ch.B. Edin., M.R.C.S. Eng., L.R.C.P. Lond.,
Anæsthetist, Throat Hospital, Golden-square, W.; late Anæsthetist, Male Lock Hospital, W.

UNIVERSITY OF ST. ANDREWS.—We learn that the Senatus Academicus of the University of St. Andrews has resolved to confer the honorary degree of LL.D. upon the following members of the medical profession, in this country and abroad, at the celebration in September of the 500th anniversary of the foundation of the University:—Professor Sir T. Clifford Allbutt, Cambridge University; Sir Thomas Barlow, President of the Royal College of Physicians of London; Mr. G. A Berry, honorary surgeon oculist to the King in Scotland; Dr. Byrom Bramwell, President of the Royal College of Physicians of Edinburgh; Dr. Robert Bridges; Dr. Alexander Crum Brown; Professor Sir Hector Cameron, University of Glasgow; Professor Francis Gotch, University of Oxford; Professor Peter Fredrik Holst, Royal Frederick University of Christiania; Professor Hector Leboucq, University of Ghent; Professor C. S. Minot, of Harvard; Professor R. A. Reddingius, University of Groningen; Professor Robert Saundby, President of the British Medical Association; Professor E. A. Schäfer, University of Edinburgh; Professor W. W. Keen of Philadelphia; Lieutenant-Colonel David Prain, Director of the Royal Botanic Gardens, Kew; Dr. Anthony Traill, Provost of Trinity College, Dublin; and Professor Johann Veit, University of Halle.

THE LANCET.

LONDON: SATURDAY, SEPTEMBER 2, 1911.

Energy and Elemental Instability.

THE presidential address delivered by Sir WILLIAM RAMSAY before the meeting of the British Association for the Advancement of Science at Portsmouth was a novelty in its distinguished position, for it was discursive. It was not confined to presenting a summary of the progress of science within the past year, nor was it devoted entirely to a given aspect of science in which the President himself had been engaged. Sir WILLIAM RAMSAY delivered an address which was generally retrospective, seeking to picture the present position of civilised nations politically, scientifically, socially, educationally, industrially, imperially, in contrast with periods of the past. In an audience necessarily cosmopolitan in its scientific tastes the address presented something of interest to everybody; while he kept his discussion of the various subjects well within the capacity of his listeners, bearing in mind that the British Association of Science opens its ranks not merely to those following different branches of science, but also to many who, though interested in the problems of science, are not engaged in actual scientific pursuits. His address, in fact, carried out his view that the greatest benefit accruing from meetings of the kind is the opportunity for intercourse. The object of the association was declared 80 years ago at its first meeting in York to be: "To give a stronger impulse and a more systematic direction to scientific inquiry, to promote the intercourse of those who cultivate science in different parts of the British Empire with one another and with foreign philosophers, to obtain a more general attention to the objects of science and a removal of any disadvantages of a public kind which impede its progress." As a mighty contributor to this progress, whose arduous researches have thrown strong light upon the constitution of matter, Sir WILLIAM RAMSAY was well qualified for the presidential post of the association.

Whilst we perceive the value of the suggestive incursions which Sir WILLIAM RAMSAY made into regions not practically explored by himself, we regard as the most remarkable passages in his address those in which he referred to the position of the elements of radium and the wonderful manifestations of its energy. He gave only a few minutes to the consideration of ancient and modern views regarding the chemical elements, and yet in those minutes he was able to announce that for the first time we have accurate knowledge as to the descent of some of the elements. This was a recognition that our ideas as to the definition of an element have been seriously disturbed. From its physical and chemical properties radium is an undoubted element, but, as Sir WILLIAM RAMSAY observed, it is a very curious one, for it is unstable, and hitherto stability has been believed to be the essential characteristic of an element. Radium, however, disintegrates—changes, that is to say, into other bodies, and at a constant rate. If one gramme is kept for 1760 years only half a gramme will be left at the end of that time; half of it will have given off other products. It yields a condensable gas—radium emanation—and besides evolves helium. Helium seems to be a veritable element, and radium emanation has been shown to be incapable of chemical union, but it has been liquefied and solidified in the laboratory of University College, London, and its spectrum has been measured and its density determined. The emanation has been called niton to recall its connexion with its congeners, argon, neon, krypton, xenon, helium, and its phosphorescent properties. The atomic weight of niton is 222·4 and that of helium 4. The sum 226·4 is the atomic weight of the parent radium. But the descent does not stop there. Niton in its turn gives radium A and helium, radium A rapidly gives another solid substance radium B, helium again accompanying the change. Soon a half of B gives place to radium C, but in this case no helium is evolved, only atoms of electricity to which the name "electrons" has been given by Dr. JOHNSTONE STONEY. Radium C has a short life, for it changes into radium C^2, parting with helium atoms. In two and a half minutes, however, radium C^2 is half gone, parting once again with electrons and forming radium D, which is longer lived, its disappearance eventuating in radium E with apparently no discharge of electrons or helium. Radium E changes spontaneously into radium F, which is the substance to which Madame CURIE gave the name "polonium." In 140 days, however, polonium in its turn is half changed into an unknown metal, supposed to be possibly lead. Then apparently a check to the rapid descent takes place, for lead within present human limitations, at any rate, is stable. But there is no reason why even the stable elements should not decompose when subjected to enormous strains. The virtue of the energy of radium consists, as Sir WILLIAM RAMSAY pointed out, in the small weight in which it is contained; energy here is in an enormously concentrated form. It is disappointing to be told, therefore, that the supply is a very limited one, and that it can safely be affirmed that the production will never surpass half an ounce in any year. The small quantities, however, which have been so far produced have afforded sufficient energy to induce the degradation of elements hitherto regarded as stable. The action of niton or radium emanation on salts of copper appears to show that the metal copper can be converted partially into lithium; and similar experiments indicate that thorium, zirconium, titanium, and silicon are degraded into carbon, for solutions of compounds of these, mixed with niton, invariably generate carbon dioxide, while cerium, silver, mercury, and some other metals give none. This is all a very wonderful story, and we may well ponder over the possibilities for the human race to which these discoveries are leading. Sir WILLIAM RAMSAY suggests that if elements are capable of disintegration the world will have at its disposal a hitherto unsuspected source of energy. If radium were to evolve its stored-up energy at the same rate that gun-cotton does we should have an undreamt-of explosive; could we control the rate, we should have a useful and

potent source of energy, provided always that a supply of radium were forthcoming. "If, however, the elements which we have been used to consider as permanent are capable of changing with evolution of energy; if some form of catalyser could be discovered which would usefully increase their almost inconceivably slow rate of change, then it is not too much to say that the whole future of our race would be altered;" that is how Sir WILLIAM RAMSAY pithily sums up the position.

There is truth in his words, for the whole progress of the human race has been due to enterprising philosophers, speculators, and workers who have discovered means of concentrating energy and of transforming one form of it into another. As discovery upon discovery is made by which any one power is utilised to control the great natural forces the consequent achievements will have far-reaching eventualities for humanity. We may well ask, then, is the future to depend upon a mighty catalyser, suggested by the energies of radium; are man's attempts to secure for his use the natural forces to be for ever unavailing? What of the tides, the internal heat of the earth, the winds, and solar heat? The answer from scientific men and men of the great engineering profession is disappointing. In this country, at least, we are told that it would be impracticable to attempt to utilise terrestrial heat from boreholes, while from the tides and the winds small supplies of energy are obtainable, but negligible in comparison with that derived from the combustion of coal. Again, nothing is to be hoped for from the direct utilisation of solar heat in this temperate and uncertain climate, while it appears improbable that we shall ever be able to utilise the energy due to the revolution of the earth on her axis, or to her proper motion round the sun. One lesson of all this is that we must make the most of our coal—a diminishing quantity in all the civilised parts of the earth—for our supply of energy, and for the means of supporting our population. Sir WILLIAM RAMSAY, in inculcating this lesson, does not appear to regard the possibilities of liquid fuel; otherwise his wise words cover all the ground. Waste must be penalised. Smoke, as an evidence of it, must be abolished even although it proceeds from the domestic hearth; energy must be transmitted by cheap channels from its sources and not manufactured from the raw material at a million tiny local centres where the conditions are sure to be clumsy, beyond control, unhygienic, and wasteful. Electricity seems to be the way out, for, to quote Sir WILLIAM RAMSAY'S words, an invention which would enable us to convert the energy of coal directly into electrical energy would revolutionise our ideas and methods.

The discovery of radium and similar radio-active substances has widened the bounds of thought, as Sir WILLIAM RAMSAY fittingly points out in a concluding appeal for the study of pure science apart from its applications. While these radio-active substances are in all probability incapable of industrial application, save in the domain of medicine, their study has shown us to what enormous advances in the concentration of energy it is permissible to look forward with the hope of applying the knowledge thereby gained to the betterment of the whole human race.

The Provision of Meals for School Children.

THE working of the Education (Provision of Meals) Act, 1906, for the year ending March 31st, 1910, forms the subject of a Parliamentary Report, from which we learn that on the date named the total number of local education authorities in existence was 327. From 128 of these, in whose areas "school canteen committees" have been formed, the Board of Education has received full replies to a circular inquiring into the working of the Act in respect of the following points: The character and composition of the committee; the method of recommendation or selection of the children for meals; the total number of children fed, with the periods during which they received meals; the number of meals provided, with the place and dietary; the method of serving and the behaviour of the children; and the cost to the rates, with a statement of additional sources of income—e.g., voluntary contributions and money contributed by, or recovered from, parents; the average estimated cost of each meal; the charges fixed as recoverable; the number of children whose meals were wholly or in part paid for by their parents, and the number withdrawn owing to unwillingness of the parents to pay; and the amount which a $\frac{1}{2}d.$ rate would have produced for the period under review. It has not been considered necessary to put the Act into force in 198 of these areas, in many cases voluntary organisations proving sufficient.

From the report it appears that during the year 1910 the total expenditure of the local education authorities was £134,105, distributed as follows: (1) For food, under Section 3 of Act, £81,728; (2) other expenditures, under Section 3, £43,644; (3) estimated share of office expenses and salaries chargeable to work under Act, £8733. The expenditure of the canteen committees was met from funds as follows: Rates for expenditures (1) and (2) above, £125,372; voluntary contributions, £9813; contributed or recovered from parents (including £225 paid by Poor-law guardians), £906; total £136,091. The total figures for 1908–09 were, expenditure, £72,333; sources of income, £85,690. The increase in 1909–10 is mainly attributable to London, and is largely due to the fact that the London County Council expenditure in 1909–10 is for 12 months, whereas in the previous year it did not begin until within three months of the end of the year, so that the returns for that year covered only three months. The total number of meals provided was as follows: In 1908–09: London, 4,546,771; elsewhere, 9,671,789. In 1909–10: London, 7,335,469; elsewhere, 8,766,635. As some authorities, including the London County Council, have made no returns of the number of children for whom meals were provided, the average estimate of meals for each child can be calculated on a portion only, excluding those areas from which details are not available. This calculation gives a total of 63·8 per child. The authorities which provided meals for the largest number of children were as follows: Birmingham, 9678; Manchester, 7421; Newcastle, 6888; Leeds, 6867; Sheffield, 5331; Bristol, 5240; Bradford, 4406. London and Sunderland made no return of children; but, as regards the largest number of meals provided, the

figures are: London, 7,335,469; Bradford, 957,739; Birmingham, 575,036; Sunderland, 509,402. The sums recoverable by the authorities from parents were about as last year—viz., from ½d. to 3d., while there was little change in the amounts so recovered. In other respects the returns show comparatively little change from those forming the basis of the earlier report.

From the public point of view, as well as from that of our readers, the most interesting thing in the report is that the Board of Education lays stress on the intimate connexion of the provision of meals with medical inspection. Unless the provision of meals is coördinated with the work of the school medical officer as a branch of the school medical service it may degenerate into a system of doles, administered in a haphazard fashion on merely eleemosynary and sentimental lines. It is only thus that, in the opinion of the Board, wasteful and reckless expenditure can be prevented, and full value in increased vigour and more effective education can be obtained for the expenditure. Even when the large scale of the operations under the Act makes it impracticable for the medical officer to examine all children recommended for meals, he can at least take a large part in the selection of children, and by concentrating attention on doubtful cases, or those in which actual neglect is suspected, can help in the establishment of a proper standard. By visiting kitchens and dining centres from time to time, also, he can advise in the choice of food and test the results of different dietaries; thus he can see that special attention is given to the more delicate children, and will have an opportunity of judging the extent to which individual children are benefited by the meals. Discovery of the main causes of malnutrition will suggest a remedy, and an important part of the "following-up" system of treatment will be supplied. As to machinery for selecting those to be fed, in 70 cases the school medical officer, and in 39 the school nurses, made the recommendations. Further light on this subject can be discovered in the medical officers' reports of Dec. 31st, 1910. The excellent work of Dr. D. FORBES, school medical officer of Brighton, is quoted. In that town all children for whom an application for meals was made, amounting in 1910 to 1633, were weighed and measured and in special cases they were thoroughly examined. Of this number those recommended for meals on account of deficient physique, deficient weight in relation to height, tuberculosis or anæmia, amounted to 45 per cent. of the boys and 42 per cent. of the girls. Other medical officers whose commendable work is cited are Dr. C. F. STOVIN of Ilford, Mr. G. FOGGIN of Newcastle-on-Tyne, Dr. C. MURRAY of Preston, and Dr. RALPH P. WILLIAMS of Sheffield. From a series of comparative tests the last-named officer speaks highly of the great superiority of the porridge breakfast. As regards the opportunity afforded by the provision of meals for the inculcation of lessons in cleanliness, courtesy, and good behaviour, it is apparent, the report says, that little attention has been paid to these things. Dirty and ragged tablecloths, unnecessary noise, deficient efforts to teach orderly eating, and even actual disorderly conduct, bolting of food, rudeness, and improper use of the utensils, are commented on, though great excuse is admitted by the Board, because with limited attendants the mere serving of the food leaves but little leisure for exerting a humanising influence. In many cases, too, those in attendance can hardly be considered capable of giving lessons in deportment, as is obvious when we read that in one instance "nine charwomen of a rather low type attend to 470 children." Contrary instances are, however, referred to, in which much better conditions prevailed as regards not only the serving of the food, but the discipline, manners, and cleanliness of the children. The report points, as the reason for citing these adverse instances, to the fact that "it is more useful, though less pleasant, to supply warnings than models." The results from a medical point of view will find a place in the reports of the school medical officers.

The Risk of Plague at Home.

THE reports[1] and papers on suspected cases of human plague in East Suffolk and on the epizootic of plague which certainly attacked rodents in that district during last autumn and winter will possess the deepest interest for all epidemiologists, and they may have historical value subsequently, for what the more or less immediate future may have in store, both as regards rodent and human plague, cannot be prophesied. Many of the points dealt with in these papers are already common knowledge owing to the interest which the occurrence excited at the time, but the facts are now for the first time set out fully and in a manner which reflects credit upon the Medical Department of the Local Government Board. The epidemiological and administrative sides of the outbreak are dealt with by the late Dr. H. T. BULSTRODE with the clearness and thoroughness that might be expected from that greatly lamented sanitarian; while the flea fauna of the rats and rabbits, together with the species of the rats found, are reported upon by Dr. C. J. MARTIN and Mr. SYDNEY ROWLAND of the Lister Institute. The pathological and bacteriological side of the epizootic was undertaken for the Local Government Board by Dr. G. F. PETRIE and Dr. G. H. K. MACALISTER, also of the Lister Institute. Dr. A. NEWSHOLME, medical officer of the Board, presents the papers to Mr. BURNS with some introductory remarks. There are some excellent maps showing the distribution of the human and rat cases of plague, which render it easy to follow the narrative.

The first thing which strikes the reader on looking at the map accompanying Dr. BULSTRODE'S general report is the relatively extensive area over which the suspected human cases were observed between 1906–07 and 1910. But these cases are divisible into three or, at most, four separate groups; two of probable pneumonic plague and one of probable bubonic and septicæmic plague. There is, too, the very instructive circumstance that rats dead of plague were actually found on both sides of the estuary of the Orwell, not far from the localities in which the suspected human cases occurred. Clearly, as Dr. BULSTRODE points out, rat plague had probably been prevalent in some degree in this neighbourhood from 1907, and perhaps earlier, and it is a matter of great interest

[1] Reports to the Local Government Board on Public Health and Medical Subjects. New Series, No. 52. Published by His Majesty's Stationery Office. Sold by Wyman and Sons, Limited, Fetter-lane, E.C., or purchased through any bookseller. London. 1911. Price 1s. 3d.

to note that, notwithstanding this widely prevalent epizootic, there were only from 1906 onwards three or, at most, four primary cases of human plague, the remainder being secondary cases. This relative immunity is probably in large measure to be accounted for by the different habits of the brown and the black rat, and by the circumstance that not one example of Pulex cheopis (to use the familiar name), the flea of the black rat, was discovered. Moreover, as Dr. MARTIN and Mr. ROWLAND show in their instructive contribution to the volume, 50 per cent. of the rat-flea population consisted of a flea which apparently bites man but rarely. The remainder of the rat-flea population was composed of Ceratophyllus fasciatus, which bites man not very readily—not nearly so readily as does the rat-flea of India. There is, therefore, left only about one man-biting rat-flea to every two rats, a flea prevalence which, according to the work of the Indian Plague Commission, is too small to give rise to a human epidemic in India. As to the future, Dr. BULSTRODE insists that the absence of further cases of human plague does not justify the belief that danger has passed and that precautions can be relaxed. On the contrary, he considers that the history of plague both in this and other countries should suffice to show the peril of such a policy. But with reference to comparisons which have been made by some writers between the Plague of London and the behaviour of the disease at the present time he points to the different conditions, both zoological and social, which now prevail. During both the Black Death and the Plague of London the black rat (Mus rattus) was presumably the dominant rodent, the brown rat (Mus decumanus) not having reached this country until about the year 1728—i.e., several years after the disappearance of human plague from the British Isles. As regards the social conditions, attention is drawn to the practice which obtained at the time of the Plague of London of shutting up the sick with the healthy, a procedure which was calculated to facilitate intercourse between rats and man and between man and man. It seems, too, that in the fourteenth and seventeenth centuries the disease not infrequently attacked several persons in the same house, whereas at the present time in India, where the bubonic type almost exclusively prevails, multiple cases in the same house are extremely rare. This difference of behaviour seems to suggest, Dr. BULSTRODE observes, material variation in methods of spread, and, inferentially, in the type of disease which may prevail at different times. It raises question, in fact, as to the proportion of pneumonic, and perhaps also septicæmic, cases in relation to the purely bubonic in the fourteenth and seventeenth centuries. In Dr. BULSTRODE'S view a study of plague literature points to the conclusion that the pneumonic type played a more important part in the diffusion of plague in past epidemics than is generally believed. It is, for example, difficult to account for the behaviour of the famous Eyam outbreak in 1665-66, on the assumption that the disease was exclusively bubonic plague, since there were apparently some 259 cases in 76 families, a house incidence which suggests considerable case-to-case infectivity.

In the report the detailed account is given of the mysterious outbreak which occurred on the banks of the Orwell in the winter of 1909 to 1910, and which involved eight persons with five deaths. This outbreak, or rather series of cases, occasioned great excitement at the time of its occurrence, and resulted in two post-mortem examinations and three inquests, there having been, it seems, some suspicion of poisoning. But this suspicion is certainly dispelled by the searching examination to which Dr. BULSTRODE subjects the evidence, and it is clear that a communicable malady, having the incubation period and many of the signs and symptoms of plague, was in question. Whether this was actually an outbreak of bubonic and septicæmic plague cannot at this date be definitely determined, but there are many epidemiologists who will agree with Dr. BULSTRODE that the outbreak is best explained upon the theory that the disease was plague. That theory alone appears to fit all the ascertained facts. The paper furnished by Dr. PETRIE and Dr. MACALISTER upon the pathological and bacteriological examinations of rats collected outside the first invaded area is highly instructive, and brings out the difficulties experienced in endeavouring to interpret the pathological, microscopical, cultural, and staining manifestations which were encountered. Those difficulties were numerous. Of the 6071 rats examined 60 were retained for further examination. Of these, 15 evinced suspicious glandular conditions, and 45 showed glandular changes in the liver and spleen. But ultimately only three rats remained over from which growths strongly resembling B. pestis were obtained. Subsequently, however, it was determined that these conformed to a pseudo-tuberculous type. In addition to the three papers referred to, the volume contains the circulars and Orders of the Local Government Board and its medical officers, as well as extracts from the report of Mr. H. LLEWELLYN HEATH, the county medical officer of health. The whole work is of permanent value. It will be of great use to all medical officers of health for reference purposes, and in the event of further trouble arising will constitute an authoritative study of the precedent conditions.

Annotations.

"Ne quid nimis."

THE PSYCHOLOGY OF KLEPTOMANIA.

DURING the season of big sales in shops, when crowds are attracted by what they believe to be bargain prices, cases of theft are frequent; and no one who has followed the newspaper accounts of these occurrences can fail to see that while some instances fall into the category of ordinary dishonesty some present very puzzling features, so motiveless is the criminal act. Some years ago in his interesting work, "Les Obsessions et la Psychasthénie," M. Pierre Janet suggested an ingenious explanation of the mode in which impulsive acts may arise in conditions of mental depression. According to this theory, which was more fully developed by the author in an article in the *Journal of Abnormal Psychology* for April, 1906, on the Pathogenesis of Certain Impulsions, the reason why the psychasthenic patient is prone to impulsive action of a more or less dangerous character is that he finds in such action a momentary stimulus which raises his emotional tone and relieves for a time his painful sense of incompleteness and inadequacy to the environment. In the issue of the *Journal*

de Psychologie Normale et Pathologique for March–April of this year, M Janet published an observation of kleptomania which so exactly fulfils the conditions of his hypothesis that it amounts almost to a demonstration of its validity. The patient, a woman of good social position, had an attack of mental depression in 1904 when she was in her fiftieth year. The symptoms were of the usual character: on the mental side, loss of interest in everything, insomnia, abulia, feelings of "a veil around the head," "a layer of cotton on the brain," and so forth; and on the physical side, anorexia, furred tongue, fœtid breath, and very obstinate constipation. After lasting for some ten months this condition passed off gradually, and the patient continued well until five years later when she had another attack characterised by exactly the same symptoms, physical and mental, and lasting for eight months. In February, 1910, six months after her recovery, the same train of symptoms reappeared. But on this occasion, when the attack had followed its regular course for a few weeks, it came suddenly to an end; the depression and inertia, as well as the physical disorders, vanished, giving place to a condition of apparent health. In October of the same year the patient, to the amazement of her friends, was detected in the act of stealing some petty articles in one of the large Paris shops. When her rooms were examined they were found to contain the kleptomaniac's usual accumulation of useless and heterogeneous objects, many of them with the sale labels still attached to them. It was ascertained that the thefts dated back to the month of February, and the patient on being questioned stated that in that month she had gone to a shop with a friend who, wishing to rouse her from her depressed condition, urged her to make some purchases. Yielding to her companion's insistence, she selected some trivial object but could not attract the attention of the shopman. As she stood with the article in her hand she suddenly thought how easily she might be taken for a thief, and this momentary alarm then gave place to a delicious sense of danger which seemed to brace and stimulate her. She made her way out of the shop, and for some days felt quite restored to her normal state. Then the depression returned, and she had recourse to the same mode of excitement, and all through the summer she continued stealing as a means of keeping off the threatening attack. She had no sense of shame or remorse, but in deference to her friends she promised not to offend in this way again. She kept her word, and in a short time she recovered normal ethical feeling and was able to recognise the immorality of her conduct; the kleptomaniac impulse disappeared, but at the same time the loss of energy and the mental depression returned, together with the constipation and the other physical symptoms. This mode of genesis of the morbid impulse from the need of excitement in conditions of psychasthenia, which appears so clearly in M. Janet's interesting observation, may frequently be traced in other cases of pathological crime, and notably in many instances of indecent exposure.

THE CLASSIFICATION OF THE BLIND.

THE authorities responsible for the Census schedules of 1911 have made a regrettable slip which seriously detracts from the utility of the statistics. Instead of employing the term "blind" as heretofore without qualification, this year the description "totally blind" is employed. It is, indeed, doubtful whether any harm has been done, because the unqualified term "blind" must have been ambiguous in former years, some regarding it as meaning totally blind and others as blind for all practical purposes, though possessing perception of light or a very low grade of visual acuity. It is certain, however, that the opportunity for distinguishing between those who possess no vision or such defective vision that for purposes of education and wage-earning capacity they must submit to the conditions and lead the life of the totally blind, and those who possess useful, though still seriously defective, vision, such as might be designated "partially blind," has been missed by the Census officials. Mr. N. Bishop Harman has drawn attention to the subject in a paper read at the recent meeting of the British Medical Association and reported in abstract on p. 520 of THE LANCET of August 19th. We agree with him that the statistics are practically useless. A very large proportion of those absolutely incapacitated as regards vision still possess perception of light or a very low grade of visual acuity, and are therefore excluded from the "totally blind." It is easy, however, to criticise the classification, but difficulty arises when the attempt is made to draw the line between those "blind for the practical purposes of life" and the "partially blind" who yet possess useful vision, as, indeed, is shown by the divergence of opinion expressed by various speakers in the discussion on the paper. Since the schedules have to be filled up by people who have no knowledge of the scientific methods of numerically estimating the degree of visual acuity, and since a man may be incapacitated by defect of the field of vision whilst useful central vision persists, it would seem best to have a broad classification of those who are "blind for the practical purposes of life" and those who are "partially blind." The same difficulty has often arisen before with regard to various institutions and asylums for the blind, many patients who are to all intents and purposes blind being ineligible for admission on account of the possession of a meagre but practically useless vestige of sight.

EXPERIMENTAL MEASLES IN THE MONKEY.

IT is somewhat remarkable that in regard to some of the commonest of the specific infectious diseases, such as measles and scarlet fever, we are still in ignorance as to the exciting cause in spite of the advances in bacteriological technique. Moreover, our information as to their communicability to animals is scanty in the extreme. Since discoveries in regard to the infection of animals are often the precursor of important advances, any observations bearing upon this matter are noteworthy. Some interesting experiments upon the transmission of measles to monkeys have recently been recorded by Dr. John F. Anderson and Dr. Joseph Goldberger in the Public Health Reports[1] of the United States for June 9th and 16th. The only work on this subject to which they could find reference was that of Dr. A. S. F. Grünbaum in the *British Medical Journal* of April 9th, 1904. He reported various attempts at infecting two chimpanzees, including the injection of blood taken direct from the median basilic vein of measles cases. He did not succeed in conveying the infection and suggested that the injections may even have conferred immunity. Dr. Anderson and Dr. Goldberger inoculated nine rhesus monkeys with defibrinated blood from four cases of measles, withdrawn at periods of not less than 14 to 32 hours after the appearance of the eruption. The blood in every case gave no visible growth in standard glucose broth in fermentation tubes, and therefore appeared to be sterile. The inoculations were carried out either by subcutaneous, intracardiac, intracerebral, or intraperitoneal injection, or by combinations of these methods. Of the nine animals inoculated only four gave any very significant evidence of reaction. All of these developed a febrile reaction nine or ten days after inoculation, and in three of them there was

[1] Published by the Public Health and Marine Hospital Service, Washington Government Printing Office, 1911.

an eruption of papules on the face, chest, scalp, or abdomen, which faded, leaving stains and causing a fine branny scaling. An attempt to re-inoculate one of these monkeys failed. Passage inoculations were made in five monkeys with defibrinated blood withdrawn from the hearts of other monkeys which had given evidence of a reaction after the introduction of blood from human cases of measles. Of these five animals, in one there was no result apparent, one gave an ill-defined reaction, and three showed well-marked effects. Dr. Anderson and Dr. Goldberger conclude that the rhesus monkey is capable of being inoculated with measles by the injection of blood from a human case, that this susceptibility is at best not very great, and that it is subject to considerable individual variations. They are apparently continuing their observations since they promise a further report and mention a successful passage to a third monkey generation. These results may lead to interesting and valuable work upon immunity and we await further work with interest.

EPIDEMICS OF ACUTE POLIOMYELITIS IN FRANCE.

EPIDEMIC poliomyelitis is *à l'ordre du jour* in France. From the year 1905 onwards, when scientific attention was more specially directed to the matter, France apparently suffered less than some other of the countries of Europe, but during 1910 epidemics appeared in many widely separated parts of the country. During last year the disease was diffused over a great part of the globe. It was reported as occurring in epidemic form in Germany, Austria, Scotland, Switzerland, Belgium, Denmark, Russia, as well as in Canada, the United States, and Cuba. An extraordinarily interesting epidemic was recorded[1] the same year in Naura, a small island in the Pacific, 160 miles from the nearest land, where, with a total population of 2330, there were 700 cases and 38 deaths. In France application was made to the Minister of the Interior to notify all the physicians of the provinces and to send them a series of questions by way of eliciting details concerning the incidence of the disease. The information thus gleaned was presented by M. Arnold Netter in report form to the *Académie de Médecine* on May 23rd, 1911, and will be found in the official *Bulletin*. This has now been published, and is a document of great value. In at least 33 of the provincial departments of France the disease was prevalent. In the departments of Aube and Yonne, within an area of 20 square kilometres, an epidemic of 19 cases occurred in three months, furnishing instances of direct infection, of familial contagion, and of infection after contact with a healthy individual from the affected area, who served as an intermediary. In the departments of Basses-Pyrénées and Landes a widespread epidemic took place in July, August, and September. It is of importance from the number of cases diagnosed as epidemic cerebro-spinal meningitis which turned out to be really cases of poliomyelitis, and from the number of *cas frustes*. The mortality was more than 10 per cent. At Salies, one of the towns, it reached 15·5 per cent. The coexistence or succession of two or more cases in one family was common. Direct infection was noted frequently; in other cases its influence seemed *nil*. One of a family of 10 was affected, but none of the other children, who were in no way isolated from the patient, developed the condition. One only, of another family of 13, fell ill. In Mayenne and Maine-et-Loire, where at least 33 cases occurred, confusion between poliomyelitis and cerebro-spinal meningitis was a noteworthy feature, no doubt because the meningeal symptoms of the former were pronounced in almost every instance. M. Netter quotes numerous examples of infection carried by an individual not himself affected. Thus a child of 10, living in Paris, was taken ill on Oct. 13th and developed a typical paralysis of the left arm on the 15th. Her sister went to the country and remained unaffected. On Nov. 13th a little girl of 8, with whom the latter had been living, was taken ill, and the next day was found to be paralysed in the right arm. M. Netter discusses the evidence that the virus of acute poliomyelitis may reside in the nasal fossæ, and the possibility of its dissemination by coughing or sneezing. The analogies between poliomyelitis and epidemic cerebro-spinal meningitis are also investigated. The report is, as a matter of fact, more of the nature of a preliminary communication, for much of the material has not yet been completely analysed, but it forms a contribution to the subject, not only of documentary value, but of practical importance. Prophylaxis is becoming a matter within the sphere of practical medicine. The precautions taken in ordinary fevers ought to be enforced in the case of poliomyelitis. In Sweden, Norway, Germany, Austria, and the United States notification is compulsory. M. Netter pleads for its adoption in France. In view of Flexner's successful experimental use of urotropin in inoculated monkeys—it appears in the cerebro-spinal fluid within a few minutes of its injection—M. Netter counsels its employment in the disease. He mentions that he has used it himself, but does not say with what result.

THE PATHOLOGY OF PAPILLŒDEMA.

A REPRINT from *Brain* (Vol. XXXIII.) contains an important contribution to the study of what is generally called "optic neuritis" from the pens of Mr. Leslie J. Paton and Dr. Gordon M. Holmes. The writers entitle their paper the "Pathology of Papillœdema," but its contents warrant an even more inclusive name. At the same time, it is certainly the finely described minute pathology of the condition and the excellent deductive reasoning from observed facts which give the article its great value. Together the descriptions and the reasoning seem to us to dispose conclusively of any explanation of "optic neuritis" which involves a necessary element of inflammation. The writers of this paper show convincingly that the essential feature of optic neuritis is œdema, that evidences of inflammation are often infrequent and of insignificant proportions, and that if the œdema is removed, then the optic neuritis, as seen clinically, is removed also. The work is based on a histological examination of 60 eyes, a larger number, we believe, than have been hitherto available for any single investigator employed on this problem. Clinically the eyes of 700 cases of cerebral tumour were examined during a period extending over ten years, so that it will be seen that Mr. Paton and Dr. Holmes make claims for their conclusions upon no inconsiderable mass of evidence. Of the 60 eyes examined histologically 50 were from cases of cerebral tumour and 10 from examples of other conditions such as meningitis, retrobulbar neuritis, and pressure atrophy. The specimens obtained represented all stages of papillœdema, and much care was given to the important point of examining the eye as short a time as possible after death. As the result of these examinations the writers state that in their opinion the presence of œdema unaccompanied by any sign of inflammation, acute or chronic, is the one unfailing histological change found in tumour papill-œdema. They show also how œdema among nerve fibrils in a particular anatomical arrangement is responsible for the appearance known as the "macular fan," and hence they confirm an observation made some time ago by the late Mr. Marcus Gunn, whose opinion on such a point was, it will be remembered, rarely at fault. According to Mr. Paton and

Dr. Holmes, the vascular changes concerned in optic neuritis are confined almost entirely to venous and capillary congestion. The chief evidence which they find that could be interpreted as inflammatory is some slight small round-cell infiltration into the connective tissue sheaths of some of the vessels. This is always of small amount and affecting only one or two vessels in any disc examined. Another argument advanced against the assumption of a "descending inflammation" or an inflammatory perineuritis as a causal factor in papillœdema is the fact that acute and extensive inflammatory lesions may exist in the optic nerves and yet produce no optic neuritis. Mr. Paton and Dr. Holmes have themselves examined such a case. The histological proofs on which the arguments are based are well reproduced in many illustrations of slides introduced into the article. Perhaps the most interesting and original part of this paper is that in which the writers advance their hypothesis for explaining the origin of the œdema which they have shown to be the essential feature of optic neuritis. In their opinion this is to be found in "the venous engorgement that results from the rise of intravenous pressure that is necessary in order that circulation should be maintained in the intravaginal portion of the vein where this is subjected to an increased sheath pressure. The increased sheath pressure is also the origin of the second factor, the obstruction to the lymph drainage from the papilla." For a detailed support and explanation of this contention we must refer our readers to the paper itself, a piece of careful work which will repay perusal and on which Mr. Paton and Dr. Holmes are to be congratulated.

THE RELATION OF ENTERIC FEVER TO LOCAL AND METEOROLOGICAL CONDITIONS.

THE close relation existing between the contamination of drinking water and outbreaks of enteric fever is now so generally recognised and accepted as a fundamental fact in regard to the epidemiology of that disease that it comes almost as a surprise to find it called in question. It is well known, however, that a long controversy raged between the "localisation theory" of Pettenkofer and the contagionist view of Koch and his followers. Pettenkofer maintained that the morbidity and mortality from enteric fever in Munich rose when the ground water was at a low level, and further that the typhoid poison was not capable of communicating the disease until it had undergone changes in the soil. We have received a copy of a pamphlet by Dr. R. J. Beck[1] in which this controversy is reopened. It forms one of a series published in commemoration of the fiftieth anniversary of the enunciation of Pettenkofer's view. It is prefaced by a note from Professor Emmerich, who is a keen supporter of the localisation theory. He maintains that a bacillus carrier is not dangerous without definite local conditions of the soil, and states that the typhoid and cholera bacilli are so weakened by their passage through the alimentary canal that they can produce little or no pathogenic effect. Dr. Beck reviews the conditions in certain epidemics of enteric fever occurring in Germany, Hungary, and South-west Africa, paying attention both to considerations of drinking water and to climatic conditions at the time of the epidemic. He claims to have proved that in none of them was a close relation between the epidemic and infection of drinking water established, whereas in all there was a close relation between the climatic conditions and the beginning and end of the epidemic. He found that the outbreaks of enteric fever were regularly preceded by a dry period—i.e., a period of diminished rainfall, varying from 3 to 21 weeks, and that with equal regularity the epidemic ended three weeks after heavy rainfall. He therefore urges that in every epidemic the conditions of soil, rain, dryness, and ground water should be considered as well as the question of drinking water. We cannot but feel that, like the earlier supporters of Pettenkofer's theory, Professor Emmerich and Dr. Beck are inclined to underestimate the importance of the typhoid organism and to exaggerate that of the soil and ground water; at the same time it is easy to go to the other extreme, and Dr. Beck's observations may serve to draw attention to the many-sided nature of the problems.

COMPLETE TRANSVERSE DESTRUCTION OF THE SPINAL CORD FROM A BULLET WOUND WITHOUT PENETRATION OF THE SPINAL CANAL.

IN the *Maryland Medical Journal* for July Professor R. Winslow has reported two cases of a remarkable injury—complete transverse destruction of the spinal cord from a bullet wound without penetration of the spinal canal. In the first case, a man, aged 24 years, was shot with a pistol, the bullet entering in the left seventh intercostal space just behind the mid-axillary line. He fell to the ground paralysed below the umbilicus. There was severe pain in the upper abdomen and chest. He was taken to hospital, where he was found to be completely paralysed both in sensation and motion up to a line extending round the body 1½ inches under the umbilicus in the middle line in front and curving upward along the upper border of the twelfth rib to the spine. Above the paralysed region was an area of hyperæsthesia 3 inches wide. The paralysis was of the flaccid type. Cremasteric and slight plantar reflexes were present, but the patellar and tendo-Achillis reflexes were absent. He could not pass urine and the bowels acted only after enemata. Kernig's and Babinski's signs were absent. Complete transverse destruction of the cord at the ninth dorsal segment was diagnosed. Irregular exacerbations of temperature supervened, but the general condition was good. A radiogram showed the bullet in or about the body of the eighth dorsal vertebra. Believing that the spinal cord was completely divided Professor Winslow determined to explore the spinal canal and, if justifiable, suture the cord. He removed the laminæ of the seventh, eighth, ninth, and tenth dorsal vertebræ. There was no blood in the canal and the dura was uninjured. The dura was opened widely, permitting the escape of much cerebro-spinal fluid. The cord did not appear to be altered, though subsequently some grumous material escaped from it. There was nothing more to do than to close the wound. Healing took place by first intention and the patient was neither improved nor made worse by the operation. The fever continued, he became emaciated, and bedsores formed, but he was living at the time of the report. In the second case a girl, aged 18 years, was shot in the left side of the neck. The bullet entered about the middle of the sterno-mastoid muscle and passed downward, inward, and backward. She fell forward with paraplegia, paralysis of the left arm, and dilatation of the left pupil. There was complete anæsthesia below the first rib on the left and the third rib on the right side. Retention of urine and fæces ensued. The diaphragm was not affected. Sensation and motion partially returned in the left arm. The reflexes were abolished and bedsores quickly formed. Bullet wound of the second dorsal vertebra, crushing or otherwise injuring the cord, was diagnosed. Death occurred on the twenty-second day. The necropsy showed that the bullet passed behind the brachial plexus, between the anterior and middle scaleni muscles, broke the tip of the transverse process of the seventh cervical vertebra, penetrated the body of the second dorsal, cut a piece from

the first rib, and impinged on, but did not penetrate, the spinal canal. Bloody serum in the canal and spinal meningitis were present. The cord was not penetrated or compressed, but was disintegrated and much reduced in size opposite the position of the bullet. In these cases the injuries appear to be due to concussion of the spinal cord, though it is difficult to understand how complete transverse destruction of the cord can occur without direct impact. However, its occurrence is recognised. During the American Civil War a number of such cases was observed. In his "Manual of Military Surgery," written for the use of surgeons of the Confederate Army, the late Professor J. Chisolm stated that concussion produced by explosion of a shell near the back was a not infrequent injury, and that its symptoms were pain and impairment of motion and sensation in the lower limbs, amounting at times to paralysis. Colonel W. F. Stevenson states in his "Wounds in War" that concussion of the cord without fracture of the spine may be produced by shell fragments or small arm projectiles, and that paralysis below the injury may be absolute, but if secondary changes do not take place in the cord, and hæmorrhage into the spinal canal does not occur, recovery may be rapid and complete. The treatment of complete division of the spinal cord is still a moot question. Physiologists declare that regeneration is impossible once the cord has been divided, but three cases of suture with slight improvement have been recorded by American surgeons. The first surgeon to perform the operation was Dr. Francis T. Stewart of Philadelphia. In a case of bullet wound of the dorsal spine he found the cord completely divided, with an interval of three-quarters of an inch between the ends. He freshened the edges and sutured the cord with three chromicised catgut sutures. The patient, who had been paraplegic, soon showed improvement, and 16 months after the operation could perform various movements with the toes and legs, and had control over the urine and fæces.

ANCIENT MEDICINE AND CLASSICAL WRITERS.

A GREEK scholar, M. Jean Psichari, has been publishing some interesting notes intending to prove indebtedness on the part of Sophocles in the "Philoctetes" to Hippocrates. Some suggestions of this kind concerning the two classics have been made before, but M. Psichari contends that two important passages have escaped notice. These are in verses 752–784 and 823–825, wherein the special medical significance of the words *στάζειν* and *αἱμορραγεῖν* are exemplified. In Hippocrates's works and the Hippocratic corpus these words are clearly differentiated, the first having been used only for slight issue of blood by drops, whilst the second was applied to indicate profuse hæmorrhage. According to Hippocratic theory, slight nasal bleeding was in certain cases considered a serious symptom, whereas profuse bleeding was regarded as providing hope of speedy recovery. It is so in these passages of the "Philoctetes," the increased hæmorrhage being followed by amelioration and sleep. The whole description of the wounding of Philoctetes is Hippocratic: his perspiration when sinking to the earth, his impaired vision shown by his inability to see Neoptolemus close by him, and the difficulty of speech and falling backward of the head are all mentioned by Hippocrates in a passage describing evil results arising from a stoppage of the proper circulation of the blood. Hippocrates would have been 50 or 60 years of age, according to which of the two dates usually assigned to the time of his birth is accepted, by the time of the production of the Philoctetes, and so Sophocles may have read some of the medical author's treatises, or they may have been common views of medical lore of the time, and so appear in the work both of the specialist and the dramatist.

The interest taken in the medical work of the ancient civilisations is certainly growing. Herr Wellman, for example, has recently assigned the authorship of the list of animal remedies in Books 28–30 of Pliny's "Natural History" to Xenocrates of Aphrodisias, a physician who preceded Galen, and was writing about 70 A.D. That Pliny's source was a Greek one is proved by parallels from Serapion, Archigenes, and Pseudo Democritus, and all point to the physician Xenocrates, whose remedies Galen ridiculed. Four extracts from the magic pharmacology of Xenocrates are quoted by Galen and Alexander of Tralles, and all these appear in Pliny. Herr Wellman has discovered references to five works by Xenocrates and has gathered together all likely to be known of him, unless an Egyptian papyrus reveals to us a portion of their lost contents. By the way, a classical author from whose work some curious items concerning the medical and anatomical knowledge of the ancients could be extracted is Melampus, whose work *παλμῶν μαντική* gives the omens derivable from observing the twitchings and throbbings and involuntary movements of various parts of the body. His treatise may be found in the "Scriptores Physiognomiæ, Veteres," and although the manuscript there used is incomplete it provides omens drawn from movements of 57 parts of the head, 83 of the trunk and upper limbs, and 49 parts of the lower limbs. The brow and the eyes are the most important parts in the author's opinion, though he holds that they may be slightly surpassed by the hands and feet in mantic value. Melampus alleges that much of his lore was derived from Egyptian sources, but recent research has detected many similar descriptions of bodily movements, or salissationes, in the "Oneirocritica" of Artemidorus, many of whose omens have been definitely traced by M. Alfred Boissier of Geneva to the augural omens and divinatory cuneiform tablets of Babylonia, where medicine and magic were more closely intermingled than in any other old-world culture. The work of Melampus requires comparing with the cuneiform, mantic and medical literature, and with the medical authors both of Greece and Rome. Salissatio, the Latin term, first occurs in the "De Medicamentis Empiricis" of Marcellinus Empiricus, who prescribes a remedy, "ad cordes pulsum suie salis sationem." This is as definitely a medical word as the Greek equivalent *παλμὸς* of Hippocrates and Aristotle.

THE ETIOLOGY OF BLACKWATER FEVER.

BLACKWATER, or hæmoglobinuric, fever is a malady which exacts a heavy toll in health and life from Europeans who, as officials, planters, missionaries, or in other capacities, have to reside in certain tropical parts of the world. The origin of this disease has hitherto been obscure, and referring to this, Sir Patrick Manson, in the last edition of his well-known "Manual of Tropical Diseases," observes that one of the most important of the still unsolved problems of tropical medicine is that of the etiology of blackwater fever. Efforts have not been wanting, and many earnest attempts have been made by competent investigators to throw light upon this difficult subject. Among the many workers who have laboured to this end may be mentioned Koch, Plehn, Stephens, Christophers, Bentley, Barratt, and Yorke. The main theories put forward up to the present time, in support of which more or less evidence has been adduced, are four in number—viz.: (1) Blackwater fever is a manifestation of an active malarial infection; (2) it is the result of quinine poisoning; (3) it is an induced condition arising from previous repeated attacks of intense malaria lasting over a certain time; and (4) it is caused by a specific organism, which, however, has not yet been isolated or identified. A recent contribution to the discussion of the etiology of this disease comes from the

Panama Canal Zone, where two American medical men, Dr. W. E. Deeks and Dr. W. M. James, physicians to the Ancon Hospital, have made a study of 230 cases of blackwater fever which occurred in that region between January, 1905, and September, 1910.[1] These observers say that their conception of the malady is the same as that of Marchifava and Bignami—namely, that "the hæmoglobinuric attack is a syndrome which is encountered not rarely, especially in hot climates, in the course of a malarial infection." They also agree with the view that instead of classing the disease among the pernicious fevers a special place should be reserved for hæmoglobinuria among the clinical forms of malarial infection. The conditions for investigation of this disease in the Canal Zone appear to be very favourable, a large percentage of the persons attacked being treated in hospital, where their personal histories can be properly inquired into. In a large proportion of the cases there was a history of previous hospital admissions, and of those which could be verified no less than 94·6 per cent. were due to malaria. Moreover, Dr. S. T. Darling, chief of the Board of Health Laboratory in the Canal Zone, under whose direction necropsies were made at Ancon Hospital, reports that he has not yet failed to find evidence of malarial infection, as shown by the presence of pigment or parasites, in each case of hæmoglobinuric fever on which a post-mortem examination was made, when such evidence had been properly sought for. There is no proof that blackwater fever can spread from one country or locality to another like kala-azar, yellow fever, or sleeping sickness. The disease only occurs when the following conditions associated with malaria are present—viz., the presence of a population non-immune to malaria; the prevalence of malaria in such quantity as to produce an almost continuous infection in this population; a large proportion of æstivo-autumnal malaria, because the amount of hæmoglobinuric fever is in direct proportion to the intensity of this variety; neglect of prompt and continued administration of quinine, especially in primary attacks, to persons non-immune against malaria. It has been demonstrated in modern times that the disease is controlled by anti-malarial prophylaxis. There is a personal predisposition in certain individuals to blackwater fever, and this predisposition is enhanced by repeated attacks of malaria. Dr. Deeks and Dr. James believe that under certain conditions the toxins of malarial poison produce hæmolysis; but why some persons are thus acted upon, while others with equal amounts of infection are not, is a problem which still awaits solution. They regard blackwater fever, therefore, as a manifestation of malarial toxicity brought about for the most part by repeated attacks of malaria; it may occur coincidently with an acute malarial paroxysm, it may be excited by any depressing influence, such as overwork or a chill, and it may be induced by the administration of quinine. Quinine alone or malarial infection alone do not cause hæmoglobinuric fever; it is caused by one of these conditions "plus the toxin eventuated during the course of one or more malarial attacks." Syphilis is a predisposing cause owing to its influence in the production of malarial recrudescence. In order to prevent recurring attacks of malaria, with possible subsequent production of blackwater fever, it is necessary to raise the patient's resistance to a maximum and to eradicate the malaria by a thorough course of quinine. The conclusions at which these investigators have arrived do not appear to differ very much from those given by Captain S. R. Christophers, I.M.S., and Dr. C. A. Bentley in their joint report upon blackwater fever after their inquiry on the subject in the Duars at the foot of the Eastern Himalayas in 1907–08. This work we reviewed in the columns of THE LANCET of Feb. 20th, 1909. The evidence so far adduced seems to support the opinion that blackwater fever is a condition intimately associated with malaria and is not a separate disease due to a specific organism.

ANÆMIA AND WANT OF VENTILATION IN THE FRENCH NAVY.

WIRELESS telegraphy in the French Navy involves, as we mentioned last year,[1] unhealthy conditions for the operators on board ships. The offices in which they do their work are deep down in the ship, under an armoured deck, which is built of steel and packed round with felt and asbestos to exclude sound; they are small, under 400 cubic feet in content, and ill-ventilated. Even in the early days it was prophesied that damage to health would result, although none had yet been observed, and latterly it has been reported that the operators were getting thin, losing strength and weight, and becoming anæmic. This anæmia has been investigated by Dr. D'Auber de Peyrelongue, médecin de 1re classe de la marine (staff surgeon), and by him is discussed in the recent numbers of the *Archives de Médecine et Pharmacie Navales*. Unfortunately, he was unable to commence his special observations during the manœuvres, when these men are employed the most busily and for the longest hours, and show most markedly the effects of their special occupation; indeed, he had to wait till after they had returned from their fortnight's manœuvre leave, by which time they had in some degree recovered. Even then he found among them some anæmia, as 26 wireless operators from battleships showed on an average only 4,218,000 red blood corpuscles per mm. cube and 81 per cent. of hæmoglobin, though seven operators from torpedo-boat destroyers (where the offices are on the upper deck in the open air) averaged 4,655,000 red blood corpuscles and 86 per cent. hæmoglobin. Sailors were less anæmic; stokers had fewer corpuscles and less hæmoglobin. Dr. D'Auber de Peyrelongue considers the possible causes of this anæmia, dismisses a theory that it is due to the ozone formed with the sparks (he estimates the maximum of ozone present at 0·002 per cent.), refuses to believe it due to the nitrites simultaneously produced (which he judges to be 0·0005 per cent. at most), declares it is not caused by the vapour of petroleum which is also present, but ascribes it to want of ventilation. He finds that in the wireless room there are few bacteria, but a great deal of zinc oxide dust, that the temperature here is 5° F. higher than in the neighbouring passages, and that the humidity is high; he has measured also large percentages of carbonic acid, 1·55 per cent. the maximum. The carbonic acid content of the air on the mess decks of men-of-war he puts at 0·12 to 0·78 per cent., the outer air containing 0·04 per cent., and though he holds that carbonic acid is not of itself dangerous in air till it reaches a proportion of 10 per cent. he insists that a proportion of 1·5 per cent. evidences very insufficient ventilation—about 50 cubic feet per hour per person. Therefore he pleads for more cubic space for wireless rooms and for better artificial ventilation. Fans have sometimes been lent by officers, and at times the offices have been blown through by jets from the torpedo charging apparatus, but only a permanent installation of a fan will be of any use. Then it is said that if a fan is supplied men will not use it always. That objection is valid; the fan makes a noise, in so small an office a sufficient fan may cause a bitterly cold draught, and unless the intake be wisely placed the fan may bring down smells and dust, and force the men to close the inlets. Dr. D'Auber

[1] THE LANCET, March 12th, 1910.

de Peyrelongue allows all this, but conditions are being improved. Wireless operators no longer suffer as formerly from mercurialism, since the old mercury interruptor has been done away with. Anæmia among them, too, will in time be mastered, and as a matter of fact after two years of discussion one ship has now a ventilating fan installed in the wireless operator's office.

A MEMORANDUM ON CHOLERA.

WE have received a Memorandum on Cholera, for the guidance of Europeans in the remote out-stations of British Malaya, which has been prepared under the directions of the Colonial Office by Mr. John D. Gimlette, Residency Surgeon, Kelantan, Straits Settlements. A large number of copies have been sent to Singapore for distribution by the Government. The memorandum is a four-page sheet of foolscap, and is written in clear, simple language which can easily be understood by any educated person. It begins with a rough sketch of the disease and its mode of spread, with a short and vivid description of the onset and progress of an ordinary case, and brief directions for putting the patient in the way of recovery in the absence of medical aid. Instructions follow for the disinfection and disposal of excreta and contaminated substances, and stress is laid on the virulence of stale cholera stools and discharges. Owing to the deep-rooted Malay prejudice against hospital wards, the treatment and isolation of natives during an outbreak in a purely Malay district are beset with difficulties; but where the native population is mixed it is possible to organise temporary field hospitals or camps on high ground within a mile or two of the main centre and to supplement these with segregation camps for contacts and suspected or doubtful cases. The memorandum proceeds to give general rules for the safeguarding of the public health in infected districts, with special reference to the water-supply and the disposal of the dead and the danger of uncooked foods. It points out that judgment is required in giving directions for the burning of dwelling places and in disturbing Malay burial customs, because the confidence of the native community is easily shaken, and there is always risk of concealment of deaths and of general panic. Ten days' quarantine is recommended, in order to be on the safe side, although this is twice as long as the period laid down by the Venice Convention. The importance of care, courage, and calmness on the part of Europeans in time of epidemic, both for their own sakes and as an example to the natives, is insisted on. Above all things, prejudice must not be aroused in the native mind. Organised hospital treatment being out of the question, the uneducated Malay has to be treated in his own home in the midst of his family, and "personal interest in the patient is almost everything." Personal influence may be of immense value in checking the disease at the beginning of an outbreak. The memorandum concludes with a copy of instructions to natives, couched in the phrases of the East, which have been translated into the Malay tongue and distributed among the head men of infected areas. They are from the pen of Mr. Warren Barnes, and their picturesqueness by no means impairs their simplicity or their practical value.

THE King has been pleased to grant to Dr. Ernest Cotton Fischer, professor of ophthalmology at the School of Medicine, Cairo, the Royal licence to accept and wear the Insignia of the Third Class of the Imperial Ottoman Order of the Medjidieh, which decoration has been conferred upon him by the Khedive of Egypt with the authorisation of the Sultan of Turkey.

THE DRAINING AND SEWERAGE OF LONDON.

MOST of us in London must have noticed during the past few years a number of wooden enclosures in the main thoroughfares in various districts, evidently connected with works of excavation. Yet comparatively few, perhaps, are aware that, deep below the surface, there is in progress one of the largest additions to the existing network of sewers yet undertaken since their formation by the Metropolitan Board of Works. The additions, estimated to cost £3,750,000, are shown on Fig. 1, and include new outfall and intercepting sewers, additional provision for storm water, extra pumping facilities, and so on.

In these strenuous days all are apt to take their surroundings too much as a matter of course. Drains—unless they become a nuisance from some defect—being out of sight, are more than many things likely to be out of mind also. Who associates the outlay of £11,000,000 with the opening of a bath waste? Yet the present system has cost this sum to enable a resident within the County of London to satisfactorily perform this simple act; moreover, it entails that an army of 2000 men shall spend their working lives immured in darkness, often midst noisome fumes and exposed to risks of flood and of fire from petrol gas. About 1000 of these men are employed by the local district councils. The aspect that such work bears in its relation to the public health may well claim our attention.

Hydrographical Features of the London Area.

That we may the better realise the elemental difficulties with which engineers have to grapple, and engineers of the London County Council in a particular degree, it will be well to refer to the hydrographical features of the district to which they have to minister, covering as it does an area of some 120 square miles. Reflection shows that these features are the basis of the whole scheme of drainage, the streams and springs of bygone days having either been converted into our main sewers or been largely responsible for their construction and position. Whitaker's "Geological Survey of England and Wales" includes the results of many borings in and around London. These indicate that a very different condition of things, in times not far remote from the present, must have existed on each side of the river than is now noticeable. (See Note A.) The continual raising of the surface of the ground in the neighbourhood of the city and the nearer suburbs must not be forgotten. Each load of building material ever brought in by barge or cart or rail has aided to raise the level.

At the beginning of the Christian era much of the low-lying land on the south side of the river (now within the jurisdiction of the London County Council) from Abbey Wood to Barnes was under water, and in many places on the north side also. Certainly at a period not very remote the river spread over Plumstead Marshes and parts of North Woolwich, across the Isle of Dogs, some parts of Deptford, and the greater part of Rotherhithe and Bermondsey, over much of Southwark, Walworth, Lambeth, and of Vauxhall, where the Effra River from Dulwich—now an important sewer, with a branch from Nine Elms—emptied into Effra Creek. The Thames spread across to Westminster, round Thorney Island as far back as the ornamental water by the Horse Guards' Parade, where it was joined by a branch of the Tyburn river (see Note B), over Pimlico, and round the backwater of what was then Chelsea Island, formed at the mouth of the Westbourne, now the Ranelagh sewer, and still further back over Fulham and parts of Hammersmith up to Shepherd's Bush, where it met the Stamford Brook, now emptying into Hammersmith Creek. On the opposite side, again, the river covered portions of Battersea and lower Wandsworth, where the still open waters of the Wandle, much polluted, empty into the Thames. The higher ground of the places named would show as islands here and there. Spreading over this lagoon in times of flood, the swollen river, checked in its course, deposited its load of earthy matter from the upper reaches to form the marshes, with their tidal creeks kept open by the many streams that gathered on the uplands. The city by some is believed to have been named by the Celts "Lyn Din," or Lake Town. (See Note C.)

The three low eminences of Ludgate Hill, Cornhill, and Tower Hill, on which the City proper stands, were surrounded

on the north by the great moor, and on the east by the marsh and fen and the estuary of the Lea. This is at Blackwall, between the East India and Victoria Docks. The south and west were bounded by the Thames and the Fleet river (see Note D). The Walbrook, now a sewer, drained the moor, passing through the centre of the City from north to south, entering near the Moorgate and running out into Dowgate Dock. Another stream, the Langbourne, yet another sewer, drained the eastern fen, crossing the City due west to its centre, and there, turning south by where is now St. Mary's Woolnoth, spread into two or three streams or sheres and was then called the Sherebourne, entering the Thames by London Bridge.

In all, there are over 20 streams within the area of the County Council. Nearly all are hidden in sewers, but they have to be taken into serious account. From the surrounding hills the water flowed towards the Thames, or soaked along the clay and gravel, saturating marsh and moorland, or helped to feed the springs whose names, like those connected with the streams, are daily on our tongues. It is this abundance of water that has been, and still is, one of the chief difficulties in dealing with our sewerage. The embankment of the river, at a cost of £2,150,000, helped immensely to overcome this, but it will be noticed, as the progress of draining London is followed, that the conveyance of storm water added to the sewage is one of the chief causes of the enormous outlay. The district has been described as formerly—

> "A land of flood, of marsh, and rills,
> Of wooded slopes and heath-crowned hills."

In addition to the responsibilities within the limits of the County of London there are others. There are certain outlying districts, including Hornsey, Tottenham, and Wood Green, a part of Willesden, Acton, West Ham, and also a part of East Ham, whose natural lines of drainage between the hills require an easement through the County Council's sewers, for which they pay a rental. This on the north side means a provision for an additional 500,000 people. On the south this applies to a part of Beckenham and Penge, while part of Croydon and Norwood are also taken in, making an addition of some 35,000 to the population to be provided for. These cover an area of over 20 square miles, making a total area of upwards of 140 square miles dealt with by the main drainage system.

Historical Account of the Drainage of London.

The subject of drainage has exercised the mind of the British legislature from the time of Henry III., and many have been the enactments passed respecting it, including the well-known Bill of Sewers in the twenty-third year of Henry VIII. in 1531. Especial attention was frequently given to the necessities of the metropolis. These Bills, however, related to surface or land drainage only, for sewers as conduits for water-borne excreta or otherwise polluted liquid are of comparatively recent date. Though a great number of sewers existed in the eighteenth century, they were but more or less enclosed channels of the water-courses taking the natural drainage of the land, and prior to 1815 it was a penal offence to use them for any other purpose. (See Note D.) The older civilisation seems to have furnished examples of which the later ones have been slow to take advantage. Layard's researches in Nineveh, made early in last century, disclosed a complete system of sewers and house drains which were in use there in the year 1200 B.C.
